Sunderland Horticultural and Floricultural Society, June 7th.—The first exhibition for the season was held in the Large Hall, at the Athenæum. The following is a list of the prizes:—TULIPS.—12 *White Ground:* 1, Mr. T. Hull; 2, Mr. J. Ranson. *Best , Ditto:* 1, Mr. T. Harper; 2, Mr. I. Mallin. *Best White*, 1, Mr. I. Mallin: 2, Mr. T. Hull. 3, *Yellow Ground:* 1, Mr. T. Harper; 2, Mr. J. Ranson. PANSIES.—*Best* 36: 1, Masterpiece, Mary Ann, Ne Plus Ultra, Earl Durham, Agnes, Captivation, Thompson, Coronation, Carlo Dolci, Duke of Wellington, Eliza, Eclipse, Flora, Julius, Joshua, Miss Nugent, Maria, Major, Odd Fellow, Pilot, Rienzi, Raphael, Rolls, Seedling Victoria, Victoria, Victoria Superb, Zillah, Beauty, Rival Yellow, Brown's Adelaide, Vivid, Golden Sovereign, Diana Superba, King of the Yellows, Grace Darling, Mulberry, Mr. Pattison; 2, Mr. G. Allen, gr. to W. R. Robinson, Esq. *Best* 24: 1, Maid of Judah, Maid of the Mill, Zillah, Grand Duke, Maria, Vandyke, Prince of Wales, Ne Plus Ultra, Rival King, Masterpiece, Don John, Duke of Wellington, Royal Eagle, Admiral Nelson, Adelaide, Page's Duke of Wellington, Hannah More, Immutable, Jane Ann, Dr. Brown, Earl of Durham, Pilot, Beauty, Rival Yellow, Mr. T. Hull; 2, Mr. I. Mallin. *Best* 12: 1, Carlo Dolci, Admiral Nelson, Seedling, Victoria, Vivid, Miss Nugent, Duke of Wellington, Earl of Durham, Thompson's Coronation, Eliza, Eclipse, Julius, Zillah, Mr. J. Hastie; 2, Mr. T. Hull. *Bouquet of Pansies:* Mr. J. Hastie. *Scarlet Brompton Stocks:* Mr. W. Archer. *White Brompton Stocks:* Mr. T. Hull. *Best Cactus:* 1, Speciosíssimus, Mr. T. Cook, gr. to Sir H. Williamson; 2, Ackermanni, Mr. J. Ross, gr. to R. Pemberton, Esq. 3 *Cacti:* 1, Speciosíssimus, Ackermanni, Jenkinsoni, Mr. J. Ross; 2, Jenkinsoni, Triumphans, Ackermanni, Mr. T. Cook. *Cabbages:* Improved Imperial, Mr. T. Cook. *Lettuces:* Belle Bonne, White Coss, Mr. G. Allen. PELARGONIUMS, six: 1, Masterpiece, Climax, Eliza Superba, Sylph, Joan of Arc, Alexandrina, Mr. T. Harper: 2, Masterpiece, Miss Annesley, Una, Decorum, Beauty of Eastwick, Fire Fly, Mr. T. Cook. *Sylph and Conservative Pelargoniums:* Mr. T. Harper. Best *Victory do.:* Mr. T. Cook. *Calceolária.* do. *Bouquet of Hardy Flowers:* do. *Bouquet of Greenhouse Flowers:* Mr. J. Ross. *Greenhouse Plants:* Kennédya monophylla, Polýgala oppositifólia, Clématis azúrea grandiflora, Mr. T. Cook. *Stove Plants:* Vinca rósea, Erythrina cristagalli, Amaryllis Regina, Mr. J. Ross. *Apples:* Mr. T. Cook. *Pears:* do. *Do.:* Mr. J. Ross. *Cucumbers:* 1, Trollop's Deceiver, Mr. Pellowe; 2, Beck's Early Frame, Mr. T. Cook. *Cucumber:* Mr. R. Gibson, gr. to Wm. Bell, Esq. *Mushrooms:* Mr. R. Gibson, *Rhubarb:* 1st and 2nd, to Mr. G. Dale, gr. to R. A. Davison, Esq. *Potatoes:* 1, Egyptian Kidney, Mr. T. Cook; 2, do. Mr. J. Ross, AMATEUR'S CLASS—*Exotic Plant:* Fúchsia corymbiflora, N. Horn, Esq. *Pelargónium:* Pavónia maxima, Mr. J. Hastie. *3 do.;* Masterpiece, Climax, Alexandrina, do; 2, Eliza Superba, Alicia, Joan of Arc, Mr. Crone. *Calceolária:* Green's Prince Albert, Mr. T. Harper. *Best* 3: 1, Shepherd's Queen Victoria, Major's Publicola, Polyphemus longiflora, Mr. J. Hastie; 2, Charlotte, Gem, Favourite, Mr. Harper. 12 *Hardy Herbaceous Flowers*, Mr. T. Cook. GENTLEMEN'S GARDENERS'—*Exotic Plant:* Pimelea élegans, Mr. T. Cook. *Pelargónium:* Jewess, Mr. J. Ross. *Best 3 do.:* 1, Village Maid, Beauty of Ware, Climax, do.; 2, Grand Duke, Duchess of Gloucester, Clarissa superba, Mr. T. Cook. *Calceolária:* Floribunda, do. *Best 3 Calceolárias:* 1, Favourite, Harlequin, Majorana superba, do; 2, Sultana, Transparent, Major's Publicola, Mr. G. Allen. 12 *Hardy Herbaceous Flowers:* Misses Watson. EXTRA PRIZES: Mr. T. Cook, for 3 beautiful Plants of Kálmia latifólia; R. A. Davison, Esq., for a collection of Verbenas, Balsams, &c. &c.; Mr. J. Dagg, gr. with H. Gibson and Son, for Seedling Pelargóniums; R. T. Wilkinson, Esq., for Cherries; Mr. Crone, for Rosa Húmea odorata; Mr. T. Harper, for a Yellow Chinese Rose; Messrs. Gibson and Son, for a collection of rare and beautiful Greenhouse Plants. Various cottagers' prizes were likewise awarded.

Warrington Tulip Show, May 19.—The prizes at this meeting were as follows: TULIPS—*Premier*, Heroine, Mr. Hunt. *Feathered Bizards:* 1, Page's George the Fourth, Mr. Hardy; 2, Catafalque Superieure, Mr. Crosfield; 3, Sultana, Mr. Hardy; 4, Trafalgar, Mr. Crosfield; 5, Duc de Savoie, Mr. Wilson; 6, Emperor Charles, Mr. Hardy. *Flamed Bizards*—1st, Phœnix, Mr. Wilson; 2, Platoff, Mr. Hardy; 3, Belle du Bois, Mr. Wilson; 4, Surpasse le Cantique, Mr. Heath; 5, Black Prince, Mr. Peuketh; 6, Catafalque Superieure, Mr. Hardy. *Feathered Byblœmen*—1, Ambassador, Mr. Wilson; 2, Cheval Noir, do.; 3, Washington, Mr. Nunnerley; 4, Baguet, Mr. Hunt; 5, Beauté d'Anglaise, Mr. Nunnerly; 6, Maitre Partout, Mr. Peuketh. *Flamed Byblœmen*—1, Queen of May, Mr. Peuketh; 2, Violet rougeatre, do.; 3, Laura, Mr. Hardy; 4. Alexander Magnus, Mr. Peuketh; 5, Washington, do.; 6, Maitre Partout, Mr. Nunnerley. *Feathered Roses*—1, Heroine, Mr. Jones; 2, Walworth, Mr. Hardy; 3, Holden's Rose, do.; 4, Comte de Vergennes, Mr. Jones; 5, Dolittle, Mr. Wilson; 6, Hero of the Nile, Mr. Bloor. *Flamed Roses*—1, Lord Hill, Mr. Crosfield; 2, Grand Valeur, Mr. Hardy; 3, Rose Vesta, do.; 4, Roi des Cerises, Mr. Nunnerley; 5, Walworth, Mr. Wilson; 6, Vulcan, Mr. Hardy. *Bizard Breeder*—1, Old Dutch Catafalque, Mr. Hardy. *Byblœmen Breeder*—1, Beauty, Mr. Hardy. *Rose Breeder*—1st, Mrs Mundy, Mr. Hardy. *Yellow Self*—1st, Mine d'Or, Mr. Nunnerley. *White Self*—1st, White Flag, Mr. Peuketh.

Whitehaven Tulip Show, May 19.—This took place, as usual, at the Savings' Bank, and was allowed by all judges to be by far the most splendid exhibition of the kind that has graced the rooms since the formation of the Society. The following is a list of the prizes: TULIPS—*Feathered Bizards:* 1 and 6, Rev. J. Fox, Trafalgar, Trebisonde; 2, 3, Miss Mossop, Goude Buers, Count Platoff; 4, Miss Fox, Firebrand; 5, Mrs. Roper, Pearson's Regent. *Feathered Byblœmens:* 1, 5, Mrs. Roper, Lord Rodney; 2, 6, Rev. J. Fox, Bien faite, Partout; 3, Miss Mossop, Bien faite; 4, Miss Fox, Washington. *Feathered Roses:* 1, 5, Miss Fox, Dolittle, Comte de Vergennes; 2, 4. S. Dodd, gr. to Lord Lonsdale, two blooms of Dolittle; 3, Rev. J. Fox, Hero of the Nile, 6, Mrs. Roper, Dolittle. *Flamed Bizards:* 1, Miss Mossop, Abercrombie; 2, Rev. J. Fox, Duke of Lancaster; 3, Miss Fox, Grande Bergere; 4, Mrs. Roper, Sir Sidney Smith; 5, 6, T. Falcon, Esq., Unknown. *Flamed Byblœmens:* 1, J. Steel, Violet Wallers; 2, Miss Fox, Vulcan; 3, 5, Rev. J. Fox, Cerise Parmo, Bacchus Rectified; 4, Williamson Peile, Esq., Unknown; 6, S. Dodd, Bien faite. *Extra Prize by Mr. J. Mossop:* 1, J. Steel, gr. to W. Peile, Esq., Violet Wallers. *Flamed Roses:* 1, Rev. J. Fox, Triomphe Royale; 2, 3, Miss Smith, Triomphe Royale, Cerise à belle forme; 4, Miss Mossop, Rose Unique; 5, Mrs. Roper, Rose Unique; 6, Miss Fox, Triomphe Royale. *Selfs.* 1, 2, J. J. Gaitskell, Mine d'Or; 3, T. Falcon, Esq., Unknown; 4, Miss Mossop, Mine d'Or; 5, William M. Hobson, Roi de Mine d'Or; 6, Mrs. Roper, Mirabelle. *Best Double Tulip:* 1, W. Ellwood, unknown; 2, W. Peile, Esq., unknown. *Best Pan of Tulips:* Rev. J. Fox, Trafalgar, Bien Faite, Roi de Siam, Glaphyra, Walworth, Firebrand, Rose Unique. *Second Pan:* Miss Fox, Trafalgar, Bien faite, Cardinal, Vulcan, Sable Rex, Fleur des Dames, Mine d'Or. PANSIES.—*Best Twenty:* 1, J. White; 2, J. Steel. *Pelargoniums:* 1, 3, 5, S. Dodd, Forsteri Roseum, Cox's Smiler, Forster's Jewess; 2, 4, W. Miller, Vandyke, Triumphant; 6, T. Bell, gr. to Capt. Walker. *Greenhouse or Stove Plants, neither Ericas, Pelargoniums, nor Calceolarias:* 1, 5, J. Gaitskell, Borónia serrulata, Grevíllea sulphúrea; 2, S. Dodd, Russéllia júncea; 3, 4, 6, R. Elliott, gr. to G. Hartley, Esq., Fúchsia fulgens, Cactus flagelliformis, Clématis Sieboldi. *Calceolarias—best four:* 1, J. Gaitskell: 2, T. Bell. *Best Hardy Plant:* 1, 3, J. Gaitskell, Rhododendron, Azálea pulchérrima; 2, 4, I. Fisher, gr to J. Hartley, Esq., A. lútea. A. Póntica alba; 5, R. Elliot, not named; 6, T. Bell, Tiarella cordifólia. *Plants—collection sent solely for Decoration:* 1, S. Dodd; 2, T. Bell, 28 varieties; 3, R. Elliot, 19 varieties; 4, I. Fisher, 4 varieties. *Ericas:* 1, T. Bell, Erica perspicua nana; 2, J. Gaitskell, E. vestita alba; 3, 4, 5, 6, I. Fisher, E. fulgida, E. hybrida; E. campanulata, E. sulphurea. *British Plant:* 1, R. Elliot, Cypripédium calceolus; 2, J. Steel, not named. *Bouquet:* 1, J. Gaitskell; 2, 4, M. Lithgow, gr. to T. Hartley, Esq.; 3, D. Gates, gr. to T. Ainsworth, Esq.; 4, M. Lithgow; 5, R. Elliot; 6, W. M. Hobson. *Asparagus:* 1, D. Gates; 2, H. Frears; 3, T. Mann. *Potatoes, New:* 1, S. Dodd; 2, Miss Smith. *Salad:* 1, R. Elliot; 2, H. Frears. *Cucumbers:* 1, S. Dodd; 2, J. Fisher. *Cabbages:* 1, H. Frears; 2, W. Thornton. EXTRA PRIZES.—H. Frears, Gooseberries; T. Mann, Broccoli, Rhubarb.

Wingham Horticultural and Floral Society, June 2.—This, the first exhibition of the present season, presented a gay display of floral beauties, although the attendance of company was not so numerous as on some former occasions. The following is the award of prizes:—FLOWERS: Best three *Pelargóniums*, Jewess, Matilda, Prince Albert, Rev. C. Oxenden; 2, Garth's Perfection, Joan of Arc, Una, do.; best single plant, Leila Jones, do. Best *Herbaceous Calceolarias*, Mabel, Hero, Invincible, J. Godfrey, Esq.; best three *Shrubby ditto*, Royal Standard, Chancellor, Delholme, ditto. Best three *Annuals*, Phlox Drummondi, Collinsia bicolor, Nemophila insignis, D. Denne, Esq. Best three *Cacti*, Speciosissimus, Sir B. Bridges, Bart.; best *Cactus*, Ackermanni, do. Best *Bulb* in flower, Ixia patens, Mrs. Hammond. Best *Fuchsia*, Fulgens, D. Denne, Esq.; 2, Globosa, do. Best *Rose*, Lee's Blush Perpetual, Lady Bridges. Best six *Greenhouse Plants*, Grevillea Manglesii, Pimelea decussata, Sollya heterophylla, Metrosideros species, Fabiana imbricata, Polygala grandiflora, J. Godfrey, Esq.; best three do., Pimelea decussata, Metrosideros saligna, Cinerária formosa, R. Brooke, Esq.; best one do., Erica hybrida, Mrs. Dickens. CUT FLOWERS: Best six *Roses*, Crimson China, Queen Victoria, Princess Esterhazy, Hymenée, Yellow China, Common China, J. Godfrey, Esq. Best 12 *Ranunculuses*, Mrs. Hammond; 2d do., Mr. G. Denne. Best three *Red Stocks*, Giant, Mrs. E. Collard; best three *Purple ditto*, Brompton, S. M. Hilton, Esq. Best 12 *Heartsease*, Jewess, Incomparable, Delicata, Duchess of Richmond, Haidee, Sylvia, Countess of Orkney, Jehu, Eclipse, Diogenes, Vivid, Bridesmaid, Rev. J. G. Hodgson; 2, Queen of the Isles, Pilot, Cream Superb, Peter Dick, Duchess of Richmond, unknown, White's Perfection, Marchioness of Lothian, Prince Albert, Imogene, Eclipse, Delicata, ditto. Best six *Pelargoniums*, Jewess, Garth's Perfection, Conservative, Colossus, Chef d'Œuvre, Beauty of Ware, Rev. C. Oxenden. Best *Bouquet*, Lady Bridges; best *Bouquet of Hardy Flowers*, Mrs. Brook. Best *Device*, Crown, Mrs. Plumptre; 2, Fountain, Capt. Swann. FRUITS: Best bunch of *Grapes*, White Frontignan, J. P. Plumptre, Esq.; 2, Black Hambro', do. Best 24 *Strawberries*, Keen's Seedling, Lady Montresor; 2, do., Sir B. W. Bridges, Bart. Best eight *Dessert Apples*, Court of Wick Pippin, Mr. J. Elgar; 2, Aromatic Russet, Mr. Dadds. Best six *Kitchen Apples*, Lady's Fame, do.; 2, Holness Seedling, Mr. W. Cooper. VEGETABLES: Best quart of *Green Peas*, Early frame, Mr. Cousins. Best brace of *Cucumbers*, Roman Emperor, Mr. G. Denne; 2, White spine, S. M. Hilton, Esq. Best 30 *Asparagus*, Gravesend, Mr. E. Gibbs; 2, do., Mr. J. Sutton. Best 30 *French Beans*, China Dwarf, Sir B. W. Bridge, Bart. Best six stalks of *Rhubarb*, Victoria, Mr. Sankey; 2, London market, Mr. Harrison. Best *Cauliflower*, Mr. Stubberfield. Best *Lettuce*, Paris Cos, D. Denne, Esq. Best *Cabbage*, London Market, Mr. Cooper. Best 12 *new round Potatoes*, Cockney, Rev. C. H. Hallett; best 12 *new Kidney do.*, Ashleaved, do. Various prizes were likewise awarded to cottagers, for the best productions of fruits, flowers, and vegetables. There was a very fine collection of Heaths, from Mr. Masters, of Canterbury, consisting of the following sorts:—Erica Lævis, Vestita rósea, Cupressina, Taxifólia, Ambígua, Fúlgida nana, Persoluta, Odorata rósea, Vestita alba, Tubiflora, Intermédia and Linnæoides; and a fine stand of named double anemones. The following Pelargóniums were from Mr. Miller's nursery, Ramsgate:—Nymph, Comte de Paris, Gipsy Maid, Firebrand, Prince Albert, Lady Carlisle, Pixey Queen, and Beauty; besides a collection of cut blooms, of several other sorts.

Yorkshire North Riding Horticultural and Floricultural Society, May 27.—The first exhibition for the present season took place in the Court Yard, Northallerton. The day was an auspicious one for the occasion, and the display of plants, flowers, fruits, and vegetables was numerous and select. Amongst the many fine specimens of plants, we particularly noticed the Stove plants, exhibited by J. Hutton, Esq., of Sowber Hill, which were in excellent health, especially Erythrina Crista Galli, Sinníngia Youngeana, Russéllia júncea, and many brilliant coloured hybrid varieties of Cactus, &c. From the Earl of Tyrconnel, T. Walker, Esq., and from the Marquess of Ailesbury's garden, at Jervaux Abbey, were many fine specimens of plants; from the latter place we noticed a beautiful new Cinerària, named Prince Albert, which was much admired; and from many other members, various productions of Flora. The splendour of the Calceolarias exhibited, excited the admiration of all present, from their novelty of colour and for their size, which surpassed those of all previous exhibitions. The Pansies were splendid; nothing could surpass the beauty of the winning stands, which contained most of the best varieties in cultivation. The Bouquets, both hardy and tender, were numerous; and from their chaste arrangement added much to the splendour of the show. The Tulips were very numerous, and amongst them were some fine flowers, but the season was too far advanced for them. In noticing the fruits, we must add, that the high state of preservation in which the Ribston Pippin Apples were brought forward, is very highly creditable, being as fine in flavour and appearance as at Christmas. The Rhubarb exhibited was of good quality; the length of some was nearly four feet, and a bundle of twelve stalks was supposed to weigh nearly 30 lbs. Ten years since, twelve stalks of Rhubarb could not be produced to weigh twelve pounds in this neighbourhood. The Cucumbers, particularly the winning brace, were pronounced, for symmetry and good growth, to be the finest ever exhibited at this meeting. The prizes were as follows: STOVE PLANTS—1, 2, J. Hutton, Esq., Sowber Hill, Sinningia guttata, Hæmanthus coccínea. GREENHOUSE PLANTS: 1, 2, do., May's Fúchsia stylosa conspicua, Borónia serrulata. ERICAS: 1, 2, Mr. May, E. pinifólia purpúrea, E. bícolor. CALCEOLARIAS. 1, 2, 3, 4, 5, 6, Lady Constable, Sylph, Victory, Wonder, Zenobia, Venus, all seedlings, Mr. May. PELARGONIUMS: Class 1—1, Mr. May, Jewess; 2, Mr. Hepton, Jewess. Class 2—1, Mr. May, Miss Herbert; 2, Mr. Hepton, Ophelia. Class 3—1, Mr. Hepton, King; 2, do., Masterpiece. Class 4—1 Mr Elliott, Grand Duke; 2, Mr. May, Maximum. Class 5—1, Mr Hepton, Victory; 2, Mr Banning, Garth's Perfection. Class 6—1, Mr. Hepton, Apollo; 2, Mr. Hepton, Chef-d'Œuvre. PANSIES: *Stand of* 18—1, Mr. Linton, with May's Goldsmith, Duchess of Cleveland, Col. Dundas, Imogene, Mr. Brown, Amulet, Jewess, Laila Rookh, Van Amburgh, Nicol Jarvie, Enfield Rival, Marc Antony, Wonder, Paul Pry, Albina, Mrs. Ward, Harriet, and Barnardiana; 2, Mr. Linton. *Stand of* 12—1, 2, do. *Stand of* 6—do. TULIPS: Class 1—1, Mr. Linton; 2, Mr. Hepton. Class 2—1, Mr. May; 2, Mr. Hepton. Class 3—1, 2, Mr. Lamb. Class 4—1, 2, Mr. Hepton. Class 5—1, 2, Mr. Linton. Class 6—1, 2, do. Class 7—1, 2, do. Class 8—1, do.; 2, Mr. May. ANEMONES: Class 1—1, Mr. Reed; 2, Mr. May. Class 2—1, 2, Mr. Linton. Class 3—1, do.; 2, Mr. Reed. Class 4—1, 2, do. Class 5—1, 2, Mr. Linton. Class 6—1, 2, Mr. Hepton. STOCKS, *Red*, Mr. Reed; *Purple*, Mr. Banning; *White*, Mr. Pinkney. STOVE AND GREENHOUSE BOUQUETS—1, Mr. May; 2, Mr. Banning. HARDY BOUQUETS—1, Mrs. Booth; 2, Mr. May. FRUITS: *Dessert Apples*—1, 2, Mr. Telford, gr. to L. Hartley, Esq. *Baking Apples*—1, 2, Mr. Telford. *Strawberries*—1, Mr. Banning, gr. to J. Hutton, Esq. VEGETABLES: *Cucumbers*—1, Mr. Banning; 2, Mr. Burrowes. *Kidney Potatoes*—1, Rev. T. Morley; 2, Mr. Telford. *Round Potatoes*—1, Mr Telford; 2, Mr. Banning. *Asparagus* 1, Mr. Burrowes; 2, Rev. T. Morley. *Small Rhubarb*—1, 2, Mr. Reed. *Large Rhubarb*—1, Mr. Banning; 2, Mr. Telford. *Kidney Beans*—1 Mr. Elliott, gr. to the Earl of Tyrconnel. *Sulphur Broccoli*—1, 2, Mr. Telford. *Pink or Purple do.*—1, do; 2, Mr. Cummin, gr. to J. C. Maynard, Esq. *Cos Lettuce*—1, Mr. Telford; 2, Mr. Elliott. *Cabbage Lettuce*—1, Mr. Elliott; 2, Mr. Telford. *Cabbages*—1, Mr. J. May, gr. to the Rev. — Mason; 2, Mr. Banning. *Best Red Onions*—1, Mr. Hepton; 2, Mr. Telford.

MISCELLANEOUS.

Liebig's Organic Chemistry Applied to Agriculture,

&c., Reviewed by Dr. Schleiden.—(Translated from the German).—Few books published in modern times have excited a more lively interest or attracted more attention from numerous classes all over Europe, than the publication, whose title is at the head of this paper, though apparently the number of its readers must be limited. Soon after its publication it was hailed, by a great number of people, as a most ingenious production, and as a torch, calculated to spread light over the darkest mazes and labyrinths of science; but at the same time voices were heard from all sides contradicting its principles, As the number of the latter is daily increasing, it is to be apprehended that the book will fall into discredit with the same rapidity with which it has risen above the common level. In investigating the real value of this work it is not difficult to point out that part by which it obtained the approbation of so many persons in so short a time. It is much less easy to lay open with precision and clearness those numerous errors and deficiencies, which no doubt will soon produce a decided alteration, and cause it to fall as quickly as it has risen. A work may easily get into favour with the public, which is written in lively and bold language, full of confidence and certainty, and which lays down in a few principles, expressed with perspicuity and precision, those scientific results which have been obtained by many tedious and laborious researches during many centuries, and which besides boldly establishes new laws, by which it seems easy to solve with certainty the most difficult problems, and to explain the most complicated phenomena. Such a book is sure to get into favour with that portion of the public which, incapable of forming its own opinion on the matter, wishes to be put in possession of the results of scientific researches, if that end can be obtained without following the deep investigations of scientific naturalists; and especially if the book be written in a language adapted to moderate talents and pretty free from technical terms. Had the book appeared under a different title, nobody would have found fault with its author or entered into a dispute with him; for no doubt agriculturists, and other practical men, may learn many useful things from it, which they must otherwise have collected from many works with great labour. But the title of the book, and still more the account the author gives in the introduction (p. ix.) of what induced him to undertake it, has subjected his publication to strict criticism, in order to ascertain its real value in a scientific point of view. The title of the book alone shows, that a single person is not able to form a just idea of the value of its contents in all their bearings, and that the opinion of the chemist, of the agriculturist, and the physiologist, may differ much respecting that point. Up to this time the opinion of only the two first classes (chemists and agriculturists) has been published. The chemists have found fault with the author for having produced very little which is new, and for having published what was already known before, as if it had been found out by himself, without mentioning the name of the discoverer. The agriculturists have probably taken well founded objections to many of the principles laid down by him, especially to his theory of manuring. It is now time that the physiologists should raise their voice, I mean the vegetable physiologists, as the other classes of physiologists find very little information in his book, if we except a few pages (pp. 299-346) where the author speaks of poison, miasma, and contagion. The vegetable physiologists have now to determine the value of Dr. Liebig's work, as far as it relates to the science they profess. Such a step on their side is completely justified by the treatment they have experienced from this author, who, as often as an opportunity occurs (and sometimes he fetches it from afar), speaks of the physiologist with such wanton contempt, that in some respects the whole book is nothing better than a libel on this class of naturalists. Since Dr. Liebig asserts (p. 32) that even the most distinguished of our physiologists do not connect any meaning with such terms as—acids, bases, alkalis, etc., I think we shall be justified in trying to prove that we, physiologists, understand much more of chemistry than Dr. Liebig of physiology and the objects of our science. It will then be obvious which of the two has most to learn from the other.

But it may be asked, why I take so much trouble with an adversary, whose book contains so little which is exclusively his own, and that little of small importance, whilst there are found in it such numerous errors, and many things bordering on complete absurdity. I therefore find myself obliged to lay before the public what entitles the author to this attention on my part, and how it happens that it is not a disgrace for me to enter the lists against him. Dr. Liebig is no philosopher. Even in the literature of philosophy he is so extremely ignorant, that, without comment, he thinks proper to call the fancies of Schelling, the "Natural Philosophy of the Germans." Still, it must be confessed, that his work adheres closely to one great fundamental principle of philosophy; and this he owes to the soundness and clearness of his genius, which nobody can deny him to be possessed of. But it does not appear that he has been fully conscious of the intimate connexion of that principle with researches in science. The principle I mean is the possibility of a natural science, founded exclusively on a hylological (material) view of the creation. The only principle or end of all scientific researches must be, to place all nature under strict mathematical laws, which do not admit of exceptions, and which ultimately are all reducible to the laws provided by those movements of matter, which arise from their fundamental qualities. This principle must be applied, without exception, to all objects of organic or inorganic nature. If this term is rightly understood, we must say that there is in nature only organic matter, or such as is subject to be continually changed by movements produced by internal, but material, powers; and inorganic matter, which, not being subject to changes, is subject to the mathematical laws of nature. The mental functions alone are entirely independent of these laws; but as the mind derives its origin from a source of quite a different nature, it must eternally remain excluded from the scientific (theoretic) researches of material nature, as an object which cannot be connected with them. This difference, however, is not very obvious; and only by a slow progress men have at last risen so far as to form a clear idea of this state of things. The union of the mental and material view of the creation in the same subject, has for a long period led men into error in this respect. This appears in the ancient myths, who attributed to each stone a spirit, —a god; in the more refined entelechia of Aristotle, who found himself compelled to adopt a spiritual principle for the explanation of the formation of forms; and in the monades of Leibnitz. We even find that the most ingenious investigators of nature, who, as it were, by instinct, have acquired the idea that the material world constitutes an independent body, have been cried down as atheists. But at last the day began to dawn, natural philosophy gradually freed itself from the fetters imposed on it by scholastic wisdom derived from traditions and ancient writings. and, leaving books aside, it applied itself to investigate the processes of nature by experiments, as soon as this manner of scientific research had been introduced by Galileo. From that period many phenomena have been placed without the pale of the mystical system. Kepler, Newton, and La Place, at least, have completely succeeded in liberating the movements of the heavenly bodies from all spiritual influence, and in subjecting them them to the laws of motion. That portion of natural philosophy which is called physics, and chemistry, have likewise gradually attained their true position, and achieved their independence. But in those branches of natural philosophy, whose object is the investigation of organic nature, the old disorder still remains, on account of difficulties arising from the complication of the problem to be solved; and more especially, because in the most perfect organic body, in man, we continually encounter the mysterious union of mental operations and of matter, which probably will remain unexplained to all eternity. Nevertheless, in these branches, too, science continues its progress on a safe road, although for a moment it has been led astray by the poetical fictions of Schelling and his adherents. The whole science of the organic world,, both in physiology and medicine, advances irresistibly, propelled by the united efforts of those who apply themselves to the investigation of these subjects. All researches now tend towards one ultimate end, namely, the establishment of a complete independence, on the part of the material world, of explanations drawn from the spiritual world, and the securing it on scientific principles. This is the bond which invisibly connects all the distinguished investigators of nature of our own times, and which unites all the different individuals engaged in the pursuit into one great school, however widely they may differ in their opinions and views. This it is which impresses on the natural philosophy of our days a peculiar character, of which it will not be deprived by the quickly-vanishing dreams of philosophical mysticism. Here I might confess that the manner in which organic chemistry is treated by Mr. Liebig, tends to the same goal, and I repeat, that on that account his book deserves to be noticed; though perhaps it will be in the end discovered that the author has not solved a single problem of vegetable physiology—that most of them he did not understand—and that consequently his book is useless, as far as the advancement of vegetable physiology is concerned.

If, on the one hand, we admit that an author has directed his views towards right objects, and that he has never swerved from the idea which must give life to his labours, we must, on the other hand, ask two questions before we can conceive a precise idea of the real value of his work. We must firstly inquire what degree of clearness this leading idea has attained in his mind, and how far it has been combined with the consciousness of its scientific tendency; and, secondly, how he has applied this idea to specific objects. It is extremely difficult, I may say impossible, to separate these two questions, and to answer them singly, in giving an opinion of this publication of Dr. Liebig's. For in reference to the last question, the principal reproach to which his work is subject is, that it has been written without consideration, and without its author having previously digested the matter as he ought to have done, as is evident from the circumstance that nearly every page, and certainly every chapter, is either not in accordance with that which precedes, or is frequently in plain contradiction to it. The whole work is, in fact, a strange mixture of contradictions, superficial observations, gross ignorance, ingenious ideas, and rich and powerful combinations, with which are interwoven the opinions and views of other authors, sometimes named and sometimes not, and just historical notices; although in other places the author intentionally, as it seems, falsifies historical facts. The reader is frequently uncertain what opinion he has to form; he does not know whether he understands the views of the author, or whether he is studying ideas conceived and written down in haste, or whether, supposing that the true view of the author is made out, it is worth exposing and proving that it does not rest on any foundation. Liebig himself does not hesitate to designate as illiterate all those who despise the value of foreign literature the more, the less they are acquainted with it; and we shall add, that it is only a proof of mental vulgarity when a man extols his own business as elevated above all others, and presents his own limited views as the only ones founded on truth. Dr. Liebig, who speaks so contemptuously of physiologists, and asserts that even the most distinguished among them do not connect any idea with such terms as carbonic acid, acids, and bases, does not show in his book that he is himself acquainted with the publications of any botanical physiologist, except those of Reum, whom nobody regards as a vegetable physiologist at all, and the general physiology of Burdach, who adheres to the poetical fancies of Schelling, which are rejected by nearly all who have acquired any reputation in these branches of science. Besides, he seems to have forgotten, or perhaps, he never knew, that Müller, Schwann, and other physiologists, have distinguished themselves by important discoveries in chemistry. Indeed, Dr. Liebig would seem to know nothing about anything except chemistry, and even in that science to be only acquainted with his own views, when, among other observations, he maintains in a very arrogant way, that the art of making experiments can only be acquired in a chemical laboratory. It would seem as if he had never heard of experimental natural philosophy, and that the names of Faraday, Arago, Biot, Seebeck, &c., have never reached his ears. What conclusions, then, shall we draw from his assertions? It is a most unpleasant task to enter into a dispute with an author who evidently has not digested what he has published, for in such a case it must remain a matter of great doubt how far he intends to be answerable for his own opinions and assertions.

We are bound to support these our opinions of Dr. Liebig's work by some passages taken from the book itself. He says, p. 18, "It is certain that plants decompose carbonic acid;" p. 60 and 61, however, he thinks it *very improbable* that the carbonic acid is decomposed, and shows that it is much more probable that water is decomposed. Page 35, he says, "As pure starch of potatoes, when dissolved in nitric acid, leaves behind a ring of the finest wax, what can be objected if the chemist hence draws the conclusion that each molecule of starch is composed of concentric layers of wax and amylum, which thus *reciprocally* protect one another against the influence of water and ether?" It does not appear to have occurred to Dr. Liebig that the term "reciprocally" must expose him to ridicule. One kind of matter must be on the external surface; and by the alternate action of water and of ether the molecule of starch should, of course, be dissolved: which, however, does not take place, as is well known. It is hard to suppose that Dr. Liebig is so ignorant of his own science as not to know that starch is easily dissolved in boiling water, diluted sulphuric acid, and diluted alkalies, and does not leave a residuum of wax; and that nitric acid not only dissolves starch, but decomposes it. Page 8, he says, "The qualities of humus and of humic acid have been transferred in an inconceivable way by vegetable physiologists to that constituent of mould to which the same name has been applied." (By whom?—I think only by chemists.) We do not know whether to consider it as ignorance of the history of his own science, or as an intentional falsification of historical facts, when we find that Dr. Liebig does not even suspect that the whole theory of humus, and its application to explaining the manner in which plants are nourished, have been invented and fully developed by Saussure, Sprengel, Malaguti, Berzelius, Mitscherlich, Mulder, and others, who were all chemists; and that but few vegetable physiologists have adopted it from them without making any material change. Dr. Liebig does not seem to know that many vegetable physiologists have always asserted humus only to contribute to the nourishment of plants by being converted into carbonic acid. This is the opinion of Senebier, Ingenhouz, Agardh, &c. I myself heard it from my teacher Bartling; and it was only at a later period that I became acquainted with the theory of humus, as explained in books, and to which I am not inclined to give my assent. But in another part of his book he does seem to know this fact, and speaks there of Senebier, Ingenhouz, &c. We read at page 22, "The same current of air which, *produced* by the rotation of the globe, has traversed the space between the equator and the poles, brings to us, on its return to the equator, the oxygen which there (where?) has been produced, and carries to it the carbonic acid of our winters?" Must we, in reading this monstrous theory of the winds, ascribe it to an entire ignorance of natural philosophy? or to an utter confusion of his ideas when the author was writing down this passage? Page 37:—"In those plants of the torrid zone which are filled with milky juices, caoutchouc and wax surround the water with a kind of impenetrable cover, similar to what is observed in oily emulsions, therefore they abound in juice. As in milk the pellicle formed on the surface prevents evaporation, thus in these plants the same effect is produced by the milky juice." Such an assertion would excite a smile on the face of a youth just beginning to study the anatomy of plants, and hardly deserves to be refuted. The whole families of Euphorbiaceæ, Asclepiadeæ, Milky Cacti, &c., consist of large thin-sided cells filled with watery juice and a little chlorophyll. Among them are distributed a few thick-sided vessels filled with a milky juice, which contains but little water. These vessels are not mechanically united with the first class of cells, and perhaps even their organic connexion may not be important. In despite of this milky juice, the watery matter of the cells would soon evaporate if it were not protected by the close texture of the epidermis. A person who applies to vegetable physiologists a language like that used by Dr. Liebig, should, we think, endeavour to understand at least the elementary principles of vegetable physiology. It is needless to produce more instances of this kind, which may be found on nearly every page; our assertions will be abundantly supported by what still remains to be introduced.

It must be considered as an unavoidable consequence of the haste with which Liebig has worked, of his striking want of scientific knowledge, and of the little consideration he has given to his subject, that his reasoning may be refuted point by point, even in matters where his views are just. In my opinion there is nothing which proves more evidently the uselessness of an author, than the circumstance that his reasoning is open to well-founded objections while his evidence is admitted. Such a man cannot fail to create a prejudice against science itself, because many will imagine that they have put an end to a subject, however solid its foundation, when the defence of it by a weak advocate has been easily thrust aside. I feel it my duty to state this expressly, as many persons would otherwise blame me for having attacked Liebig on account of views which I myself have defended at other times. My object in writing this paper is not to treat of certain laws and principles of physiology, but to show, what Dr. Liebig does not understand—the problems which that science has to solve; and that at least, in this publication, he has not in any essential way contributed to the solution of these problems. In order to proceed regularly in the performance of this task, I shall subject the principal sections of his work, as far as they regard vegetable physiology, to a more exact and minute examination.

The first section (from 6 to 43) treats of the assimilation of carbonic acid. I have already mentioned that he begins with stating as an historical fact that which is not true. The humus of the soil has indeed been identified with artificial humus, and has been considered as the principal source from which plants receive nourishment. This, however, has not been done originally by the vegetable physiologists, but by chemists; as is evident from the circumstance that Dr. Liebig, in his short view of the theory of humus, does not produce the name of one physiologist, but only those of chemists. Further, Dr. Liebig is of opinion, that it can be shown by the strictest proof, that humus, in that form in which it exists in the soil, does not, *in the slightest way*, contribute to the nourishment of plants. According to my view of the matter, we are not yet so far advanced in our researches as to be authorised to make such an assertion. It is easy to show that Dr. Liebig has not succeeded in establishing what he promised; but, instead of it, he has adduced a fact which perhaps may give a slight probability to this view of the matter. His first observation (p. 9), is, that the cold of winter and the heat of summer deprive the humic acid of solubility in water; which is quite in accordance with the old experience, that drought in summer and a high degree of cold without snow in winter, considerably diminish the fertility of soil. This observation, therefore, may rather be considered as supporting than as refuting the theory of humus. The observation which follows, that cold water deprives the good mould only of the salts of the rain water, and that it remains colourless, is not true, according to the experiments of Berzelius (viii. 386). I myself always have obtained from good mould a yellowish extract, which indeed differed considerably according to the difference of the earthy matter, but which always contained a considerable admixture of brown organic matter. By these two observations, which evidently prove nothing, Dr. Liebig thinks he has succeeded in completely disposing of humic acid (p. 10), and passes to humic salts. Here he offers us some calculations by which he intends to prove that they are equally incapable of supplying a plant with the amount of carbonic acid required for its nourishment. All calculations beginning with such phrases as, "Let us suppose," "Let us put aside for the present," &c., are usually valueless to science; and if they are made without the least regard to essential points, and are based on arbitrary suppositions, as those of Dr. Liebig, they are perfectly childish. His first calculation is to prove that the ashes obtained from a plant, if all its salts have been taken up as humates, are only sufficient to account for one-thirtieth part of the carbonic acid which is produced. Here we first meet with the erroneous assumption that potash and soda do not differ from lime in their capacity of saturation. I should have expected Dr. Liebig to know that the difference is very great. Further, he has entirely omitted ammonia, which forms the salt richest in humus, and which, in his own opinion, is introduced into the plant by the roots, on account of its great affinity to the humic acid of the soil, probably as a humate, being afterwards decomposed by the plant for the purpose of forming matters containing nitrogen. Lastly, the author has not taken notice of secretion from the roots, of which he is elsewhere a strenuous advocate. According to this theory, it would be probable that a great quantity of bases, after having given the plant this humus, are secreted, and consequently cannot be found in the ashes. But these bases can again be directly saturated with humic acid, can thus re-enter the plant, and will then undergo again decomposition and secretion, and so on. This calculation, then, is entirely void of all the fundamental data required to prove, even remotely, the improbability of the theory of humus. The second calculation has for its object the quantity of humic acid which may be introduced into a plant by the water which is contained in the soil. Liebig begins by assuming that (according to Schübler) an acre of land receives, during a period of four months' vegetation, 700,000 lbs. of rain water, which reaches plants while saturated with that salt which is the most soluble and contains the greatest quantity of humic acid, *i. e.* with lime; but by this, not one-sixth of the carbonic acid which is produced can be accounted for. This calculation is equally worthless with the last, because lime constitutes neither the most soluble salt, nor that which contains the greatest portion of humic acid. Ammonia, indeed, is such a salt; and this, according to Liebig himself, is always found in sufficient quantity. The following calculation, which I oppose to those of Dr. Liebig, will show how insignificant such estimates are:—An acre contains 40,000 square feet. If the crust of soil operative in vegetation is taken to extend to the depth of a foot, and the specific gravity of the earth at 2.0, the acre contains 4,000,000 cubic feet. Suppose that it contains *one per cent.* of humus, the humus amounts to 40,000 lbs. According to Berzelius these materials absorb from the atmosphere in 24 hours 40,000 lbs. of water; consequently in 120 days, during the period of vegetation, 4,800,000 lbs. of water. To these are to be added 700,000 lbs of rain, which raises the quantity to 5,500,000 lbs. of water. In this way the plants receive 2,200 lbs. of lime saturated with humic acid, which is equal to 2,016 lbs. of humic acid, or to 1,169 lbs. carbonic acid. Now the Corn and Straw grown on the acre contain, according to Liebig, 1,020 lbs. carbonic acid. There is, consequently, still left 149 lbs. to account for the carbonic acid consumed in forming roots and the lower part of the haulm. Again, according to the opinion of the author, the atmosphere always contains ammonia, which is readily absorbed by humus, and forms that salt which is most soluble and contains the greatest proportions of humus. If, for the formation of humate of ammonia ten times the same quantity of water is required, that quantity (700,000 lbs.) brings to the plants 70,000 lbs. of humate of ammonia. This quantity contains, according to the calculation of Mulder, 42,000 lbs. of carbonic acid, and if we suppose that only one-tenth of the water is used in the nourishment of the plants, they receive still 4,200 lbs. of carbonic acid. I could wish to learn from Dr. Liebig what the plants are to do with this immense surplus of carbonic acid?

On the other hand, the author at page 13, has made calculations which render it in the highest degree improbable that plants are nourished by humus contained in soil. After having repeated the old observation, that in forests or meadows, in despite of the crops annually taken from them, the soil continually increases the proportion of humus without the assistance of manure, he produces a calculation, according to which equal spaces of ground, whether used for the growth of Forest-trees, Grass, Corn, or Turnips, produce annually nearly the same quantity of carbonic acid. If this was true, it would prove that the production of carbonic acid is entirely independent of the mode of cultivation and the application of manure. The facts on which this calculation rests are not within my province, but Dr. F. X. Hlubek, in his examination of this our author's book, has proved, in a very satisfactory way, that these facts are mere fancies of Dr. Liebig.

The author arrives at the conclusion, that as the soil cannot be the source from which carbonic acid is derived, it must be the atmosphere. I think he has come to this conclusion too hastily. I venture to affirm, that it is certain that the vegetable matter contained in soil is changed into carbonic acid by the oxygen of the air, by way of combustion. It cannot be questioned, that the carbonic acid produced in this way is absorbed by the moisture contained in soil, and then attracted by the roots. It is therefore very probable that soil contributes much to the nourishment of plants; and this probability is increased by the observation, that the quantity of carbonic acid does not appear to have increased in forests, which for a thousand years never have been cut, and certainly not in proportion to the quantity of vegetable matter produced by the falling of leaves, the breaking of branches, &c.

Dr. Liebig next inserts (p. 15) a very absurd observation: "Humus," he says, "is produced, according to the opinion of all scientific men, by decomposition and decay. Therefore there cannot be an original humus, as there existed plants before the humus." I answer; "carbonic acid is produced, according to Dr. Liebig and the opinion of all scientific men, by the process of combustion and respiration; therefore there cannot have been an original carbonic acid, as there existed plants before animals and combustion." But of what use are such follies in a scientific work? What do we know of the nature of that process by which the earth forms her productions? I think, just nothing. Carbonic acid is a combination of carbon and oxygen; humus is a combination of carbonic acid, oxygen, and hydrogen. Does Dr. Liebig think it more difficult for nature to bring about the combination of the three last mentioned substances, than that of the two first?

After Dr. Liebig (p. 17, &c.) has repeated the well known facts respecting the continued production of carbonic acid, and that nevertheless the portion of this matter contained in the atmosphere does apparently * not increase, he briefly asks, "what becomes of the carbonic acid?" and he answers as briefly, "it is absorbed by the leaves of plants from the air, decomposed into its constituents, and after the carbon has been fixed in the plant, the oxygen is emitted." This question, however, cannot be decided in so hasty a way, if it were only because the answer expresses much more than the question implies. The question, What becomes of the carbonic acid? and the answer, It remains fixed in the plants, have nothing to do with the other questions, By what organ is carbonic acid introduced into a plant? and, Is it there decomposed, or only fixed? That carbonic acid is the matter from which the carbon of plants is derived, is a fact which has been stated long ago, and which, up to this day, has been asserted as true, by a great number of physiologists. That under certain circumstances plants absorb carbonic acid, and emit oxygen, by means of their leaves, is likewise a fact, which has been acknowledged since the times of Senebier, Priestley, and Sáussure. But that it is certain, as Dr. Liebig thinks, that carbonic acid is dissolved in the leaves of plants, has not in any way been proved, and he himself thinks it very improbable in another part of his book. Lastly, that the leaves absorb *all* the carbonic acid which is required for the maintenance and growth of the plants from the atmosphere; that the plants, when they are perfectly formed, are not in need of the carbonic acid of the soil; and that want of moisture and complete dryness of the soil do not impede the completion of their development (p. [illegible]);—all these propositions are mere fictions, and have evidently been written without consideration. For common experience shews, that plants must die if the soil loses its moisture entirely, and thus refutes the statement of the author in a manner which cannot be questioned. In conceiving this unfounded theory, he evidently has been influenced by a solitary instance mentioned in his Appendix (p. 181.) I do not call in doubt the credibility of Mr. W. Macnab, though many important difficulties have risen in my mind on reading his account; but I must observe, that Ficus australis is a plant whose roots grow in the air, and that it appears to me more than probable that such plants are, more than others, possessed of qualities which enable them to condense the moisture of the atmosphere. But even if this fact is admitted in all its force, it proves nothing more, than that Ficus australis constitutes an exception to the general rule. Experiments by which this question is settled may be made every day. It will be found that a plant in a pot dies if it is not watered, that in the open ground it continues to live for a considerable length of time without rain, because the soil continually absorbs the watery vapours of the atmosphere, especially during the night; but that when drought continues for a long period, plants growing in the open country suffer, especially because the drought diminishes the capacity of the humus for absorbing moisture (Mitscherlich). These facts are known to every peasant, to every gardener, but as it seems, are unknown to Dr. Liebig.

To prove the absorption of carbonic acid by leaves, the author appeals to the well-known experiments of Saussure. According to the same experiment, he is obliged to admit that they emit carbonic acid at night; but he asserts, without any kind of proof, that this carbonic acid is derived from a quite different source, and that the quantity thus emitted is not equal to that which has previously been absorbed. But since the experiments of Saussure, Link, and Grischow, according to which, plants vegetating in an air, to which that of the atmosphere has not access, do not change the air in its qualitive or quantitive relations, have not been reported by Dr. Liebig, I shall take the liberty to oppose these well conducted and exact experiments, to the phrases of Dr. Liebig, and I think I may assert that in this matter there is still a great vacuum in our knowledge, to fill up which, this author does not seem better qualified than physiologists.

Meyen being aware of these difficulties, was nearly the first and only physiologist to deny that the atmosphere is improved by the functions of the leaves, and he has proposed a theory, resting, indeed, on a very weak foundation. Now, Dr. Liebig asserts (p. 24), that in the writings of all vegetable physiologists and botanists, the assimilation of the carbonic acid of the air is called in doubt, and that most of them deny that the air is improved by plants. This is another proof of his great ignorance, or rather gross falsification of historical data known to every body, and it is not worth my while to answer them more fully.

Dr. Liebig, after having (p. 26) enumerated a number of single well-known facts, which have produced in his mind the certain conviction that the carbonic acid emitted at night by plants enters them originally in that state, and that the oxygen absorbed does not serve for the combustion of the carbon, he at last, (p. 30), produces a decisive proof which, in his opinion, clearly shows that the plants give a greater quantity of oxygen to the air than they withdraw from it. He rests this proof on the known fact of air-bubbles beneath ice, which are said to be filled with pure oxygen; and this oxygen is stated to be derived only from plants. Dr. Liebig asserts that it is pure oxygen, and we must give him credit; and he adds also that this oxygen is always increasing in quantity, and never diminishing. But, I ask, must this be considered as a proof of that great art of making experiments, only to be learnt in chemical laboratories? If it is so to be considered, I am glad that I have learnt it in other places. How is it possible that Dr. Liebig can expect to solve, in ditches and ponds, such delicate problems, in such a way as to render them in the least degree useful to science? He does not seem to know that ice absorbs gases; that certainly water is never separated from the air hermetically, as it were, by ice; that in water a continual absorption and exchange takes place between the gases; that carbonic acid is more easily absorbed by water than oxygen; that frost separates from the water the gases which it has absorbed; that such a separation especially takes place at points and edges, and, consequently, at leaves and small branches; that—but this is enough to prove, that he who considers the solution of the above-mentioned problem so very easy a task, must have but a superficial knowledge of the matter; and that this remnant of knowledge is arrogantly employed for the purpose of showing up, as ignorant fellows, all those botanists who have entertained different opinions, although founded on innumerable facts. Though I certainly am not partial to Mr. Meyen, and decidedly differ from him in the solution of the problem in question, yet I assert boldly that, in conceiving his theory, he has evinced a degree of sagacity and of knowledge of chemistry much superior to that of Dr. Liebig in his chapter on the Assimilation of Carbonic Acid. Not to mention his frequent contradictions, his historical, physical, and physiological perversions, he shows in this chapter a want of knowledge in even his own chemistry, by producing his untenable theory of starch. The only new thing which he has advanced in it, is the view that carbonic acid is assimilated by plants by means of their leaves; and this proposition must, for the present at least, be regarded as quite unfounded. In proof that carbonic acid dissolved in water is introduced into plants by their roots, I shall here produce two calculations, which rest on very different foundations, and yet agree in so remarkable a way with one another, and with other facts, that I think many will be inclined to put some value on them.

---

* Mr. A. Dumas, in his Statics of Organic Chemistry, has shown that our eudiometric experiments are much too scanty to prove that the atmosphere is not subject to any change in the proportion of its components.

I. According to *Hales*, a sunflower, 3½ ft. high, evaporated every day 1 lb. and 4 oz.; therefore in 120 days, during its vegetation, 150 lbs., = 3 cubic feet. These, saturated, contain 3 cubic feet of carbonic acid. I shall allot to every plant 2 square feet of soil. There would therefore be on the acre, assumed by Dr. Liebig, 20,000 of such plants. 3 cubic feet of carbonic acid have the weight of about 5 oz. Therefore all the plants absorb with the water 6,250 lbs. of carbonic acid, or 1,600 lbs. of carbon. The production of carbon over the surface of an acre is, according to Liebig's calculation, equal to 1,029 lbs. There remain, therefore, still 630 lbs., which have been employed in the growth of the roots, &c., as also in that of the leaves which have withered during the period of vegetation.

II. The supposed acre, if we assume one foot for the depth of the earth which contributes to the growth of the plants, contains 40,000 cubic ft.; or, if we assume the specific gravity of the earth at an average at 2.0, it contains 400,000 lbs. of earth. These again contain 40,000 lbs. of humus, or 1 per cent. They absorb from the atmosphere, in 24 hours, 40,000 lbs. of water, and in the assumed period of vegetation, *i. e.* in 120 days, 4,800,000 lbs. of water. To this is to be added the average quantity of rain, viz., 600,000 lbs., and then we obtain 5,400,000 lbs. of water. The sunflowers, which Hales used for his experiments, have only on the lower side of their leaves stomates by which evaporation takes place. Let us suppose that the surface of the plant is 38 square ft., but that only 2 square ft. are occupied by the stomates, by which evaporation is effected: then we find that that portion of the surface of the plant by which the evaporation goes on is equal to the surface of the earth from which it draws its nourishment. If we suppose that the evaporation does not vary, we obtain for all the plants 2,700,000 lbs., or 54,000 cubic feet of water. With this water an equal number of cubic feet, or 5,625 lbs. of carbonic acid, are introduced into the plants, which answers to about 1,500 lbs. of carbon.

Though, from the nature of the subject, the facts on which these two calculations are founded have no claim to great exactness, and are only to be considered as a very rough estimate, yet they give a result in which the difference is not very great; and they prove at least one thing, namely,—that the carbonic acid which enters plants with water, by means of their roots, is completely sufficient to explain the source of carbon existing in the plants. When we consider, moreover, the capacity of humus to absorb carbonic acid, we shall be almost justified in assuming that the water which is absorbed by roots is completely saturated with carbonic acid.

I have now shown that Dr. Liebig has not at all understood the problems of physiology, as far as he has touched upon them in this chapter; that he has not produced any new fact, with the exception of the unfounded assertion that equal extents of soil produce equal quantities of carbon; that he does not know, or pretends not to know, that all the false theories on which he has stumbled, have been invented by chemists, and have only been adopted from them by physiologists, among whom, however, there always have been some who have entertained more just views; and lastly, that the only new thing which he has introduced, appears, according to our present knowledge, to be quite unfounded. It cannot, then, fail to excite indignation, that Dr. Liebig should, at the end of the chapter, make a violent attack upon physiologists, of whom, in his ignorance, he has formed an idea, existing only in his own fancy, and on which all his offensive language is grounded. It is rather unfortunate that in a book dedicated to Alexander Von Humboldt, the author should assert, that the most distinguished of our physiologists are unacquainted with the elements of chemistry, whilst that class of natural philosophers with pride and truth enumerate among them that great philosopher himself.

Dr. Liebig reproaches vegetable physiologists with ignorance of chemistry and physics, and says, they are incapable of making experiments. As to the first point, I shall use the words of Dr. Liebig himself, and assert, that that man acts like a blockhead who treats other sciences with contempt in proportion to his ignorance of them. Whoever has read the publications of Dutrochet, Mohl, Unger, Göppert, &c., will certainly confess that they know quite as much of chemistry as can be required from persons who do not profess that science; and that in those writers no such absurd theories are found as the nonsense about alternate layers of starch and wax protecting one another reciprocally against the influence of water and ether. As to their knowledge of physics, I think they have a much greater share of it than Dr. Liebig, as is evidently proved by his Theory of the Winds.

Dr. Liebig thinks that all the talents of vegetable physiologists have been wasted in a study of the structure and formation of plants, and that they have proceeded in this task without consulting chemistry and physics. I confess that our physiologists, in their ignorance, have always been such simpletons as to think that a person must first be perfectly acquainted with all the parts of a machine—with its wheels, levers, &c., before he can expect to be able to explain its action in any reasonable way. I do not doubt that they are also of opinion, that if Dr. Liebig had only had a small idea of the structure and physiology of plants, he would have avoided expressing himself as he has done in speaking of the milky juice; or, as at p. 66, where he says: "The vegetable physiologist considers a leaf in every case only as a leaf, notwithstanding that a leaf, which produces oil of turpentine, must be of a different description from that which gives oxalic acid." A leaf is indeed always a leaf. But the physiologist has ascertained, by the anatomy of plants, that neither leaves nor stems of themselves produce oil, or any other matter, and that these are formed only in separate cells. It is indifferent whether these cells occur in the leaves or in the stem. To explain these processes, it is of the greatest importance to investigate anatomically the most minute portions of the cells; for the productive power of two cells, placed near one another in the same leaf, differs frequently much more than that of two plants distant from one another, and quite different in their habits. If Dr. Liebig had the least notion of a microscope, and its use, he would not have exposed himself to ridicule by his idle objections to the existence of fungi producing fermentation. That the microscope may lead to more certain results than common chemistry, may be proved by his view of the composition of starch; and what he says of gluten in bread (p. 36), proves nothing more than that he does not know how to use a microscope. Nobody has ever thought of distinguishing, either with the microscope or the naked eye (for in this matter it is the same), things which possess the same qualities in an optical view. But if, as is probable, gluten and dextrin have a different capacity of refracting light, and these two substances are indeed mechanically mixed up in the bread, Dr. Liebig may be certain that the distribution of gluten in bread may be discovered as well by the microscope as by his chemical processes.

As to the inability of physiologists to make experiments, I confess that we do not make experiments like those of Dr. Liebig, where a fish-pond represents the pneumatic trough, and a scating-ground a graduated tube. They know too well what they are about, and that their object is not to reason about the possibility of a chemical or physical explanation, but to ascertain how nature proceeds in her operations in each given case. We are far indeed from being able to effect this, and the principal reason of our inability must be looked for in the state of chemistry, which leaves us in the lurch, and offers nothing to our assistance except a great number of *ines* and *ides*, which are useless in the explanation of the theory of vital actions; and about as many hypotheses respecting the composition of organic matter, which are just as useless, because they do not rest on consistent ideas and are not coherent in themselves. Dr. Liebig is, no doubt, able to explain how, according to the opinion of some chemists, it may be imagined that an atom of starch is composed by the combination of his elements; but can he prove how it must be composed according to scientific principles, which do not admit of any objection? Is Dr. Liebig able to give us a theory which explains the transformation of starch into gum and sugar, &c., and which contains something more than empty phrases—such as catalys, contact, a body in activity, and so forth? So long as in these two matters, which themselves constitute the real foundation of vegetation, we cannot give a satisfactory explanation, we can hardly expect to understand the zoochemistry of the cells of plants; nevertheless, it may be hereafter found that the life of the whole plant, and of its organs, may result from the life and productive faculties of single cells. It cannot be denied that vegetable physiologists have made many experiments little to the purpose; but it is unreasonable to inveigh against them on that account; and is it not most indecent, when it is done by the chemist, and in the arrogant way of this book? would Dr. Liebig wish to be reproached with all the nonsense which in the last thirty years has been produced by chemists? That most silly proposition—that plants are able to form metals and earths from water and air, was the result of the bad experiments of chemists. In fact, Dr. Liebig may look into the literature of starch, his own views included, to convince himself how little chemistry is entitled to reproach physiology with the mistakes which have been committed by particular individuals. Dr. Liebig, however, would no doubt be ready to answer, "other chemists are nothing to me; when I use the term Chemistry, I understand by it only myself—me, Doctor Justus Liebig, of Giessen, the only German chemist, the director of the only laboratory existing in Germany." Thus, at least, he has explained himself formerly.

(To be continued.)

To Destroy the Turnip Fly.—A correspondent of the *Mark Lane Express* says—"I have great pleasure in communicating to my brother farmers, that I have discovered gas lime, sown upon Turnips before their coming up, to be a sure preventive against the ravages of the fly. When gas lime cannot be obtained, gas tar, reduced with common lime, may be successfully applied between the drills, carefully avoiding the plants. A mixture of twenty pounds of flour of sulphur with a ton of lime (which will not injure the plant) may be sown upon two acres, which will also produce a beneficial effect."—*Worcester Herald.*

GARDEN MEMORANDA.

Dropmore.—It is in the beginning of summer that the great features of beauty in this charming place are most striking; for it is then that the woods are filled with banks of Rhododendrons, Azaleas, and Kalmias, of all colours and forms; the borders with myriads of Roses; and the flower-beds are covering with their carpets of white and azure and crimson and gold. Early summer is the season, too, when the Pine woods are fragrant with their balsamic exhalations, when the new foliage is emeralding the Fir-trees, and when the wild flowers still retain their freshness. Such was the condition of Dropmore a few days since: walks embowered with thousands of Boursault and de Lisle Roses, through which the sunbeams shed a ruddy and broken glow, led to the Architectural Gardens, whose well-filled borders and marble statuary were so relieved by deep banks of verdant laurels, that the dryness of the neighbouring country seemed a dream. The earth, indeed, was hot and parched, for watering was hardly possible; but the plants were fresh and vigorous, and showed no sign of suffering. Among the many beautiful flowers here in great profusion, the "Pink Nosegay" Pelargonium was conspicuous for its beauty on the walls, and the "Compactum" in the borders. Florists, indeed, despise such things; but walls and borders have an equal contempt for Florists' Pelargoniums. Among the yellow flowers in large masses, Calceolária viscosíssima was singularly striking, from its dwarf and compact mode of growth, and golden yellow blossoms. Rosa Banksia was there too; not in flower indeed, but in long festoons, produced in wild luxuriance. The season for pruning it had just arrived, and Mr. Frost was about to cut it in, in order to secure a full crop of flowers hereafter. He had succeeded in obtaining a fine hybrid Fuchsia, between fulgens and globosa, which deserves to be in general cultivation. In the Pinetum, the specimens of Coniferous plants were all beautiful, except the Stone Pines, which are dying off. Abies Douglasii is forming cones of the clearest and most transparent green; and the Araucarias are darting up higher and higher every month. Abies Webbiana, too, is *producing its singular cones*, erect on its rigid branches, of the deepest plum colour, fashioned with admirable symmetry, and already streaming with tears of transparent balsam. That this magnificent species should have borne its fruit for the first time in Europe at Dropmore, is only what was to be expected in the finest Pinetum in Europe, and must be highly gratifying to Lady Grenville. But in what terms of indignation shall we speak of the thief who, taking advantage of the liberality with which this noble lady allows her beautiful grounds to be visited, has stolen one of these rare and precious cones! He would be kicked out of every garden from the Land's End to John-o'-Groats, if he were but known. As is always the case, the keeping of the whole garden establishment here was excellent, and reflects the greatest credit upon, not only the skill, but the zeal and untiring industry, of Mr. Frost, the gardener.

Mrs. Marryatt's, Wimbledon.—In the Orchidaceous house are some beautiful specimens of Oncídium flexuosum, whose graceful and drooping panicles are loaded with an abundance of yellow flowers; the singular yet beautiful Oncídium Papilio; Brássia Lanceana, and Epidendrum variegatum, with 7 spikes of green flowers, spotted with purple; Epidendrum nocturnum, which exhales such a fragrant perfume during the night; Dendróbium secundum, with several spikes of delicate rose-coloured flowers; Cattleya Forbesii; Acanthophíppium bícolor; an immense plant of Cymbídium aloifólium, loaded with racemes of waxlike blossoms; and an excellent variety of Oncídium ampliatum. An immense plant of Passiflora alata covers the whole roof of the stove, where we observed Anigozanthos coccínea, in flower; and Curcuma longa, a pretty tuberous plant, which, although introduced above 80 years since, is nevertheless seldom seen. Here is also a well-grown specimen of Allamanda cathártica. In the Green house we saw Acrophyllum venosum, a handsome shrubby plant, from New Holland, of rather recent introduction; the flowers, which are white, are produced in whorls; the leaves are deeply and regularly serrated, and arranged in threes around the stem. The beauty of its foliage, independently of its blossoms, is sufficient to render it worthy of general notice. This house also contains some noble specimens of Cacti, which will be splendid objects in a few days; fine plants of Fúchsia affinis and Witsénia corymbosa, and several varieties of Lílium lancifólium. The Heath-house is very gay with well-bloomed plants of Erica vestita coccínea, E. tubiflora, E. ventricosa superba, E. perspícua nana (the latter not more than 6 in. high, but a complete mass of bloom; Lachnæa ericifólia, covered with heads of delicate white flowers; Borónia serrulata, Azálea fulgens, A. variegata, and Pimelea decussata. A fine plant of Triptilion spinosum is just coming into bloom. The Tacsónia pinnatistípula partially conceals the roof of the conservatory, from the rafters of which its twining branches hang in festoons, covered with a profusion of beautiful rose-coloured blossoms. Here also are some Hydrángeas, with blue flowers, which are produced by being potted in the pure Wimbledon loam. The flower-garden, which is tastefully laid out, is partly surrounded by a belt of Rhododendrons, which are now in full perfection, and add greatly to its lively appearance. We noticed a particularly good method of training Standard Roses, which ought to be more generally adopted; namely, over a circular iron trellis, somewhat resembling an umbrella in form, upon which the branches are tied down as they require it. The stem of the Rose, in the present instance, was about 5 ft. high, and its head of the same diameter; when the blossoms are fully expanded it will be a complete mass of bloom. A clump of Gaulthéria Shallon, about 28 ft. in circumference, is covered with a multitude of its snow-white flowers. In the centre of the flower-garden is a fine spreading specimen of the deciduous Cypress; and on the lawn a noble tree of Salisbúria adiantifólia, near which a large plant of Stuártia virginica is just coming into flower. The Vineries and Peach-house contain abundant crops; one of the former was almost filled with Camellias, which had nearly completed their growth of wood. Mr. Redding, the gardener, allows them to remain in heat until their blossom-buds are about the size of peas, when he removes them to a cooler situation. This treatment succeeds admirably.—*R. A., June* 6.

Crewe Hall, Cheshire.—A noble specimen of the Cactus speciosissimus is now flowering in the Conservatory here, having upwards of 350 flowers upon it; forming a mass of brilliancy easier to be imagined than described by the spectator.—*June* 14.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

MIMOSA URUGUENSIS. The Uruguay Mimosa. (*Greenhouse Shrub.*) Polygámia Monœ'cia. Leguminosæ, § Mimóseæ.—A pretty greenhouse shrub, very nearly hardy, which would no doubt improve much in appearance under the hands of a good cultivator, and it would reward his pains. It is a native of the province of Buenos Ayres, whence seeds were received by the Hon. W. F. Strangways, and given to the Horticultural Society. It flowered at Chiswick, in June 1841. It requires such protection in this country as is given to Verbenas, Acácias, and things of that description. It grows well in a mixture of light loam and leaf-mould, and may be readily propagated by cuttings in the usual manner.—*Bot. Reg.*

HABRANTHUS PRATENSIS. Meadow Habranthus. Amaryllidáceæ. Hexándria Monogynia. (*Stove Bulbous Plant.*)—The bulbs of this beautiful plant were received by C. B. Warner, Esq., from South Chili. It has a peculiarly brilliant appearance, on account of the contrast between the rich yellow at the bottom of its flowers and bright crimson of their limb. It seems to like a light loamy soil to grow in, and sends up its flower-stems and leaves early in spring. After the flower fades the plant ought to be grown in a light situation and freely watered, in order that it may be able to perfect its leaves. When these are fully formed and die off, it should be removed to a dry shelf, and kept there until the period of growth comes round, when it can be watered and treated as before. Young bulbs are formed round the old one every season, by which it can be propagated.—*Bot. Reg.*

CŒ'LIA BAUERANA. Mr. Bauer's Cœlia. Orchidáceæ, § Epidéndreæ. Gynándria Monándria. (*Stove Eyiphyte.*)—The West Indies and Mexico produce this little epiphyte, which, although white and inconspicuous, is, like our own Lily of the Valley, so sweet that it must take precedence of most of its race. No Hawthorn hedge is more fragrant than a bed of this Cœ'lia. This plant succeeds best when cultivated in a cool stove, and suspended from the rafters on a block of wood. Almost all those persons who grow many of this tribe are now dividing those which require a hot temperature from others which grow best in a cooler place. Amongst the latter, therefore, this should be placed, and it will then flourish with little care. It grows fast and is easily multiplied.—*Bot. Reg.*

Reviews.

Encyclopædia of Cottage, Farm, and Villa Architecture and Furniture; bringing down Improvements in these Arts to 1842. Illustrated by numerous woodcuts. By J. C. Loudon, F.L.S., &c. Longman and Co.

COTTAGE Architecture! Why what a change is here from what even we remember in our youth. The very word speaks of civilisation, good taste, and benevolence. Let us hope that the time is fast approaching when hut, hovel, and cabin, shall be regarded as synonymous with dog-kennel and cattle-shed, as they in melancholy truth have been, and still are. Rich men in former days built castles for themselves, and styes for their vassals and serfs. In later times, vassals changed place with their lords; but while houses rose up, and surrounded the mouldering walls of feudal fortresses, the stye remained to the cottager, and, to the shame of too many of the selfish of all European countries, still remains.

It is however, consolatory to find that what was formerly the rule and custom is now the exception and disgrace; and that the strong condemnation of society compels an attention to the comforts of their cottagers, even from those who have not human feeling enough to see the propriety of it. We have at last arrived at the time when the rich are willing to recognise the existence of other rights on the part of the poor than such as the cold page of the statute-book prescribes. The inevitable effect of this must be not only to increase the good feeling which binds together the various ranks of society, but to improve the taste of the middle and lower orders, and to create a demand for works in which the arts of design and arrangement are treated of. Half a century ago, such a book as this of Mr. Loudon's would have been a bibliographical extravagance; under existing circumstances, it is a work of the utmost practical utility. Indeed, we are not sure that we do not agree with the "Times" in considering it the most valuable of all Mr. Loudon's many writings; for there is nothing theoretical or fanciful in it; but it is a vast accumulation of sound practical information upon just that subject which most men are anxious to understand, but are little able to judge of in the absence of a safe and elaborate guide. There are few country gentlemen who do not build cottages; in ordinary cases it is not worth employing a professional architect to design them; but the planning is left to a country carpenter or bricklayer who knows nothing of anything except joinery or brickwork. The consequence is just what might be expected; materials are wasted, and estates are disfigured.

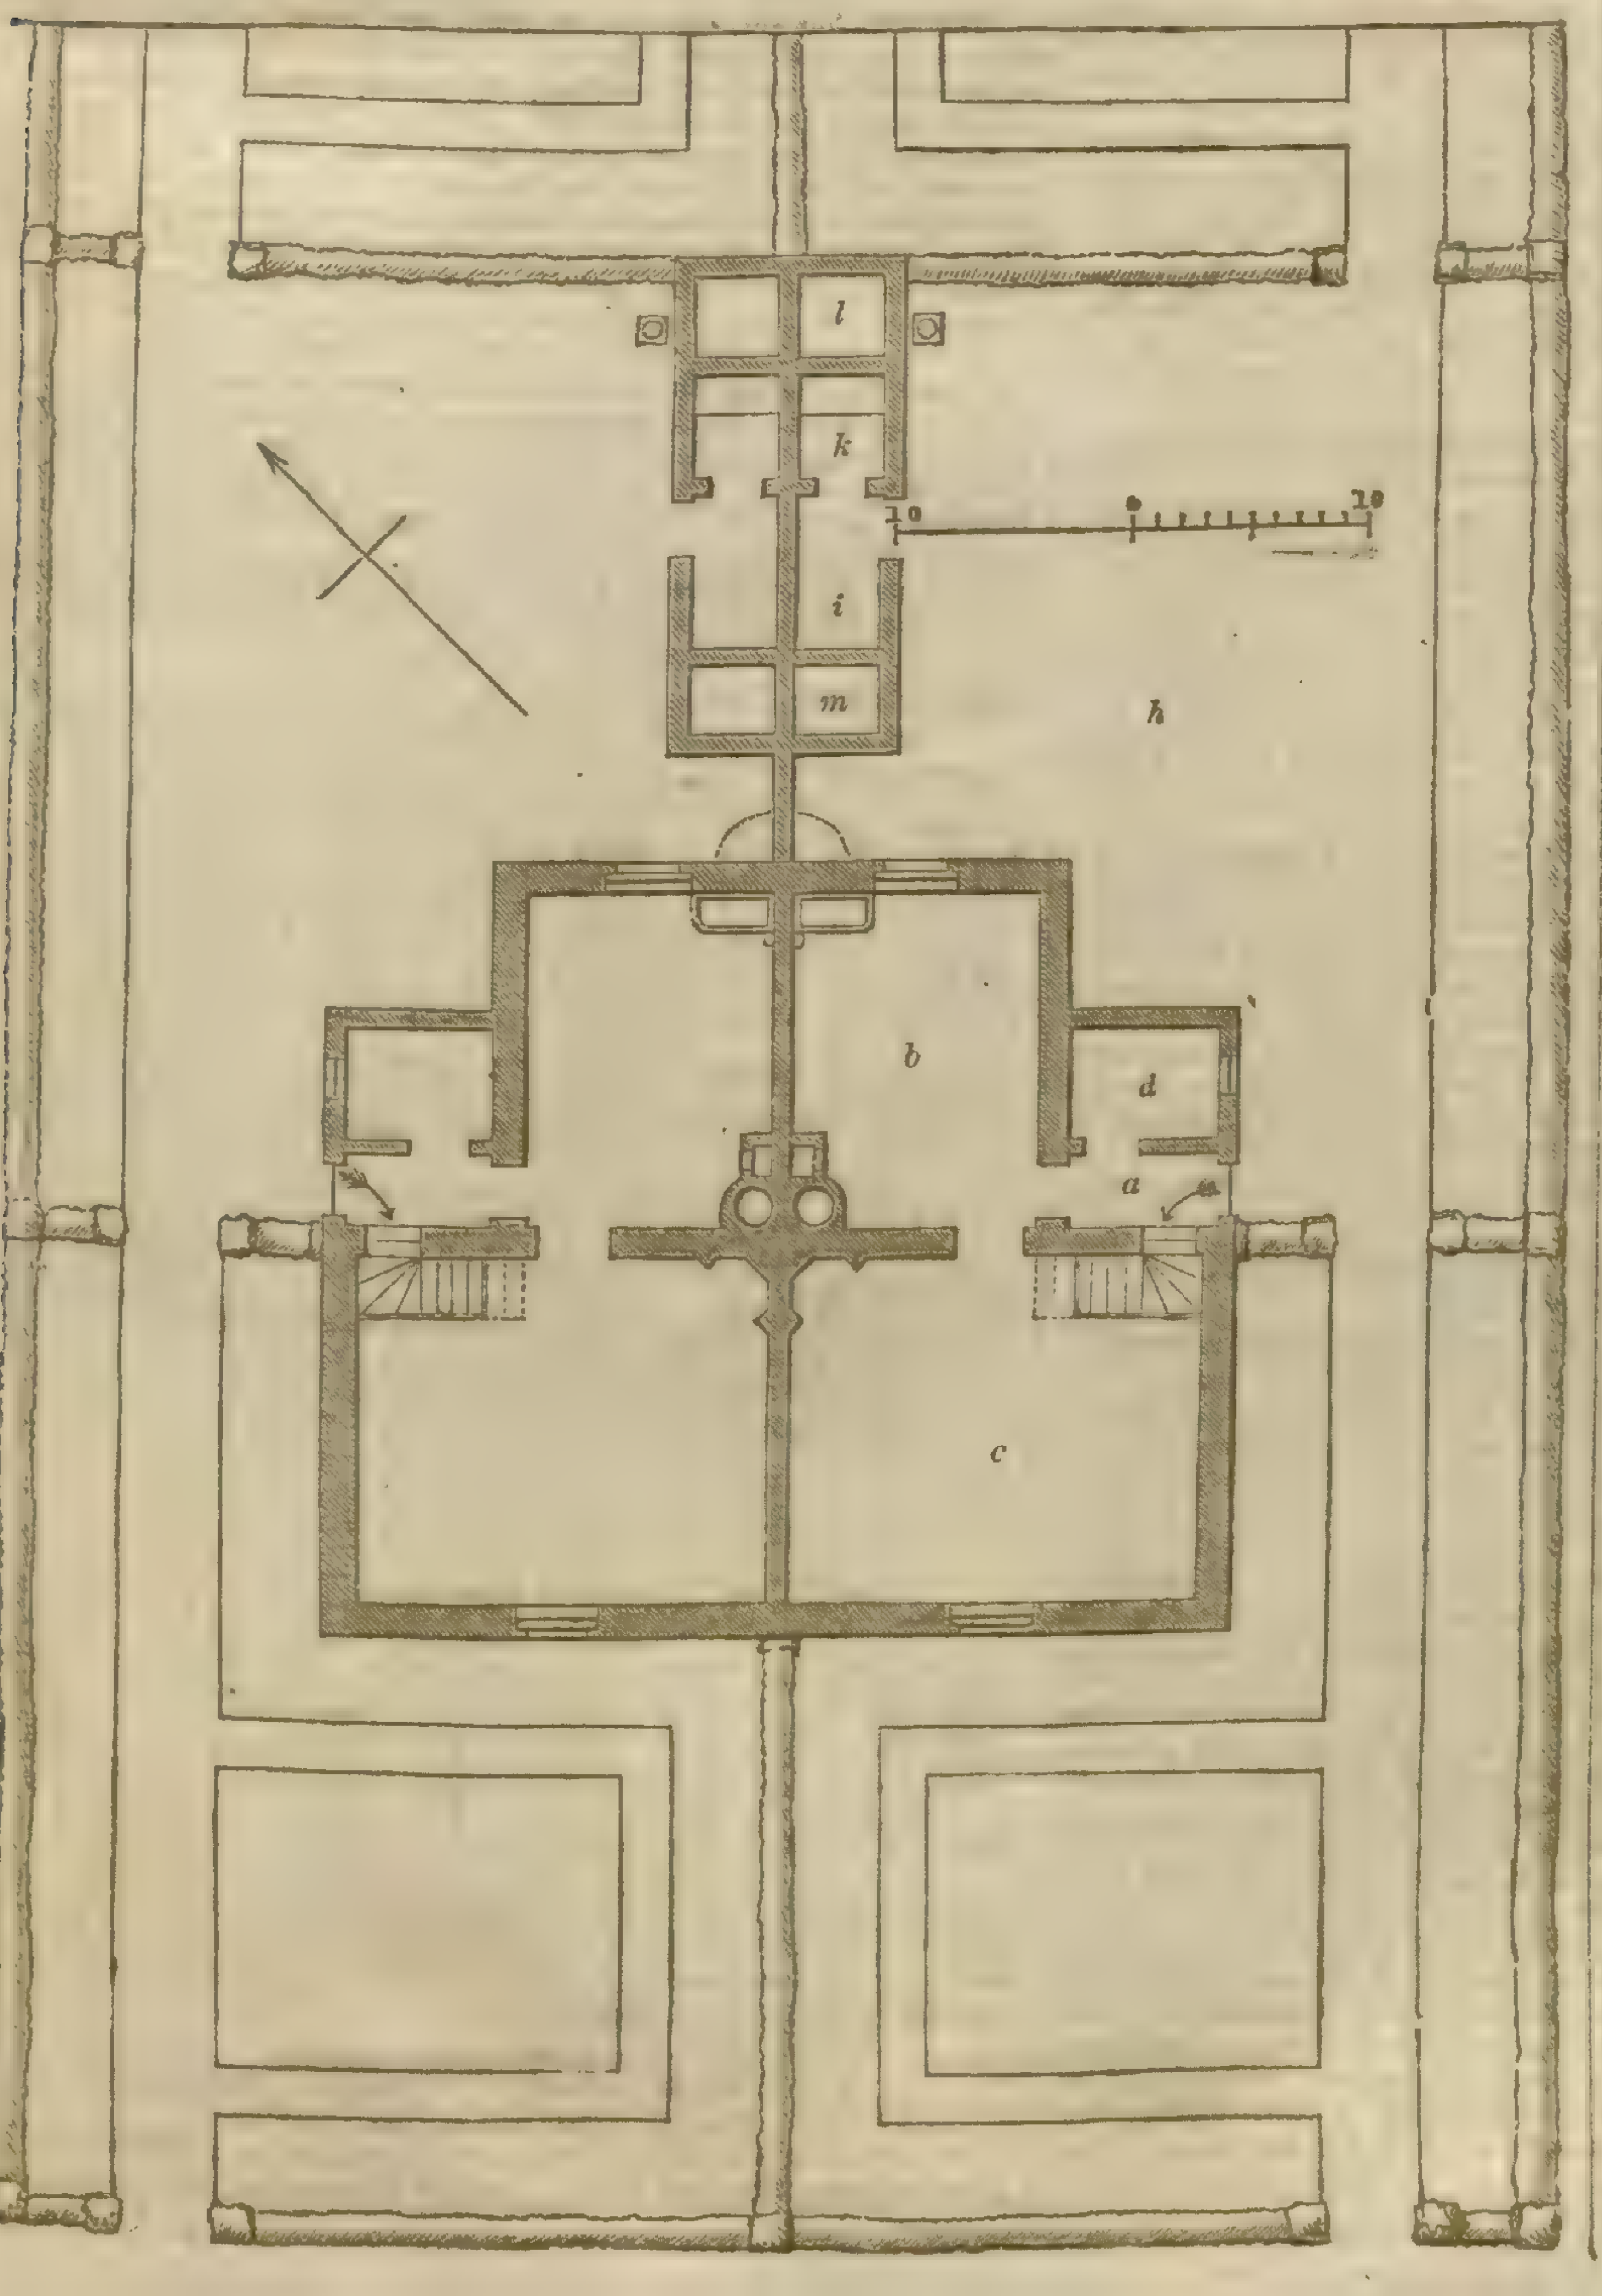
The work before us is an 8vo of 1300 pages, including a Supplement which has just appeared. It comprehends an infinite variety of designs, working drawings, and *estimates of expense*, for cottages, farmhouses, farm-buildings, country inns, parochial schools, corn-mills, malt-houses, cider-houses, brick-kilns, villas, stables, aviaries, lodges, dog-kennels, garden-buildings, fountains, and we know not what besides: moreover, there is information concerning all manner of fittings up, furniture, ovens, kitchen utensils, and all sorts of domestic conveniences; so that there is hardly a question that can be asked concerning buildings connected with the comforts or wants of country people that is not well answered. For example, a correspondent inquired last week where he could best obtain a plan for a lime-kiln. Upon turning over Mr. Loudon's pages, we find full information upon that subject at p. 600 of the work before us, with 6 or 7 explanatory woodcuts.

Even the analysis of a work illustrated by no fewer than two thousand three hundred woodcuts would be an impossible labour. We shall therefore confine ourselves to a couple of extracts, which will show the manner in which Mr. Loudon has treated his numerous subjects; selecting them from the Supplement, which has just appeared, it being the newest part.

The following are plans and designs for a model on which the cottages of mechanics may be constructed:

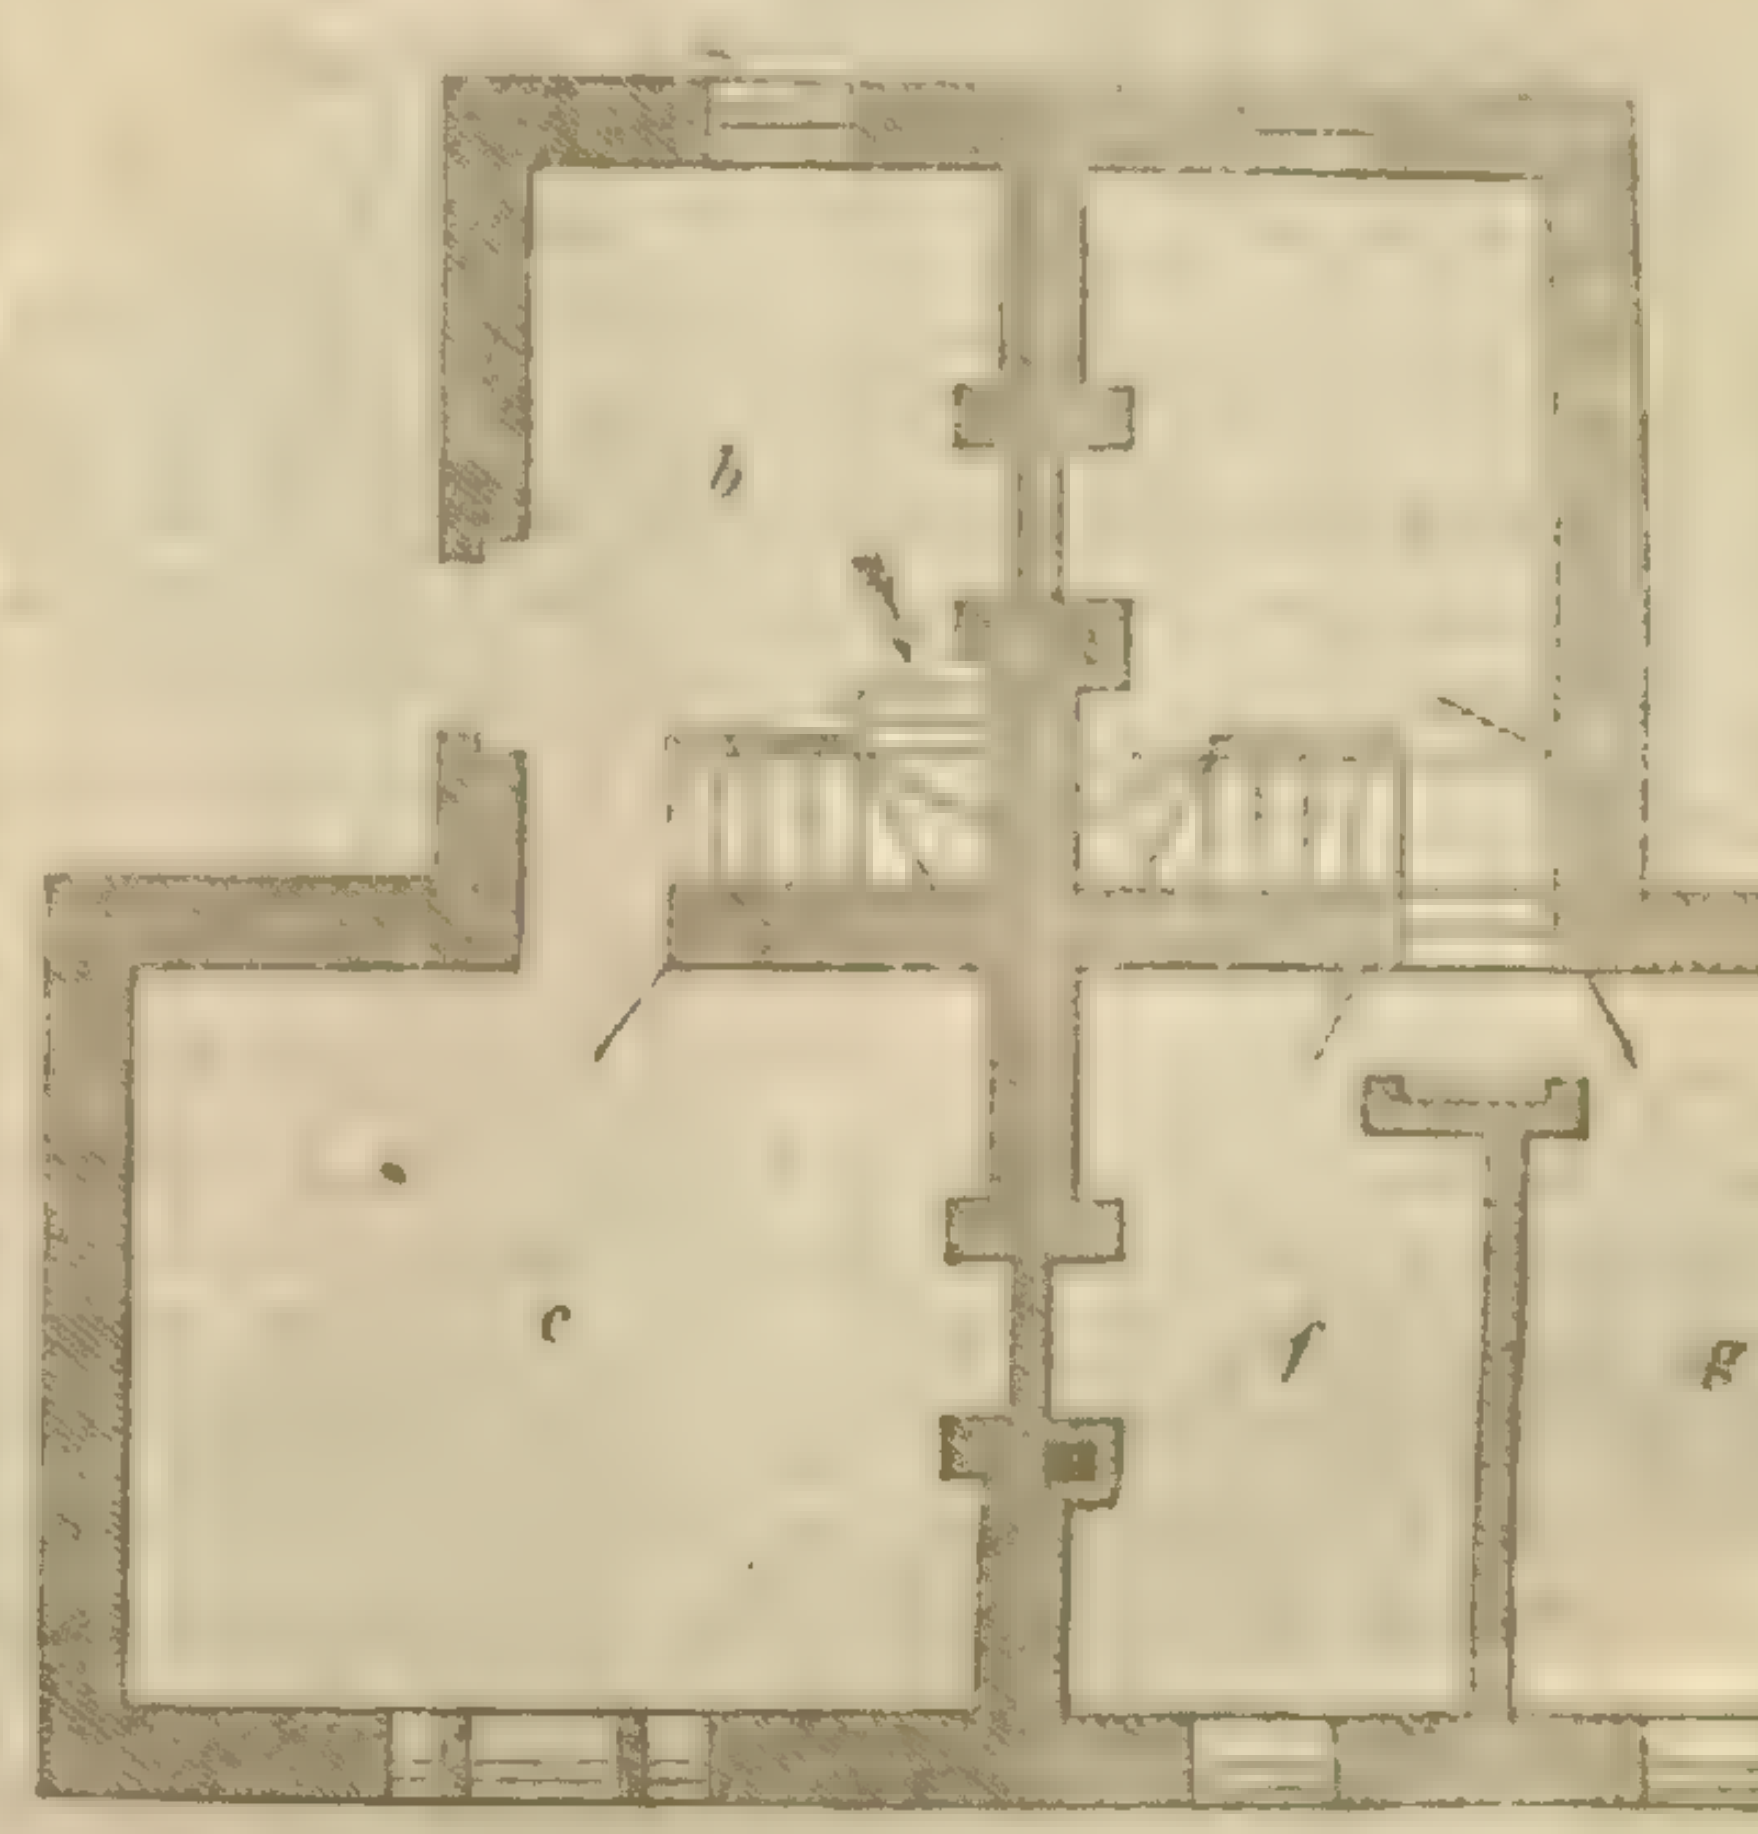
The Mechanics' Model Cottage may be built singly, but the most economical arraugement is obtained by building them in pairs. For the idea of this model we are indebted to Thomas Wilson, Esq., of the Banks near Barnsley, who sent us the design, fig. 2048, on which our draftsman, Mr. Marks, made the improvement, with a view to economy in building, shown in fig. 2049, which being sent to Mr. Wilson, he completed the work by changing the entrance to the stair from the back-room to the porch, as in fig. 2050, the advantages of which, to use his own words, 'are great: the sitting-room is altogether private; and, in case of illness, there is an obvious gain in not having to pass through the house from a sick-room. There is another point not usually considered: when an inmate has to be removed to his last home, the preparations, and particularly the carrying down stairs, would by this arrangement of the stair, all be accomplished while the family were in the sitting-room. In cottages as they are at present built, that which is never accomplished without difficulty, is almost always rendered scarcely practicable by the narrowness and awkwardness of the stairs. No architect of feeling should overlook this.' In fig. 2047 *a* is the porch into which the staircase opens; *b* is the back kitchen, with a pump and sink-stone, arranged in connexion with a tank or well, as in the agriculturist's model cottage; *c* is the principal room: *d* a pantry; and there is a light closet under the stair, *e*, in fig. 2050. There are three bed-rooms shown in the plan of the adjoining cottage at *e*, *f*, *g*, in fig. 2048. In the back yard, *h*, there is a place for fuel, *i*; a privy, *k*; a liquid-manure tank, *l*; and place for ashes, &c., *m*. The gardens may be arranged as in the figure, or in any other mode that is considered most convenient. The isometrical elevation of fig. 2047 is shown in fig. 2046.

2047

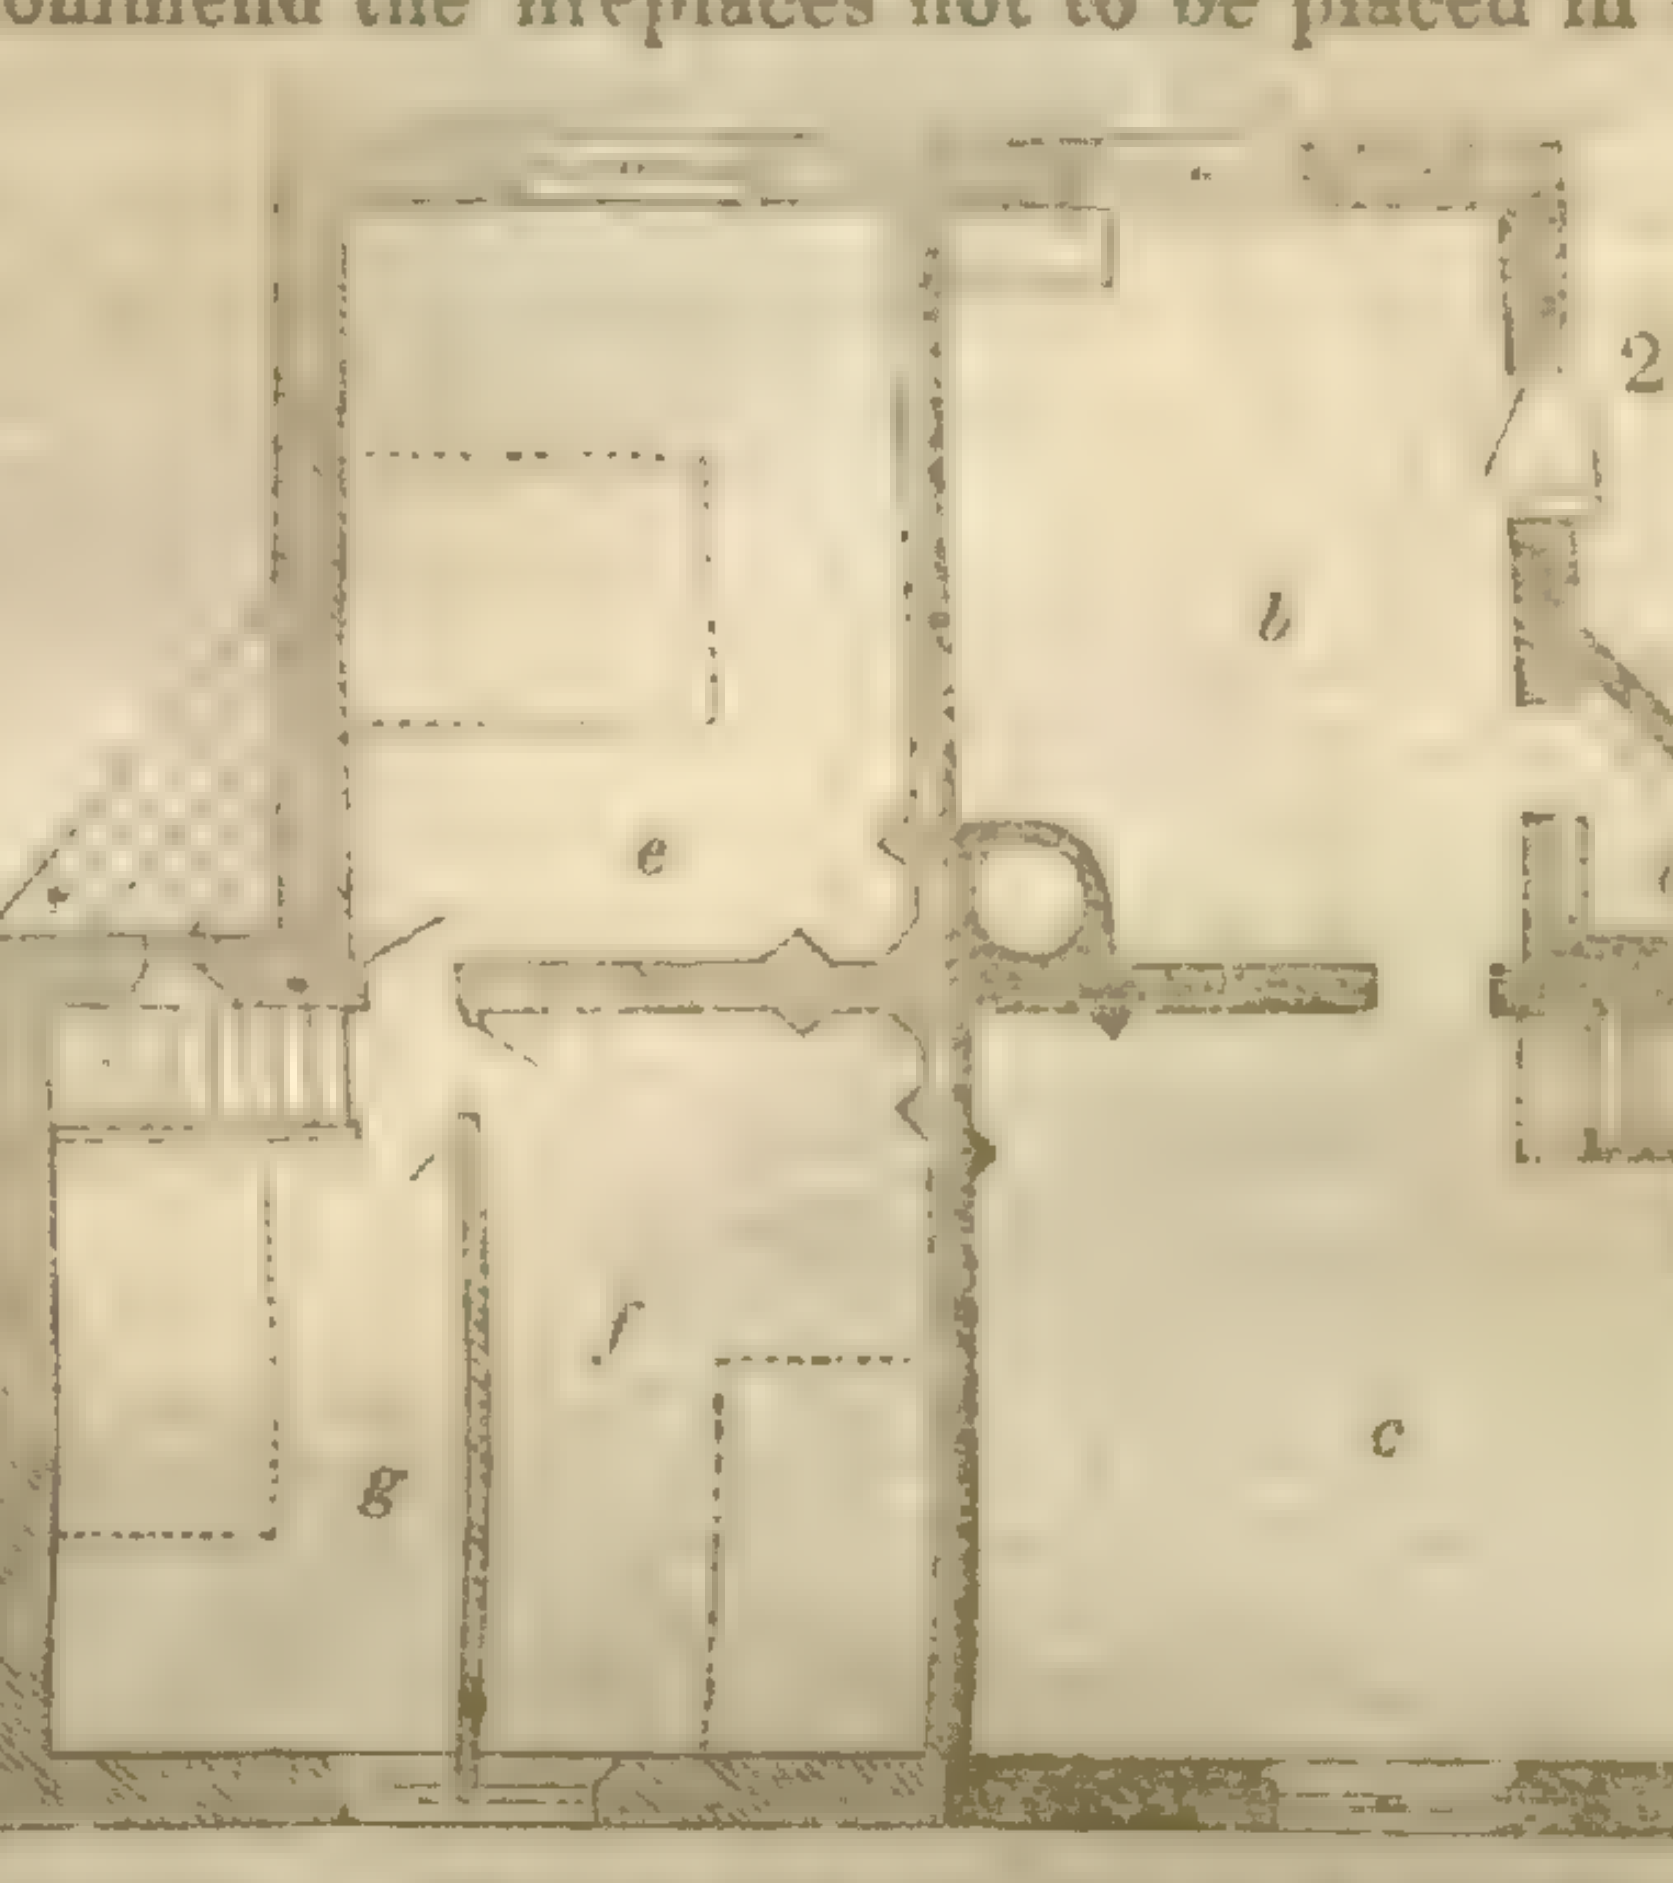


"*General Estimate.* — The cubic contents of the two cottages are 15,200 feet, at 6*d.* per foot, 380*l.*; at 4*d.*, 253*l.*; at 3*d.*, 190*l.*; and at 2*d.*, 126*l.*; or for each cottage, 190*l.*, 126*l.*, 95*l.*, and 63*l.*

"*Remarks.*—Our readers, we are sure, will agree with us in thanking Mr. Wilson for his most economical and commodious plan, and for his very humane and feeling observations respecting it. We consider the design, finally improved, as uniting more comfort at less expense than any other given in this Supplement. The only drawback to the arrangement that we know is, that it is necessary to pass through the back kitchen in order to enter the best room; but this might be remedied, either by enlarging the porch, or by adding a porch in front. In either case additional expense would be incurred. Where comfort is more the object than expense, we would recommend the fireplaces not to be placed in the angles, but back to back, as in fig. 2048, by which more room is obtained for persons sitting round the fire, and the heat is more equally radiated through the room. For the sake of economy we have shown dormer windows in the elevation, fig. 2051, and also in the isometrical view; but where economy is not an object, we would prefer having the side walls as high as the tops of the windows. A cottage of this form may be rendered highly ornamental by enlarging the parlour window, and projecting it with a bay; by forming two separate windows to the principal bed-rooms, ornamenting the gables, and forming a group of columnar chimneys. It might even be rendered more artistical by simply splaying the jambs of the doors and windows, slightly rounding their upper angles, and either raising the side walls so as not to have the windows in the roof, or retaining them in the roof and finishing them with pediments and span-roofs.



2048

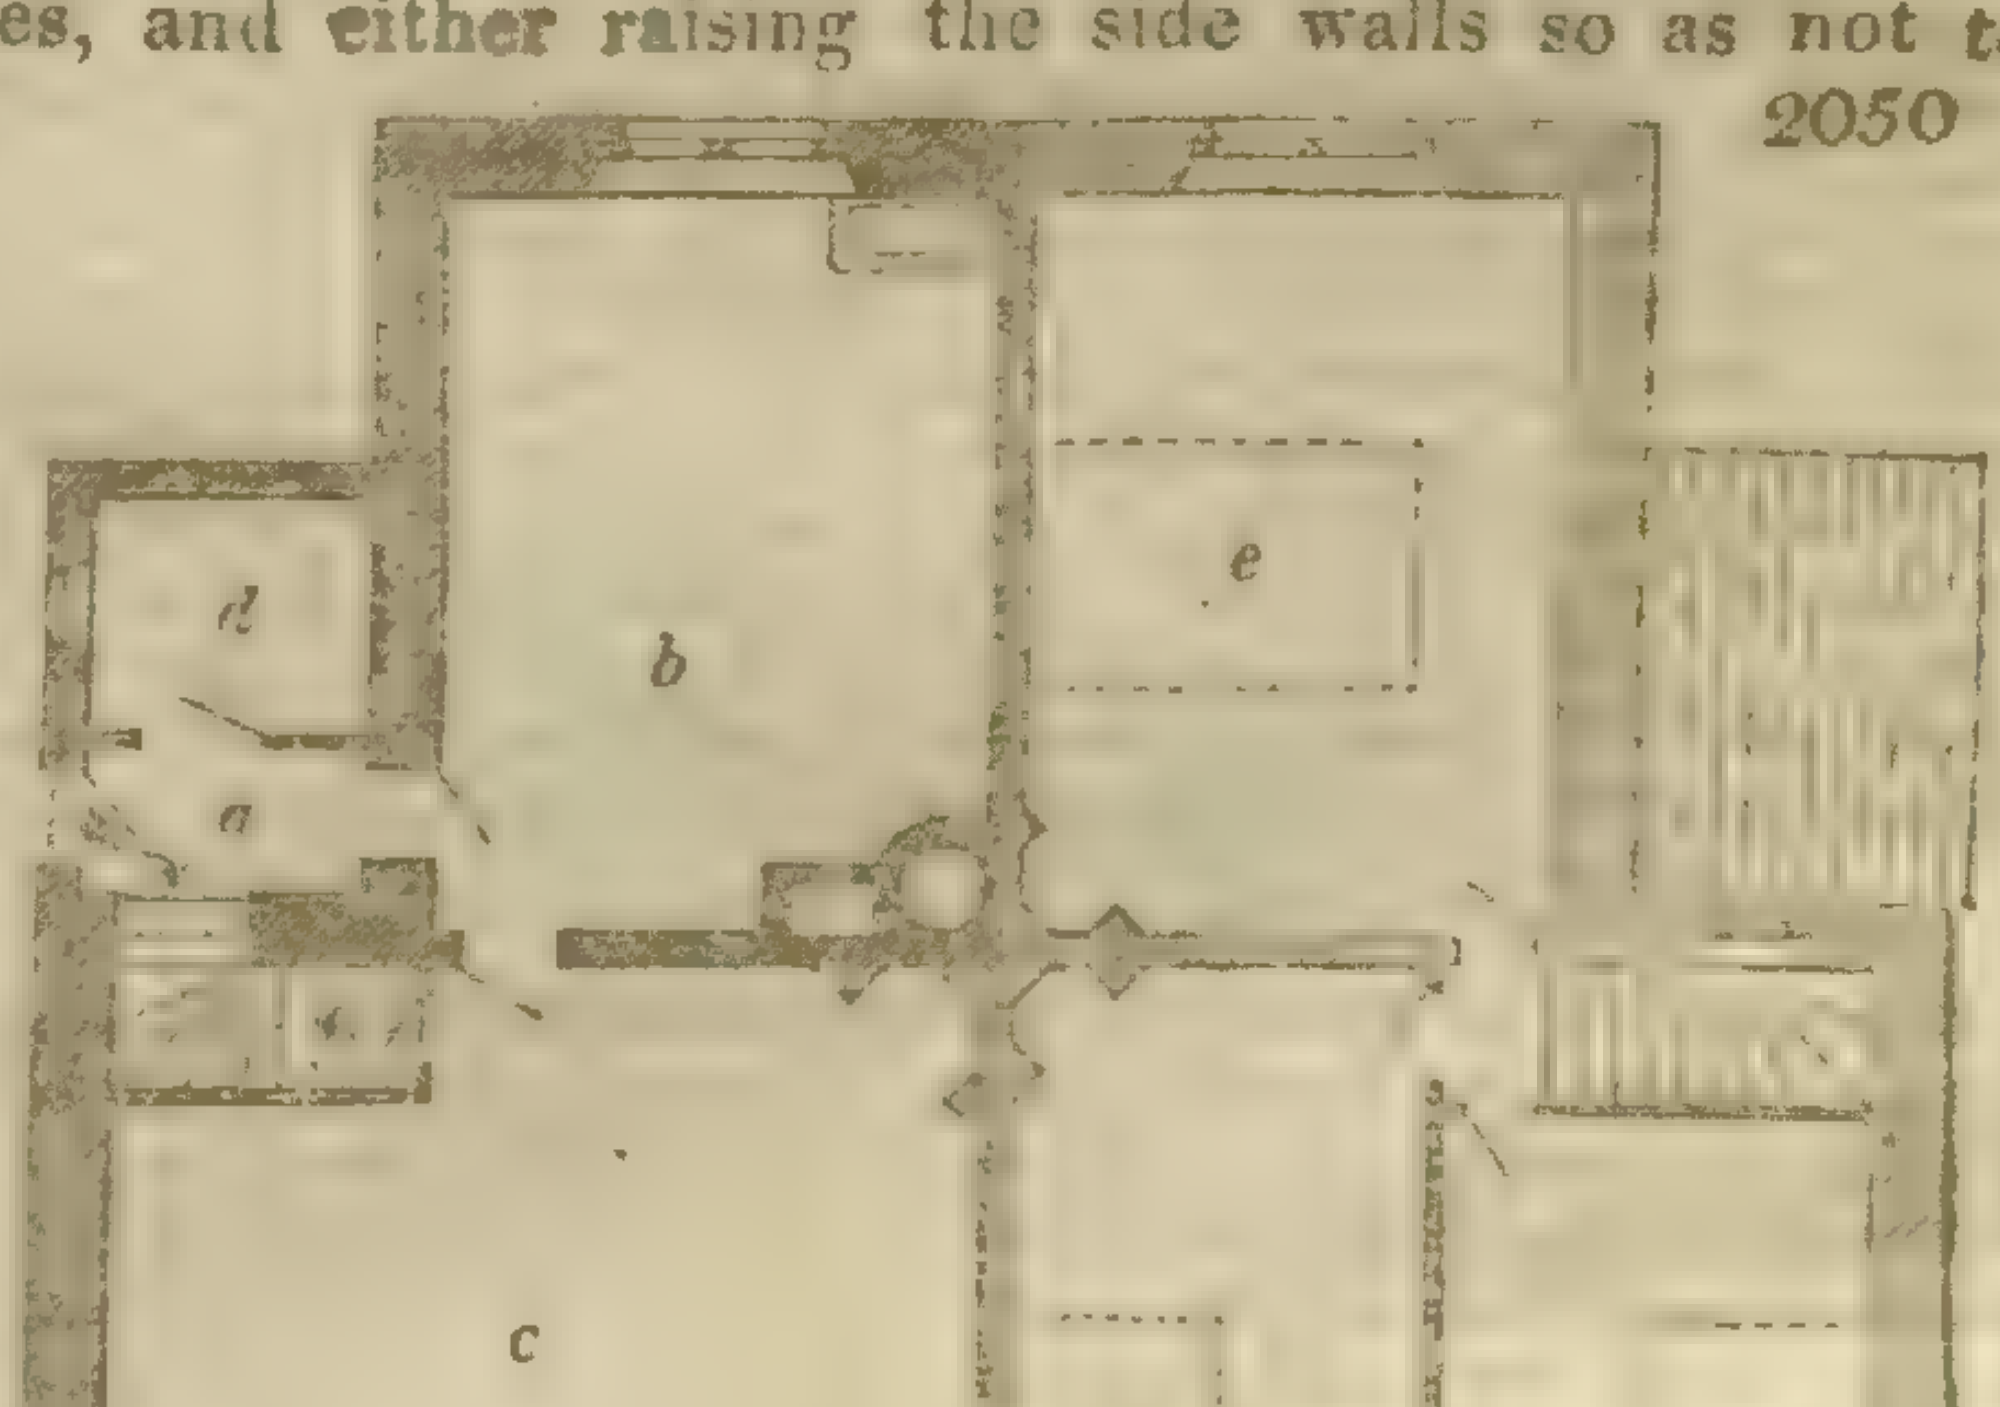


2049

"As this design is not shown placed on a platform, it is peculiarly suitable for having the walls covered with ornamental shrubs, such as Climbing Roses, Honeysuckles, Clematises, Chimonanthus, and Virginian Creeper; or with fruit-trees or Vines.

"All the ornamental climbers which have been mentioned, with the exception of Chimonanthus, may be planted about two feet apart, and trained in direct lines from the ground to the eaves; but the Chimonanthus, being a woody plant, should be trained more in the fan manner practised with Plums, Peaches, and Apricots.

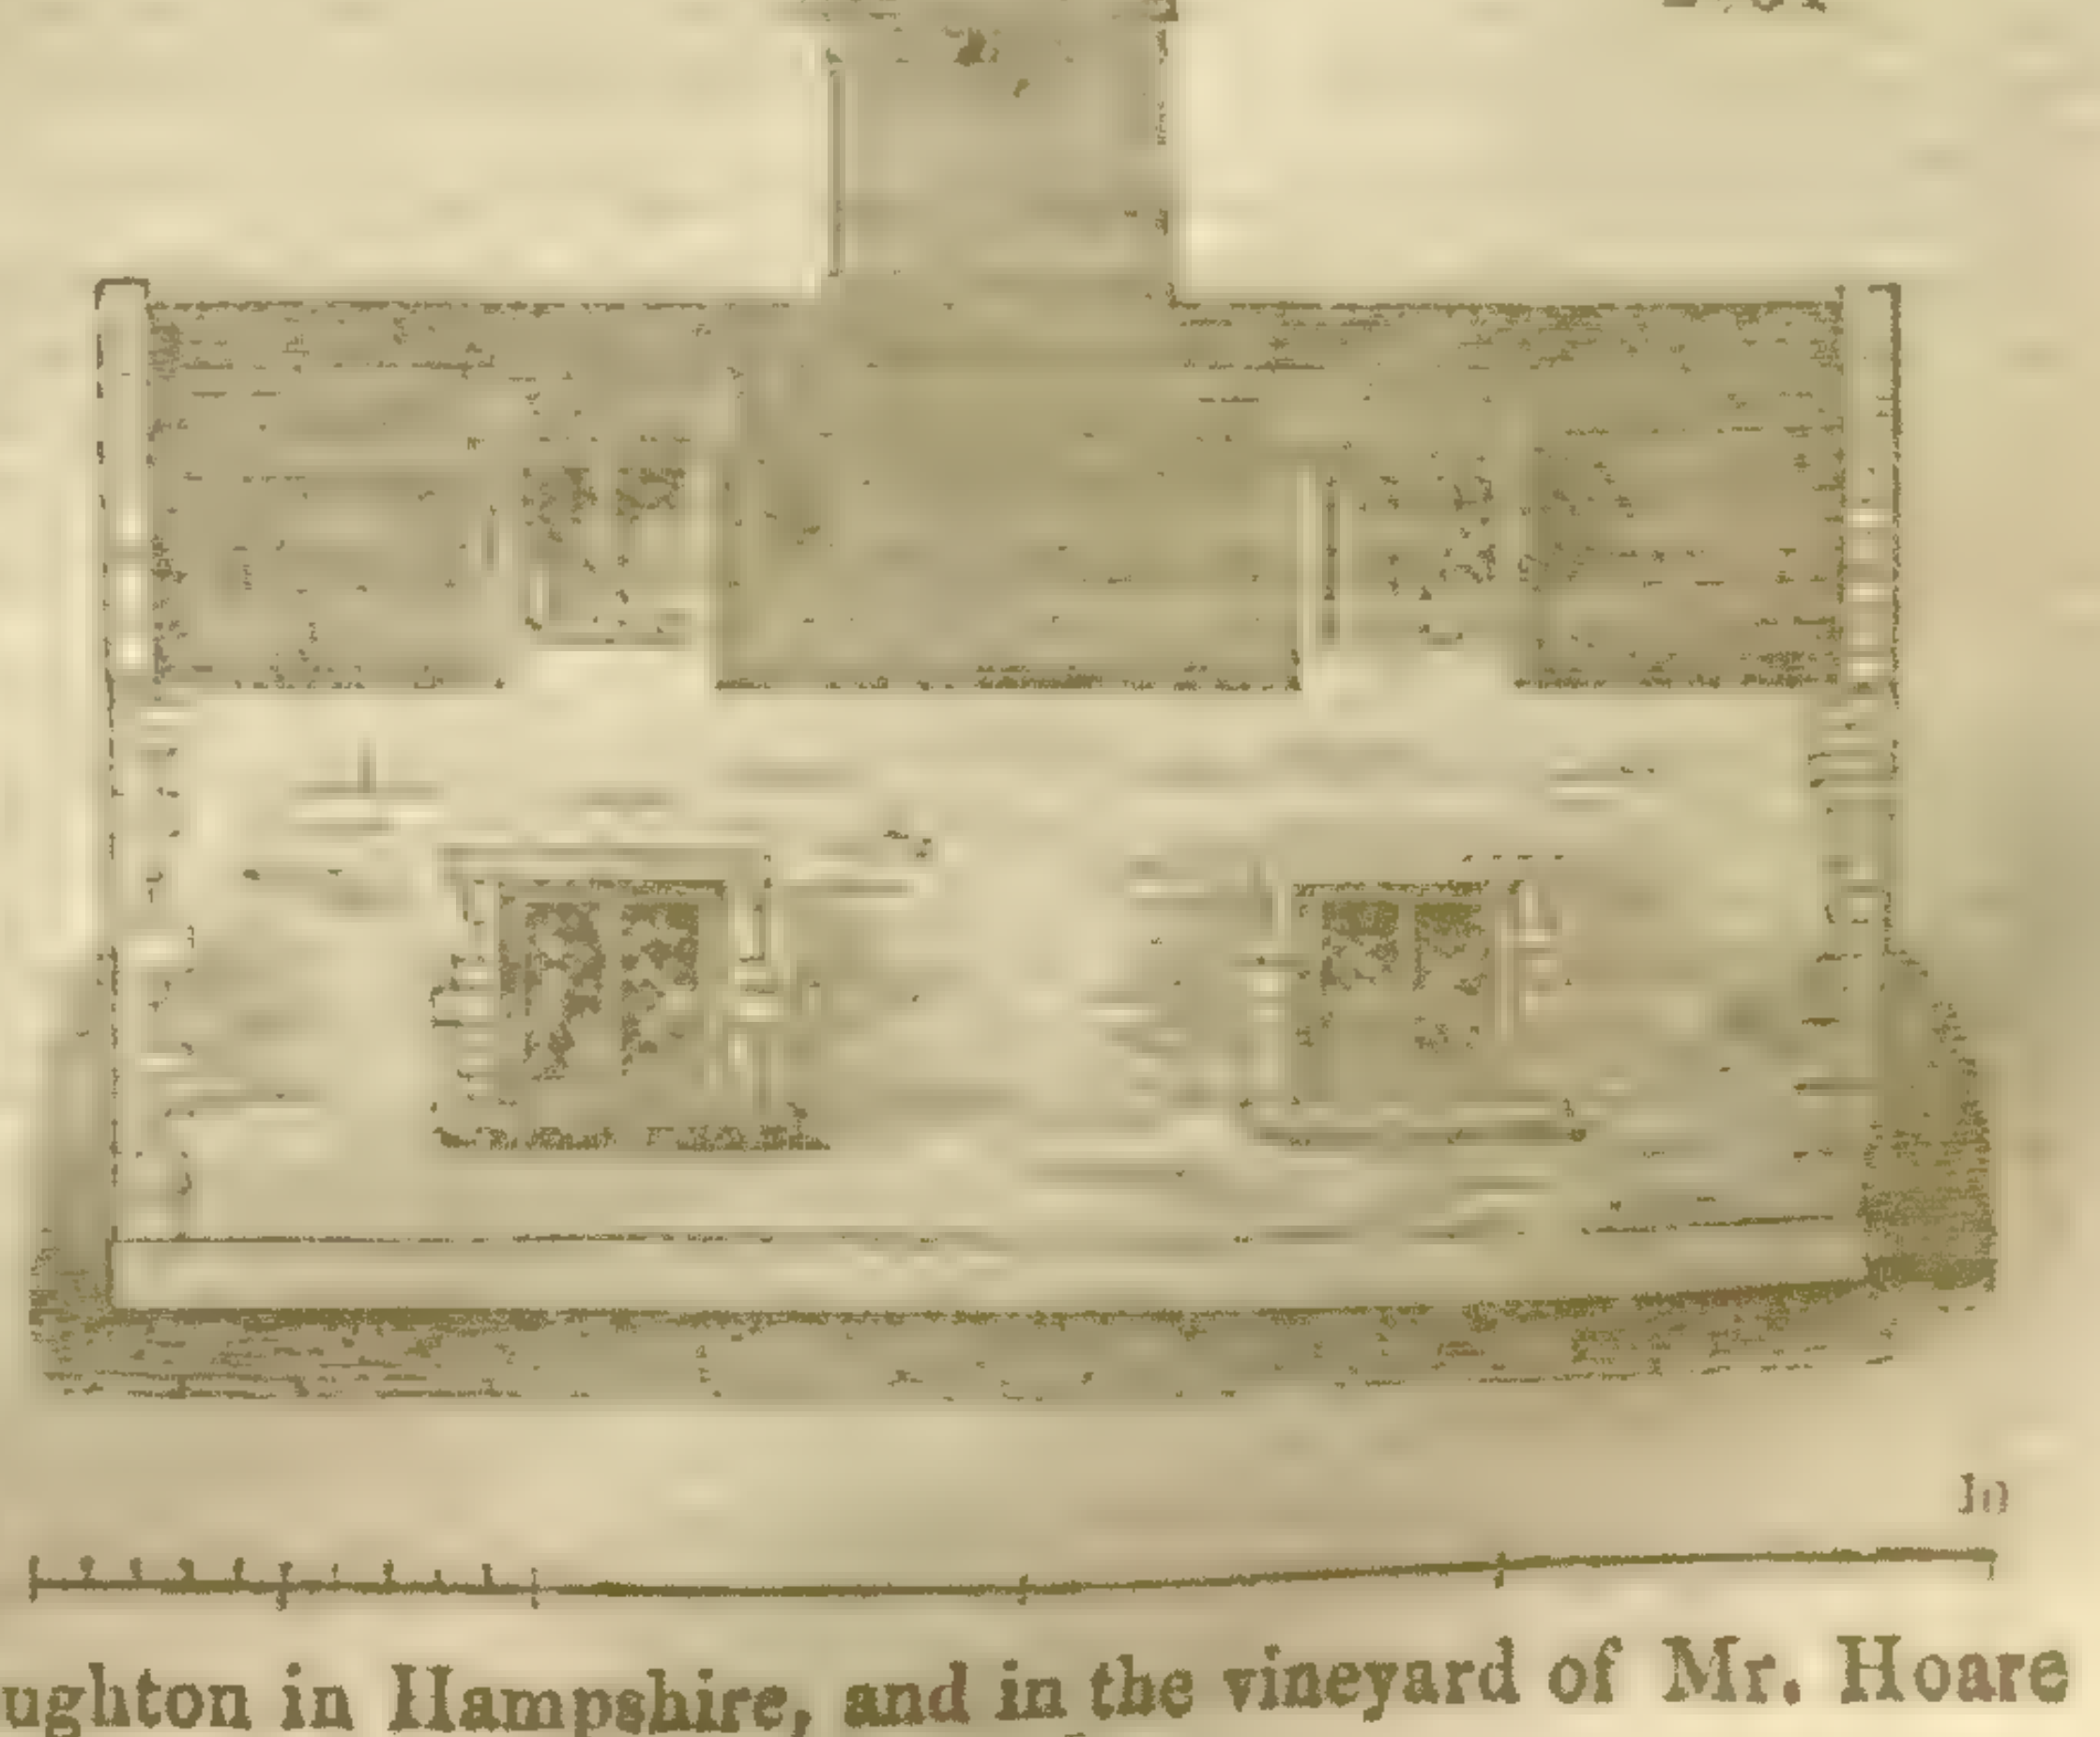
2050



"The fruit-trees should be trained differently, according to their kinds: the Pear and the Apple horizontally; the Plum, Cherry, Apricot, and Peach, in the fan manner; and the Gooseberry and Currant perpendicularly, one shoot only, or at most two, being carried up from each plant.

"The Vine may be trained in the perpendicular manner, placing the plants at two feet apart, retaining only one shoot to each plant, and obtaining the bearing wood by spurring in that shoot: but the best mode of training the Vine against a house is to have the main branches of every plant in the form of the letter T, and to train the bearing branches upwards from the two horizontal arms, in the manner practised at Thomery near Fontainebleau, on the houses in Stockbridge and Broughton in Hampshire, and in the vineyard of Mr. Hoare

2051



at Southampton. These hints on training trees against the walls of cottages will be sufficient for any one who knows a little of gardening; for those who do not, we would recommend the 'Suburban Horticulturist,' in which the subject of training trees is treated in detail, and more especially the training of Vines against cottages.

"With respect to the propriety of training fruit-trees against cottages, much depends on the climate and aspect. We cannot recommend it as a general practice in a wet climate, because it would have a tendency to keep the walls damp after rain was driven against them; nor on cottages that have one side to the south, and another to the north, except on the south side, because on the north side fruit trees would do little good, and any other description of deciduous plant would prevent the evaporation of the rain driven against them from the north. On the walls of all cottages placed with their diagonal line in the direction of south and north, trees may be trained on every side, without danger of producing damp, as every side would enjoy sun."

As an expression of the conclusions at which Mr. Loudon has arrived after many years' experience in Cottage Architecture, the following statement deserves attention:—

Situation.—It ought to be constantly borne in mind, that the main object in building a cottage is to produce a comfortable dwelling; and that for this purpose a dry airy situation, in which, if possible, the ground falls gently from the cottage on every side; an aspect that will allow the sun to shine on every side wall of the cottage a portion of every day in the year; thick walls, and thick or double far-projecting roofs of high pitch; are most desirable requisites. Whether the front, the end, or one side of the cottage is parallel to the adjoining road, ought to be considered a matter of no consequence; indeed, so far from a parallel position being desirable, an oblique one is in general preferable, as we have shown § 2237.

Garden.—The garden ought always, if possible, to surround the cottage, and it ought never to be less in extent than a sixth of an acre; but as in cottages already existing it may often be found impracticable to surround the cottage with its garden, the next best arrangements are, to have the garden before, or behind, or on one side; or partly before and behind and partly on one side. If the main body of the garden must of necessity be separated from the cottage, then there should be a direct communication with it by a path, so as to diminish as much as possible the inconvenience and discomfort of an isolated garden. Cottage allotments, by which are to be understood portions of ground in a field allotted to cottages at some distance, are much better than no gardens at all; but they are far from producing the comfort and enjoyment of a garden in close contact with the cottage to which it belongs.

Materials.—When the walls are of pisé, mud, cob, clay lumps, or any other description of consolidated earth, the thickness of two feet may be obtained in solid materials; and this may also be the case where stone is abundant; but where brick must, of necessity, be used, the thickness of eighteen inches or two feet is to be attained most economically by building the walls with brick on edge hollow, and filling them up with concrete. By this means we form a mass of solid material, which will, of course, have a greater capacity for heat than a hollow wall, and consequently give out more when it is wanted for heating the air of the rooms. The advantages of thick walls, and of thick or double roofs, of high pitch, and projecting at the eaves, with reference to retaining heat, are greater than can well be conceived by those who have not dwelt in a cottage. A high and dry floor is essential, whether this be obtained by placing the cottage on a terrace, as in the model cottage No. I. in p. 1141; or by raising the floor inside, and ascending to it by outside steps, as in the mechanic's model cottage in p. 1145 (that we have selected in the preceding extract).

Designing Cottages.—In page 1140 we have summed up the essential requisites for a labourer's cottage, with a view to convenience, comfort, and other directly useful properties. The following rules are to be considered as additional to those given in the page referred to, and as having for their object to superadd to comfort and convenience, architectural design and taste. 1. Every exterior wall should show a plinth at its base, and a frieze or wall-plate immediately under the roof. In the case of earthen walls, the plinth should be of brick or stone, and the wall-plate of wood. The stones of the plinth should be larger than those used in the plain parts of the wall which are above it; and the upper finishing of the plinth may be the outer edge of a course of slates, flagstone, tiles, or bricks, laid in cement, extending through the entire thickness of the wall, in order to prevent the rising of damp; the appearance of the edge of this course as a moulding or string course crowning the plinth, will, therefore, be highly expressive of utility; or the entire plinth may be built in cement, which will be equally effective in preventing the rising of damp, as well as expressive of that important use. 2. The pitch of the roof, whatever may be the material with which it is covered, should be such as to prevent snow from lying on it; and for this purpose the cross section should generally be an equilateral triangle. Cottages which form gate-lodges in the Grecian or Italian styles form exceptions to this rule; but such lodges never express the same ideas of comfort as high-roofed cottages, with high and bold chimneys. Such lodges, indeed, are commonly called "boxes;" and in fact many of them are so deficient in height, and in every other dimension, that they give rise to ideas the very opposite of those of freedom and comfort. 3. When the wall is built of rubble-work, small stones, or bricks, a framing or casing of larger stones as quoins to the exterior angles, and jams lintels and sills to the doors, windows, and other openings, seems to add to the strength and security of the wall, by preventing the small stones or bricks from being loosened by the weather or by accident, and so dropping out. Hence all doors and windows in such walls should be surrounded by facings of some sort, or have the jambs, sills, or lintels splayed. Hence, also, the propriety of quoin-stones at the angles or corners, of coping-stones to the gables, of cut and dressed stones to the chimney-tops, and of larger stones to the plinths than those generally used in the plain parts of the wall above them. In the case of earthen walls, the jambs may be splayed, or both jambs and lintels may be faced with boards or formed of brick carried up from the plinth. 4. Every stack of chimneys should consist of four parts; a plinth, which should be distinctly seen above the roof; one or more base mouldings, or splayed weatherings resting on the plinth; a shaft rising from the base mouldings, of analogous proportions to the doors and windows; and a capital or cornice moulding and cap or blocking, as a termination to the shaft. The materials of the chimney-tops ought in general to be superior in quality to those of the walls; for example, if the walls are of rubble stone, the chimneys should be of stone squared and dressed. When the walls are of earth the entire stack of chimneys will, of course, be built of brick or stone. 5. When the flues of the chimneys are carried up in the outer wall, there ought always to be a projection outwards in that wall, beneath the chimneys, carried up from the ground, so as to give the necessary space for the flues, the strength of a buttress to the wall, with a sufficient breadth for supporting the chimney-tops, and the architectural expression of all these purposes. 6. Eaves-gutters, and ridge and hip coverings, with similar details essential as "finishings," as well as for habitableness and comfort, should never be omitted. The eaves-gutters should be properly supported by brackets, these being of stone or brick, except in the case of earthen walls, where they ought to be of wood. 7. Over the front door or porch of every cottage, there ought to be a worked stone, on which should be cut the name of the cottage, the initials of the first occupant, a number, a sign, or some distinctive mark of the cottage, by which it may be registered in the Book of the Estate. See § 2327. 8. In rendering cottages ornamental, the most important parts and members of structure are those on which most decoration should be bestowed; such as the porch, entrance door, window of the principal room, upper parts of the gables, chimney-tops, &c.; and, in ornamenting each particular part, the most important details of that part should receive the highest degree of decoration; for example, the hinges and latch or lock of a door should be made richer than the muntings and styles, and the muntings and styles richer than the panels; and, hence, a door in which no ornament is bestowed on the latch or the hinges ought not to have the muntings, styles, or panels, studded over with ornamental nail heads as is often done. 9. Nothing should be introduced in any design, however ornamental it may appear to be, that is at variance with propriety, comfort, or sound workmanship.

In conclusion, we most strongly recommend this work to all who are interested in the matters to which it refers.

CALENDAR OF OPERATIONS *for the ensuing week.*

Upon soils not naturally retentive of moisture, all kinds of plants, and more especially those whose quality depends upon their succulence, must have suffered severely from the lengthened and excessive drought. To give only temporary relief in the usual way, by means of watering-pots and manual labour, to the many hundreds of plants that require it, is totally impossible; and merely to keep those alive upon which the future supply of the table depends, is beyond the limited means of many gardeners to accomplish. This, therefore, is a favourable opportunity to direct the attention of our readers to the great advantages of surface irrigation by means of open drains and sluices; a practice which has been recommended by several writers on gardening, but which proprietors have generally been deterred from adopting by its apparently heavy expense. But a little calculation (which it is not necessary to enter into here) will show that in a few years, economy would be on the side of irrigation, in places suitable to the adoption of that system,—independently of the benefit and gratification of having, in the dryest season, an abundant stock of fresh and juicy vegetables. Our object in bringing forward this subject now is not for the purpose of recommending an immediate or a hasty adoption of this system, but to point out, at a time when it can be properly appreciated, its unquestionable superiority.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—The directions given last week for shading, watering, &c., ought to be followed so long as the drought and heat continue; but in case a change to gloom and rain should take place, no shade, and less moisture, must be given. As a general rule, young plants should be potted at any time they require it; but unless they are taking harm for want of shifting, it is always better to wait a short time for dull weather, which is much more suitable for the operation than such scorching heat as we have lately had.

Vinery.—If the latest Grapes are set and swelling, let them be thinned without delay, remembering the precautions formerly mentioned as to the handling of the bunches. Maintain a humid atmosphere in all the houses where Grapes are swelling. If the roots are near the surface, and the outer borders not mulched, they will need water once a week, or oftener, if very dry; manure water should be used, if the borders are poor, or the Vines heavily cropped.

Peach-house.—Ply the engine well, wherever there is no ripening fruit, and see to the watering of the exterior borders. In very hot weather, Peaches are apt to ripen faster than they can be used; when this is likely to be the case, a portion may be retarded a little by screening them from the sun; the fruit should also be gathered before it is quite soft.

Fig-house.—See the directions in last week's Calendar.

Mushroom-house.—This has been a capital season for the preparation of droppings, of which a good stock ought to be got ready for winter beds. The atmosphere of the house should be kept moist, and bearing beds in the open air will require to be often sprinkled. Spawn may be made now, or at any time when the weather is dry.

Cucumbers and Melons.—Train the shoots of the successional crops before they get confused; it cannot be done afterwards, without twisting and bruising them. Plants upon which Melons are swelling must not be stinted for want of water; and the fruit should be prevented from coming in contact with the damp earth, by placing a piece of slate or other hard substance below it. If the main stem is sound, of those plants from which the fruit has been gathered, cut back the old stalks to a healthy leaf or a young shoot, give the plants a good watering, and afterwards keep them warm, when they will bear another crop; but if canker has made its appearance at the base of the stem, the plants had better be replaced by young ones, after changing the soil.

Out-door Department.

Unless in particular spots which have lately been favoured by showers, nothing can now be done with the parched soil except hoeing and loosening its surface. The watering of transplanted crops must not on any account be neglected. Take advantage of the first rains to plant out Lettuce, Celery, Cauliflowers, and every kind of crop that is required. Herbs of many kinds may now be cut, and dried in the shade; the flower-stalks of such plants as Sorrel should be constantly cut off.

Asparagus.—Cease cutting after this time.

Celery.—Water this daily while the hot and dry weather continues. The surface of the ground about the plants should be frequently stirred with a hoe, which will prevent it from drying so quickly. The plants for later crops must be well supplied with moisture, and kept free from weeds.

Endive.—Thin the young plants moderately, leaving enough for transplanting at the first favourable opportunity.

Lettuce.—It is indispensable to have a regular supply of these in many places, whatever the weather may be; therefore, if necessary, some plants should now be put out; previously well waterin ground, and afterwards keeping them shaded.

Mustard and Cress must be regularly sown, and, with Radishes and all small salading, constantly watered to make them succulent.

Turnips.—Sow a good breadth immediately, if the previous crop is found deficient, otherwise it will be best to wait for rain. In the former case, water the ground well after the seeds are sown, and then fill in the drills.

Orchard.—The finest Strawberries should be kept clear of the ground, by supporting the stems with forked sticks; these preserve them in some measure from slugs, and likewise keep them comparatively dry and clean. If necessary to water the beds, it should be done thoroughly, after gathering all the ripe fruit. Raspberry plants are grievously mismanaged in many gardens, by permitting three or four times the number of canes to grow up, than are likely to be wanted for next year's bearing wood. To obtain strong canes and fine fruit, cut off all the weak shoots of the present year, leaving from three to five, according to the vigour of the plants. Continue the nailing of wall-trees; they should also be engined as often as convenient.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—If the weather continues warm, give all the ventilation which can be commanded, by opening the doors as well as the sashes; the plants will get weakly and drawn if this is not attended to. The stove should be managed more like a greenhouse now, except that the plants require the atmosphere rather more moist; they should also be shaded more than greenhouse plants. Any seedlings which have vegetated lately should be potted off without delay, and placed in a warm and shaded place, until they establish themselves.

Greenhouse and Conservatory.—In the latter house, the plants in the borders will require much water now; they should also be occasionally washed with an engine. Use tobacco-water or snuff for the destruction of aphides; smoking a large conservatory will be found very expensive and such houses being generally attached to the mansion, the smell of tobacco would be offensive. As Calceolárias in the greenhouse lose their beauty, replace them with Balsams and other annuals from the pits. Pelargoniums, which have done flowering, should be set in a shady place to ripen their wood, previous to being cut down.

Pits and Frames.—Take care that cuttings, young seedlings, and all delicate plants are properly shaded in the heat of the day, but do not exclude the light unnecessarily. Propagate a good number of Verbenas, Anagallises, &c., to fill those beds in the flower-garden, now occupied by such short-lived annuals as Collínsia bícolor, and Gília trícolor. Some annuals should also be kept in pots, for a similar purpose; many species would flower in autumn, if sown now in pots.

Out-door Department.

Hedges should now be clipped; also box-edgings, if not yet done. On level lawns, the mowing machine will be found much more efficient than the scythe, while the ground continues dry. Water transplanted shrubs and trees, and loosen the surface after watering, if the ground is not mulched. More attention than usual is requisite in sweeping the lawns and walks; the drought having caused evergreens to shed their old leaves in a greater quantity than is natural. Water regularly, and continue to tie up flowering-plants as they require it. Sow Brompton Stocks on a north border; these are to be potted in autumn, and sheltered during winter.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Roses for standards might now be budded if the stocks are in a fit state. At this early season, it is best not to work any but perfectly hardy varieties, because as the buds are almost certain to push before winter, the immature shoots of the more tender sorts would be liable to be killed by frost; these, therefore, should not be budded till August.

Forest and Coppice Woods.—Proceed with the work pointed out in the three last Calendars.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending June 16, 1842, as observed at the Horticultural Garden, Chiswick.

June		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	10	30.100	30.064	81	51	66.0	N.E.	
Saturday	11	30.180	30.133	89	54	71.5	N.E.	
Sunday	12	30.263	30.241	90	51	70.5	S.E.	
Monday	13	30.293	30.153	90	55	72.5	N.E.	
Tuesday	14	30.094	30.012	83	53	70.5	S.W.	[illegible]
Wednesday	15	30.048	29.989	80	48	64.0	N.E.	
Thursday	16	29.995	29.990	76	48	62.0	N.W.	
Average		30.139	30.083	84.8	51.4	68.1		[illegible]

June 10. Clear; hot and dry with brisk N.E. wind; clear, and very fine at night.
11. Very fine; hot and dry; sultry; clear.
12. Clear; very hot and dry; fine, with clouds at night.
13. Clear; very hot and dry; lightning in the evening; cloudy and fine.
14. Hot and dry; cloudy, and very fine at night.
15. Fine with light clouds; overcast at night.
16. Light clouds; overcast; cloudy and fine.

Mean temperature of the week 6½° above the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending June 25, 1842.

June.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sun.	19	70.8	50.3	60.6	8	0.37 in.	—	1	1	—	—	—	10	4
Mon.	20	72.6	51.8	62.2	7	0.21	1	—	—	1	3	5	5	1
Tues.	21	73.2	52.7	62.9	9	0.68	—	2	1	1	1	7	4	—
Wed.	22	71.0	49.7	60.3	9	0.54	—	—	1	—	2	7	5	1
Thurs.	23	72.4	48.4	60.4	3	0.40	—	1	1	1	2	6	4	1
Fri.	24	72.3	49.7	61.0	6	0.49	—	—	3	1	2	4	5	1
Sat.	25	72.1	50.8	61.4	8	0.72	—	1	5	[illegible]	2	2	3	2

The highest temperature during the above period occurred on the 21st, in 1834—thermometer 91°; and the lowest on the 22nd, in 1830—thermometer 39°. The prevalence of W. or N.W. winds on the 19th is remarkable.

REPORT ON COVENT GARDEN MARKET,

For the week ending June 17, 1842.

Although the supplies of both fruit and vegetables have been good during the past week, yet the absence of rain begins to be severely felt. Trade has, upon the whole, been much brisker than in our last Report.—*Fruit.* Pines are remarkably fine, and are selling from 8s. to 12s. per lb. Grapes are abundant and of good quality; the Muscats are fetching 10s. per lb., the Black Hamburgh and other kinds from 4s. to 8s. per lb. Melons are plentiful, of the same kinds as mentioned in our last account. Peaches and Nectarines are somewhat advanced in price, being from 15s. to 28s. per dozen. Cherries are abundant; the wall-fruit is good, and fetches from 2s. to 5s. per lb.; the standard fruit is rather small and deficient in flavour, from 2s. 6d. to 3s. 6d. per dozen lbs. Strawberries are exceedingly plentiful, from 6d. to 2s. per gallon. Gooseberries continue much the same, but Currants are beginning to change colour, and have risen to 4s. and 7s. per half-sieve. Apples are very scarce; we observed a few Gooseberry Pippins, which were selling from 7s. to 12s. per bushel. Cucumbers are abundant, from 4s. to 6s. per dozen. *Vegetables.*—Asparagus is nearly over; of the small quantity to be procured, the best is selling at 5s. per bundle. Cauliflowers are tolerably plentiful, from 1s. to 5s. per dozen. Peas are considerably cheaper; the common kinds fetch from 2s. to 3s. per bushel-sieve; the Prussian from 4s. to 5s., and the Imperial 5s. 6d. per sieve. A few Windsor and Mazagan Beans are to be obtained, from 2s. to 5s. per sieve. New Potatoes are becoming more abundant; some have appeared from the open ground, selling from 4d. to 7d. per lb.; the frame kinds from 5d. to 6d. per lb. Cabbages are rather scarce, and consist of little but exterior leaves: their price is the same as in our last report. Artichokes sell from 3s. to 6s. per dozen. Mushrooms are very scarce, and have risen to 2s. 6d. and 4s. per pottle. *Flowers.*—Moss Roses are particularly abundant; and amongst the other cut flowers we observed fine specimens of Ixora, Kalmia, Erica, Cacti, Picotee, and the Balsam.

PRICES SATURDAY, JUNE 11, 1842.—FRUITS:—

Apples, Kitchen, per bush. 7s to 12s
Strawberries, per gallon, 6d to 2s
Peaches, per doz. 15s to 28s
Nectarines, per doz., 15s to 28s
Pine Apple, per lb. 8s to 12s
Grapes, hothouse, per pound, 4s to 8s
— Muscats, per pound, 10s
Oranges, per doz., 1s to 2s 6d
— per 100, 6s to 16s
Lemons, per doz. 1s to 2s 6d
— per 100, 6s to 16s
Cucumbers, per doz., 4s to 6s

Melons, each, 3s to 7s
Cherries, wall, per lb. 2s to 5s
— standard, per doz. lbs., 2s 6d to 3s
Gooseberries, per hf. sve., 2s 6d to 3s 6d
Currants, per half sieve, 4s to 7s
Almonds, per peck, 7s
Sweet Almonds, per pound, 3s
Walnuts, per bushel, 16s to 24s
Nuts, per bushel—
— Brazil, 20s
— Spanish, 16s
— Barcelona, 20s to 24s

VEGETABLES.

Cabbage, per doz. 1s to 2s
Cabbage Plants, per doz., 3s to 4s
Cauliflowers, per doz., 1s to 5s
Peas, per sieve, 2s 6d to 5s 6d
— per half sieve, 1s 6d to 3s
— per sack, 6s to 10s
Beans, Kidney, forced, p. 100, 1s to 2s
— Windsor, p. sieve, 2s to 4s
Potatoes, per ton, 45s to 80s
— per cwt. 2s 6d to 4s
— per bushel, 1s 6d to 2s 6d
— Kidney, per bush. 2s to 2s 6d
— New, per lb., 2d to 6d
— Natural per lb., 4d to 7d
Artichokes, per doz. 3s to 6s
Turnips, White, per doz. bun., 2s to 3s
Carrots, per doz. bunch, 4s to 12s
Red Beet, per dozen, 1s to 1s 6d
Horse Radish, per bundle, 2s 6d to 7s
Radish, per doz. hands (24 to 30 each) 9d to 1s
— Turnip, p. doz. bch., 9d to 1s
Spinach, per sieve, 1s 6d
Chives, per pot, 3d

Leeks, per dozen bunches, 1s to 2s
Onions, Old, per half sieve, 4s to 5s
— Green, per doz. bch., 2s to 4s
Garlic, per bunch, 4d to 6d
Shallots, per bch., 3d to 4d
Asparagus, per 100, large, 5s
— Second or Middling, 1s 6d to 2s 6d
— Sprue, or Small, 1s to 1s 6d
Lettuce, Cabbage, p. score, 1s 6d
— Cos, 6d to 1s 6d
Celery, young, per bundle, 1s to 3s
Small Salads, per punnet, 2d to 3d
Watercress, p. dz. small bunch. 4d to 6d
Parsley, per half sieve, 1s to 1s 6d
Tarragon, per dozen bunches, 3s
Fennel, per dozen bunches, 2s
Thyme, per doz. bunches, 2s
Sage, per doz. bunches, 2s
Mint, per dozen bunches, 2s to 3s
Marjoram, per doz. bunches, 2s
Savory, per doz. bunch., 2s
Basil, per doz. bunches, 2s
Rhubarb Stalks, doz. bundles, 4s to 6s
Mushrooms, per pottle, 2s to 4s

Notices to Correspondents.

MANY COMMUNICATIONS, for which we have been anxious to find room, have been unavoidably kept back, in consequence of the long report upon the Exhibition of the Horticultural Society.

A CORRESPONDENT signing himself *J. O.*, would feel obliged by any of our readers informing him of the best method for destroying the HOUSE CRICKET. His house has only been recently erected, but as soon as the lights are extinguished in the evening, these pests come forth from the oven and fireplace by hundreds, and are occasionally found in the bedrooms.

H. H.'s three grubs are true wire-worms, which will produce beetles of the genus Elater: we wish we could tell him how to get rid of them effectually; the most successful plan in a garden is to stick down slices of Potato near the infested plants, and examine them every morning, when they will be found in and under the pieces. The beetles are the CURCULIO (HYLOBIUS) ABIETIS, the larvæ of which are often bred in Fir-trees.—*R.*

Mr. Page's Bee is the MEGACHILE CENTUNCULARIS, which cuts out portions of the leaves of Roses and various plants to construct its nest; we do not remember to have heard of its attacking the flowers of the Geranium, but a French species lines its cells with the petals of a scarlet Poppy. The description and history of these Bees will be found in "Curtis's Brit. Ent.," fol. 218, with a figure, &c.—*R.*

W. B.'s three insects are CURCULIO (LIOPHLŒUS) NUBILUS, CARABUS (ABAX) TROGLA, and the common Cockroach BLATTA ORIENTALIS. The first would naturally feed upon plants, and we think there must be some error in supposing that it killed the other two insects. The best means of destroying Curculios will be found in Vol. 1, p. 292.—*R.*

S.—The proper season for heading down the PORTUGAL AND COMMON LAUREL is during the winter, or early in the spring.

A. W.'s plant is the Hotéia Japónica.

X. O. P. may propagate any kind of ROSES FROM CUTTINGS of this year's wood. The most successful method of striking the Tuscan and other similar sorts is to make a hole in the ground, of the required dimensions, and about 1½ft. deep, filling this with fresh stable litter, or other fermenting material, and covering it to the depth of five or six inches with fine sandy soil. Let this be covered with hand-glasses, and in a few days the cuttings may be planted beneath them. The following CREEPERS are suitable for a small greenhouse:—Maurándya Barclayana, M. floribunda, Tropæolum peregrinum, Rhodochiton volúbile, Kennédya Marryattæ, K. racemosa, Zíchya glabrata, Clematis azúrea grandiflora, C. Sieboldi, Sollya heterophylla, and S. linearis.

Indymus.—Your plants are Verónica agrestis and Sálvia verbenáca.

R. E.'s plants are,—1, Goodénia ovata; 2, Tristánia conferta; 3, a species of Rhus; 5, Duvaua, sp.; 6, Ruscus andrógynus.

Clivia.—It is the nature of FUCHSIA CORYMBIFLORA to become bare of leaves at the bottom: it can only be partially remedied by cutting it back, and this is not generally recommended. If, however, you wish to prune back your plant, you had better defer it until the autumn, or early in the spring. ORANGES, and various other evergreens, are liable to sport from their natural green to a variegated state; it cannot be satisfactorily accounted for.

P. B.'s plant is Burchéllia capensis.

Rosa.—Your best plan to check the increase of the GREEN-FLY upon your Roses will be to procure some Tobacco-water, and having diluted it with an equal quantity of pure water, to dip the points of all the infested shoots into the mixture. This will effectually stop them.

Lusor's weevils which destroyed the early Peas, are the CURCULIO (SITONA) LINEATA. We are obliged to him, and wish he could be *certain* that they are the insects which notch the Bean-leaves.—*R.*

Windsor's insects are a species of Chaffer called ANISOPLIA HORTICOLA, which sometimes injures the Rose-flowers to a great extent. The maggots producing them are smallish grubs, which live under turf, completely destroying it in some seasons.—*R.*

W. S. K.—Your seedling PELARGONIUM had fallen to pieces when we received it, so that it was impossible to determine whether it was a good one or not. If you will send another bloom it may, perhaps, be more fortunate.

Rosebud.—The name of the Rose which you observed on the wall in the vicinity of the Committee-room, in the Horticultural Society's Garden, is Rosa Blairi, or Triomphe de Navarre. The DIGITALIS exhibited at the meeting was sent by Mr. Gaines, of Battersea. No doubt it would be much better if all ROSES EXHIBITED FOR PRIZES were shown in single flowers or branches: at all events there must be an entire change in the manner of exhibiting them before another year.

P. W. H.—The large seedling PELARGONIUM with salmon-coloured flowers, will make a striking ornament for the greenhouse: there are certain points in its structure which precludes its coming into the class of prize flowers: for instance,—the lower petals are too narrow and too long, and the upper petals are too much crumpled; the colour is very beautiful, and the upper part of the flower very rich and effective. The general form of the lighter variety is much more perfect; the under petals are much shorter and broader: the spot is good, and the delicate purple tint of the flower very desirable; the upper petals are a little too pointed.

W. B.—Your seedling VÉRBENAS are pretty and showy varieties, but they do not vary sufficiently from those we already possess; every person who has cultivated this beautiful little flower from seed, has raised varieties resembling yours. The blue Anagallis is pretty, from the circle being so well filled-up. The pink one, also, is an improvement in this respect; many we have seen have been too starry.

Tyro will find his question fully answered in one of our previous leading articles.

An Amateur.—We must refer you to some of the advertisements in our columns, for an answer to your question respecting a HOT-WATER BOILER. It will be more advantageous to procure it of any of these persons than to employ a common iron-founder to make one. For a house 10ft. by 12ft. a very small one will be required.

J. Schofield.—No. 10 is a first rate Pansy, inside white and small, in consequence of the band of deep rich bluish-purple which surrounds the lower petals being very broad. The eye is bold and rich: the upper petals are mulberry-purple; the flower is large, of fine form, good substance, without crumple.

Geranium.—We know of no means of obtaining autumn Pelargonium flowers except by constantly nipping off the early blossoms as they appear.

A. T.—Let your CHAMBER-LEY become putrid, then mix green vitriol with it till it ceases to smell, and afterwards employ it sparingly as a liquid manure. SOAPSUDS require no preparation. As to the *quantity* to be used, that you must ascertain by experiment: and if you will favour us with your results we shall be obliged. Your PEACHES are mildewed. This disease may be checked by dusting the infected parts with flour-of-sulphur. The INSECTS infesting your Plum-trees are the Aphides, or Green-fly; and the black insects upon your Morello Cherry-tree are another species of Aphis. They may both be destroyed by dipping the ends of the shoots upon which they appear into a saucer filled with Tobacco-water.

An Admiring Reader.—With the best intentions your friend at Calcutta has taken the greatest pains to prevent your SEEDS growing, and we anticipate no success with them further than has already been obtained. For the reason of our opinion we must refer you to p. 715 of last year's *Chronicle*. Of your seeds Nos. 2, 6, 7, 8, 9, 10, 12, 15, 19, and 21, are new; Nos. 7, 9, 16, and 19, are valuable and showy, particularly Limónia laureola, which is a hardy Evergreen. All of them are hardy, with the exception of No. 5, which requires a stove.

A Subscriber will not find any remedy efficacious for destroying the MILDEW ON ROSES, except cutting-off all the infected parts as soon as they appear, and *burning* them immediately. A little sulphur dusted over the bushes, after the diseased parts have been removed, would probably prevent the reappearance of the evil.

G. W.—The plant is a green variety of Catasetum maculatum, a very variable species. Your Dendróbiums, which produce shoots instead of flower-stems, have been kept too continually in a state of growth. They want more rest than you have given them. Stephanotis floribunda is a fine climber, recently introduced from the Isle of France.

H. G. B.—If you can FORCE Gooseberries and Currants you will be cleverer than your neighbours. It is very difficult. The only chance of succeeding is to use no fire-heat at first, very little afterwards, and none at all at night.

D. A. G.—The reason why so many of your MELONS drop off, after the blossoms have faded, is probably owing to your having allowed the plants to produce fruit before they have attained sufficient strength to swell them. It is advisable when Melons are first put out, to nip off all the blossoms as they appear, until the Vines nearly cover the interior of the frames, at the same time thinning-out the shoots, and stopping them, whenever necessary. When the plants have collected strength enough to swell their fruit, the blossoms may be allowed to remain: and the female flowers, as they expand, should be fertilised with the pollen of the male flowers. It should be remembered that two or three good-sized fruit are sufficient for any ordinary plant to swell at one time. Your CYTISUS appears to have been affected by the long drought. Dry weather acts so partially upon plants of this genus, that sometimes whole branches will die without any apparent cause, while other shoots, upon the same tree, are growing with vigour.

J. M. W.—We would recommend you to remove the soil from around the bulbs of your SHALLOTS; this is the only remedy we know of to prevent them from decaying. Watering them with Tobacco-water is more likely to increase than to remove the disease. The stocks of LABURNUM and other trees upon which the grafts have failed, will answer very well for budding upon this season. SILVER-SAND procured from pits in various parts of this country is the best adapted for cuttings. In preparing CUTTINGS OF ROSES, choose the half-ripened wood, and with a sharp knife cut it through immediately below a joint, about three or four inches from the top of the shoot, and remove the two bottom buds or eyes, which will prevent them from forming suckers. When the CUCUMBERS which you wish to preserve for seed have become perfectly yellow, you may cut them off, and place them in a vinery or other warm situation to ripen thoroughly. You may increase the CALYCANTHUS FLÓRIDA by layers, and the WHITE FLOWERING JASMINE by cuttings.

A Country Vicar.—As you disclaim all pretension on the part of your little PELARGONIUM being regarded as a prize flower, no one can object to so cheerful-looking a greenhouse companion, more especially if it proves a free bloomer: its brilliant colour and white throat make it attractive. We have seen varieties somewhat similar, but none so well formed and pretty. Your PANSIES are too small. No. 3 is pretty, on account of its delicate blue edging, but none of them possess any of the distinguishing marks of a good flower; they are deficient in form, size, and substance.

A. E. N.—Your PELARGONIUMS are well formed, but the colours are common, and we have too many in the same way superior in size and substance.

Daniel Judd.—Your flowers are numbered according to their merits. No. 1 is the best: the colour is good, and the rich spot in the upper petals is well defined; there appears to be a little crumple in the upper petals, which disfigures the flower. No. 2 is peculiar in colour, but neither this nor No. 3 are sufficiently distinct from many others already out. 4 is decidedly inferior.

T. D. J.—Your plants are,—3, a Crotalária; 4, Phyteuma orbiculare; 6, Geránium striatum; 7, Sedum Forsterianum; 8, Sedum acre; 9, Sedum dasyphyllum.

Double Dorset's plant is Herminium pyrenaicum.

S. M.—Your plants are,—1, Abutilon striatum; 2, Leschenaúltia formosa; 3, Lotus Jacobœus; 4, Lobélia grácilis.

Theobald's Climbing plant is Periploca Græca.

D. W. S.—Your seedling is Cratægus torminalis.

J. A.—Your VERBENAS were quite withered when they arrived; it is, therefore, impossible to pass an opinion upon them.

A. S.—Acácia decurrens.

Omikron.—It is illegal to prefix the price of a book to a review, or we would gladly do so. Your letter will appear next week.

An Original Subscriber.—Plans for WARD'S CASES will be found at pp. 221 and 756. We fear Mr. Ward would be overwhelmed if he were to allow everybody to see his cases. There would be no harm in writing to ask him.

L. L.—It is impossible to extirpate your WEEDS without incessant hoeing and cleaning; if, however, you never let them seed, perish they must in time. You cannot use any agent that will kill weeds which will not also kill other plants. We do *not* advise you to destroy the plants in your pond; they no doubt keep it sweet; you may keep them sufficiently under by frequent cutting.

J. A.—We should throw the SEA-WEED and PEAT together in heaps to putrify, adding fish, if possible, to accelerate and increase the fermentation. If the poor fishermen were to bring home unsaleable fish, and employ them thus, they would soon have plenty of excellent manure. It would be improved by adding the ashes of burnt sea-weed. The "Microscopical Journal" may be had through all booksellers.

H. S. S.—Your plant of ERICA WESTPHALÍNGIA, which has just ceased to flower, and which is again putting out flower-buds, will be strengthened and rendered bushy by pinching-off the buds. The pond for the Agapanthus umbellatus may be 1½ft. or 2ft. deep, according to the depth of the pot in which it is grown; a considerable portion of the leaves should be allowed to appear above the water. Ipomœa Learii will thrive better in a hothouse than in a greenhouse.

Charles.—Your plants are,—1, Carex teretiúscula; 2, Carex stricta; 3, Carex ovalis; 4, Teesdàlia nudicaulis; 6, Arabis hirsuta; 8, Alopecurus pratensis.

φιλοσπεζυα.—Your seeds are,—1, Abrus precatórius; 3, Guilandina Bonduc; 2, another species of Guilandina.

W. F. G. F.—The only difficulty we have found with CYRTOPODIUMS is in making them form flower-stems; when formed, they generally perfect the flowers, if the plant is in a healthy state. We recommend you to pot it in rich loamy soil at the next shifting. Without knowing something more of your general treatment, it is impossible for us to say what is the reason of the flowers falling off. Are you sure your plant is a Cyrtopodium at all? There is no such plant as Cyrtopodium venustum.

Limerick.—Our statement about the new sweeping machine was taken from common report. We are not ourselves acquainted with it.

W. C. A.—We are not sure that SULPHATE OF SODA will improve the quality of the mud of ditches. Such a substance should be of itself rich in alkalies. Better try the experiment gently, and report the result.

R. Kilgour.—We have not received the Ranunculuses.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

IN France, the dissolution of the Chambers and the approaching elections exclusively occupy attention. The session was closed on Saturday by Royal ordonnance; the elections are fixed for the 9th July, and the first meeting of the new Chambers will take place on the 3d August. As might have been expected from the present position of parties in France, the result of a general election is regarded with great interest; and although powerful efforts are already making by the Opposition, it is believed that the Government will succeed in obtaining a decided Conservative majority.—In Spain, the Ministerial crisis still continues, and all attempts to form a new administration have hitherto been unsuccessful. Gen. Rodil, who has undertaken the task, has at present found only two colleagues, and considerable anxiety begins to be felt for the result. The Regent is said to have determined to dissolve the Cortes, as it is thought that no Ministry can be found strong enough to carry on the affairs of the country, unless it be composed of members of the Opposition, most of whom decline office. In the meantime, there are daily indications of events threatening the peace of the kingdom; the Republican party gains ground, and serious apprehensions are entertained of another revolution. The Constitution of 1812 has been proclaimed at Burgos, and disturbances have again occurred at Barcelona. The Regent has acted with his usual vigour in repressing these outbreaks by the power of the military, but the general condition of the country is such as to excite alarm for its continued tranquillity.—From Portugal we learn that the commercial treaty has been definitively concluded, and that although some new difficulty has occurred in regard to the Slave trade treaty, it is not likely to impede the ratification of the measure. The elections took place on the 5th, and passed off quietly, giving a considerable majority in favour of the Government.—In Switzerland, the long pending question of the new Constitution of the canton of Geneva has been settled by its adoption in the Electoral colleges by a large majority.—Advices from Turkey mention that no advance has been made in the settlement of the Syrian and Greek questions; the Porte is said to have resolved on maintaining the present state of things in Syria, and to have refused the recall of the Pacha of the Lebanon.—From the United States we learn that Lord Ashburton's mission is advancing favourably; the Boundary dispute is likely to be speedily arranged, and commissioners have been appointed by the States of Maine and Massachusetts to confer with the Federal Government in regard to the definitive settlement of the question. The intentions of the Government have assumed a more friendly aspect; a general reduction of the armaments has taken place, and the improved credit of the financial department also indicates an increasing confidence in the maintenance of peace.—From the West Indies we have intelligence of a calamitous earthquake, which has desolated St. Domingo. It was severely felt in all parts of the island, but chiefly in the town of Cape Haytien, which was totally destroyed; and at least 10,000 persons are said to have perished. The shock appears to have been felt in one uniform line throughout a great portion of South America; but it is believed that our West Indian possessions have escaped without injury.

At home, Parliament continues to excite general interest by the importance of the measures still under discussion. In the Lords, the proceedings have been chiefly connected with the discussion on the third reading of the Income Tax Bill; an amendment, affirming the inexpediency of the measure, and the greater comparative advantages of reducing the duty on corn, timber, and sugar, was moved last night by the Marquis of Lansdowne, and negatived by a large majority. In the Commons, the debates have principally been confined to the Tariff; the different clauses have given rise to lengthened discussion, and all the proposed amendments have been negatived. Ministers, however, have modified their original intention respecting the export of coals, by reducing the duty from 4*s.* to 2*s.* a ton. The bill has passed through committee, and been read a third time; and Sir Robert Peel has announced, that as a general rule, the new duties will come into operation from the passing of the Act.—The trial of John Francis for the late attempt against her Majesty's life took place yesterday at the Central Criminal Court; he was found guilty of high treason, and sentenced to death with the forms prescribed by law in the case of traitors.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal continue well. On Saturday the Queen reviewed the Royal Horse Guards and the 15th Reg. of Foot in the Great Park, Windsor. On Monday Her Majesty received an address from the Eton scholars on the late treasonable attempt on Her Majesty's life. In the afternoon of the same day the Queen left Windsor Castle for Buckingham Palace, proceeding to town, for the first time, by railway; a special train and carriage having been prepared for the occasion by the Great Western Railway Company. On her arrival in town, the Queen held a Court and Privy Council, at which Her Majesty made a declaration signifying her approbation of the marriage of Prince George of Cumberland with the Princess Alexandrina Mary, daughter of the Duke of Saxe-Altenburg. On Tuesday the Queen honoured the Italian Opera with her presence. On Wednesday Her Majesty received addresses at Buckingham Palace from the Universities of Oxford and Cambridge, and from the Corporation of the City of London. In the evening of the same day the Queen and Prince Albert honoured the Duke and Duchess of Sutherland with their company at dinner, at Stafford House. On Thursday Her Majesty held a drawing-room at St. James's Palace, which was numerously attended. The Honourable Misses Paget and Liddell have been succeeded by the Hon. Misses Hamilton and Stanley as Maids of Honour. The Queen has appointed the Hon. Clementina Hamilton to be one of the Maids of Honour in Ordinary to Her Majesty, in the room of the Hon. Sarah Mary Cavendish. It is rumoured among the fashionable circles, that Her Majesty and Prince Albert intend to honour the Duke of Buckingham and Chandos with a visit at his mansion at Stowe in August next.

The Queen Dowager.—Her Majesty the Queen Dowager, who is now entirely recovered from her late illness, left Marlborough House on Wednesday, by a special train on the South-Western Railway for Southampton, where Her Majesty embarked for Ryde. Her Majesty's visit to the Isle of Wight is understood to be for the purpose of selecting a temporary residence in that island. The Queen Dowager is expected to return to town this day, when Her Majesty will go to Bushy for a fortnight or three weeks. It is said that Her Majesty will reside about three months at the Isle of Wight, and pass the winter in the metropolis.

Church Preferment.—The Rev. Geo. Tomlinson, Minister of St. Matthew's Chapel, Spring Gardens, and Secretary of the Society for promoting Christian Knowledge, lately nominated to the Bishopric of Gibraltar, has been accepted by her Majesty on the recommendation of the Archbishop of Canterbury, and appointed to the new See.

Official Appointments.—The Queen has appointed Major-Gen. Sir W. M. Gomm, K.C.B., to be Governor and Commander-in-Chief of the Island of Mauritius and its dependencies.

Parliamentary Movements.—Mr. Harris, the Liberal Candidate, has been elected for the borough of Newcastle-under-Lyne; the numbers at the close of the poll being:—for Mr. Harris, 499; for Mr. Colquhoun, 477.—Mr. Corbally has been elected, without opposition, for the county of Meath.—The Athlone Election Committee have decided that Mr. G. P. Beresford was not duly elected for that borough, and that Mr. Farrell was duly elected, and ought to have been returned.—The Brighton election petition has been abandoned.

Foreign.

FRANCE.—*The Chambers.*—The dissolution of the Chamber of Deputies, and the approaching elections occupy public attention to the exclusion of almost every other subject. The session closed on Saturday. In the Chamber of Deputies there were about 80 members present, several of the Ministers being on the Ministerial benches. M. Duchatel, Minister of Public Works, read the Royal ordonnance closing the session of 1842. The same ceremony took place in the Peers. On Monday the "Moniteur" published the Royal ordonnance pronouncing the dissolution of the Chamber of Deputies, and convoking the Electoral Colleges for the 9th July. The two Electoral Colleges of Corsica are not to meet until the 12th of the same month. By a subsequent article the two Chambers are convoked for the 3d Aug. It is, however, stated by the "Débats," that the first session will be of short duration; and that the verification of the claims of deputies to sit, the nomination of president, secretaries, and questors, will be its only business. Every exertion is making by the friends and advocates of the different political parties, and by the different journals by which they are supported, to secure a majority in the elections; but though the papers anticipate the result differently, according to their several political views, it appears to be the general impression that the present Government will obtain a considerable majority in its favour. It is computed that the entire number of electors who may be expected to go to the poll will not exceed 150,000.

Trade with England.—The "Journal des Débats," referring to the subject of the increased duty, proposed to be laid by the Government on the import of English linens and threads, to which we have before alluded, argues strongly in favour of such a measure, and contends "that England, levying a tax of 400 per cent. on French wines, and of 700 on brandies, would with a bad grace complain of France raising the duties on foreign linens and threads to 15 or 20 per cent. as a protection for a manufacture just springing into existence. A protecting duty of 20 per cent., under such circumstances, ought to be regarded as a proof of our moderation, for which the English manufacturers should thank our Government. 20 per cent. is the minimum of the English tariff. England keeps up duties of from 20 to 30 per cent. to protect her cotton and woollen manufactures, in which she has no rival, and she is astonished at our endeavouring to shelter our first attempts at weaving linen by machinery by a duty of 20 per cent! Were this pretension put forth seriously—and we are confident this cannot be the case—it would deserve to be treated with severity. But whether it be serious or not, we repeat, that the determination of Ministers to increase the import duty is irrevocable."

The Press.—It has been officially announced that the King has exercised his prerogative in the case of M. Levy, printer of the "Charivari," who was sentenced to six months' imprisonment for having printed a libel in that journal, and M. Proux, the printer of "La Mode," condemned to three months' imprisonment for a similar offence, by reducing the period of their imprisonment to two months and one month respectively. M. Levy was set at liberty on Saturday.

Boulogne.—Another trial, which has created some interest, has just taken place before the Civil Tribunal in this town, in connection with the French Post-office and the London Press. The suit originated in the stoppage by the Boulogne Post-office, of an important letter connected with the Indian mail, and which should have been forwarded immediately to the London morning papers. The action was brought by the agent of the papers referred to, against the Post-office director in this town, by whom the letter in question was kept back 24 hours, and the damages were laid at 10,000 francs. The defence set up by the Post-office authorities was, that by virtue of some old law of the Republic, the office was not responsible for any letters that might be lost if not registered at the time of posting. The report of the proceedings extends to great length, but ultimately the court decided that the Post-office was responsible for letters though not registered, but considering that the agent could show no just claim for damages on the ground of injury received, they declared his demand ill-founded and not receivable in his facts and conclusions, and condemned him in the costs.

Algeria.—Accounts have been received from Algiers of the 7th inst. They contain a long despatch from Gen. Bedeau, who commands at Tlemcen, in the west of Algeria. It begins with an account of the reduction of some tribes, and then states, that the Emperor of Morocco had given positive orders that no assistance should be rendered to Abd-el-Kader, and was desirous of giving the French no cause of complaint. Gen. Bedeau adds, that if the Emperor is sincere in this, the rest of the tribes of the West will submit before the end of June. Private letters, however, received from Algiers in Toulon, state that there was a rumour of an insurrection in the province of Constantine, and that Abd-el-Kader had re-appeared in the province of Algiers at the head of 200 horsemen, having left the rest of his troops on the frontiers of Morocco, under the orders of El Barkani and Sidi Embdarach. The Emir, it is said, was going to join Ben Salem and the Marabout Ben-Sadoud, with the intention of attacking the French in the east of the regency. A telegraphic despatch subsequently received by Government and published in the "Moniteur" of Tuesday makes no mention of this rising in Constantina against the French troops. Its date is from Algiers the 10th inst., and states that the Governor-General arrived at Blidah in the afternoon of the 9th; that the Oran division and 2,000 Arab horse, allies of the French, who marched with the Governor-General, were expected to arrive at Blidah on the 10th inst., as well as the column of Gen. Changarnier; that submissions were multiplying in the environs of Blidah, and that the great tribe of Mouzaia was among those who had already submitted.

SPAIN.—Our accounts from Madrid are of the 11th inst. Gen. Rodil arrived in the capital on the 5th, and immediately had an interview with the Regent. It appears, that on his arrival it had been contemplated to form an exclusively military Cabinet. It was stated that Gens. Rodil, Serrano, Ayerbe, Capaz, and Linage, were to hold offices in the new Administration, the plan of which, however, seems to have been soon abandoned, as incompatible with the exigencies of the Parliamentary party. Although nothing was decided on the 6th, the following combination was considered as most probable:—Gen. Rodil, Minister of War and President of the Council; M. Almadovar, Minister for Foreign Affairs; M. Laborda, Minister of the Interior; M. Ayllon, editor of the "Eco del Comercio," Minister of Finance; Gen. Capaz, Vice President of the Council, Minister of Marine. Landero, was mentioned for the Judiciary Department. The general opinion, however, appeared to be that the members of the Government would ultimately be chosen out of the ranks of the Coalition, and that whatever ministry came in would merely bring forward supplies and close the session immediately afterwards. M. Valle was believed to have no objection to retain the department of Finance. The "Gazette" publishes another circular against the Republicans, signed by the late Minister of the Interior, but which is supposed to have been drawn up by the Regent himself. This document is couched in terms still more energetic than the former, but it was feared that it would not prevent the expected proclamation of the Constitution of 1812. A banquet was given to the retired Ministers by their Parliamentary friends on the 5th inst. The number of guests was about 70; the Ministers present were Messrs. Gonzales, Infante, San Miguel, Alonzo, and Camba. M. Surra y Rull, late Minister of Finance, who had likewise been invited, was indisposed and could not attend. Great cordiality, it is said, prevailed during the dinner, which was concluded by toasts to the Queen, the Constitution, the Regent, the Ministers, the Presidents of the two Houses of Congress, to the memory of Riego and Mina, to liberty, and to the union of all Spaniards. M. Gonzales declared on this occasion that he and his colleagues would support their successors in office, provided they did not depart from the constitutional path.—An attempt has been made at Burgos to proclaim the Constitution of 1812. Gen. Hoyos has been sent from Madrid with troops to put down this attempt. The papers state that Senor Lopez, one of the most distinguished members of the Opposition, had met with a severe accident, fracturing his arm in two places by a fall from his horse. Gen. Ayerbe had arrived at Tolosa to assume the command of the army of the north, which Gen. Rodil had confided to him on leaving for the capital. Letters from Barcelona of the 7th inst. announce that some disturbances had taken place in that city, in consequence of the determination evinced by the operatives not only to resist by force the importation of foreign manufactured goods, but to tear off the dresses of those persons whom they suspect of wearing articles not of Catalonian manufacture. It appears that a party of workmen, having forcibly stripped some individuals who had continental clothes on, made a bonfire of the spoil. The authorities succeeded in restoring order, but an impression appears to prevail among the foreign mercantile community resident in the city, that neither life nor property is safe during the present excited state of the population. Accounts from Badajoz mention the appearance in that neighbourhood of sixty armed men, who had crossed the frontier from Portugal, but it is not stated whether they were Carlists, Christinos, or brigands. The "Times" of Thursday, referring to the letter reported to have been written by Maria Christina, ex-queen of Spain, to Don Carlos, given in our last, observes, that the non-appearance in the French papers of any observation on it may be regarded as establishing its authenticity. It adds, that of the answer to that letter on the part of Don Carlos no copy has been obtained, but that the general tenour of it may be collected from the contents of a second letter, written on the same subject, by the ex-Queen of Spain to Don Carlos, and which it gives at length. Our space will not admit of our giving it entire; but the substance of it is, that Maria Christina expresses her acquiescence in Don Carlos's proposal for a marriage between her daughter, the Queen of Spain, and the Prince of Asturias; adding—"However this consent on my part may run counter with the views of a powerful throne, which have been long entertained, it is my duty, for the prosperity of my well-beloved subjects, and urged on by circumstances, to unite with your desires." She then proceeds to say that she would desire that this alliance be not concluded until a year after the defeat of him who has usurped all her powers—powers which are to be restored to her immediately after the establishment of peace. She states that it does not enter into her views to deprive Spain of a constitution, although, at the same time, she must admit that that which is now in force necessitates certain modifications and ameliorations. After expressing a hope that his Highness will coincide with her views and proposals, the letter concludes with the following words:—"I therefore desire that, without further hesitation, you should commence, with the enterprise projected between us, the regeneration of a country equally dear to both.—Your affectionate, M. C."

PORTUGAL.—We have advices from Lisbon by the usual weekly steamer, to the 6th inst., but neither the commercial nor the slave trade treaty have arrived. The former, however, had been definitively concluded, and was, at the time the packet left, in the hands of the copyist. A fresh difficulty had been started with reference to the slave trade treaty, but it does not appear to be of such a nature as to cause much trouble, and both treaties were expected to be forwarded, duly signed, by the next packet. The elections had taken place throughout the kingdom on the 5th inst., and the result, so far as they were known, gave a large majority in favour of Government. Disturbances had been apprehended in some quarters, but the elections everywhere had passed off quietly. Some changes were on the point of taking place at Lisbon. The British man-of-war Indus was to leave in the course of the week for the Mediterranean, the Alban war steamer having arrived early in the week with orders to that effect. The Lynx, 3-gun brig, was to remain in the Tagus, and a line-of-battle ship was expected out from England to complete the British force. It was believed that the Peninsula Company intend to remove the Tagus and The Lady Mary Wood from the Lisbon station. The Ambassadors of France and Spain had both been recalled, the former in disgrace, having been petitioned against by the French residents in the capital, and the latter to fill the post of Foreign Secretary in the new Government at Madrid. The change in the Spanish Government was not expected to affect in any degree the stability of the existing order of things in Portugal.

GERMANY.—Accounts from Berlin, dated the 4th inst., state that the King of Prussia on that day held a chapter of the Order of Merit for the Arts and Sciences at Potsdam; Baron Humboldt officiating as chancellor of the order. The same accounts inform us that the King has ordered the tragedies of Shakspeare to be represented at the Royal theatre, with the scenery of Queen Elizabeth's time. M. Von Rochow, Minister of the Interior, has issued a circular to all the chief presidents of the provinces of the kingdom, in which he states that it has hitherto been supposed that copper-plate, lithographic, or other prints, intended for sale, were liable to the censorship; but that, on mature consideration, he is convinced that there is no legal authority for subjecting prints to the censorship. The law refers only to printed books, pamphlets, &c. The censorship, he says, being an exception to general rules, must be understood in the strictest sense, and be rigorously confined within the limits assigned to it by positive laws. Engravings, therefore, are no longer to be submitted to the censorship. If there is any inscription on the print, it is of course to be submitted to the censor previous to publication. The police is to confine itself to hindering the sale of immoral and offensive prints. The rescript on the censorship of prints, of Jan. 21, 1823, is therefore revoked.—The papers inform us that Berlin is about to be enriched with a collection of 815 Indian manuscripts, almost all in the Sanscrit, and containing the whole of the Vedas, which Chev. Bunsen, the privy counciller of the embassy at London, has purchased from the heirs of the late Sir R. Chambers. It is added that the Vedas are in no library, either at London or Paris, and the Bodleian collection at Oxford has obtained this work only within a few weeks, by Professor Wilson's agreeing to cede his valuable collection. The copy of the Vedas purchased for Berlin alone cost 1,000*l.* in India, and comprises 120 numbers. It is said that the whole collection cost Chev. Bunsen 1,250*l.*—The "Frankfort Journal" announces the occurrence of a serious accident at Coburg. It seems that the riding-school of that town had been converted into a temporary theatre; and during the performance the edifice fell in with a loud crash, just at the rising of the curtain. Thirty lives were lost, and many persons wounded.

HAMBURG.—Accounts from this city inform us that active progress is making in the removal of the ruins caused by the late conflagration, and in the reconstruction of the city. The relief committee has published the last report of its proceedings to the end of the month in which it was formed. It had received up to the end of May, 90,224 marks currency (about 16 marks to 1*l.* sterling), 197,027 marks banco (13 2-5th to 1*l.* sterling), and 1,000*l.* sterling. The general relief committee appointed by the Senate has likewise begun the publication of the sums received. It commences with the gifts of several kings and sovereign princes, and then gives those received from different places, in alphabetical order, beginning with Auclam, and ending (as far as is at present published) with Konigsburg. The sum total is not yet given, nor is the list complete, many contributions having been received since it went to press. A special committee has been formed to promote the rebuilding of St. Peter's church.

BELGIUM.—Accounts from Brussels inform us that the time for the opening of the stations of the railway to the frontier of France is finally determined, and that on the 17th July, the anniversary of the arrival of the king in Belgium, the section from Mons to Quiverain will be opened; and on the 21st of the same month (the date of the King's entrance into Brussels), the section from Courtray to Monseron will be open to the public. It is also announced that the section from St. Sauloe (Valenciennes) to Quiverain will be opened on the 8th Aug., the anniversary of the inauguration of the King of the French.

HOLLAND.—The Luxembourg papers give a long account of the entry of His Majesty the Grand Duke into the city of Luxembourg, on the 7th inst. His Majesty, who was received with enthusiasm by the inhabitants, entered the city on horseback, accompanied by the Prince of Orange. On the same day his Majesty opened the session of the Estates of the Grand Duchy with a speech in the French language. His Majesty having declared the sessions opened, the members took the oath of allegiance, which was read to them in both languages, that each might choose which they pleased. All having taken the oath, his Majesty and the Prince withdrew, amidst renewed acclamations.

SWITZERLAND.—Accounts received from Geneva, dated the 10th inst., announce that the new constitution has been adopted by the Electoral Colleges by a majority of 1841 against 530. The constitution of 1814 had only 2,441 votes, out of 40,000 inhabitants, whilst that of the constitution of 1842 had nearly double the number, out of 59,800 inhabitants. The journals announce the arrival at Berne of Count Morier, the French Ambassador. They however deny that the French Government has declared itself positively on the question of the convents, as had been stated, and seem to expect that M. Morier will act as a mediator in this affair between the Canton of Argau and Austria, the latter of which has expressed itself in decided terms against the course adopted by the Government of the Canton.

RUSSIA.—Private letters from St. Petersburgh state, that the Government had entered into a negotiation with the house of Steiglitz to obtain the funds necessary for the construction of the railroad from St. Petersburgh to Moscow. The sum required is 50,000,000 rubles, to be advanced at the rate of 10,000,000 each year. The Treasury had proposed to guarantee an interest of five per cent. to the lenders.

ITALY.—It is now announced that Mr. Brunel, who, as stated in a former Number, has recently visited this country, with the view of constructing a line of railway between Genoa, Milan, and Turin, proposes to apply the atmospheric principle to a portion of the line where a mountain steep is to be passed. Water-power, of which there is an abundant supply, will, it is understood, be employed in working the air-pumps. The length of the line from Genoa, including an extension to the Lago Maggiore, will be about 150 miles. The railway from Milan to Venice is rapidly advancing.—Accounts from Pisa state that some students of the University in that city have been arrested on suspicion of being engaged in a conspiracy against the Government, and of having pledged themselves to hostile proceedings against all their professors of Conservative principles.

MALTA.—Accounts from this island of the 5th inst. state that the squadron under Sir W. Owen had returned from its cruise to Sicily on the 4th inst. The Savage left for Tunis on the 3d. It was not known whether any necessity would exist to send a squadron to Tripoli, as Ashker Pasha had been recalled by the Porte, on the demand of Sir S. Canning. Advices had been received from Athens to the 21st ult., but they contain no political news. Some interest had been excited in Malta on the subject of a supposed insult offered to the French Admiral Lasusse on his arrival at the Piræus, by Capt. Chambers, of H.M.S. Monarch, who did not salute the Admiral's flag. It appears that the orders from the Admiralty are to salute foreign admirals when meeting them at sea, and Capt. Chambers, differing in opinion from other captains who have been on this station, considered that as he was at anchor in a foreign harbour when the French Admiral's flag came in sight, he ought not to salute him. It is asserted that Admiral Lasusse has given orders to all French vessels on the station not to salute any English admirals. The Vernon sailed for Corfu on the 14th inst. The Beacon and Magpie surveying vessels were at the Piræus; and no change had taken place in the French squadron.

TURKEY.—By the arrival of the Levant mail we have intelligence from Constantinople to the 27th ult. The Syrian and Greek questions appear to have made no advance towards a settlement. The representatives of England, France, Russia, Austria, and Prussia, on the 27th ult., held a conference with Sarim Effendi, the Minister of Foreign Affairs, on the subject, it was supposed, of Syria. It is stated that the Porte is determined to maintain the present state of things, and that this determination has been confirmed by a petition to the Porte, signed by the principal Maronite Sheiks, expressing their satisfaction with the Turkish local government, and objecting to the restoration of the Emir Beschir's family. It appears, however, that a counter petition, signed by 40 inferior Maronite delegates, had also been prepared; but that the Seraskier, having discovered that foreign agents were accessary to this proceeding, arrested the bearer, and suppressed the petition. These agents, it is added, in their reports to their legations, denounce the original petition as the result of intrigue and compulsion. The Porte has yielded to the application of Sir S. Canning, and deposed the Pacha of Tripoli, as stated in our Malta intelligence; Mehemed Pacha, late Governor of Angora, has been appointed in his place. Private letters mention the dismissal of Hadschi Saib Pacha, the Governor of the Dardanelles. The Porte has addressed a communication to the Danish Minister, refusing the firman to allow a frigate of his nation, having on board Prince Frederick of Hesse Cassell, nephew of the King of Denmark, to enter the Dardanelles, on account of the convention of the 13th July, signed by the Five Powers, confirming the right of the Sultan to shut the Dardanelles and Bosphorus to all vessels of war. An order had also been addressed by the Porte to the Greek Patriarch, prescribing certain regulations for the printing of religious and other works of the Christians in Turkey.—The intelligence from Persia, received in Constantinople, was stated to be favourable to British interests. The Shah was observing strict neutrality; and a report that he had been sending troops to Herat, to encourage the Affghans in their insurrection, proves to be without foundation.

EGYPT.—The intelligence from Alexandria brought by the Levant Mail possesses no interest for a foreign reader, our advices, which are to the 26th ult., being only one day later than those reported in our last number, which were brought by the overland mail.

UNITED STATES.—By the arrival at Liverpool on Monday of the royal mail steamer Acadia, we have received New York Papers to the 2d inst. With respect to the progress of Lord Ashburton's negotiations, they do not supply any precise information; but it appears still to be the general opinion that everything is proceeding favourably. It was thought that the boundary dispute was in a fair train to be speedily settled. The Governor and Council of Massachusetts had appointed the Hon. Abbott Lawrence, and Messrs. Mills and Allen, to be commissioners on the part of the state, with full powers to assent to such an arrangement of the North-eastern boundary as may be negotiated by the General Government, provided the conditions are, in their opinion, consistent with the rights and interests of the state. The Legislature of Maine had appointed the Hon. E. Kent, Messrs. Preble, Cavanagh, and Otis, to be commissioners, with similar authority on the part of that state. As a proof of the peaceable intentions of the Government it is stated that the orders which had been given for launching four frigates from four different navy-yards have been countermanded, and that further orders had been issued to discharge numerous workmen, and to suspend public works in the yards. It is also said that the army and navy are greatly reducing; and it is thought that this would not be the case if the Government anticipated any prospect of a war with England. Another fact regarded as favourable to the continuance of peace is the return to specie payments by several Southern and Western banks, as also the loan of three millions and a half to Government by Messrs. Ward and Co. The resumption of specie payments by the New Orleans banks appears to have been the cause of disturbances in that city, which at one time assumed a rather serious appearance. It seems that, owing to the New Orleans ship-brokers refusing to take "municipality notes" at any discount, a mob collected in that city, and destroyed several brokers' offices, appropriating about 20,000 dollars in the confusion. The riot, however, was promptly suppressed, without bloodshed, by the citizens and military, and the ringleaders taken into custody. The papers inform us that although the governor of Vera Cruz had offered Fanny Elsler an escort of a hundred men from that port to the capital of Montezuma, she had declined the offer and had returned to New York, in order to proceed to Europe. More than 6,000 immigrants landed in New York within the week before the steamer left; the Governor of Rhode Island had sent requisitions to the governors of several other states, requiring them to apprehend and give up to the authorities of Rhode Island, T. W. Dorr, the insurgent governor, elected by the revolutionary party, to take his trial for offences which had nearly produced much bloodshed.—The steam-ship, British Queen, had grounded on the rocks of Corlaer's Hook, while entering the port of New York. A steamer was sent to her assistance, and she was got off, but not without difficulty and after sustaining considerable damage, the amount of which was not fully known.—Mr. Petrich, the sculptor, was attacked in his own house at Washington, on the 30th ult., by two men disguised; who forced their way into his studio, and after inflicting several dangerous wounds on him with knives, made their escape. Mr. Petrich was still alive, but no hopes were entertained of his recovery. The authors of the attack, as well as the cause which led to it, are unknown.—Letters have also reached New York from Mexico, stating that Mr. Egerton, an English artist, and a female with whom he had eloped, were recently murdered in the city of Mexico, under circumstances of much mystery. From facts which have come to light, there appears no doubt that the act was prompted by revenge of the most determined character.

ST. DOMINGO.—The New York papers brought by the Acadia, are filled with accounts received from Port-au-Prince, in St. Domingo, of a terrific earthquake, which occurred in that island on the 7th of May, attended with great loss of life. The principal fact of which we yet have any account, is the entire destruction of the town of Cape Haytien, and the loss of at least 10,000 persons. The following details of this serious calamity are furnished by the papers. The approach of the earthquake was indicated in Port-au-Prince by great heat, and heavy clouds that covered the neighbouring hills, and followed the direction of the south-west to the north-east. The sailors on board the vessels at anchor, state that they experienced the shock before they saw the houses agitated, from which it is concluded that the shock came from the west. There were two shocks at Port-au-Prince distinctly felt, the first not so long as the second; the latter continuing about three minutes. Every person hastened to get out of the houses, and the streets were filled with the affrighted population. It is said that there is hardly a house or a wall in Port-au-Prince that has not suffered, and some have become almost uninhabitable. The front of the Senate House, where the arms of the Republic are sculptured, was detached and broken, but the interior was uninjured. On several successive days there were other severe shocks felt; but the mischief done by them was not so great, although the alarm created amongst the inhabitants is represented to have been extreme. A letter from St. Marc states that the earthquake was felt there with great violence. Many houses were seriously damaged, and some destroyed, but no loss of life is mentioned. At Gonaives the shocks were more serious, the greater part of the houses being overthrown. A fire broke out at the same time, and there was no water in the town. All the houses that were not burnt suffered from the earthquake; and the Church, Prison, Palais National, Treasury, and Arsenal were all destroyed. The number of persons killed at these places, had not been fully ascertained. Intelligence had been received by the Government at Port-au-Prince from the Governor of Limbe, a place near the Cape, stating that after the shock he sent to that city for news. His aide-de-camp found the city destroyed, and the ruins covered by the sea, with the exception of a small portion, where were assembled the surviving inhabitants and authorities, most of the latter seriously wounded. The population consisted of 15,000 persons, of whom 10,000 are supposed to have been destroyed by the earthquake. In addition to this disastrous intelligence a courier arrived at Port-au-Prince a few hours previous to the departure of the packet which brought the news to New York, who stated that a fire broke out at Cape Haytien after the earthquake, which destroyed the powder magazine, and with it the remnant of the inhabitants who had escaped the earthquake. The towns of St. Nicholas and Port Paix are also said to be destroyed. Other parts of the island had not been heard from when these advices left; but it is feared that all the towns in the north are a mass of ruins. Besides the places above noticed, to which the earthquake extended, accounts by the southern mail received at New York, state, that on the same day that Cape Haytien was destroyed, a severe shock was felt at St. Martinsville and other towns in Louisiana. At Catahoula, Louisiana, a lake and river rose six feet in a few minutes, and did much damage, drowning several persons in the country, and subsiding again as suddenly as they rose. At Opelousas and Attakapas the shock was also severe. As far as accounts have been received, the earthquake appears to have extended from west longitude 56°, in the northern part of the tropics, to west longitude 91°. It passed Cuba, and to the west of that island, and seems to have gone northward through the Gulf of Mexico, and to have entered the United States in Louisiana. The most northern limit of its influence, so far as our advices yet extend, was in lat. 36°. Although the length of the course the earthquake seems to have taken, is so great, yet in breadth the region affected by the shocks appears to have been comparatively narrow; and therefore hopes are entertained that most of the British West India islands have escaped. Further accounts, however, are looked for with interest; and it is feared that they will bring intelligence of still more serious loss of life and property than is at present known.

India.—The "Morning Post" of Thursday contains the following paragraph relative to the fate of the garrison of Ghuznee:—"We have been permitted to transcribe the following melancholy passage from a private letter, addressed to one of his friends in England by an officer of the 3d Native Infantry:—'Ahmedabad, April 22, 1842.—Intelligence has just arrived that these poor fellows have been destroyed to a man. There were about 25 officers and 700 men, sick included. The sepoys could not hold their muskets, and the Ghazis referred to in the P.S., perceiving this, closed upon and destroyed them.'"

Parliament.

HOUSE OF LORDS.

Monday.—Several bills were brought up from the House of Commons, and read a first time. Lord Wharncliffe, in answer to some observations by Lord Beaumont and the Duke of Cleveland, stated that Government were about to adopt some measure to facilitate the exchange of light sovereigns for those of full weight. Much imposition, he said, had been practised upon the more ignorant holders of light coin, but from the average of that which had been received at the Bank, the actual deficiency in weight appeared to amount to not more than from one and a half to two per cent. Lord Campbell then, pursuant to notice, brought on his motion for certain papers relating to a trial before the Lord Justice Clerk at the last Stirling Assizes, in which the evidence of the prosecutor was, at the recommendation of the Judge, withdrawn as being unworthy of credit, on the ground that the man was an atheist. The noble Lord entered at length into the subject of the evidence, and after citing a number of authorities to prove that the course which had been taken was contrary to the law both of England and Scotland, concluded by expressing his intention, if there were any ambiguity, of bringing in a bill to remove it.

The Lord Chancellor defended the course which had been adopted by the Judges who had presided at the trial, and after a prolonged discussion, in which Lords Denman, Brougham, and several other law Lords took part, the motion was withdrawn.

Tuesday.—After the presentation of petitions, the Duke of Wellington moved the order of the day for going into committee on the Property-tax Bill. Viscount Duncannon laid on the table the resolution intended to be moved as an amendment to the bill by the Marquis of Lansdowne, which was as follows: "That while the House is unwilling to obstruct the progress of measures calculated to supply the present deficiency of the public income, and make it fully adequate to meet the public charges, it cannot refrain from recording its opinion that a judicious alteration of the duties affecting corn, sugar, and timber would have greatly diminished the amount of additional taxation required by the exigencies of the State; and would, at the same time, from its effects in increasing the comforts of all classes, and lessening the privations of the great body of the people, together with such additions as might have been obtained from some other sources, have been preferable to a tax on income in the present circumstances of the country." The Bill then went through committee, was reported without amendments, and ordered to be read a third time on Friday.

The Marquis of Clanricarde asked some questions respecting the Tipperary special commission.—The Duke of Wellington objecting to such questions, without notice, declined answering them.—Lord Wharncliffe presented a petition from a person who complained of the law requiring individuals on trial to plead to their indictments. Lord Denman said that the plea of "Not Guilty," by a guilty person, was an addition of solemn falsehood to crime, and that the law requiring pleading to indictments was unnecessary. Similar sentiments were expressed by other law Lords.

Lord Brougham moved the second reading of the Witnesses' Indemnity Bill. He denied that it was the exclusive privilege of the other House to legislate for the prevention of bribery in the election of its members, contending that the offence was one which came as much as any other under the cognisance of their Lordships. By the bill which he had himself introduced, and to the compilation of which he had been urged by the general cry throughout the country at the enormities which had lately made elections a mockery, he had not given, as the present measure proposed, indemnity to witnesses, but only the power to a committee of indemnifying those who should appear to deserve such immunity. This bill had, however, been thrown aside by the other House, rather, as he believed, because it had originated with their Lordships than for any other reason. And although a large portion of it was, word for word, retained, a new measure had been substituted, and a most unnecessary delay in the contemplated inquiry incurred. He could not but suspect that some motive more potent and more personal than a regard for privilege had weighed with some of those who had adopted this course; but as the best mode of frustrating their designs, he would recommend that the bill, with all its defects, should be passed instantly, that no loophole of escape might be left. After contrasting his own with the present measure, and expressing his opinion that, shorn as the latter was of some of its most valuable provisions, the inquiries conducted under it might still be beneficial, he concluded by pressing the House to throw no obstacle in the way, but to render as much as possible of the remaining period of the session available for the inquiry.—Lord Wicklow had no objection to the bill, but thought it unnecessary to suspend the standing orders to proceed with it.—Lord Campbell defended the other House from the imputation of tardiness and want of zeal in the suppression of bribery, and charged Lord Brougham with a disposition to cast imputations upon an assembly of which he had been so many years a member.—Lord Brougham replied; and after a few words of explanation, the standing orders were suspended, and the bill went through committee, was reported, read a third time, and passed.

Thursday.—Lord Monteagle moved for a return of the number and amount of Exchequer Bills which had been bought on account of the Savings' Banks, and converted into stock; also the dates of such purchases, and the price of such Exchequer Bills, and the price of stock at the time. He said his object in making this motion was to remove some misapprehensions which had gone forth on the subject.—The motion was granted.—Several Bills were brought up from the House of Commons, and advanced a stage.—The Sugar Duties Bill was read a second time, and the committee fixed for this day.

The Earl of Radnor asked for certain returns relative to the importation of corn into this country; and took the opportunity to express his hostility to the present Corn Laws. He concluded by asking if Government meant to take any measures for the relief of the distress before the close of the session?—The Duke of Wellington replied that Government did not contemplate any other measures than those already under their consideration, which he thought were calculated to give great relief, not merely to the manufacturing interests, but to the whole community.—Lord Kinnaird moved for a copy of the report made by the gentlemen sent down to Paisley to investigate the state of distress in that place; but withdrew the motion on its having been objected to by the Duke of Wellington and Lord Wharncliffe, on the ground that the communication was strictly a confidential one.

The Earl of Aberdeen, in reply to questions by Lord Howden, said that the recent accounts from Syria were in some degree more favourable than those previously received: but that still there was much, not only in the condition of that country, but of every other Turkish province, which presented matter for regret and disapprobation. The question, however, was, how far we could interfere, with due respect for the independence of Turkey. In restoring Syria to the Turkish authority, we did not engage to govern it also; still, good faith required our interference on behalf of the inhabitants of Syria, which had taken place in concert with the other Powers of Europe. Their great duty was to see that more especially the Christian population of Syria were secured in certain privileges, hitherto possessed by them, and whose continuance had been promised under the auspices of the British Government. Part of the pledges, such as relief from the excessive burden of taxation, had been redeemed by the Turkish Government; and the British Government would still continue to use its influence on behalf of the inhabitants of Syria.

The Lord Chancellor brought in a Bill, which was read a first time, to regulate the practice of County Courts; and stated, in reply to Lord Campbell, that it was not a Local Courts Bill.

Friday.—The Sugar Duties Bill was read a third time, and passed. The Earl of Ripon, in a speech of considerable length, moved the third reading of the Income Tax Bill, and entered into an elaborate estimate of the probable produce of the tax. The Marquis of Lansdowne then moved, as an amendment, the resolutions of which notice was given on Tuesday. A long discussion ensued, and the House divided, negativing the resolutions by a majority of 60 to 52. The adjournment of the debate was then moved, and after two divisions, and a long desultory conversation on the inexpediency of taking the third reading at so late an hour, (3 A.M.), the debate was adjourned to Tuesday.

HOUSE OF COMMONS.

Monday.—The Lords' amendments to the following Bills were agreed to and the Bills passed:—The Yarmouth and Norwich Railway Bill, the Slug-road Bill, the Dundee and Arbroath Railway Bill, the Indemnity and Mutual Insurance Company Bill, and the Kingstown Mariners Church Bill.

In reply to Mr. Disraeli, Sir R. Peel said, that the recognition of the blockade of Mexico by the state of Texas did not necessarily imply a recognition of the latter as an independent state; but he should feel it his duty to uphold the good faith of the British Government by advising the ratification, within the specified period, of the treaty with Texas; and he said this without expressing any opinion as to the wisdom of that treaty, but simply on the ground that it had been concluded on the part of this country by persons duly authorised for the purpose who, so far as he had reason to believe, had not exceeded their instructions.

In answer to a question from Mr. Childers, the Chancellor of the Exchequer said he would take that opportunity to dispel the delusion which seemed to exist among a great portion of the public as to the extreme depreciation of the gold coinage. The utmost depreciation did not exceed from 1¼ to 1½ per cent., so that a deduction of 3*d.* from the value of any light sovereign was the utmost that should be exacted.

Mr. O'Connell asked if there would be any objection to lay the coroners' inquisition on the table of the House, relating to the late serious transactions at Ennis, in Ireland?—Sir R. Peel said that the Irish Government had promptly sent down a barrister to investigate the whole matter; and, as the parties implicated by the coroner's inquest must take their trial, he hoped that nothing would be asked for which might tend to prejudice the proceedings.

The committee on the Tariff was then resumed.—Mr. Mitchell proposed to raise the duty on cables from 6*l.* to 8*l.* per ton, arguing that the Government rate of duty would not give sufficient protection to the interests concerned.—Mr. Gladstone opposed the amendment, which, after a short discussion, was negatived by a majority of 163 to 35.—Mr. G. Bankes proposed the continuance of the duty on stones for building purposes, chiefly with a view to the protection of the quarries in the Isle of Portland.—Mr. Christie supported the reduction proposed in the Tariff; and stated that the population was one among which the truck system was extensively prevalent.—After a few words from Lord Ashley, Mr. Gladstone contended that a continuance of the present duty, 20 per cent. on so rude an article was more than even the parties interested themselves asked for.—The amendment was then withdrawn.

On the article of foreign coffee, Lord Howick moved that the import duty, set down in the Tariff at 8*d.* per lb., should be reduced to 7*d.* He said that at 8*d.* per lb. the better kinds of coffee from foreign plantations would pay about 100 per cent., and the inferior kinds a much larger per centage; and these were duties upon an article entering largely into the consumption of the poor. This high impost could not be justified on the score of discouragement to the slave-trade, for the great foreign coffee country was that of Hayti, which is cultivated by free labour. The reduction he now sought being only 1*d.* per lb., could not be important to the revenue—nay, he believed would be fully made up by the increase of consumption, to say nothing of the advantage which would be produced in the discouragement of adulteration.—Mr. Gladstone urged the House to maintain the higher duties for the present, mainly on the ground that in some of the now pending treaties with foreign states, the remission of these duties might be made the considerations for important concessions to the trade of this country.—Mr. Hume supported Lord Howick's proposition, and regretted he did not go farther.—Sir R. Peel admitted that, amongst philosophers, it was doubtless sound philosophy that we should buy as cheap and sell as dear as we could. But as we were not dealing with philosophers, but with nations, whose protected interests were strong, we should not lightly throw away advantages which we possessed for appealing to their sense of common advantage, with a view to the extending of the market for our manufactures. For instance, the unwise proposition of the French Government to raise the duty on our linen yarns was creating a great sensation in the wine-growing districts of the south of France.—Mr. Hawes objected, that the effect of the per centage in the Tariff would be to let the rich have their coffee at a lower proportionate duty than the poor.—Dr. Bowring was persuaded, that in order to conciliate France, the best instrument we could use would be a diminution of the duty on her wines.—Mr. Baring said, he should have understood Sir R. Peel's argument about negotiation, if he had let coffee alone altogether; but Sir R. Peel had taken off 2*d.*, which he seemed to think quite harmless to his diplomacy, and yet entertained a great apprehension from one penny which Lord Howick desired to reduce.—After a few remarks from Mr. Villiers, the committee divided, rejecting Lord Howick's amendment by a majority of 81 to 48.

Viscount Sandon then moved, "That the stock of naturalised coffee in bond, as well as that on the way, which shall arrive on or before the 1st Aug. next, shall be reduced from 9*d.* to 7*d.*"—Mr. Gladstone could not admit the force of arguments based solely on individual claims. In all these changes, there must be individual cases of temporary hardship, which however could not stand in the way of general interest.—A long discussion ensued, in the course of which Sir R. Peel contended that no sufficient grounds had been made out for this claim. It would have been impossible to have carried the Tariff, had regard been paid to individual interests.—The amendment was finally negatived by a majority of 133 to 69.

Mr. Lindsay and Mr. Mangles pressed Sir R. Peel to consider the practicability of lowering the duty on tea; but Sir R. Peel resisted the suggestion, on the score of revenue.—On the article of books, Sir R. Peel, in answer to a question from Dr. Bowring, expressed his intention to reconsider the duty, with reference to its effect upon copyright.—On the item of tallow candles, Lord Worsley begged that the protection, instead of 10*s.* per cwt., might be 20*s.*; but Mr. Gladstone adhered to the lower sum, which was adopted by the committee.—On the proposal of a duty of 5*d.* per pound on corks squared for rounding, Mr. T. Duncombe moved that the duty be reduced from 5*d.* the pound to 1*s.* the ton. After some discussion the committee divided—for the amendment, 81; against it, 137; majority, 56.

On schedule 20 (spirits and wines), the last of those relating to imports, Sir R. Peel, in reply to Dr. Bowring, said that, with respect to any difficulties that existed as to arrangements with France upon the duties upon that article, none of them had originated on the part of the British Government, and that France was aware that this country was perfectly ready to renew negotiations upon the fair principles of commercial policy.—Dr. Bowring then proposed an *ad valorem* duty of 20 per cent. on straw hats and platting, instead of the Government duty of 8*s.* 6*d.* per pound on straw hats, and 7*s.* 6*d.* on straw platting. This was negatived without a division.—After some further progress, the committee rose, Sir R. Peel expressing a hope that the Tariff would be entirely disposed of the following evening.

The Chancellor of the Exchequer obtained leave to bring in a bill for the composition of Assessed Taxes. The bill was then brought in, and read a first time.

Tuesday.—Gair's Naturalisation Bill and the Carlow Roads Bill were read a third time and passed. The following bills were read a second time and ordered to be committed:—Bourne's Naturalisation Bill, Lesbazielle's Naturalisation Bill, Ashton's Divorce Bill, and Toxteth Park Paving and Sewerage Bill.

Mr. Shaw then moved the issue of a new writ for Belfast.—Lord Sandon, with reference to the suspension of this writ on the 3rd inst., on account of an alleged compromise, read a letter from Mr. Tennent and Mr. Johnson, the late members, denying that they had been parties to any such arrangement.—Mr. O'Connell moved as an amendment, the appointment of a select committee to inquire into a corrupt compromise, the fact of which was not denied. He said he was provided with proof of the bribery and personation practised at the last Belfast election, the guilt of which, he considered, was shared by both parties. After a few remarks from Capt. Polhill, Sir H. W. Barron said he was enabled to state to the House the names of the parties who made the compromise, and the amount of money agreed to be paid. The person who acted on behalf of the Conservative candidates was Mr. John M'Neile, of Belfast; and the gentleman who acted for the petitioners was Mr. Campbell, of the same borough. The money agreed to be paid to prevent anything from going before the committee—to keep back the evidence, and prevent members of the committee from knowing anything of the kind was, 600*l.* paid down, and a further sum of 400*l.* agreed to be paid according to the arbitration of a gentleman resident in Belfast. That gentleman the parties agreed to fix on to determine whether the additional 400*l.* should be paid or not. He thought he need not give that gentleman's name, as he was not mixed up in the transaction, but if the House required it he was prepared to do so.—Sir R. Peel thought this case analogous to that of Penrhyn, where the sitting member had disclaimed all share in any compromise, but where, nevertheless, the writ had been suspended. The House ought to show that it was in earnest in its endeavours to suppress bribery. He admitted the necessity of an inquiry, and should vote for the suspension of the writ for a limited period. After a few observations from Sir C. Lemon, Sir R. Inglis, and Mr. Redington, Lord J. Russell said he did not agree in thinking that the suspension would be useless, except with a view to disfranchisement. Inquiry might lead to disclosures, which would prevent much corruption at the approaching election. Mr. Shaw replied, after which the House divided; when the numbers were, for the motion, 73; for the amendment, 170; majority against issuing the writ, 97.

The House then went into committee on the Tariff, when the first resolution relating to the duties on exports, and which merely states that there shall be charged upon goods, wares, and merchandise exported from the United Kingdom to foreign possessions, the duties to be afterwards agreed upon, was adopted.

The Chancellor of the Exchequer then brought forward the Government proposition for imposing a duty of 2*s.* on the export of coals to foreign countries. The original intention of Government was to propose a duty of 4*s.*, from which they anticipated a revenue of 200,000*l.* But having, on consideration of the interests involved, altered their intention, the anticipated revenue would probably be reduced by 60,000*l.*, which, however, might be compensated by increased exportation.—Mr. Bell expressed his satisfaction at the reduction, and his hope that even this diminution of duty would be modified should it be found to act injuriously.—Lord Howick read various documents relating to the negotiations of the coal-owners with Government, which, he said, ended in their obtaining this compromise, as a condition of their foregoing their threatened opposition. Small as the amount of this diminished impost might appear, it would materially affect our export trade in coals, which was at present exposed to a competition that threatened our hold of the Mediterranean and continental markets. So far from making foreign nations tributary to us by this tax on coals, we should drive them to those supplies of cheap fuel which were within their reach; and for what were we going to incur all this risk? For a revenue of 140,000*l.*, from which must be subtracted the additional cost to be incurred in collecting it.

Mr. Hutt resisted the proposed tax on similar grounds to those urged by Lord Howick.—The Chancellor of the Exchequer gave some explanation as to the alleged compromise with the coal-owners, which he distinctly disclaimed.—Mr. Liddell vindicated Mr. Bell and the other North of England members acting for the coal-owners, in the course which they had adopted in acquiescing in the amended proposition of Government.—Mr. Bernal supported the amendment to the Government proposition.—Mr. Gladstone observed upon the extreme difficulty of raising revenue in any mode whatever, since there was always an equally strenuous resistance whether the proposed taxation were direct or indirect. There were objections, no doubt, to all modes of taxation, but no peculiar objections to the taxation here proposed. He was not afraid that the duty would be unproductive; for it would not in general make an addition of quite so much as ten per cent to the selling prices in the foreign markets.—After some observations from Mr. Lambton, Lord Mahon supported the Government proposition, on geological arguments. He said he wished to husband our stores of coal, and to prevent (in the words of a witness before a committee of the House) "foreigners from eating the vitals of our posterity."—Mr. F. T. Baring was much obliged to Lord Mahon for an argument based upon the assumption that the proposed measure would effectually check the export of coal. The reason assigned for the tax was revenue; but the amount to be derived was altogether worthless in comparison to the important interests which were endangered by it, such as the maritime trade.

Sir R. Peel rejoiced that the income tax had been secured, for this night's debate had shown what sort of chance he would have had for raising a revenue of four millions on articles of consumption. The present proposal was pretty generally supported by the coal trade; but that, they were told, was through a compromise. Was, he would ask, Government to be debarred from communication with parties interested in these changes? If the conduct of Government in this case were a compromise, then Lord Howick himself was open to similar charges, for no later than the previous night he had made an arrangement with Lord Sandon in the debate on the coffee duties. As to the question itself, Government were seeking to remedy the deficiency in the revenue as compared with the expenditure; and looking at the article on which this duty was proposed to be laid, an article incapable of reproduction, our peculiar supplies of qualities in great request abroad, and our growing trade in its exportation, he saw no danger to be incurred by the imposition of the tax.

Mr. Hume resisted the imposition of this duty as opposed to all sound commercial legislation.—Mr. H. Hinde, on the part of the coal-owners, could not say that they actually approved this tax. Willing, however, when he could not get what he wished, to take what he could get, he was prepared to support Government in the present vote.—Lord J. Russell, considering that this tax was proposed solely on grounds of revenue, and not from any anti-commercial motive, would vote for it. There was doubtless some risk in the experiment, but he did not apprehend such injury to the trade as to lead him to refuse Government the revenue they wanted.—After some remarks from Mr. C. Buller, in opposition to the tax, the House divided, when there appeared—For the Government proposition, 209; against it, 67.

After some conversation on the expediency of allowing a drawback on coal exported for use in British steam vessels, and on some other points, the duties on the exportation of coal, clay, and china stone, &c., were agreed to. The last item was the resolution authorising, on the articles of this tariff, the levy of the additional charge of 5 per cent., introduced by 3d Victoria, chap. 17.—After a few words from Dr. Bowring, the resolution passed, and the Committee concluded its labours on the Tariff.—In reply to a question, Sir R. Peel said that as a universal rule the new duties would come into operation from the passing of the Act.—The House having resumed, several Bills were forwarded in their respective stages.

Wednesday.—The Lords' amendments to the Great North of England Railway Bill, and the Boston Harbour Bill, were agreed to, and the bills passed. The Stourbridge Roads Bill was read a third time and passed.

The Scotch Church Patronage Bill had been expected to occupy the attention of the House this day; but soon after the public business began, it appeared that a formal obstacle existed to the progress of the measure, in the want of a consent from the Crown to its introduction: that preliminary sanction being required by the constitution to any provision affecting the Crown's patronage. Mr. F. Maule asked whether Sir R. Peel was willing to wave this objection. Sir R. Peel declined to depart from precedent: and Mr. F. Maule then gave notice of a motion on a future day for an address to her Majesty upon the subject.

Sir J. Graham, in answer to Lord J. Russell, gave a contradiction to the rumour that Government were going to alter the Poor Law Bill now in the House. They meant to press it forward in the shape in which it had been presented.

Sir R. Peel in reply to questions from Mr. Disraeli respecting the state of the negotiation with America on the boundary question, said, that the transaction rested altogether between the state of Maine and the Government of the United States. Negotiations of the utmost importance were pending, but he felt that it would be wholly inconsistent with his duty to make any statement respecting them to the House.

The motion of Mr. Mackinnon for the issue of the Southampton writ was postponed for a fortnight, on an announcement from Mr. O. Stanley that he should move, on Thursday, for a select committee to inquire into the allegations of bribery and treating at the last election for that borough.

Mr. M. Gibson moved the second reading of the bill to prevent any person registered as an elector for a borough from losing his vote by a removal between the registry and the election. Mr. Hodgson objected to the measure, as tending to increase expense, by allowing voters who had quitted the place to be brought back to it, for the purposes of the election. Sir G. Grey supported the bill. It would be easy, he thought, to exclude outvoters by altering the form of the third question put to them at the poll, and substituting for the inquiry whether the voter retain the same qualification, an inquiry whether he be still resident within the limits of the borough. After a few remarks from Mr. Brotherton, Mr. Escott said that the point upon which he disagreed with his right hon. friend was, that the residing within the limits of the borough should constitute the qualification. The Reform Bill established a 10*l.* qualification, and a voter ought not to exercise the franchise unless he could show he was in possession of that qualification.—Sir J. Graham admitted that the present rule did often operate with considerable hardship. But the persons who in large cities were the most apt to change their residences, were the lowest class of voters, the most liable to temptation, and therefore the most carefully to be watched. And if the proposed alteration were made in the third question, those scrutinies must be held at the poll which it was one great object of the Reform Act to preclude.

Lord J. Russell approved of the principle of Mr. Escott's suggestion, but did not yet see his way clearly to its accomplishment. He would support the second reading, and try to apply the desired remedy in committee. Some further discussion ensued: and finally the House divided, when there appeared—For the second reading, 102; Against it, 120; Majority, 18.—It was next proposed that the bill should be read on that day three months.—Mr. Hume asked if Government would bring in a bill to remedy the admitted grievance which it was the object of the lost bill to provide for?—Mr. Duncombe also asked if Sir R. Peel intended to bring a registration measure, as they had been led to expect. A similar question was put by Lord Clements with respect to Ireland.—Sir R. Peel said that in a day or two Sir J. Graham would state to the House the intentions of Government in reference to these matters.—Mr Fox Maule, upon this, moved, as an amendment, that the present bill should be read on that day week.—Another division took place, when the original motion was carried by 161 to 79.

The report of the committee on the Salmon Fisheries (Scotland) (No. 2) Bill, several amendments having been made in it, was agreed to. The Dean Forest Poor Bill, Ecclesiastical Districts Bill, and the St. Briavel's Small Debts Bill went through committee.—Mr. Greene brought up the report of the committee on the Tariff, which was reconsidered in committee, and several amendments were agreed to without any discussion.—The House then resumed, and the report was ordered to be received on Thursday.

Thursday.—The appointment of the Belfast election committee was proposed by Mr. O'Connell.—Sir R. Inglis said he would not trouble the House to divide on that question, but he must strongly protest against such a proceeding as the present. When his right hon. friend at the head of the Government, and the noble Lord at the head of the party opposite agreed upon any course, it was quite useless to oppose them.

Sir R. Peel said that his hon. friend had again referred to him, and he, therefore, had again to repeat, that all he asked was to be allowed to exercise his own individual judgment. He did not wish in any way to influence any one. He had not asked any man for his vote, but he did claim for himself the right of deciding what course he should take. Considering the appearances of compromise that have been shown, and considering the extensive bribery that has been proved to have prevailed at the last general election, he stated it as his deliberate opinion that it would not be to the character or the credit of the House of Commons to put these questions aside solely upon technical objections. If any parties are guilty of corrupt compromise for the purpose of preventing inquiry into practices of bribery, he never would use the influence of party to prevent inquiry into such abuses. He thought that such a course would have a strong tendency to diminish the high character of the House of Commons. Those who were guilty of bribery, if there are any such, must take the consequences, for he now gave public notice, that he would not exercise any influence he may possess for the purpose of preventing inquiry. After some conversation the committee was appointed.

Lord J. Russell's Bribery at Elections Bill was read a first and second time. In answer to Mr. Hawes, Sir R. H. Inglis repeated the assurance of his intention of bringing the subject of church extension before the House during the present session.—Mr. W. O. Stanley moved for a committee of inquiry in the case of the Southampton election. The committee, after a few observations from one or two Members, was agreed to.

Sir J. Easthope moved, pursuant to notice, for leave to bring in a bill to abolish Church-rates. After some introductory remarks, he said he proposed to abolish Church-rates altogether; and for the maintenance of the fabrics of churches and chapels, he would give power to the churchwardens and other authorities to make up the necessary expenses by pew rents, where voluntary subscriptions or endowments were insufficient. One half of the sum now levied for Church-rates would be sufficient for the purpose of maintaining the fabrics of the establishment; and for an amount so insignificant as that which Dissenters were considered to contribute to this impost, was it worth while to keep up all the bitterness and mischief attending its collection—the pain given to tender consciences, the fines, imprisonments, and unseemly contests—which accompanied Church-rates." On these and other grounds, which he did not wish to dwell on, as the subject had been so repeatedly discussed, he moved for leave to bring in his bill.—Mr. M. Philips seconded the motion.—Mr. S. Crawford said that opposed as he was to all these imposts, Tithes, Church-rates, &c., on principle he supported the motion, and regretted that Sir J. Easthope did not take higher and bolder ground, and question the right of the people of England to be burdened with a church establishment at all.—Sir R. Inglis and Mr. G. Knight opposed the motion.

Lord J. Russell ridiculed the argument of the inseparable connexion between an Established Church and Church-rates. What was wanted was some suitable provision for the fabrics of the establishment; and it was not to be denied that the present system of collecting that provision was productive of much evil. Sir J. Easthope had very properly, in proposing to abolish Church-rates, suggested a substitute; and without giving any opinion on that plan, which he feared a majority would not suffer to be brought before the House, he hoped that the time was not far distant when the subject would be taken up with a view to a satisfactory alteration of the law.—The Chancellor of the Exchequer gave credit for sincerity to Sir J. Easthope, in thus producing a substitute for Church-rates; but the plan of raising the necessary sums for maintaining the fabrics of the Church by pew rents, was opposed to the doctrines of our religion, which taught that the Gospel should be preached to the poor. He should therefore oppose the motion.—After some further discussion the House divided, when there appeared, for leave to bring in the bill, 81; against it, 162; majority, 81.

Capt. Pechell moved for returns relating to the number of slave vessels brought before the Courts of Mixed Commission; and also of claims for bounties, &c., which, after some conversation, was agreed to.

Mr. Ferrand brought forward a motion, that the House should, on the 21st June, resolve itself into a committee of the whole House, for the purpose of considering a resolution that an address be presented to her Majesty, praying for the immediate application of a sum not exceeding one million sterling, for the temporary relief of the distress and destitution of the working classes in the manufacturing districts; and that the House would make good the same. The House of Commons had voted twenty millions for the emancipation of the slaves in the West Indies, who were much better off than the working classes of England. These classes had been robbed of their property without their consent, banished, under the new Poor-law, from the south to the north of England, where they were dying at the doors of their masters.

Sir R. Peel said he rose to speak, lest his silence should be construed into indifference for the sufferings of the working classes. He protested against the motion, as dangerous in precedent, and opposed to equity; and also cautioned the House against being led away by what appeared exaggerated statements of the sufferings which the working classes were enduring. At the same time, he hoped that the appeal to the sympathies of the public mind would not be made in vain, and that something effectual would be done to relieve the distress, which was borne with so much patient fortitude. The Rt. Hon. Baronet concluded by saying, "The poor, I know, are suffering, and I can assure the Hon. Member that the distress is a subject of painful attention on the part of Government, who are silently (for publicity may frustrate our efforts), but not ineffectually, attempting to assuage the sufferings of those who, it is admitted, are exposed to great privation and suffering."—After a long debate, in which several Members joined, the motion was ultimately lost by a majority of 106 to 6.

The report on the Customs Acts (the Tariff), was brought up, and leave was given to bring in a bill founded on the resolutions.

A debate arose on the motion, by the Earl of Lincoln, for going into committee on the Forest of Dean Ecclesiastical Districts Bill, with the object of granting an augmentation of the incomes of the clergy, and to provide for the spiritual wants of the inhabitants of the forest. The bill was opposed by Dr. Bowring, Messrs. T. Duncombe, Hawes, and Hume, as being a stealthy measure of Church extension; and a division took place on a motion of Mr. Duncombe, that the Speaker leave the chair, when there appeared 101 against, 25 in its favour.—Mr. Hume still persisted in his opposition, and called on Sir R. Peel to explain the ground on which the Government supported this bill.—Sir R. Peel, in reply, said, that the spiritual destitution of the inhabitants of this public property, called for public interference, on every consideration of moral right and duty, which would be amply compensated, even on the lowest pecuniary grounds, by the improved condition of the district.—After Mr. Protheroe had spoken in support of the bill, Mr. Hume again divided the House, on the motion that the Speaker leave the chair, when there appeared 101 to 13 against it.

The House then went into committee on the bill, which, after some further discussion, was considered, and ordered to be reported.

Friday.—Sir J. Graham moved the order of the day for the second reading of the Poor Law Continuance Bill, and contented himself with simply referring to his former statements as to the provisions of that measure.—Mr. S. Crawford moved that the Bill be read a second time this day three months, supporting the motion in a speech in which he opposed the bill on the ground of its violation of the constitutional rights of the people of England, and the despotic power which it gave to the commissioners.—Capt. Pechell seconded the motion.

Mr. Pakington, Sir J. Graham, Col. Wood, and Mr. Liddell spoke in favour of the second reading: and Gen. Johnson, Col. Sibthorp, and Mr. Ferrand opposed it.—The House then divided, when there appeared—For the second reading, 260; against it, 61: majority, 199.

The other orders of the day were then disposed of. The third reading of the Dean Forest Poor Bill was resisted; but was carried, on a division, by 82 to 21.

CITY.

Money Market, Friday.—Consols for the account closed $91\frac{3}{8}$ to $\frac{1}{2}$; Bank Stock, 167 to 168; Exchequer-bills, old, 45s. to 47s. premium; Ditto, new, 40s. to 42s. premium; and India Bonds, 21s. to 23s. premium.

Metropolis and its Vicinity.

Trial of Francis for High Treason.—A true bill against John Francis having been found by the Grand Jury on Wednesday, the trial came on yesterday, at the Central Criminal Court. The prosecution was conducted by the Attorney and Solicitor-Gen., Mr. Adolphus and Mr. Waddington. The prisoner pleaded Not Guilty, and was defended by Mr. Clarkson. The evidence for the prosecution closed at one o'clock, when Mr. Clarkson commenced his defence, urging in behalf of the prisoner that there was no direct proof that the pistol was loaded with ball. The Solicitor-General having replied, Lord Chief Justice Tindal summed up the evidence; the jury returned a verdict finding the prisoner Guilty on the second and third counts, but stating that they were not satisfied on the first, which affirmed that the pistol contained a bullet. This amounted to a sentence of Guilty on the charge of high treason. The Chief Justice then passed the sentence of death usual in the case of traitors, directing that he be drawn to the place of execution on a hurdle, and there hung; that his head be cut off after death, and his body quartered. At the conclusion of the sentence, the prisoner fell back fainting in the arms of the gaolers.

Court of Common Council.—On Thursday a Court was held for the despatch of public business. Among other matters of less importance, Mr. R. L. Jones moved that the report of Officers and Clerk's Committee, relative to the office of Town Clerk, recommending that the salary of that officer should be fixed at 2,000*l.* per annum, &c., be agreed to. An amendment was proposed by Mr. Peacock, that the salary be reduced to 1,500*l.* per annum. After some discussion, the original motion was carried by a majority of 11, the numbers being—For the report, 52; against it, 41. The report was then referred back to the committee to be carried into execution. A motion was then made, "That upon the election of Town Clerk in place of the late Henry Woodthorpe, Esq., the standing order 'That no person not having been admitted to the freedom of this city two years, except entitled thereto by servitude or patrimony, shall be elected to any place or appointment of emolument in the gift of this Court, or of any committee or commission chosen by them,' be suspended." After a debate of some length, the Court then divided, when there appeared in favour of the suspension of the standing order, a majority of 13, the numbers being, For the report, 68; against the report, 55. The Lord Mayor then informed the Court that the election for the office of Town Clerk would take place on Thursday next. The report of the Committee for repaving London Bridge was then brought up. It recommended, that as well for the convenience of the public as the durability of the work, the bridge should be completely closed, as regarded the traffic, during the re-paving of it. Alderman Sir M. Wood said, the inconvenience to the public business would be serious if the bridge was wholly closed, and suggested the propriety of keeping open one-half of the carriage way during the period of the repaving. Petitions were presented from the managers of the joint stations, and others, against closing the bridge entirely, and the majority of the Court approved of the suggestion of Sir M. Wood. The report was ultimately referred back to the committee, with instructions that during the re-paving of the bridge the public accommodation should be properly attended to.

Metropolitan Improvements.—On Wednesday a deputation from the Metropolitan Improvement Society, headed by Lord R. Grosvenor, had an interview with Sir R. Peel, their chief object being to prevail on Government to advise with the Commissioners of Woods and Forests, and other competent parties, upon the practicability of carrying out the plans now in progress for the improvement of the metropolis, on a scale better adapted to the end proposed. They were also desirous, as a basis for future legislation on this subject, that Government should cause to be prepared an official scientific report upon the general character of the improvements required in reference to new thoroughfares and open spaces, roads connecting the railroad termini, the most practicable means of throwing open the banks of the Thames, and the steps to be taken for the drainage of unhealthy districts. Sir R. Peel said, that without troubling the deputation to enter into any particular explanation, he might at once say that the subject was one which had engaged his serious attention, and that with the general views expressed by the deputation his own opinions coincided. Without pledging himself to the exact course which he might deem it desirable to take relative to the appointment of any board, he certainly thought that the object would be promoted by taking a broad and comprehensive view of the whole subject, instead of legislating wholly upon detail; and that for this purpose a committee of the House of Commons—open, perhaps, to local influence—was not the most desirable body to whom such an inquiry should be entrusted. He might further add, that as the object appeared to him one of paramount importance, both in reference to the sanatory state of the poorer districts, and the greater facilities of communication required, he did not think the consideration of a trifling expense should stand in the way, and he should probably not hesitate to propose such a grant as would be sufficient to render the inquiry effectual. Some conversation then ensued relative to the character of the improvements now in progress, plans of which were produced; Lord Grosvenor especially urging the attention of Sir R. Peel to the fact, that if the formation of the new main thoroughfare streets were built of a width of 52 feet where 60 feet at least were required, and made crooked where they ought to be straight, the opportunity lost might be a constant source of regret, but could never be recalled.

Boat Race.—On Saturday the great annual rowing match between the Universities of Oxford and Cambridge, which usually excites considerable interest, came off on the Thames. Great numbers of spectators assembled on the banks of the river and the different bridges to witness the race, and seven steamers accompanied the rowers. It was a cutter match, each boat containing eight men. Oxford won the choice of station, and took the Middlesex side of the centre arch of Westminster bridge, the match being from Westminster to Putney, with tide. After starting, they kept together some time, until at length the Oxford boat took the lead; and, after a spirited and well-contested race, passed through Putney bridge six seconds a-head of their opponents, amid the cheers of the spectators, and after one of the finest races ever witnessed.

Public Meetings.—On Saturday a meeting was held of the committee and subscribers to the Wilkie testimonial. Three questions were submitted to the meeting for their decision: first, the character and nature of the testimonial; secondly, the sum the artist should receive for it; and thirdly, who should be the artist. Sir R. Peel presided. He was of opinion that a statue should be erected, and that the sum of 1,600*l*. should be appropriated to that purpose. He thought that the memory of one of our greatest artists ought to be perpetuated, and that 1,600*l*. would not be too high a remuneration. For his own part, if a first-rate sculptor demanded 2,000*l*. for the required statue, he should not like to refuse it. Sir P. Laurie was of opinion, that even should the amount of subscriptions be more than 1,600*l*., it ought to be given to the sculptor who might be selected to erect the statue. After a short conversation between the chairman, the Bishop of Llandaff, and Sir P. Laurie, a resolution was agreed to, that the full amount of the subscriptions should be applied to the erection of the proposed statue. The chairman said that they had now to consider who should be selected to execute the statue. Mr. Hall proposed that Mr. Joseph should be employed, on account of his having made a bust of Sir D. Wilkie, which was considered by Sir David's family an excellent likeness. Sir W. Newton, R.A., seconded the resolution. An amendment was then moved, that the execution of the statue should be decided by open competition. Sir P. Laurie and Sir C. Forbes spoke in favour of the original resolution, and deprecated competition. They cited the Duke of Wellington as an authority, who, in the instance of the Nelson pillar, had advised the committee not to have recourse to competition. After a long conversation, the following resolution, proposed by Lord Mahon, was ultimately adopted: "That this meeting be postponed until Saturday, the 2d July, and that the committee meet on that day for the purpose of choosing an artist for the execution of the statue." It was also resolved, "That at the next meeting the name of no artist should be proposed, unless previous intimation had been sent to the secretary seven days before, and that the names of the artists should be then stated to the committee."

East India Trade.—A circular has been issued by Mr. S. Briggs, the object of which is to state, that the temporary suspension of payments by Messrs. Briggs, Thurburn, and Co., of London and Liverpool, announced in our last, will in no degree affect the house of Briggs and Co., of Alexandria; and that with respect to the drafts of this latter firm, arrangements have been made with Messrs. Heath, Furse, and Co., to pay them when due.

Mortality in the Metropolis.—The total number of deaths in the metropolis, from all causes, registered in the week ending the 4th inst., is 760. The average weekly deaths in 1841 were 912.

Strawberry Hill.—On Monday, the sale of Horace Walpole's collection of original drawings and prints commenced, at Mr. Robins's rooms, Covent Garden, and has continued throughout the week. The catalogue contains nearly 11,000 lots, among which are some rare and valuable prints. The sale created considerable interest, and has been well attended. Some of the drawings realised high prices; those most sought after being the portraits illustrative of the reigns of Queen Anne and the first two Georges, many of them of great rarity. The sale is expected to last altogether ten days, and to realise several thousand pounds.

Deptford.—On Sunday some interest was excited in this town and neighbourhood by the arrival in the river of an Arabian man of war, the first, it is said, that ever appeared in English waters. She was moored off the Victualling-yard, having a pennant flying at her main-topmast head, with a red ensign hoisted at her mizen, and was the object of much curiosity. She is from Zanzebar, and has brought over four Arabian horses as a present from the Imaum of Muscat to her Majesty. On Monday she was towed up to the St. Katherine's Dock, and after some trouble the horses were finally landed without any accident, and conveyed to the royal stables. A large concourse of persons witnessed their landing. The vessel is a fine-looking ship of 300 tons register, and carries 10 brass guns. She is officered and manned by Arabs, with the exception of an interpreter, and a native of the United States. She has on board other presents, consisting of shawls, spices, &c., for her Majesty; and has brought passenger Said Alie Bin Nassore, the governor of Mombas. Many thousand persons, it is said, have visited her since her arrival in the Docks.

Woolwich.—The King and Queen of the Belgians are expected here on Monday, on a visit to her Majesty. Their Majesties were to have left Ostend on Thursday, and were expected to arrive early yesterday morning. A guard of honour was in attendance to receive their Majesties, but their departure was postponed.—On Monday, some fresh experiments were carried on in the Marshes before Col. Cockburn and Lieut. Col. Dansey, members of the select committee, to test the qualities of metal tubes, of one and a half inches and two inches in length, filled with a composition, some of them plugged, and others not plugged, to ascertain the number of seconds from the time they were fired, until the time of their explosion, which was regulated by a pendulum. The range was 1,250 yards, one gun for 32-pounders, and the other eight inch shells. The practical class of gentlemen cadets attended in the Marshes for the purpose of firing a heavy 24 pounder, and a heavy 18-pounder, mounted on wheel carriages placed upon new platforms, at a range of 400 yards. The object at which they were to fire was a breastwork, representing the gabrons of a fortification within which have been placed two old 12-pounder guns, mounted on ship carriages, which the cadets were to attempt to destroy when firing. The interruption, however, in the river being very great in the afternoon, as on former occasions, the practice was postponed. Some good ricochet practice, however, took place, carried on by the Royal Artillery, under the command of Lieut.-Col. Wylde, from the various batteries. The rocket troop also went through their practice in the Marshes, and the discharges of ten rockets at one time had a striking effect.

Chatham.—An official order was received in this garrison on Monday for an embarkation of troops to proceed immediately to China. The men, amounting to about 1000, have been selected from the provisional battalion to fill up the casualties which have happened to the regiments in that country. The troops received orders to be in readiness for embarkation on Wednesday, when they marched from this garrison to Gravesend, and there embarked for their destination.

Provincial News.

Birmingham.—A public meeting, numerously attended, has been held in this town, for the purpose of taking into consideration a proposition condemnatory of the introduction of the New Poor Law Amendment Act into the town. The Mayor presided and briefly introduced the subject before the meeting. Mr. Alderman Cutler then rose, and after alluding to the probable introduction of the New Poor Law Act into the town, and strongly animadverting on several of the clauses proposed by Sir J. Graham, concluded by proposing a resolution:—That the powers of the local act for the management of the poor of this parish are sufficiently ample, that their application has hitherto been satisfactory to the parish; that, therefore, any interference by the Commissioners of the New Poor Law, cannot fail to be mischievous, and that a petition be presented to Parliament for the exemption of this town from the operation of the said bill. Mr. Alderman Mathews, in seconding the motion, said that the New Poor Law was an innovation of the rights of the people by the aristocracy, and the industrious classes were the victims of it. It was an innovation upon the rights of the poor receivers, and an imposition upon the parishioners who were called upon to pay. It was their duty to watch the progress of the measure through Parliament, and to do all in their power to counteract it. Alderman Muntz agreed that those who paid the poor-rate ought to have the power of its management and disposal; but in the first place he did not believe the commissioners would have the power over local acts which it was said the new law would confer upon them. He moved, as an amendment, "That this council petition Parliament that powers be given to guardians of the poor to administer out-door relief in all cases they deem necessary." A desultory conversation ensued, during which the Mayor took occasion to defend the Poor Law, and expressed his opinion that the popular outcry against it was greatly abated, and would soon cease altogether. After a lengthened debate, the proceedings terminated by the withdrawal of both the previous resolutions, and the unanimous adoption of the following:—"That this council, apprehensive that the bill now before the House of Commons, for the amendment of the Poor Law, may be construed to interfere with the present management of the poor of Birmingham, resolve that it be referred to the Parliamentary committee to frame such a petition as it shall think requisite, declaratory of the opinion of the council that such interference is not called for, and would be contrary to the wishes of the rate-payers generally and the interests of the poor." It was also resolved, "That the council do petition both Houses of Parliament for such alteration in the laws relative to the government of the poor as shall empower the guardians to administer in their respective parishes such out-door relief as to them may appear expedient." The petition was then drawn up, and directed to be transmitted to the borough members for presentation, and the county members were requested to support it.—A meeting of the guardians of the poor was also held on Monday, when it was resolved to adopt every constitutional measure to resist the introduction of the New Poor Law into this town, and a petition against the bill was agreed to and forwarded to the House of Commons.

Burnley.—The local papers publish the following statements, in confirmation of the accounts we have given in a former number, of the serious distress prevailing among the operatives of this town and district. It is stated that the Burnley Union comprises about 26 townships, having an aggregate population of 53,000, of which upwards of 12,000 are upon the parish books. The increase of the poor-rates in the respective townships is represented as very great; particularly in the townships of Marsden, Briercliffe, Rough Lee, and Barrowford, the greater proportion of the population in them being employed in handloom weaving. The annual value of the rateable property in Marsden is 13,000*l*.; the average rates from 1834 to 1839 were 950*l*. per annum, but from the 1st of Jan. 1842 to the present date, there have been collected rates to the amount of 2,710*l*., and the township is indebted besides to the union upwards of 800*l*. The annual value of rateable property in Briercliffe is 4,000*l*.; the average rates for 1836 and 1837 were 210*l*. per annum; in 1841 they were 1,900*l*., and from Jan. 1842, to May 9, they amount to 600*l*. This township is also said to be indebted to the union. The annual value of the rateable property in Rough Lee is 1,700*l*.; the average rates, from 1834 to 1840, were 290*l*. per annum, in 1841 they were 352*l*., and from March 25th, 1842, to May 30th, the rates have amounted to 281*l*., and it is stated that the overseers find it almost impossible to collect the rates at all. The annual value of the rateable property in Barrowford is not stated, but from 1831 to 1836 the average rates were 630*l*. per annum; in 1841 they were 1,120*l*.; and in the first quarter of the present year they amounted to 420*l*. It is added that wages of all descriptions of labour are on the decline; that artisans who have lately been in the receipt of sufficient wages are for the most part unemployed, and that the distress generally prevailing among this class of persons is becoming daily more serious.—A fire broke out on Saturday at the mills of Messrs. Barker and Barwise, between this town and Todmorden. It appears that about nine in the morning, whilst the mill was at work, the cotton in the upper story, used for the process of dressing, suddenly ignited. The flames spread with rapidity to other parts of the building, and in the course of two hours the whole of the premises were destroyed, together with 50 bales of cotton, and the machinery,—the loss being estimated at from 9,000*l*. to 10,000*l*. A number of workmen will be thrown out of employment by this unfortunate occurrence.

Hertford.—A serious fire, attended by great destruction of property, occurred at Hitchin, in this county, on Sunday. In consequence of a deficient supply of water, the flames spread with great rapidity; and the fire having broken out in a close neighbourhood, chiefly inhabited by the working classes, no less than 14 houses were destroyed in the space of two hours. By great exertions the fire was at length got under; but the extent of the damage done is considerable, and nearly 50 families of the labouring classes have in consequence been deprived of their homes.

Manchester.—A preliminary meeting of the shopkeepers of this town was held on Monday, to take into consideration the depressed state of their trade. From statements made by several tradesmen present, it appears that the working-classes in this great manufacturing town and district are in a very reduced condition, from want of employment and the inability to procure the necessaries of life; in consequence of which the business of shopkeepers has suffered severely, occasioning the bankruptcy of many, and seriously reducing others. After several tradesmen had addressed the meeting and entered into long details in proof of the above statements, a resolution was adopted, adjourning the meeting for a week, with a view to the full consideration of the subject, and the adoption of means for the attainment of immediate relief.

Oxford.—At the late Convocation held in this University, it was unanimously agreed to affix the university seal to an address to the Queen on her Majesty's providential preservation from the late treasonable attempt upon her life. The Rev. R. Harington, late fellow of Brasennose College, has been elected principal of that college, in the room of the Bishop of Chichester; and Mr. W. Kay, fellow of Lincoln College, has been elected to fill the Pusey and Ellerton Hebrew scholarships.

Portsmouth.—Some interest was excited in this town on Wednesday, by the arrival of her Majesty the Queen Dowager. A Government steamer left the harbour at an early hour, and proceeded to Southampton for the purpose of embarking her Majesty, who arrived by the noon train from London. About two in the afternoon the steamer passed through Spithead, with the Royal standard flying; and at three o'clock her Majesty and suite entered the harbour, receiving the customary salutes from the men-of-war and batteries; many persons assembled on the fortifications and beach, and loudly cheered her Majesty as she passed. The Queen Dowager visited the Victory, and St. Vincent, flag-ship of the Commander-in-Chief, Sir Edw. Codrington, and proceeded up the harbour round the Hastings 74, in which ship her Majesty, on her late visit to Malta, embarked. At seven the Royal party proceeded in the steamer to Ryde, where her Majesty landed, remaining the night at the Pier Hotel, and proceeded the following day to the village of Ventnor, where it was supposed her Majesty would remain a few days.—A local paper states that a rumour is prevalent in well-informed quarters in this town, that six additional sail of the line are to be immediately commissioned. The same paper adds that the armament for the Vengeance and Collingwood, of 84 guns each, has already been got ready in the gun wharf at this port.

Rugby.—We regret to announce that the Rev. Thomas Arnold, D.D., head master of the school in this town, died on Sunday morning, of disease of the heart, after an illness of a few hours. Dr. Arnold was well known as one of the most distinguished writers and classical scholars of the day. He was in his 52nd year, having been for 15 years head master of this school.

Truro.—The local papers state that considerable distress prevails among the working classes in this town and neighbourhood; and that there are from 4,000 to 5,000 men out of employ in the mining districts, with a considerable number of women, boys, and girls, whose employment is connected with the mines in these parts. The want of employment is stated to arise from the recent stoppage of several mines, in consequence of the panic among the shareholders, produced by the new Tariff duty on foreign copper.

Windsor.—On Saturday the Queen reviewed, in the Great Park, the regiment of Royal Horse Guards, and the 15th regiment of Foot. Her Majesty was accompanied by Prince Albert, the Duchess of Kent, Count Mensdorff and his four sons, and a numerous suite. Her Majesty was on horseback, and wore the star and ribbon of the Order of the Garter. On the Queen's arrival on the ground, the Royal Horse Guards marched past by squadrons and by threes, and trotted past by troops, then wheeled into line on the original ground and advanced, and went through a variety of evolutions. The 15th regt. of Foot afterwards passed by in parade order, before leaving the ground. Her Majesty and the Prince complimented the Colonels of the regiments on the soldier-like appearance and discipline of the men. The Royal Horse Guards, by special command of her Majesty, wore on this occasion, for the first time, their new helmets; they are considered to be an improvement on the old ones, both with respect to weight and appearance. A number of persons assembled to witness the review; and her Majesty, both on her arrival and on leaving the Park, was loudly cheered.

Railways.—The following are the returns of the principal railways during the past week:—London and Birmingham, 17,352*l.* 7*s.* 9*d.*; Great Western, 13,581*l.* 14*s.* 3*d.*; South Western, 6,303*l.* 10*s.* 5*d.*; Brighton, 3,233*l.* 18*s.* 3*d.*; Blackwall, 1,158*l.* 16*s.* 10*d.*; North Midland, 3,980*l.* 17*s.* 6*d.*; York and North Midland, 1,570*l.* 2*s.* 5*d.*—An accident, fortunately not attended with fatal consequences, occurred last week on the line of the Great Western Railway. It seems that some empty carriages, which had been used in conveying passengers from Ascot Races, had been left on the line, and the down mail train ran into them, and two or three passengers were rather seriously injured, but fortunately no lives were lost. It is stated that one of the trains to Ascot, on the day of the races, carried no less than 1,600 persons.—On Wednesday, a special general meeting was held of the shareholders of the Northern and Eastern Railway Company, for the purpose of considering the propriety of disposing of 3,186 forfeited shares, and on other business. The mode of disposing of the shares submitted by the directors was by means of public and private tender, to be sent in before the 6th July, which would then be opened at the station in Shoreditch, in the presence of five shareholders. After a long discussion as to the necessity of selling by tender, instead of appropriating the shares, the plan of the directors was adopted unanimously. The question of disposing of another lot of 958 shares, in the hands of the company, was adjourned for further consideration. In reply to a proprietor, the chairman said the total expenditure to the present time was 817,300*l.*, and that the treaty between this and the Eastern Counties Railway Company, for a reduction of toll, so as to cheapen the fares, had been broken off.

IRELAND.

Dublin.—The Government has decided upon issuing a special commission, notwithstanding the near approach of the assizes, for the trial of prisoners now in custody for the serious outrages perpetrated in Tipperary during the last two months, and to which we have referred from time to time. It has been resolved that the two Chief Justices, Pennefather and Doherty, to whom the commission will be directed, shall preside at the trials, and that the prosecutions shall be conducted by the Attorney-General in person.—A return recently made in the House of Commons of the spirits taken out for home consumption in Ireland since the 5th Jan. to 5th April last, and corresponding periods of 1840 and 1841, shows that the decrease has been very considerable. In the quarter ending April 5, 1840, the number of gallons was 2,212,465; while in the corresponding quarter this year it was only 1,682,548, a reduction of 529,917 gallons in three months. —Considerable interest has been manifested with respect to the judgment delivered by the Court of Queen's Bench, in this city, relative to the validity of Presbyterian marriages. The question, which has been in abeyance some time, was raised by two distinct trials for bigamy, in which the defence set up by the prisoners was, that the marriages in question were illegal, in consequence of their having been performed by Presbyterian ministers. The result of the Court's decision is, that marriages so performed are not valid. In giving judgment, however, the Court differed in their opinions. Mr. Justice Perrin and Mr. Justice Crampton were in favour of the Crown and the validity of the marriage; the latter upon one part of the case, but the former upon the whole. Mr. Justice Burton and the Chief Justice gave judgment against the Crown and in favour of the prisoners. The Court was thus equally divided; but Mr. Justice Perrin gave way *pro formâ*, in order that an appeal should go to the House of Lords.—The Repeal Association held its weekly meeting on Tuesday. The Secretary, among other letters and subscriptions, announced the receipt of 9s. 8d., all in farthings, from the coal-porters of this city. The repeal rent for the week was stated to amount to 71*l.* 9s. 9½d. In the course of the proceedings Mr. Daunt brought forward his motion in reference to the late unfortunate loss of life in Ennis, and concluded a long speech with the following resolution:—"That this Association, viewing with horror the recent lamentable loss of human life at Ennis, and most deeply sympathising with the survivors and advisers of those who have fallen in that fatal occurrence, do nevertheless address to the Irish people their most solemn and earnest entreaty to await with all possible patience and forbearance the due course of law." The resolution was seconded, and carried unanimously.

Belfast.—A meeting has been held in this town, for the purpose of celebrating the establishment of Presbyterianism in Ireland 200 years ago. The Rev. Dr. Cooke, Moderator of the Assembly, was called to the chair. A number of speeches were delivered by Presbyterian ministers in praise of this form of church government, but the proceedings present no feature of particular interest.

Ennis.—We noticed in our last a collision which had taken place in this town, between the police and the people, in consequence of an attempt made by the latter to seize some flour-mills: the result of which was that the mob were fired on by the police, when two persons were killed and a number of others seriously wounded. The affair has produced considerable sensation, not only in the town and neighbourhood, but throughout the country, in consequense of the fact that the Riot Act was not read before the police fired; and that the latter acted without orders either from their officers or the magistrates. An inquest has been held on a woman named Catherine Sheehan, one of the persons killed by the fire of the police. The proceedings created great interest, and considerable excitement was manifested among the mob who crowded the court and its neighbourhood. There was much conflicting testimony in the evidence adduced, and the only facts which appear certain are these:—That on Monday the 6th inst. Messrs. Bannatyne, corn-merchants of Ennis, had reason to apprehend an attack upon their premises by the populace of the town, for the purpose of pillaging their stock of provisions; an outbreak of a similar character having taken place on the previous Saturday. They requested from the authorities a guard of police; and a force of 42 policemen, men and officers, were charged with the service of protecting them. In the evening, towards dusk, the anticipated attack took place. A numerous mob of men, women, and children, assembled; stones were thrown, policemen and magistrates struck, and worse violence seemed about to follow. The confusion increased as night closed in: both magistrates and inspectors of police appear to have lost their self-possession; some magistrates absented themselves, or would not act with their colleagues; excited discussions arose, in which the necessity of firing was talked about, and the word "fire!" was audibly used, but by whom does not seem to be clearly ascertained. At last, whether with or without orders, (for this point still remains uncertain,) but before the Riot Act had been read, the police fired, when upwards of fifteen persons, including women and children, were wounded, two of whom soon afterwards died. The verdict of the jury was, that the police did not receive sufficient provocation from the people, who were tumultuously assembled, to warrant them in firing, and that they fired not only without orders from any magistrate or any officers, but in opposition to the positive orders of the officers. 38 policemen have consequently been committed: and in their removal to the gaol, the escort of a numerous body of troops was required to protect them from the mob. Great excitement prevailed throughout the town, and the military constantly patrolled the streets to prevent any outbreak. An inquiry into the whole affair has been instituted by Government, and Mr. Smith, Q.C., has proceeded to the spot, to investigate all the circumstances connected with it. Two other persons wounded by the fire of the police have since died.

SCOTLAND.

Ayr.—A public meeting was held in this town a few days since, to take into consideration the construction of a railway from this place to Cumnock. The line, which it is computed will cost about 6,000*l.* per mile, or 132,000*l.* for the 22 miles, its proposed length, will, it is said, be so laid down as to pass through the mineral districts which abound in this part of the country, either by way of Joppa, Ochiltree and Auchinleck, or by Joppa, south of Ochiltree and Auchinleck. The general feeling of the meeting was in favour of the scheme, and an attempt, it is said, will at once be made to accomplish it.

Dundee.—On Monday a serious fire occurred in this town, attended by great destruction of property. It originated on the premises of Messrs. Taws and Sons, mill-spinners, in Lower Chapelshade. In consequence of a deficient supply of water, the flames spread with rapidity, and entirely destroyed the building in which the fire commenced, together with an adjoining house. It is stated that from sixty to seventy workmen will in consequence be thrown out of employment, which will add greatly to the distress already existing among the operative classes in this town.

THEATRICALS.

ITALIAN OPERA.—Much interest was felt in the performances at this theatre on Monday, in consequence of the reappearance of Signor Rubini, for a few nights only, previous to his quitting the stage. The house was crowded throughout; her Majesty, Prince Albert, the Queen Dowager, and other members of the Royal family, with a great number of the nobility being present. The opera performed was "La Sonnambula," Signor Rubini taking the leading part and Madame Persiani *Amina.* The performance was frequently interrupted by loud applause, and at the fall of the curtain, Signor Rubini, together with Madame Persiani, was called for, and received with general and long-continued cheers. On Thursday, he appeared in his favourite character of *Don Ottavio*, in "Don Giovanni."

Miscellaneous.

The Gold Coinage.—The proclamation issued by Government, given in our last, relative to the gold coinage, has produced considerable confusion among the commercial and trading community, and has occasioned much inconvenience to all classes. Great difficulty has been experienced in passing gold coin at all, without considerable deduction; and in some instances, particularly among the poor, on Saturday night, a great panic prevailed; as much as 5s., it is said, being exacted in some instances, and in the generality of cases the deduction amounting to 1s. From the statements made by Ministers in Parliament, it appears that the average deficiency is about 2½d. or 3d. on each sovereign; but the loss on the exchange at the bullion shops is generally much higher. The exchange at the Bank of England has caused a scene of bustle and confusion in that establishment during the week; although the business has been divided into three departments—sums not exceeding 100*l.* being taken in the rotunda, those not exceeding 500*l.* in the hall, and all above 500*l.* in the bullion-office. The amount already exchanged by the Bank is very considerable, as much as 70,000 sovereigns having been presented in one day. As the Bank, however, will receive no sums less than 50*l.*, much inconvenience has been experienced by the public in getting the light coin exchanged; but, from the statements made by Ministers, it is expected that some measure will be adopted by Government for the relief of the public in this respect; and it is said that arrangements are now making with the Bank and the Commissioners of Customs, Excise, and Stamps for this purpose. A new coinage will be immediately struck, the Master of the Mint having, it is said, received a notice from the Chancellor of the Exchequer, that Government will call in the gold coinage from 1817 up to 1835; on what conditions, however, is not yet stated. It is reported, that out of about 50,000 sovereigns and half-sovereigns exchanged since the issuing of the proclamation at the Bank, upwards of 15,000 have been found light, particularly those of the coinage of George III., issued in 1817, and George IV., in 1821, 1823, 1824, and 1830. Those of the present reign are, generally speaking, full weight, or the wear and tear very trifling. Among those presented at the Bank, and at other Bankers in the Metropolis, are some perfect coins of George II. and III., said to be in as good a state of preservation as if just struck, particularly "spade" guineas, which have been hoarded up for nearly two-thirds of a century. At the Privy Council held by her Majesty on Monday, a proclamation was ordered to be issued respecting a new coinage of half farthings.

SPORTING.

ASCOT RACES (*concluded from last week*).

FRIDAY.—The course was more numerously attended than usual on the last day, and the sport was excellent. The races commenced at half past twelve with—

The [illegible] Produce Stakes of 100 sovs. each. Old mile. 4 subs.—Mr. Greville's Gunter walked over.

The Wokingham Stakes of 5 sovs. each, handicap. Last three quarters of the New Mile. 38 subs. (First Class.)

Mr. Gardnor's Monops . . . . (Chapple) 1
Mr. Payne's Johnny 2
Col. Wyndham's Singleton 3

The following also started, but were not placed:—Lord Rosslyn's Cornuto; Mr. J. Stanley's na. Sister to Glencoe; Gen. Grosvenor's na. Knightsbridge; Lord G. Bentinck's Yorkshire Lady; Mr. C. Brookes' c. by Zealot, out of Zillah; Lord Eglinton's na. Victor; Mr. Wreford's f. by Taurus, out of Escape; Lord Exeter's Albion; Lord March's Teapot; Lord Verulam's Gazelle; and Mr. Pettit's Sweetmeat. Betting 4 to 1 agst Johnny, 6 to 1 agst Knightsbridge, 8 to 1 each agst Monops, Escape filly, Albion, and Singleton, and 9 to 1 agst Sweetmeat. Knightsbridge jumped off with the lead and made strong running for three parts of the distance; Monops, Johnny, and Singleton then passed him, the former taking the lead, keeping it to the end, and winning by half a length; Singleton was a bad third.

Sweepstakes of 10 sovs. each; 50 sovs. added. The winner to be sold for 200l. The Old Mile.

Mr. Clarke's ch. c. Vakeel, by Plenipotentiary—Acacia . . . 1
Mr. Shelley's Iole 2

The following also started but were not placed:—Mr. Charlton's Lasso, Mr. Goodman's Rover, and Mr. Phillimore's Solomon. Betting—6 to 4 agst the Acacia colt, 4 to 1 each agst Iole and Rover, and 5 to 1 agst Solomon. Iole made play to the turn, where the favourite passed her, made the remainder of the running, and won cleverly by a length: Solomon was beaten off. The winner was claimed.

The Wokingham Stakes of 5 sovs. each. (Second Class). &c.

Lord Stradbroke's Jeremy Diddler . . . (Bartholomew) 1
Mr. H. Scott's Windsor 2
Mr. Gardnor's c. by Camel, out of Cecilia 3

The following also started, but were not placed:—Mr. Clarke's Currycomb, Mr. Balchin's Dromedary, Lord Chesterfield's All Fours, Mr. J. Day's Mulciber, Mr. Etwall nd. c. by Plenipotentiary, out of Acacia, Mr. Phillimore's Solomon, Mr. Lichtwald's Trident, Mr. Robert's nd. Decision, Lord Exeter's Saros, Lord Exeter's Patchwork. Betting—3 to 1 agst Windsor, 7 to 2 agst All Fours, 6 to 1 agst Vakeel (Acacia c.), and 7 to 4 each agst Trident and Solomon, and 7 to 1 each agst Trident and Cecilia colt; the winner not mentioned. This was too hollow a race to call for a description. Jeremy Diddler had it all his own way, and won by three lengths. Every other horse was tailed off.

Plate of 50l., given by the Members for the Borough, added to a Sweepstakes of 10 sovs. each. The winner to be sold for 200l. Three-quarters of a mile. Six subs.

Mr. Booth's St. Jean D'Acre . . . . . . (Sly) 1
Lord G. Bentinck's African 2
Mr. Lichtwald's Trident 3

The following also started, but were not placed:—Mr. S. Scott's f. by Glaucus, d. by Comus, Lord Exeter's Patchwork, and Mr. Goodman's Bother'em. Betting—7 to 4 agst Trident, 5 to 2 agst African, 3 to 1 agst Bother'em, and 5 to 1 agst St. Jean D'Acre. St. Jean D'Acre made all the running, and won in a canter by two lengths. He was claimed.

The Selling Stakes of 5 sovs. each, with 50 added. The second to receive 10l., and the winner to be sold for 150l. Old Mile. (9 subs.

Mr. Phillimore's Rochester . . . . . . (Chapple) 1
Mr. Forth's Camillus 2

The following were not placed:—Lord Exeter's Revision, Lord G. Bentinck's Miss Heathcote, Mr. Balchin's Dromedary, Mr. Kling's Dahlia, and Lord Rosslyn's Cornuto. Betting—2 to 1 agst Camillus, 5 to 2 agst Miss Heathcote, and 4 to 1 agst Rochester. Rochester made all the running, and after a good race from the stand, won by half a length.

Law.

VICE-CHANCELLOR'S COURT.—*Duncan* v. *Campbell.*—The plaintiff, John Gray Duncan, filed this bill against his wife, and the trustees of their marriage settlement, under these circumstances:—In 1825 two Scotch ladies, Margaret Campbell and Marion Campbell, of Culreath, in Scotland, executed mutual deeds, by which they reserved a life interest in their properties to themselves and the survivor of them. And they charged their personal and heritable means with payment, after the death of the survivor of them, of 3,000*l.* to Helen Hodges. In 1829, Helen Hodges, being entitled to this reversionary interest, married the plaintiff at Java. In [illegible], Mr. and Mrs. Duncan had returned to England, and Margaret Campbell being then dead, they applied to Marion Campbell, the survivor, to assist them by an immediate advance of a portion of the 3,000*l.*, to which proposal she assented; and in Oct. [illegible] a deed was prepared in Scotch phraseology, by which it was recited that Marion Campbell, at the request of Mr. and Mrs. Duncan, had agreed to advance them two thousand pounds, "in order to enable them to make provision for themselves and the survivor of them, by sinking the money, along with two thousand pounds more of Mr. Duncan's own money, in the purchase of an annuity for their joint lives and the life of the survivor, or for investing that sum in the names of trustees in the public securities, the interest to be payable to them during their joint lives, and the principal to be at the disposal of the longest liver;" and that the remaining one thousand pounds was to be for the exclusive use of Mrs. Duncan. And then the operative part of the instrument consisted in the release of the Misses Campbell and their estates from the two thousand pounds they advanced. And it was provided that the deed should be registered in Scotland.

This deed was executed by Marion Campbell in Scotland, and by Mr. Duncan and his wife in England; and the four thousand pounds were invested in the English funds. About six years ago Mrs. Duncan eloped from her husband, who had since obtained a divorce *a mensâ et thoro*. Mr. Duncan, by this bill, claimed payment to himself exclusively of the whole dividends. Mr. John Beames Campbell, one of the trustees who had received the dividends, had made advances to Mrs. Duncan, for the support of herself and her child, born since the elopement, to the amount of 500*l*., which he claimed to be allowed. The remaining trustee had not interfered. The Counsel for the husband contended that the deed of Oct. 1823 was to be construed according to English law, and that the husband was entitled to receive the whole dividends during the joint lives of himself and his wife. His Honour in giving judgment observed that there was very good reason that the instrument of Oct. 1823 should have been prepared according to the Scotch form, because the 4,000*l*. was charged upon real estates in Scotland, and at the same time there was an inconsistency in treating the personal contract contained in it between parties domiciled in England as an English contract. His Honour further observed, that Mr. Duncan was, in the strictest sense, a purchaser for valuable consideration of the benefits he was entitled to in the 4,000*l*., for he had contributed 2,000*l*. of his own to the fund. Under that instrument the husband had a right to demand payment to himself; and as the wife had, by her own misconduct, produced a state of things in which the husband may with propriety (and no impropriety was alleged against him) live separate from her, she had made out no case for intercepting the fund. He therefore decreed that the husband was entitled to receive the dividends.

Burridge v. *Row*.—This case came before the Court in a petition, and the question raised was rather a curious one. The late Mr. Alderman Winchester, on the marriage of his daughter with a Mr. Row, covenanted to settle upon her the sum of 5,000*l*., payable after his death. Row, in like manner, covenanted to settle the sum of 5,000*l*., also payable after his death. Alderman Winchester and Mr. Row were subsequently made bankrupts, and Mrs. Row was now Mrs. Burridge. The trustees of the settlement had proved the value of Row's settlement under the commission against him; but shortly afterwards he died, and the whole 5,000*l*. was paid, in consequence of an assurance upon Row's life. The question therefore was, to whom the dividends upon the proof against Row's estate belonged. Row had a reversion in the 5,000*l*., and his reversion had been bought by Alderman Winchester, and was now vested in the assignees under his bankruptcy. On the part of the plaintiffs it was contended, that if the dividends belonged to the assignees, under the purchase of the reversion, Mrs. Burridge had a lien upon the same for the amount of her father's bond. His Honour said, upon the whole case, he must make a decree establishing the lien.

COURT OF QUEEN'S BENCH.—*The Queen* v. *the Directors of the South-western Railway*.—This was an appeal against a rate made for the relief of the poor of the parish of Micheldever, in the county of Southampton, by which the defendants were rated at the sum of 4,320*l*., by a rate of which the following is a copy:—"London and South Western Railway Company, railway 4 miles and a half, 4,320*l*." The defendants appealed to the sessions, where the rate was confirmed, subject to a case. When brought up to this court, it was admitted that the rate could not be sustained to the extent of 4,320*l*.; but the question was whether it was to be reduced to 3,800*l*, or 1,400*l*. Lord Denman delivered judgment, deciding in favour of the principle of rating adopted by the parish, and reducing the rate to the sum of 3,800*l*.—Judgment accordingly.

MARK LANE, FRIDAY, JUNE 17.—We have had very little English Wheat up since Monday which has been taken off at fully that day's quotations.—For free Foreign the demand has been limited, but we do not observe any alteration in its value; in floating cargoes and bonded there is little doing, the holders generally being firm in their demands, which buyers are unwilling to comply with.—Barley, Beans, and Peas, are each 1s. dearer. Oats have also advanced 1s. per qr., but the demand is not so lively as on Wednesday, although still active for bonded at fully 2s. over Monday's prices.

GAZETTE OF THE WEEK.

INSOLVENTS.—E. Hilton & N. Walsh, Manchester, paper-manufacturers.

BANKRUPTCIES SUPERSEDED.—Jas. Roberts, Berwick-street, Soho, licensed victualler—G. Hibbert, jun., Chesterfield, Derbyshire—W. Headland, Louth, Lincolnshire, tailor.

BANKRUPTCY ANNULLED.—Chas. Nicholls, Shrewsbury, Shropshire, flannel merchant.

BANKRUPTS.—C. D. Bowers, Cannon street, City, comb-maker—H. F. Delamain, St. Mary-at-Hill, City, wine merchant—T. Ridgway, Huddersfield, Yorkshire, wool merchant—M. C. Price, Brentford, glass-seller—W. Webb, Northampton terrace, York street, City-road, watch-maker—T. Long, Beaufort place, Chelsea, [illegible]—T. Turpin, Wivenhoe, Essex, innkeeper—H. Merriden, Coventry, [illegible] manufacturer—W. Houlding, Salford, Lancashire, cordwainer—W. [illegible], Southampton, glass-merchant—T. Meale, Brynmawr, Breconshire, [illegible]—W. and Geo. Beard, Bilston, Staffordshire, maltsters—T. [illegible], Great [illegible], Wiltshire, spirit-merchant—Thos. Dawson, [illegible], Worcestershire, [illegible]—W. Brown, Manchester, cotton-manufacturer—M. and W. Johnson, Cheadle, Staffordshire, grocers—Abel Crompton, Manchester, grocer—R. Wilson, [illegible], Cheshire, linen draper—J. Jackson, Nottingham, plumber—J. [illegible] and J. Keir, Fleetwood-on-Wyre, Lancashire, [illegible]—P. Peters, Newtown, Montgomery, grocer—J. A. and D. Webb, Great Marlow, Bucks, farmers—J. Brettargh, Pendleton, Lancashire, [illegible]—[illegible], [illegible]—Jos. and Ralph Bradbury, [illegible]—J. [illegible], [illegible], Yorkshire, [illegible]—J. Hughes, Leighton Buzzard, Bedfordshire, butcher—J. [illegible] and W. Man, St. [illegible], Cornhill, merchants—H. English, New Broad street, City, [illegible]—J. [illegible], [illegible] street, bookseller—W. Smith, Leeds.

SCOTCH SEQUESTRATIONS.—[illegible], grocer and spirit merchant and agent—J. [illegible], Paisley—W. Struthers, Glasgow, merchant and [illegible]—W. [illegible], Glasgow, wright and [illegible]—A. Wallace, Glasgow, [illegible] and porter—T. Saunders and J. Laing, Dundee, [illegible]—D. Spence, Perth, [illegible]—J. [illegible], Edinburgh, bookseller & newspaper-agent.

BIRTHS.—On the 4th inst., at Harting, Sussex, the wife of W. Curtis, Esq., of a daughter—On the 16th inst. in Cadogan place, the lady of Lieut.-Colonel N. Alves, of the Madras army, of a son—In Hertford-street, Mayfair, the Hon. Mrs. [illegible], of a son.

MARRIED.—On the [illegible] instant, at St. George's, Hanover square, the Hon. and Rev. [illegible], 2nd son of the Earl and Countess of Verulam, to [illegible], eldest daughter of J. Morier, Esq., late Minister at Dresden—On the 14th inst., at Himley, the Rev. T. L. Claughton, vicar of Kidderminster, to the Hon. Julia Susannah, daughter of the late and sister to the present Lord Ward.

DIED.—On the 10th inst., at his residence in the neighbourhood of London, the Earl of Erne—On the 15th inst., at Claremont-lodge, North Brixton, Mr. S. T. Anderson, aged 75—On the 9th inst., at Cheltenham, Mrs. Quicke, widow of J. Quicke, Esq., of Newton-house, near Exeter—On the 12th inst., at Frome, L. Dorothy, [illegible] of F. Bush, Esq., eldest and only surviving sister of Adm. Edgell, of Standerwick Court, Somerset—On the 12th inst., in the 69th year of his age, J. [illegible], Esq., of [illegible]-place, Ball's-pond-road, Islington, formerly of Lower Edmonton—On the 12th instant, at Rugby, suddenly, the Rev. Dr. Arnold, Regius Professor of Modern History in the University of Oxford, and Head Master of Rugby School.

NEW WORKS.

1.

LETTERS FROM HOFWYL, on the Educational Institutions of De Fellenberg. By a PARENT. With an Appendix, containing Woodbridge's Sketches of Hofwyl, reprinted from the "Annals of Education." Post 8vo, 9*s*. cloth.

"A very pleasing and informing book."—*John Bull.*

2.

THUCYDIDES' HISTORY of the PELOPONNESIAN WAR. A New Recension of the Text, with an amended Punctuation, and copious Notes. By the Rev. S. T. BLOOMFIELD, D.D., F.S.A. Illustrated by Maps and Plans. In 2 vols. Vol. 1, 8vo, 18*s*. cloth. Vol. 2 is in the Press.

3.

THE USE and STUDY of HISTORY. By W. TORRENS M'CULLAGH, of the Royal Irish Academy, and of the Archæological Society of Ireland. 8vo, 7*s*. 6*d*. cloth.

CONVERSATIONS on BOTANY. With 22 Plates. Ninth Edition, fcap. 8vo, 7*s*. 6*d*. cloth; with the Plates coloured, 12*s*. cloth.

6.

Reprinted, with additions and corrections,

A GENERAL CATALOGUE of the best MODERN WORKS, in all branches of Literature, classified and arranged; with the full Title, size, price, and date, given under each work; and a general Alphabetical Index. Second edition, in 8vo (pp. 152), 2*s*. 6*d*. cloth.

"A manual of great value, and a necessary appendage to every library; literally a cosmorama of the world of letters."—*Sporting Review.*

*** Messrs. Longman and Co.'s Six Catalogues,—1, One-Volume Encyclopædias and Dictionaries; 2, Lardner's Cabinet Cyclopædia; 3, New Works in General Literature and Science (in Two Parts); 4, Educational Works and School Classics; 5, Medical and Surgical Literature; and 6, Second hand Books,—reprinted for 1842, may be had *Gratis* of all Booksellers.

London: Longman, Brown, Green, and Longmans.

IMPORTANT TO AGRICULTURISTS, &c. &c.

Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1s.,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15*s*. per cwt. cash.—Chemical Works, Upper Fore-street, London.

NEW WORK ON BEES.

In small 8vo, (with numerous Engravings on Wood), price 12*s*.

MY BEE-BOOK. By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxon; and Chaplain to the Lord Bishop of New Zealand.

Rivingtons, St. Paul's Churchyard, and Waterloo-place.

Just published, by the same Author,

SHORT and SIMPLE LETTERS to COTTAGERS. (With Woodcuts.)—1. The Village.—2. Village School. PART I. (To School Children.)—3. Village School. PART II. (To Parents.)—4. Village School. PART III. (To Schoolmasters and Schoolmistresses.) Price 6*d*. each, or 5*s*. per doz.

MAGAZINE OF DOMESTIC ECONOMY.—This day is published, in cloth boards, price 6*s*. 6*d*., the Seventh Volume of this popular Magazine,—completing the First Series.

On the 1st July will be commenced a New and Enlarged Series, price One Shilling, under the title of "THE MAGAZINE OF DOMESTIC ECONOMY AND FAMILY REVIEW." This alteration has been adopted as likely to increase the usefulness of the Work, by giving space for the notice of many subjects hitherto necessarily excluded.

"A review of the labour of seven years, and the vast mass of original and selected information diffused over the First Series, will convince every impartial person of the utility of *The Magazine of Domestic Economy*; and we do but repeat the encomiums that have been bestowed upon us so liberally in public and private, when we venture to assert that a more valuable present than the series embraced in the seven volumes which we now conclude, cannot be made to a young wife when entering upon the important duties of managing a household."—*Extract from Preface to Vol. 7.*

London: W. S. Orr and Co., Paternoster row; and sold by all Booksellers in town and country.

THE BOTANIC GARDEN,

At 1*s*. 6*d*. and 1*s*.

THE NUMBER FOR JUNE contains an Index to the FLORAL REGISTER, and an Index to the AUCTARIUM. These two works combined form a quarto volume uniform with the BOTANIC GARDEN. The Volume contains nearly 1,200 Woodcuts and Descriptions of the rarest Flowering Plants cultivated in Great Britain; and also nearly 200 interesting articles on Gardening, &c.

Purchasers of Eight Volumes of the BOTANIC GARDEN receive this work without extra charge. Large 37*s*., Small 25*s*., per vol. See Advertisement in last week's *Chronicle*.

Simpkin, Marshall, and Co.; and Sherwood and Co.

Publishing Monthly, Price Sixpence, in 8vo, 24 pages,

THE FLORICULTURAL CABINET & FLORIST'S MAGAZINE; conducted by JOSEPH HARRISON.

Each Number contains finely-coloured Figures of TWO or MORE of the NEWEST and MOST RARE and SHOWY PLANTS, selected for their beauty and utility, with particulars of their History, Mode of Treatment, &c. In addition to which there are in each Number, several Articles on the Culture of other Flowers and Subjects connected with Floriculture; Descriptions of all the new and rare Plants as introduced; Queries on Floricultural Subjects, and answers to; Monthly Calendar, with Notices of, and Remarks upon, whatever is known to be of use in Floriculture.

This Publication has been honoured for nine years with the support of a Floral Public to an unprecedented degree—its monthly circulation far exceeding that of any other Floricultural Publication. This unequivocal testimony of public patronage in its favour, has been bestowed in consequence of the Number, Variety, and Practical Value of those communications with which the Work has been enriched. No. 7, of Vol. 10, will be published on July 1st. That, or the previously-published Numbers, or Volumes in cloth, may be obtained through the order of any Bookseller, or of the Publishers, Messrs. Whittaker and Co., Ave-Maria Lane, London.

Also, by the same Conductor, and published by Messrs. Whittaker and Co.,

THE GARDENER AND FORESTER'S RECORD.

Each Number contains 24 pages of Letter-press, with coloured Figures of one or more of the newest and best kinds of Fruits. Three Volumes are now published, bound, 8*s*. each.

PUNCH, or, the LONDON CHARIVARI.—The SECOND VOLUME will be published on the 30th instant, price 8*s*. This volume contains PUNCH'S ALMANACK, VALENTINES, and LIONS OF LONDON; and many hundred Illustrations by HARVEY, BROWN, LEECH, CROWQUILL, MEADOWS, and other eminent Artists. A Number is published every Saturday, price 3*d*.

Office, 13, Wellington-street, Strand.

Now ready, with 150 Woodcuts, fcap. 8vo, 8*s*.

BOTANY FOR LADIES; or a Popular Introduction to the Natural System of Plants. By Mrs. LOUDON.

John Murray, Albemarle-street.

EMIGRATION TO NEW ZEALAND, under the NEW ZEALAND COMPANY, Incorporated by Royal Charter.

Governor.

JOSEPH SOMES, Esq.

Deputy-Governor—Hon. FRANCIS BARING.

William Hutt, Esq., M.P.	
William King, Esq.	

NOTICE IS HEREBY GIVEN, that Ships will be regularly despatched on the 1st day of every month during the present year, to one or more of the Company's Settlements of Wellington, Nelson, and New Plymouth.

In the Wellington District the Sales take place by Auction, and an allowance of 25 per cent. is made towards the passage-money of purchasers arriving from England.

Lands in the Nelson Settlement are sold in this country at the price of 300*l*. per allotment; comprising 1 town acre, 50 acres of accommodation, and 150 acres of rural land. Purchasers receive passage allowances not exceeding 25 per cent. upon their purchase-moneys.

Lands in New Plymouth are sold in this country to actual colonists at 75*l*. per allotment of 50 acres; and a town lot, with passage allowances not exceeding 25 per cent.

The Company continues to offer a Free Passage to Agricultural Labourers and Mechanics of good character, and eligible according to the regulations.

Maps and Views of the Country may be seen, and all necessary information obtained, by application at this House.

By order of the Court,
JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings,
19th May, 1842.

SHIPS FOR NEW ZEALAND.—NOTICE IS HEREBY GIVEN, that the following Emigrant Ships have been Chartered by the New Zealand Company to sail from the ports and on the days undermentioned, viz.—

FOR NELSON.

OLYMPUS, A 1, 316 Tons, from London, June 15th.
NEW ZEALAND, A 1, 380 Tons, from Greenock, July 1st.

FOR WELLINGTON.

GEORGE FYFE, A 1, 391 Tons, from London, June 15th.

FOR WELLINGTON and NEW PLYMOUTH.

BLENHEIM, A 1, 374 Tons, from Plymouth, July 1st.

Applications for Free Passage by labouring persons duly qualified are received daily at this House.

By order of the Court,
JOHN WARD, Secretary.

New Zealand House, Broad-street Buildings,
19th May, 1842.

TO MARKET GARDENERS.

TO be LET, a very extensive WALLED GARDEN; also an ORCHARD of choice Fruit Trees in full bearing; together with an excellent and varied assortment of Wall-Fruit Trees, trained to a wall from 10 ft. to 12 ft. high, which surrounds the whole area, comprising about four acres. The Premises are most complete, and contain extensive Conservatories, Pineries, &c., within the walls. The whole is delightfully situated, being effectually sheltered from the prevailing cold winds, and is in the highest state of cultivation.

Applications, addressed to H. T., Post-office, Llandilo, Carmarthenshire (prepaid), will be immediately attended to, and further particulars given; but no application will be noticed unless it contains one or more unexceptionable references.

TO BE DISPOSED OF, by Private Contract, the LEASE of an Old Established NURSERY, with Seedshop, Hothouses, Pineries, Greenhouses, and every other convenience requisite for a first-rate Trade, comprising about Seven Acres stocked with the choicest Trees, Plants, and Shrubs fit for immediate sale. There are upwards of sixty years of the Lease unexpired, and upon a portion of the ground is erected Ten Cottages, with ample room for the erection of Ten more. The rent is moderate, and all the premises in most excellent repair. The premises are situate within a short distance of London. For cards to view, and particulars, apply to Mr. Neal, Solicitor, 4, Tokenhouse-yard, London.

DECEPTION AND FRAUD.—The reputation of READ'S GARDEN ENGINES and MACHINES, for Horticultural purposes, has induced some unprincipled adventurers to palm upon the Public BASE IMITATIONS of his Patent Machines; and to deceive the unwary, Cards are exhibited in their windows, stating them to be "READ'S IMPROVED PATENT SYRINGES," &c. J. R. begs to caution the Public against these impostors, who would palm upon their Customers USELESS INSTRUMENTS for the sake of gain. The genuine Instruments are manufactured ONLY by the Patentee, 35, Regent Circus, Piccadilly, where they may be seen and proved.

N.B. None are genuine except stamped with the words "READ'S PATENT."

ROWLAND'S KALYDOR, a creamy, odoriferous preparation from Oriental Exotics, is now universally known as the only safe and efficient protector and beautifier of the Skin and Complexion. Its virtues are commonly displayed in thoroughly eradicating all pimples, spots, redness, tan, freckles, and other unsightly cutaneous defects; in healing sun-burns, stings of insects, and in rendering the most rough and uneven skin pleasantly soft and smooth. To the complexion it imparts a juvenile, roseate hue, and to the neck, hand, and arm, a delicacy and fairness unrivalled.

It is invaluable as a renovating and refreshing Wash, during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it particularly grateful after shaving, in healing the smarting pain.

Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

Ask for "Rowland's Kalydor." "A. Rowland & Son, 20, Hatton Garden," are engraven on the Government Stamp.—*** Beware of Imitations.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 18, 1842.

THANET FLORICULTURAL and HORTICULTURAL SOCIETY.—A Prize of 10*l*., open to all England, will be awarded at the Exhibition, to be held July the 14th, at the Ranelagh Gardens, St. Peter's, (Two Miles distant from Margate, for the best Miscellaneous Collection of Flowering Plants. Nurserymen, Gentlemen's Gardeners, and others, desirous of exhibiting are particularly requested to signify their intention to the Secretary, on or before the 7th of July.

Vicarage, St. Peter's, near Margate, June 6th, 1842.
J. G. HODGSON, Hon. Sec.

N.B.—No Plants admitted for competition after 11 o'clock.

HULL BOTANIC GARDEN.

THE ANNUAL GRAND FLORICULTURAL and HORTICULTURAL EXHIBITION—open to all England—will be held in the Botanic Garden, Hull, on Tuesday, the 30th of August next. Two valuable Silver Cups, and other Prizes in Money, will be awarded to Dahlias: and suitable Prizes to all other articles enumerated in the extensive Schedule.

F. R. HORNER, M.D., President of the Garden.
Hull, 21st June, 1842.

NEW AND SPLENDID FUCHSIAS.

MESSRS. YOUELL have much pleasure in referring the admirers of the above beautiful tribe to their list as advertised in the *Gardener's Chronicle* of the 18th July, which they continue sending out per post, free, upon the terms there named.—Great Yarmouth Nursery, June 23, 1842.

CHRYSANTHEMUMS. — CHANDLER and SONS, Nurserymen, Vauxhall, London, beg to state that they have good plants, in small pots, of their Chrysanthemums now ready, to send out, and that they can supply the Jersey varieties at 12*s*. per dozen, different sorts; and also the French and Spanish varieties at 18*s*. per dozen.—A list of their collection may be had on application, if by letter, prepaid.

SUNBURY NURSERY, MIDDLESEX.

S. T. WILLMER, Florist to Her Majesty, will have Plants of 20 new superb PINKS to send out in September, at 5*s*. per pair. Cooper's Prince Albert, large red-laced, back tier flower; Cooper's Princess Royal, fine violet-laced, with rose leaf, constant, fine show flowers. Blooms of them may be seen at Messrs. Warner and Co.'s, Cornhill; Mrs. Johnson's, Grand-row, Covent Garden; and Willmer and Son's, King's-road, Chelsea.—June 16.

ROSES.

MESSRS. LANE and SON, GREAT BERKHAMPSTED, Herts, have the honour to inform their Friends that their extensive Collection of ROSES, &c., are now in BLOOM; and they can state with confidence that those who favour their Nurseries with a visit during the season will be highly gratified.

The Trains leave Euston-square, London, at the following hours: 7, 8, ½-pt. 1, 3, and 6 respectively; returning at 7, 9, 11, and 12, 20 m. pt. 4, and 20 m. pt. 8. The Nurseries are about a quarter of a mile from the Berkhampsted station. All the Trains stop at Tring, 3½ miles beyond Berkhampsted; and persons arriving too late for the Berkhampsted Trains, may avail themselves of this opportunity.

ROSES.

E. DENYER, NURSERYMAN and FLORIST, Loughborough-road, North Brixton, near London, begs to inform his Friends and the Public that his splendid COLLECTION OF ROSES are now in bloom, and worthy of inspection. He has increased his last year's stock with all the new varieties worthy of notice, and informs them that the period of blooming is the best time for orders to be given, as a better selection, as to colour, form, &c., can then be made.

ROSES.

MESSRS. PAUL & SON, Florists, &c., Cheshunt, Herts., having been requested by many admirers of the ROSE to give notice when their Collection would be in the greatest perfection of bloom, have the pleasure of announcing the PRESENT TIME, and flatter themselves, that whoever visits their grounds will be highly gratified.

To the numerous company who honoured them with a visit last season they beg to intimate, that their Collection this season will prove doubly interesting in consequence of the numerous additions of new and fine Roses received from abroad.

Cheshunt is only 13 miles from London, situated on the high road from London to Hertford and Ware, being a delightful carriage-drive from the West End, either through the green lanes and Theobald's Park, or through Tottenham and Waltham Cross.

The Northern and Eastern Railway also affords a cheap and expeditious method of reaching the Nurseries, trains running from London to Waltham Cross in the short space of half an hour, from whence a coach runs to the Nurseries in ten minutes.

N.B.—The trains run from the station, High-street, Shoreditch, eight times daily, and return eight times, all stopping at the Waltham Cross Station.

Cheshunt Nurseries, June 18, 1842.

ARAUCARIA IMBRICATA.—W. SKIRVING, WALTON NURSERY, LIVERPOOL, begs leave to offer to the Public his extensive Stock of this interesting hardy Tree, at the following Prices, viz.—

2 years' old from Seed . . . 5*s*. each.
3 " " . . . 10*s*. 6*d*.
4 " " . . . 21*s*.

W. S. also offers fine Plants of Araucaria Braziliensis, 2½ feet high, at 42*s*. each: and some very fine specimens of that most beautiful of all trees, the Araucaria excelsa, five to six feet high, at Ten Guineas each. The above Plants are all in pots, and can be sent safely to any part of this Kingdom, or the Continent.

THE PASSIFLORA MIDDLETONIA OR FRAGRANS.

MESSRS. MARNOCK and MANLEY beg to inform their friends and the Public that flowers of this beautiful new Climber will be exhibited during the next fortnight at Messrs. Warner and Warner's, 28, Cornhill, by whom orders will be received.—Nursery, Hackney, June 24th, 1842.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, Album, and Punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

TO NURSERYMEN AND FLORISTS.

JAMES PAMPLIN, NURSERYMAN, Walthamstow, Essex, begs to acquaint Nurserymen and Amateurs that his SPLENDID PELARGONIUMS, which have been so much and justly admired, viz. — Enchantress, Camilla, Van Amburgh, Anna, Alice Grey, &c. &c. &c.; together with many New and Splendid Seedlings not yet in the possession of any other person, are now in Bloom, and may be seen at his Nursery.

Walthamstow, June 9th, 1842.

WILLIAM MAY begs to announce that he is now sending out his SIX NEW FUCHSIAS for 30*s*., and his SIX NEW CALCEOLARIAS for 42*s*. "Lady Constable" Calceolaria, if separate, at 21*s*. each; this plant will be sent post free. He has also a few collections of his splendid SPANISH CHRYSANTHEMUMS left. Descriptive Lists may be had on application.—Hope Nursery, Leeming-lane, near Bedale, Yorkshire, June 10th, 1842.

TO NURSERYMEN and HEATH-GROWERS.—About 40 splendid Specimens of ERICA ECHIIFLORA, raised from seed. These plants are beautifully grown, in perfect health, and will be parted with a great bargain. May be seen, and further particulars obtained, of Mr. Story's Gardener, Isleworth.

SPLENDID SALE of the WOODHALL COLLECTION OF EXOTICS.

There will be Sold by Auction, within the Gardens of Woodhall, in the parish of Bothwell, and County of Lanark, lying 10 Miles east of Glasgow, between Airdrie and Holytown, on THURSDAY, the 28th day of JULY next, and following day, commencing at 11 o'clock each day, the whole of that extensive and celebrated COLLECTION of HOTHOUSE and GREENHOUSE PLANTS, consisting of numerous rare and valuable species, among which are many magnificent specimens of Camellias, Heaths, Epiphyllums, Citrons, Oranges, Shaddocks, Zamias and other Palms; with a very extensive and superior variety of Pelargoniums (Geranium), Indian Azaleas, and other miscellaneous Greenhouse and Stove Plants: of which Catalogues may be had by applying to Mr. Murray, of the Botanic Gardens, Glasgow; Messrs. Austin and M'Aslan, Nursery and Seedsmen, Trongate, Glasgow: Woodhall Office, 33, Buchanan-street, Glasgow; or to the Gardener by Holytown.

The collection of Camellias is well known as not surpassed by any in the Empire, the specimens being of the very finest growth, many of them from 15 to 20 feet in height. The Heaths also afford numerous specimens of the finest sort, which for size and furnishing, it is believed far surpass any collection ever shown.

The whole of the Plants are in the very best state of health; and as the operations of the mineral workings on the estate have already encroached upon the garden, they must be sold off, as it is, in consequence of the said operations, to be entirely broken up; therefore, great bargains may be expected. The Plants will be set up in Lots to suit purchasers, beginning with the Camellias, Heaths, Epiphyllums, &c.

The collection may be viewed any day prior to the Sale, by applying at Woodhall Garden. Further information learned, and particulars given, on applying to the Factor, Woodhall-house, Holytown.

BARCLAY and SKIRVING, Auctioneers.
Woodhall-house, May 1842.

TO NURSERYMEN AND OTHERS.

TO BE DISPOSED OF, by Private Contract, the LEASE of an Old Established NURSERY, with Seedshop, Hothouses, Pineries, Greenhouses, and every other convenience requisite for a first-rate Trade, comprising about Twelve Acres stocked with the choicest Trees, Plants, and Shrubs, fit for immediate sale. There are upwards of sixty years of the Lease of Seven Acres unexpired, and upon a portion of the ground are erected Ten Cottages, with ample room for the erection of Ten more. The rent is moderate, and all the premises in most excellent repair. The Nursery and other premises are now in the occupation of Messrs. Adamson and Son, of Stoke-Newington Common, and immediate possession will be given, if required. For cards to view, and particulars, apply to Mr. Neal, Solicitor, 4, Tokenhouse-yard, London.

ENDERBY, NEAR LEICESTER.
STRAWBERRY, FRUIT, AND TEA-GARDENS.

TO BE SOLD BY AUCTION, on MONDAY, the 11th day of JULY, 1842, by B. PAYNE & SON, at the Bell Hotel, in Leicester, at Six o'clock in the evening,

This highly-favoured spot, consisting of a comfortable Cottage Residence, and Thirteen Acres of Land, beautifully arranged, in excellent condition, and in every way adapted for Horticultural purposes.

THE HOUSE is situate in the centre of one of the most delightful valleys, surrounded by Gardens, with their Evergreens, Rural Arbours, and Beds of Flowers.

THE LAND is well planted with upwards of 17,000 Fruit-Trees, of the choicest sort, consisting of Apples, Cherries, Plums, Pears, Gooseberries, Currants, Filberts, &c.

THE TREES are in the greatest vigour, laden with fruit, and the annual produce is very great.

THE STRAWBERRY-BEDS are the admiration of all beholders, not only for their produce, but also for their excellent arrangement, being on a plan dissimilar to almost all others, and the land peculiarly adapted for their growth. Upward of One Ton a-day of this delicious fruit has been forwarded from these productive Beds to Leicester, and other neighbouring markets.

THE SERPENTINE, and other Gravel Walks, are very extensive, and admirably planned, interspersed with rustic seats, &c.

ENDERBY is situate within five miles of Leicester and of the Midland Counties Railway, ten from Lutterworth, and eight from Hinckley.

THE GARDENS have been for several years past the resort of parties from Leicester, and the surrounding places, during the summer months; and the only cause of the Proprietor being disposed to sell, arises entirely from ill health.

For further particulars, apply to Messrs. B. Payne and Son, Leicester.

Note—Half the purchase-money may remain on security of the premises, if required.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l*. for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.

PETER MORRISON, Resident Director.

A liberal commission allowed to Solicitors and Agents.

WESTERN LIFE-ASSURANCE SOCIETY.—OFFICE—49, PARLIAMENT STREET, WESTMINSTER.
Capital 500,000*l*.—10,000 Shares, 50*l*. each.
Deposit 5*l*. each Share.

This Society is established for the Assurance of Lives, upon principles combining economy with perfect security.

Directors.

Henry Edgeworth Bicknell, Esq., 28, Upper Bedford-place.
William Cabell, Esq., Newington-place, Surrey.
Thomas Somers Cocks, jun., Esq., Charing Cross.
George Henry Drew, Esq., Bermondsey.
William Evans, Esq., Millbank.
William Freeman, Esq., Millbank-street.
Francis Fuller, Esq., Poultry, London, and Croydon.
James Hunt, Esq., Whitehall.
John Arscott Lethbridge, Esq., Greenwich Hospital.
Edmund Lucas, Esq., Millbank-street.
George Kennet Pollock, Esq., Great George-st., Westminster.
James Lys Seager, Esq., Millbank.
John Bazley White, Esq., Millbank-street, and Swanscombe.
Joseph Carter Wood, Esq., Artillery-place, Westminster.
Henry Wrench, Esq., King William-street, London Bridge.

Trustees.—William Whateley, Esq.; L. C. Humfrey, Esq.; George Drew, Esq.

Auditors.—Ormus Biddulph, Esq.; John Freeman, Esq.; John Bazley White, jun., Esq.

Consulting Counsel.—William Page Wood, Esq.

Conveyancing Counsel.—Samuel Jay, Esq.

Physician.—William Richard Basham, Esq., M.D., 17, Chester-street, Grosvenor-place.

Surgeons.—Alfred Leggatt, Esq.; George David Pollock, Esq.

Bankers.—Messrs. Cocks, Biddulph, and Co., Charing Cross.

Solicitors.—Messrs. J. L. Bicknell and J. C. Lethbridge, 25, Abingdon-street, Westminster.

TABLE OF PREMIUMS to assure £100 for the whole term of Life.

Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.
20	1 14 2	35	2 11 0	50	4 3 3
25	1 18 11	40	2 19 6	55	5 5 4
30	2 4 8	45	3 9 1	60	6 15 3

The object of this Society is to afford to the Assured all the benefits of Life-Assurance, at a great reduction in the rates of Premium.—FOR EXAMPLE—A person aged 30, may with this Society assure his life for 500*l*. by the annual payment of 11*l*. 3*s*. 4*d*., which in a Society where the bonus is held out as a main inducement, would cost him 13*l*. 7*s*. 4*d*., or, in other words, for the same annual premium he could at this Office assure very nearly 600*l*., whereby he derives AN IMMEDIATE AND CERTAIN BONUS OF 100*l*.

All particulars as to Shares, Loans, Assurances, &c., may be obtained on application to the Secretary; and, if required, forwarded to the country.

Parties in the country eligible for undertaking Agencies are requested to apply.

A very liberal Commission allowed to Solicitors and Agents.

EDW. T. RICHARDSON,
Actuary and Secretary.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hot-houses, Conservatories, and Private Houses, by means of Hot-water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted-up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and dispatch.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering-pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c. the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete. Geo. Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c., which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

⁂ NUTT ON BEES (5th edition) now published.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.

390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

GARDEN SEATS, FLOWER STANDS, WIRE WORK, GREENHOUSES, &c.

J. CRIPPS, No. 11, MARKHAM PLACE, KING'S ROAD, CHELSEA, Wire Worker by special appointment to her Majesty Queen Victoria, the Dowager Queen Adelaide, and her Royal Highness the Duchess of Kent, begs respectfully to inform the Nobility and Gentry that he has at present on hand, the largest stock in London of Rustic and other Garden Seats, Chairs, Stools, Tables, Flower Stands, Mignonette and Plant Boxes, Wire Work of every description, as Arches for walks, Flower Bordering, Trainers for plants, &c. &c. J. C. also constructs Forcing Houses, Conservatories, Greenhouses, Verandahs, Alcoves, and Summer Seats, Invisible and Hare-proof Fences, Gates, &c.; in short, almost every decorative appendage to the Rural Residence.

Plans and Estimates submitted for works in contemplation. Blinds of every description made, repaired, altered, or painted.

Now ready, with 150 Woodcuts, fcap. 8vo, 8s.

BOTANY FOR LADIES; or a Popular Introduction to the Natural System of Plants. By MRS. LOUDON.

John Murray, Albemarle-street.

PUNCH; or, the LONDON CHARIVARI.—The SECOND VOLUME will be published on the 30th inst., price 8s. This Volume contains PUNCH'S ALMANACK, VALENTINES, and LIONS OF LONDON; and many hundred Illustrations by HARVEY, BROWN, LEECH, CROWQUILL, MEADOWS, and other eminent Artists. A Number is published every Saturday, price 3*d*.

Office, 13, Wellington-street, Strand.

THE QUARTERLY REVIEW, No. CXXXIX., is published THIS DAY.—CONTENTS—

1. Paris—the Dangerous Classes of its Population.
2. History and Completion of the Encyclopædia Britannica.
3. Rio on the Royalist Insurrection of the Breton Students, in 1815.
4. Liebig's Animal Chemistry.
5. Mure's Tour in Greece and the Ionian Islands—Strong's "Greece as a Kingdom."
6. Report on Colliers and Collieries—Employment of Women and Children in Mines.
7. Mad. d'Arblay's Memoirs—Court and Household of George III. and Queen Charlotte.
8. The Flower-Garden.

John Murray, Albemarle-street.

MEXICAN BOTANY.

This day is published, part Second, price 1*s*.,

PLANTAS HARTWEGIANAS IMPRIMIS MEXICANAS, adjectis nonnullis Grahamianis, enumerat novasque describit GEORGIUS BENTHAM.

Part the First may still be had, price 2*s*. 6*d*., or the two Parts in one, complete, price 3*s*. 6*d*.

William Pamplin, London.

ILLUSTRATIONS OF INDIAN BOTANY—JUST IMPORTED FROM MADRAS.

WIGHT'S ILLUSTRATIONS OF INDIAN BOTANY. Volume 2d, Part 1st, price 25*s*.

Any of the previous Parts may still be had, price 7*s*. 6*d*. each Part.

WIGHT'S ICONES PLANTARUM INDIÆ ORIENTALIS. Volume 2d, Part 3d, price 30*s*.

Any of the previous Parts of this Work also may still be had, price 5*s*. each Part.

WIGHT'S PRODROMUS FLORÆ INDIÆ ORIENTALIS PENINSULÆ, &c. New, in cloth, Vol. 1, price 16*s*.

WIGHT'S CONTRIBUTIONS to the BOTANY of INDIA. New, in cloth, price 7*s*. 6*d*.

William Pamplin, 55, Frith-street, and 9, Queen-street, Soho-square, London.

IMPORTANT TO AGRICULTURISTS, &c. &c.

Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1*s*.,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15*s*. per cwt. cash.—Chemical Works, Upper Fore-street, London.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates. Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY. The Number for June, 1842, contains highly-finished drawings of *Epidendrum phœniceum*, *Fuchsia cordifolia*, *Lobelia heterophylla* var. *Major*, and *Clerodendron splendens*; likewise Papers on Gardening as a science; Advantages of removing decaying Flowers; Tender Climbers for Summer Purposes; Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for May, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

A NEW EDITION,
Corrected, with a SUPPLEMENT bringing down the work to 1842.
In One thick 8vo. Volume,
Consisting of about 1200 pages of letterpress, and nearly
3000 ENGRAVINGS BEAUTIFULLY EXECUTED ON WOOD,
Price £3 3s.,

THE ENCYCLOPÆDIA OF COTTAGE, FARM, and VILLA ARCHITECTURE and FURNITURE; embracing Designs of Cottages, Farm-houses, Farmeries, Villas, Country Inns, Public-houses, Parochial Schools, &c., including the interior Finishings and Furniture; accompanied by Analytical and Critical Remarks, illustrative of the Principles of Architectural Science and Taste, on which the Designs for Dwellings are composed; and of Landscape-Gardening, with reference to their accompaniments.

"No single work has ever effected so much good in improving the arrangement and the external appearance of country dwellings generally."—"Times," Feb. 2, 1839.

"One principle pervades the whole book—the desire for an unlimited diffusion of a love of comfort, and even of elegance."—"Penny Magazine."

"A vast accumulation of sound practical information upon just that subject which most men are anxious to understand, but are little able to judge of in the absence of a safe and elaborate guide. Indeed, we are not sure that we do not agree with the 'Times,' in considering it the most valuable of all Mr. Loudon's many writings." — Dr. Lindley, in *The Gardeners' Chronicle*, June 18, 1842.

"The most ample instructions for improvements in cottage building will be found in the invaluable work of Mr. Loudon—'Encyclopædia of Cottage, Farm, and Villa Architecture,' &c. No land-proprietor ought to be without this book."—*The Peasantry of the Border*, &c.; by the Rev. Dr. Gilly.

A SUPPLEMENT to the ENCYCLOPÆDIA of COTTAGE ARCHITECTURE, bringing down Improvements in Rural and Domestic Architecture and Furniture to the year 1842; with nearly 300 Engravings. 8vo, price 7*s*. 6*d*.

WANTS a SITUATION as GARDENER, a Single Man, aged 31. Has a perfect knowledge of his business; can be well recommended from his last situation, where he lived two years.—Direct to J. C., Shealer's Nursery, Battersea Fields.

WANTS a SITUATION as GARDENER, a Single Man, 30 Years of Age, who can undertake the management of the Kitchen-garden, Flower-garden, Greenhouse, Hothouse, and general Forcing. Can have a good character from his employer whom he is about to leave. No single-handed place accepted.—Apply, by letter, to M. C. Stone-Dean, Beaconsfield, Bucks.

WANTS a SITUATION as GARDENER, a Married Man, aged 30, with a good character from his last situation, where he had the management of the Flower and Kitchen Garden and Forcing in all its branches. His Wife can take the management of a Dairy or Poultry, if required. Direct W. A. Post-office, Blackheath, Kent.

WANTS a SITUATION as GARDENER. An experienced Young Man, aged 34, will be happy to engage with any Nobleman or Gentleman who may be in want of a useful and confidential servant in the above capacity.—Address A. Ingram, Gardener to Col. H. Bentinck, Tilgate, Crawley, Sussex. Satisfactory testimonials can be had from Col. Bentinck, and former employers, if required.

WANTS a SITUATION as GARDENER.—John Halliday is about to leave his present employer, Lord Sondes, and is desirous of obtaining another situation. He has a good practical knowledge of his business in all its different branches, and can obtain most satisfactory testimonials from his present employer. Address, J. Halliday, Elmham Hall, near Dereham, Norfolk.

WANTS a SITUATION as GARDENER, a Single Man, who can with confidence say he is thoroughly acquainted with Forcing, and Kitchen and Flower Garden, having from early life lived in most excellent places of practice in every respect; he possesses also a thorough knowledge of the cultivation of Plants, having been a pupil of the late Mr. R. Sweet. Has lived three years in his last situation.—Address A. B., No. 1, Melbourne-place, St. John's Wood-road, Maida-hill.

Just published, in 2 vols. 8vo. cloth, price 24*s*.

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2*s*. cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2*s*.

THE HAND-BOOK OF AGRICULTURE;
Chiefly for the use of those interested in the Allotment System. Price 1*s*. 3*d*.

THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2*s*. cloth.

THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Person. Price 2*s*. cloth.

THE HAND-BOOK OF THE LAUNDRY;
Expressly intended for those who "wash at home." Price 1*s*. 9*d*.

THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2*s*. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1*s*. 9*d*.

London: W. S. Orr and Co.; and W. and R. Chambers, Edinburgh.

TO MARKET GARDENERS.

TO be LET, a very extensive WALLED GARDEN; also an ORCHARD of choice Fruit Trees in full bearing; together with an excellent and varied assortment of Wall-Fruit Trees, trained to a wall from 10 ft. to 12 ft. high, which surrounds the whole area, comprising about four acres. The Premises are most complete, and contain extensive Conservatories, Pineries, &c., within the walls. The whole is delightfully situated, being effectually sheltered from the prevailing cold winds, and is in the highest state of cultivation.

Applications, addressed to H. T., Post-office, Llandilo, Carmarthenshire (prepaid), will be immediately attended to, and further particulars given; but no application will be noticed unless it contains one or more unexceptionable references.

TO LANDLORDS, MARKET GARDENERS, AND OTHERS. Wanted to rent within 12 miles of Covent Garden, a good Market Garden, from 12 to 20 acres, and a small portion of meadow and arable land, with a dwelling and other requisite buildings for carrying on the business of a Market Gardener.—Address, by prepaid letters, to W. P., *Chronicle* Office, No. 3, Charles-street, Covent Garden.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief, is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s*. 6*d*., 4*s*. 6*d*., and 8*s*. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s*. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

THE following communication (translated from the German) was addressed to Messrs. Rowland's Agent at Cologne:—

13, Straitz Euggasse, Cologne,
May 23, 1841.

Mr. Th. S. Ditges,

Sir,—I have much pleasure in informing you of the extraordinary effects of "ROWLAND'S MACASSAR OIL." For about nine years I had not a particle of hair on my head, when I was casually recommended to give this celebrated Oil a trial; I accordingly purchased two bottles at your establishment, and strictly followed the printed directions: in the course of two months my head was covered with fine short hair, which I had cut off, and continued to persevere in the use of the Oil. The result is, that after five months' perseverance, I can now boast of as good a head of hair as any man in this city. In justice to the inventors I make this acknowledgment, and shall feel great pleasure in satisfying any inquiry.—I salute you with respect.

ADAM BAUER, 8th Artillery Brigade.

ROWLAND'S MACASSAR OIL prevents hair from falling off, or turning Grey; changes Grey Hair to its original colour, frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

⁂ Ask for "ROWLAND'S MACASSAR OIL." The LOWEST PRICE is 3*s*. 6*d*.; the next price is 7*s*.—10*s*. 6*d*., and 21*s*. per bottle.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.

THE last Exhibition will take place on Saturday, the 9th of July. Subjects for Exhibition must be at this Office on Friday, the 8th of July, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition. The Gates will be opened at One, P.M.—Tickets are issued to Fellows at this Office, price 5s. each; or at the Garden in the afternoon of the days of Exhibition at 10s. each; but none will be issued without an order from a Fellow of the Society.—21, Regent-street.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies required.

The Gardeners' Chronicle.

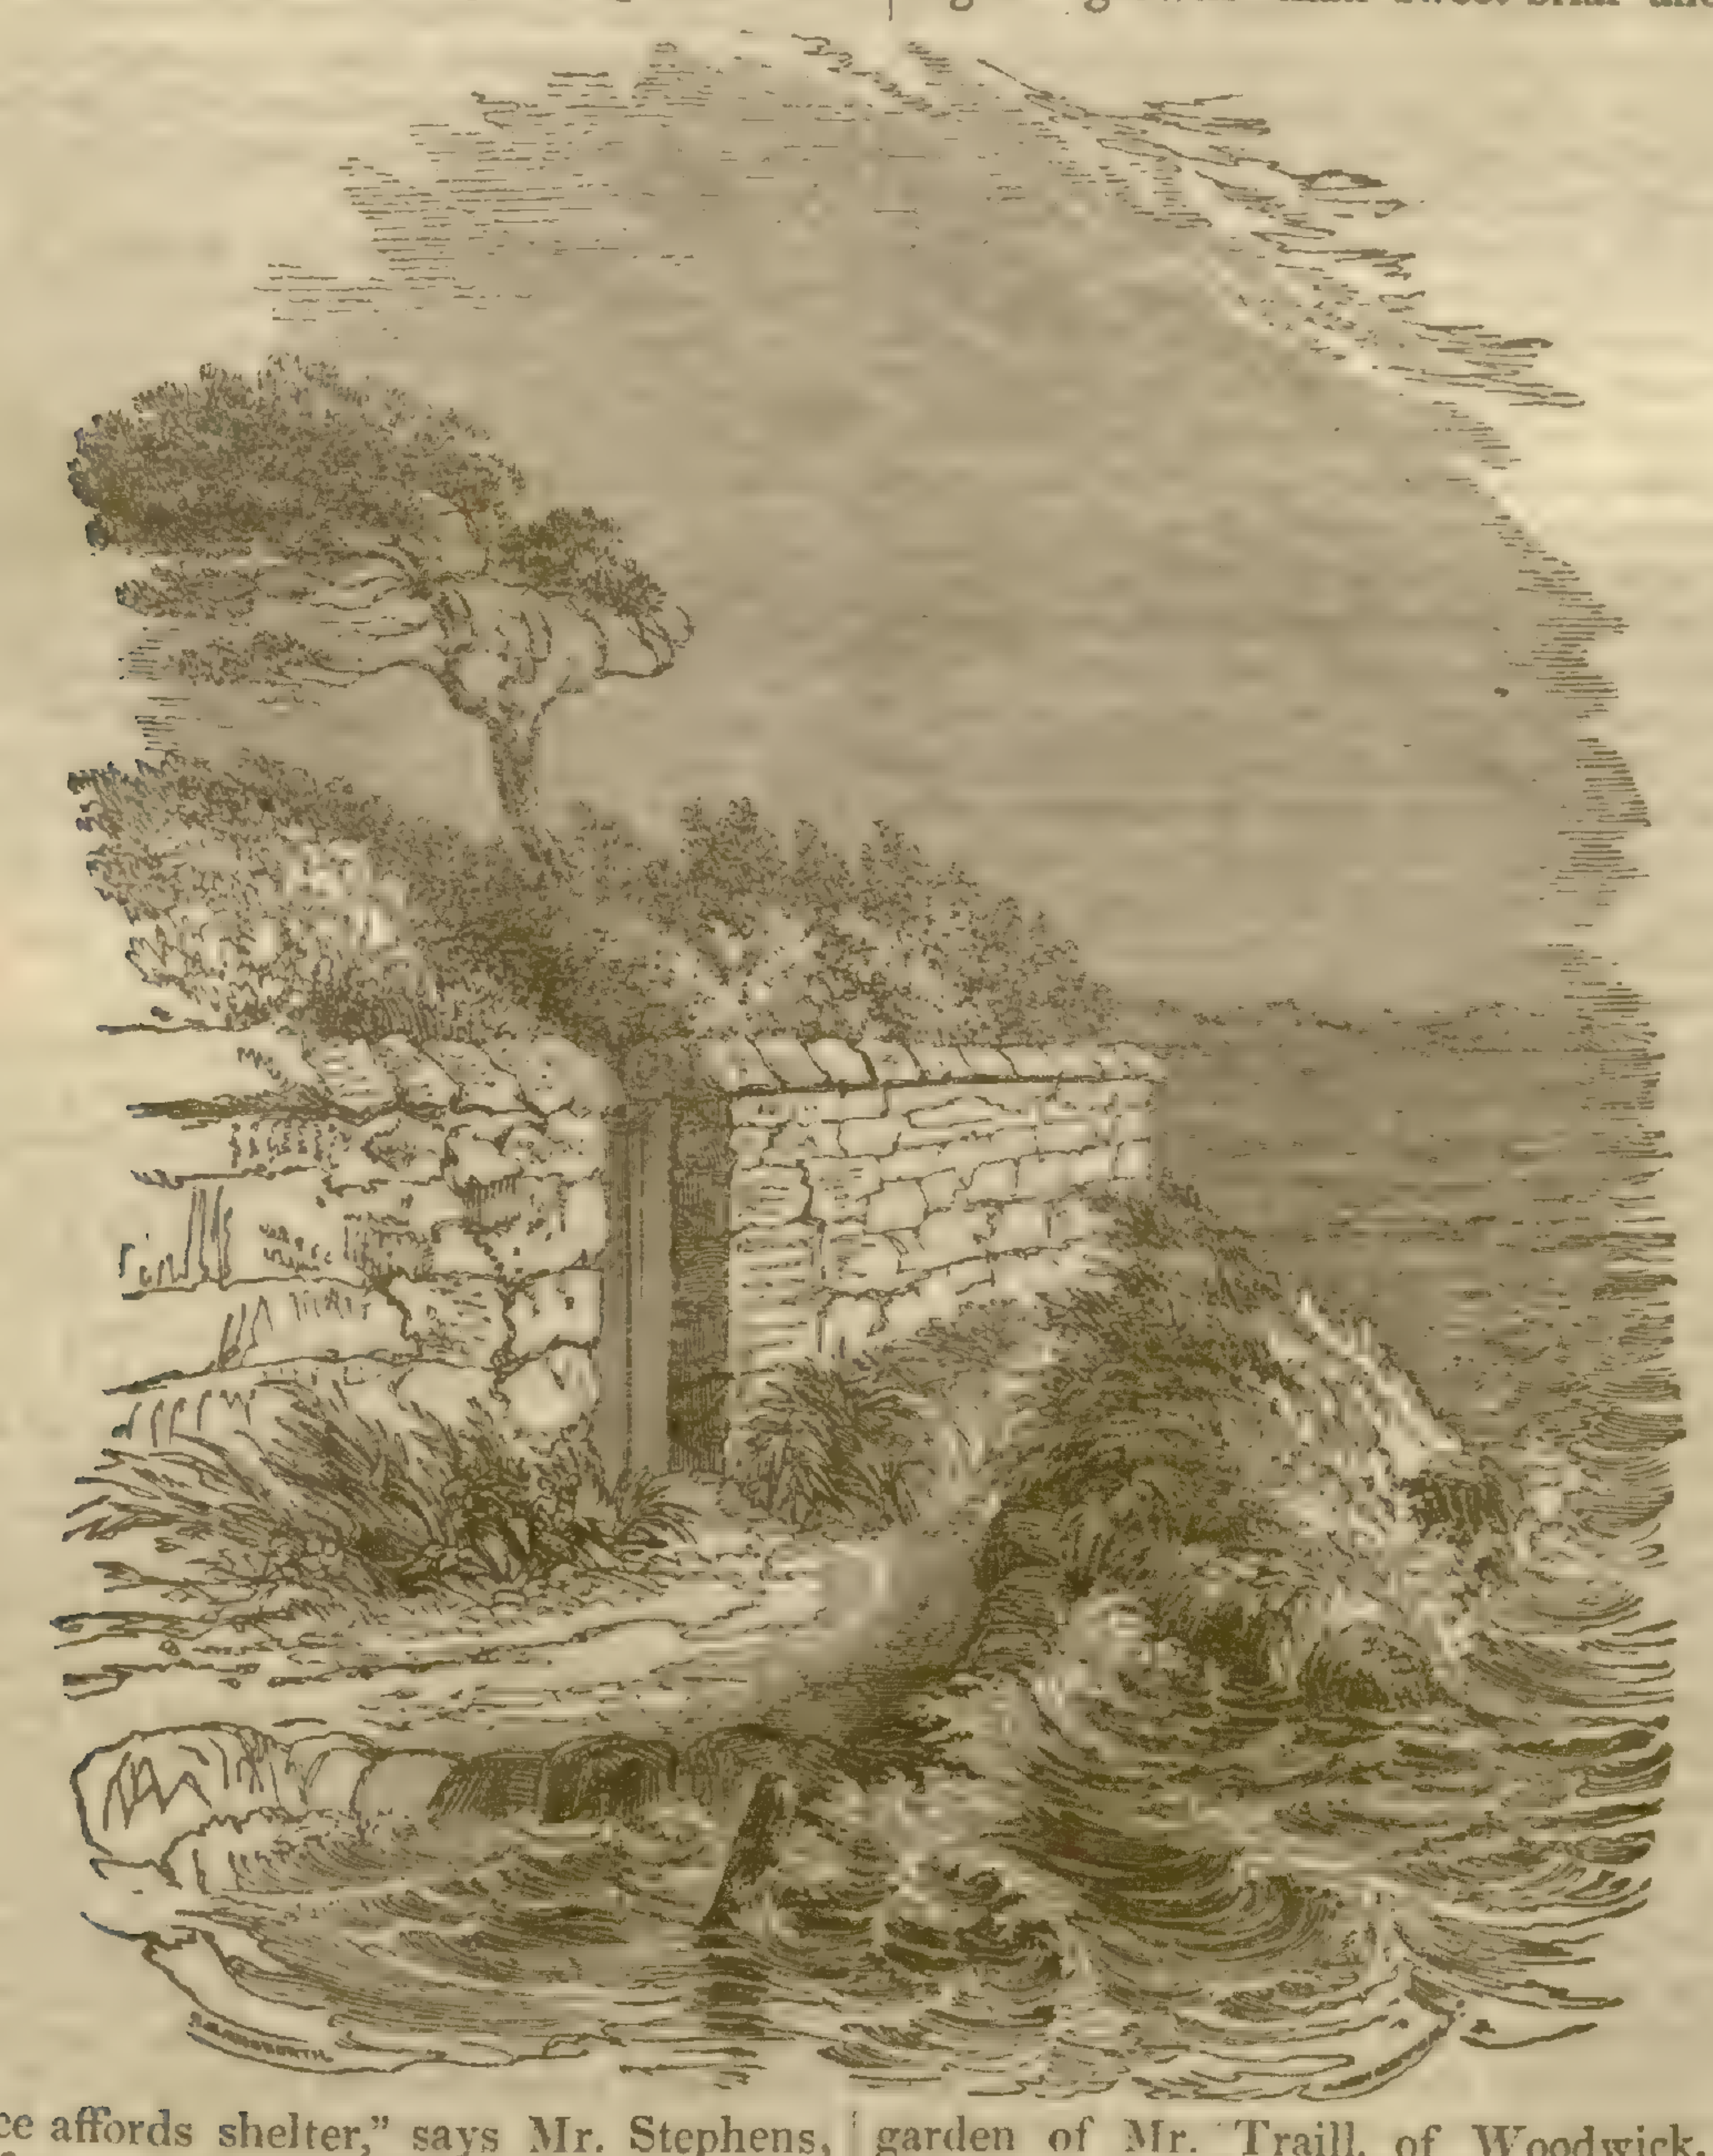
Wednesday . . . . Geological . . . . . . 8½ P.M.

COUNTRY SHOWS.—June 27, Felton Florists. 28, Tamworth. 29, Norwich, Nottingham.

FEW things are of greater importance to those who live in bleak situations, or on the coast, than to know in what way they best may break the force of the prevailing winds. Belts of wood are generally resorted to, and when they can be formed, they are the best kind of defence; but the difficulty is to obtain them. Many persons are to be found in these islands who, after incurring considerable expense in the attempt, have been obliged to abandon it as hopeless. In Mr. Stephens's "Book of the Farm," of which we have on former occasions spoken as a most valuable work, full of interesting practical information, is an account of a method of protecting bleak situations effectually, which will certainly be interesting, and probably will be new to our readers; and which, by permission of the proprietors of that work, we have been able to introduce into our pages. The excellent remarks of the author render any addition on our part superfluous:



"That a fence affords shelter," says Mr. Stephens, "must be a fact cognisant to every one. Feel the warmth of a walled garden,—the calm felt under the walls of even a ruin compared to the howling blast around,—observe the forward grass, in early spring, on the south side of a hedge compared to that on its other side,—and listen to the subdued tone of the wind under a shed to its boisterous noise heard in the open air. Sensibly felt as all these instances of shelter are, they are but isolated cases. In more extended spheres, cottages stand in a calm in the midst of a forest, come the wind from whatever quarter it may. Farm-steadings lie snug under the lee side of a hill. Whole farms are unaffected by wind when embayed amidst encircling hills; and be the shelter, therefore, great or small, the advantages derived from it are sensibly felt. As one instance of the benefits of shelter afforded by even a low wall to a park, from the cutting effects of the sea air, I give a sketch (see below), to show you its effects better than words can convey. The wall and the wood next it are of the same height, but a few yards only inwards, the wood rises to a considerable height, and this is effected by a very simple contrivance, namely, the peculiar form of the cope of the wall. It is raised like an isosceles triangle, by which the wind, when it beats against its side, is reflected upwards into the air at the same angle. Had the cope been flat, the blast would have cut off the tops of the trees in a horizontal direction. But without the wood such a form of coping would afford similar shelter. Suppose land exposed on the top of a high coast, where the wind generally sweeps along the surface of the ground, injuring every plant it blows against by a momentum acquired in passing over miles of ocean. Were a wall built on the top of the crag, at such a distance from its brow, and of such a height and with such an angle to its cope, as would deflect the wind upwards, it would cause the wind to have lost most of its momentum before it again reached the ground. Such a wall, or such a belt of wood, or such a plantation without a wall, if projected on a large scale, and planted near the top of a sloping precipice, or other rising ground, would shelter a large extent of country against the prevailing winds. Were such barriers placed in lines, in suitable places, across the country, not only its local, but its general climate would be greatly ameliorated.

"Instances are not wanting to show the usefulness of such barriers. Even within the experience of the present generation, shelter has been found to amend the climate and increase the crops of particular parts of the country. As instances of wall shelter, the garden of the Earl of Lauderdale at Dunbar, and the plantations along the sea-side of the Earl of Wemyss, at Gosford, both in East Lothian, afford good examples. In the latter instance a coped wall, has afforded so perfect a shelter to the plantations, that at the distance of from twenty to thirty yards the forest-trees are scarcely affected by the sea-breeze, on ground which formerly produced nothing of higher growth than sweet-briar and whins. The garden of Mr. Traill, of Woodwick, at Kirkwall, Orkney, affords another remarkable instance of the benefits of wall-shelter. But the benefits derived from plantations are far more extensive and important, not only in affording shelter, but in improving poor land. 'Previous to the division of the common moor of Methven (in Perthshire) in 1793,' says Mr. Thomas Bishop, 'the venerable Lord Lynedoch and Lord Methven had each secured their lower slopes of land adjoining the moor with belts of plantation. The year following I entered Lord Methven's service, and in 1798 planted about 60 acres of the higher moorground, valued at 2s. per acre, for shelter to 80 or 90 acres set apart for cultivation, and let in three divisions to six individuals. The progress made in improving the land was very slow for the first 15 years, but thereafter went on rapidly, being aided by the shelter derived from the growth of the plantations; and the whole has now become fair land, bearing annually crops of Oats, Barley, Peas, Potatoes, and Turnips; and in spring, 1838, exactly 40 years from the time of putting down the said plantation, I sold four acres of Larch and Fir (average growth) standing therein for 220*l.*, which, with the value of reserved trees, and average amount per acre of thinnings sold previously, gave a return of 67*l.* per acre.' In some situations trees will afford better shelter than stone walls, the latter being most available near the sea-side in warding off the blighting effects of the sea-breeze. On the summit of Shotley-fell, 16 miles W. of Newcastle-upon-Tyne, Mr. Burnet, of Shotley-bridge, enclosed 400 acres of moorland with high stone walls, and he cropped the ground in an easy manner for the soil. The land was thus kept in good heart; but the soil being very poor, stock advanced but little, and consequently the land would not have let for above 6d. an acre, even under the best management, and after all that had been done for it; but the centre part of each field was then put within a plantation, and the improvement was then surprising.'"

AT a lecture the other evening at the Royal Institution, it was shown that the process recommended by Dr. Boucherie to render wood incombustible, does not possess the property ascribed to it by that author; for deal, saturated with muriate of lime, was found, at the end of a twelvemonth, to be as combustible as that which had not been so prepared.

In consequence of this failure, some specimens of deal charged with another substance, the nature of which we are unable to state, were exhibited a few days afterwards to the Horticultural Society, and were shown to be really incombustible, even in the state of fine shavings, which it must be confessed is by no means a fair way of testing them. Placed in the flame of a candle they would not burn, but became black with difficulty, and eventually only charred.

So very important a property being thus *proved* to exist in wood thus prepared, we made some inquiry into the nature of the preparation. It proves to be the subject of a patent taken out by Mr. Charles Payne, concerning which a friend has furnished us with the following memorandum; to which we are bound to add that specimens of wood, prepared under the patent, are evidently *filled throughout* with the substances, of whatever nature, with which they are prepared:—

"The attention which has, of late years, been directed to the discovery of an efficacious and economical method of preserving timber from decay, has led, as is well known, to Boucherie and Kyan's processes, and to that of Sir William Burnett. To these has now to be added a system patented by Mr. Charles Payne. With reference to wood, Mr. Payne attains the following results:—1st. Wood is rendered thoroughly proof against dry and wet rot. 2nd. It is rendered uninflammable. 3rd. It is rendered proof against the ravages of insects. 4th. The most inferior woods are rendered, in point of strength, durability, and usefulness, equal to the hardest and best descriptions. 5th. Wood, for pavement, can have a surface given to it that will in a great measure, if not entirely, prevent slipperiness. The process is also applicable to the preservation of canvas, &c. &c.

"These results are obtained by applying to wood the force of exhaustion, pressure, and filtration, for the purpose of filling the tissue with metallic oxides, alkalis, and earths, so as to form in the substance, by means of single and double decomposition, *new* and *insoluble* compounds. The materials employed are of such trifling cost, that where any considerable quantity of work is done, the expense in this respect is scarcely appreciable."

We are informed that repeated and conclusive experiments have proved, in the most satisfactory manner, that the results narrated above are really obtained.

WE perceive by a paragraph in "The Times" that the British Association commenced its sittings in Manchester on Thursday morning, and *that the number of members attending it is not so great as was expected.* It required no great foresight to anticipate that this would be the case; and, without much risk, we may predict that the falling off of members will increase, unless the management of the Association undergoes a great change. The geologists may be held together, but they are very likely in that case to have the Association to themselves.

THE Banksian is one of the most beautiful of Roses, but it baffles the skill of even very good gardeners to bloom it. At Dropmore, however, the profusion of its flowers, when it hangs in festoons over some lofty trellis-work, is a subject of universal admiration; and we are sure our readers will be glad to know in what way Lady Grenville's skilful gardener, Mr. Frost, contrives to succeed so much better than his neighbours. A communication with which he has favoured us has enabled us to explain the matter.

The Banksian Rose produces its blossoms upon one year old wood, and not otherwise. If, as is customary, the plant is pruned in the spring, all the flowering-wood is removed, and so good bye to blossoms till new wood can be formed. By the autumn, the new wood is ready; but in the succeeding spring, it is usually cut off again: and in this way the flowering branches are incessantly removed.

The proper time for pruning the Banksian Rose is *Midsummer*, after the flowering is over; then new wood is formed abundantly in the latter part of the year; and when the spring arrives, will pour forth its floral treasures with the profusion of a prodigal. Now, then, is the season for cutting the branches close back, and we trust our readers will profit by our advice. Mr. Frost finds that the stronger the plant is, and the more young wood is laid in after Midsummer-pruning, the finer will be the bloom, for there will be a cluster of Roses on the end of every shoot that starts from the bosom of the leaves.

KENSINGTON GARDENS.

SINCE our last communication some further information has been obtained respecting this interesting subject, which does not at all tend to lessen the objections already entertained, but rather to strengthen them very considerably. When the plan was brought out, it was stated that one part of it was the making a public way between Kensington and Bayswater; at least, it is generally so understood. It turns out, however, that the road is to be anything but a public one: it is to be closed at each end by gates, and these gates kept by persons paid by the holders of the villas. In fact, excepting the conditions which may be made, and which, in so numerous a body as forty proprietors, may easily be evaded, the road will be a private one, by which certain portions of the public will probably be allowed to profit; but the restrictions alluded to completely deprive that part of the plan of any general advantage to the community at large.

This road is to be carried through the centre of the ground, and to be 70 ft. wide! Had it been intended to sacrifice and destroy the valuable ground in question, no more effectual plan could have been devised than this mode of laying it out. The inherent defect in the ground is that it is narrow in proportion to the length; and the cutting it in two longitudinally, of course, aggravates the evil in very great degree. The breadth of the road as projected is far too great; those in the Regent's Park are under 30 ft., and are models of size and convenience. A few feet are no object at Hounslow or Bagshot; but in such a locality as this it is preposterous, and a useless sacrifice of valuable land. With respect to the laying out the ground, on more fully considering the subject, there appears to be no great objection to the plan of continuous villas, say, in three blocks or divisions, so that an opening may be left between each, in case of future alterations; and the road may be left either in front or rear of the houses. If it be meant to be a restricted road, it is better in front, and the backs of the houses on the boundary; but if the public could have the full and entire use, it would be better on the extreme limit of the land, making the entrances to the houses, in any case, to the road. If this be done, a neat row of buildings, not too high and with good elevations, would be far from unsightly as a termination to the Gardens; and the situation would be so desirable, that there is no question they would be readily let.

As to the ground itself, whether it be left entire or not, why not make it an Italian terrace, or ornamented walk, with vases, statues, evergreens, and such like characteristic ornaments? The form particularly fits it for this mode of appropriation; and, from its sheltered position, it would make an admirable and beautiful winter promenade. There is nothing in this style about the metropolis; though in the Regent's and St. James's Park, and in Hyde Park, we have the most admirable specimens of the English, or free style of gardening; and if properly done, there is probably nothing in any metropolis in Europe which would equal it.

It is the more incumbent on the Government not to sacrifice this ground, because, as every person must be aware, buildings are extending on both sides of Kensington; even the nursery-grounds are hardly safe, but are daily being sold off to the builders; and every exertion should be made to add to the lungs of the Metropolis, as well as to increase the ornament of it; nor do we know a more easy and more legitimate source of popularity to the Queen and the Government, than attending to such subjects, and carrying on the great improvements in the Parks, which the present generation have had the good fortune to witness.—*W. C.*

ON THE CULTURE OF THE RANUNCULUS.

THE Ranunculus is of the class Polyandria, order Polygynia, Linnæus, and of the natural order Ranunculáceæ of Jussieu. The variety R. Asiaticus is that which is cultivated in our gardens, and is said to be a native of the Levant. In its character of a single flower, it has been grown in England for some centuries; the splendid double varieties of the present time, the only ones prized by florists, having been gradually produced in the progress of its cultivation.

This flower is an universal favourite; not only is it highly valued by the critical florist, but the general admirer of flowers ever regards it as one of Flora's most attractive beauties. And, indeed, when we contemplate its luxuriant and elegant foliage, green-carpetting the ground; its graceful stems rising from the midst, and supporting an imposing head of flowers, enriched with every diversity of colour, which, though blended and mixed, is yet arranged in most exact and constant relative order; while each flower among the gorgeous multitude is found still to differ from its fellow in hue, in tint, and its surrounding foliage,—we admit that the preference is merited. Though the Ranunculus, however, will bloom most profusely when properly cultivated, it is yet impatient of improper treatment; and hence has it obtained the uninviting character of being an uncertain and capricious flower. The fault is really attributable to the unskilfulness or mismanagement of the cultivator himself: and if the following directions be adhered to, the reader may rest assured, that he will rarely again experience regret and disappointment, but that every healthy root in his collection will bloom.

Soil and Situation.—We are instructed by the natural habits of the Ranunculus tribe, that a somewhat moist and cool situation is the most suitable. The bed, therefore, should be so situated, that it receive but a few hours of the morning sun, and be in the lowest part of the garden. It must not be raised higher than the surrounding walks, should be two feet in depth of soil, and have board instead of Box edging, that slugs, &c., which often eat the tender foliage and opening flower-buds of some varieties, may not be sheltered. The only suitable soil, is a retentive loam from the surface of a rich old pasture, the sods included; to which should be added, and well incorporated, one third of thoroughly decayed cow manure. Fresh manure must be avoided, as the roots will not bloom where it exists, but many will perish; all hot and stimulating composts are equally pernicious. With the enriched soil just recommended, the bed should be made at the beginning of October, and finished off, and on no account disturbed till planting time: for it is all-important that the soil be compact and close in which the roots are planted. The practice of putting some inches of manure at the bottom of the bed, is not to be commended; the roots either will not reach it at all, or if they do, their sudden transition into deep compost is, at least, unnatural: it is more consonant with reason that the food should be generally and equally distributed.

Planting.—It is impossible to insist too strongly on the importance of early planting. It should always be done at the beginning of February, and never deferred beyond St. Valentine's-day. At this time the ground is moist; the roots rapidly vegetate, and become firmly fixed in the soil. Whereas, if deferred till March, arid winds are apt to prevail, the soil becomes dry; the young roots lack moisture, are injured, and unable so to establish themselves as, at future periods, to afford sufficient nutriment to throw the plant into bloom. The bed being about 4 feet in width, and any suitable length, and having been neatly smoothed over, the roots should be planted about 5 in. distant from each other, in rows, which, again, should be about 6 in. apart: if planted closer, as is commonly the case, the plants will grow comparatively weak, and bloom more sparingly. The situation of the rows having been marked out, holes 1½ in. deep should be dibbed with the finger, or other instrument, in which the roots should be compactly set, and covered over with soil, after the manner of dibbling Beans, so much approved of by agriculturists; by this means the surrounding soil is not disturbed, but left close and retentive. The next best plan is, drawing drills across the bed in rows, setting the roots therein, and then filling them up with the displaced soil; the worst of all plans being, the raking the bed evenly over, setting the roots on it, and then covering the whole 1½ in. with loose soil: yet this is commonly practised.

General Management.—About the beginning of April, the young plants will appear above ground, when the loosened soil should be carefully, yet firmly, compressed with the fingers about the roots. During the months of April and May, should a continuance of dry weather prevail, water may be cautiously administered, at intervals, in an evening, but only just so much as will prevent the soil of the bed from cracking; or a little moss, or old spent tanners' bark, &c., may be neatly placed between the rows, which will retain the moisture in the soil. The injudicious and over-abundant application of water is a very common error, and one of the greatest evils. It not unfrequently happens that plants, which have looked well for a time, at length begin to turn yellow in the foliage, and the flower-buds dwindle and go off. This indeed is a very common cause of complaint and disappointment; it is chiefly attributable to the practice of deluging the bed with water between the rows in hot dry weather. The roots absorbing the large supply of water thus artificially afforded to them, transmit it in abundant quantities to the leaves, which are now excited by the hot and dry atmosphere to greatly increased exhalation; this unnatural excitement at length weakens and destroys their vitality, and they perish. Hence the common and trite caution, to water only between the rows, and not on the foliage, lest it should thereby be turned yellow, is founded altogether on a mistaken hypothesis. The dying of the leaves in some instances evidently depends on a want of vigour, or partial rot in the root; and in some few cases it would appear to be caused by large earthworms forming their wide tracks amid the roots of the plants, nearly undermining them; but in the great majority of cases it is produced by injudicious watering, as just explained. During the expansion of the flower-buds, and when they are fully blown, a stage and awning should be erected over the bed, as in the case of Tulips, that rain and hot sun may be excluded; and gentle waterings, every second or third evening, may be given, which will keep the bed cool and moist and promote the size of the flowers. As much air should be admitted as possible, that the flower-stems be not drawn and weakened.

Taking up the Roots.—Of all the points in the cultivation of the Ranunculus, this is the most vital and important. The tubers are extremely apt to start, or put forth roots again, if allowed to remain too long in the ground—this fatal event being most liable to occur under the influence of heat and moisture. Hence, if the weather be showery, the top awning should never be removed till the stalks and foliage of the plants have turned yellow, indicating the proper period for taking up the roots; when they have put on this appearance they should be at once harvested. If the tuber has again vegetated, it will either grow weakly, or, in all probability, perish when planted the following year. But though the young roots may not always be visible to casual observation, if but an impetus be given—an effort, as it were, to grow be induced—there will be a failure in the bloom the following summer; the root being weakened and injured by its previous attempt at growth. When taken up, they should be kept in a dry yet airy apartment, being very liable to contract mould; a proper cabinet should be provided for the purpose, or they may be kept in partition drawers, or hung up in paper bags.

In conclusion, the friendly caution is given to the young florist, not to purchase any of the older varieties of the Ranunculus, with the exception of about a dozen sorts—the self-coloured ones: they are uncertain, poor, and meagre in the extreme, when compared with the splendid varieties raised by Messrs. Tyso, and with the best sorts of the Scotch seedling, of Messrs. Lightbody and Waterstone.—*F. R. Horner, M.D., Hull.*

ON THE PROPAGATION OF PINKS.

ALTHOUGH many persons defer this operation until a later period, yet I would not recommend it to be delayed longer than the last week in June, or the first week in July. The reason for commencing thus early is obvious; not only will the young plants form more vigorous roots before the approach of cold weather, but their blooms next season will be finer than could be produced by cuttings, which, not being properly rooted, would have a hard struggle to live through the winter.

The most certain and expeditious method of propagation is by pipings, or cuttings of the grass of the present year. Before commencing this operation, a slight hot-bed should be formed of leaves, or any other material which is not likely to heat violently. Upon this, a layer of the rough siftings of decayed vegetable mould should be spread to serve for drainage; and upon the whole a mixture of finely-sifted leaf-mould and silver sand, to the depth of three or four inches. This bed, after being made perfectly level, and firmly beaten down with the back of a shovel, should be well watered through a fine rose; and in a few days it will be fit for use.

In selecting the grass for pipings, strong and short-jointed shoots should be chosen. The piping should be cut off with a sharp knife immediately below the second or third joint from the top of the shoot; and it may then be readily disengaged from the two leaves which surround its base, and which are commonly termed a sheath. The tips of the leaves should be shortened, for the sake of convenience; otherwise, when planted, it will be difficult to prevent the hand-glass from resting upon them, or from disturbing them whenever it is removed. As the pipings are prepared, they should be put into a basin or pan filled with water, to prevent them from flagging before they are planted. For this and similar delicate operations, the cool hours of the evening are most suitable.

In planting the pipings, they should be pressed firmly into the soil to the depth of about half an inch, leaving them an inch and a half apart every way; and after being properly secured, they should be gently watered through a fine rose to settle the mould closely round their stems; and as soon as the leaves become thoroughly dry, a bell glass should be placed over them. The glass should be pressed lightly into the mould to prevent, as much as possible, the ingress of air. In sunny days, the bed should be shaded from 7 or 8 o'clock in the morning until 5 or 6 in the afternoon; and if there is any appearance of damp amongst the pipings, the glasses should be occasionally taken off to allow them to dry, and all plants so attacked should be immediately removed.

It is very probable that the pipings will not require to be watered until the greater part of them have taken root; should watering, however, be necessary, the leaves must be allowed to become dry before the glasses are replaced. As soon as roots are formed, the hand-glasses should be slightly raised on one side, and this may be gradually increased, until at last they may be entirely dispensed with. The young plants, after being by degrees inured to the sun, may be transplanted six inches apart in an open bed, previously prepared for the purpose; in which situation they may remain, until required for planting finally in the beds, where they are to bloom.—*T. R.*

AMATEUR'S GARDEN.—No. XXVI.

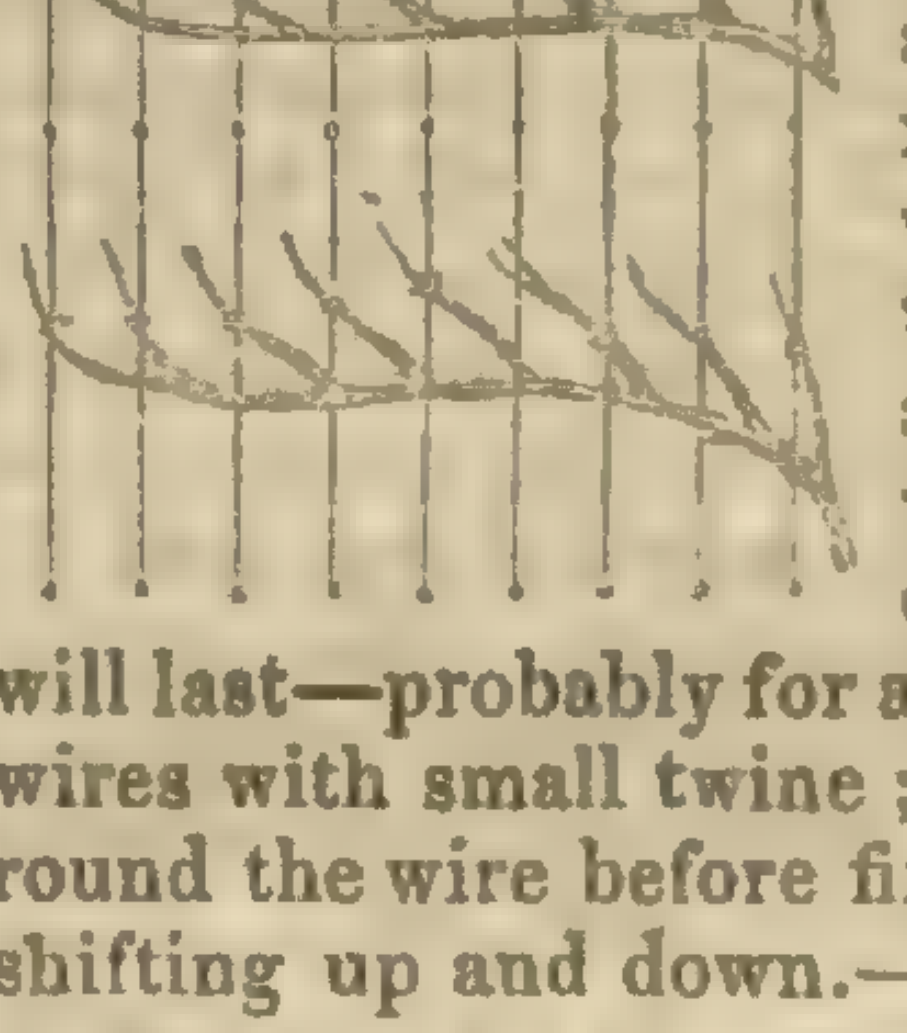
I SHALL now suppose the amateur to be walking round his garden, viewing and enjoying the results of his labours, and I may, therefore, take this opportunity of pointing out to him the state in which it ought to be, providing the directions which have been given from time to time have been attended to. The late dry weather has been very unfavourable to the growth of trees and shrubs which were carelessly transplanted, or injudiciously root-pruned last spring. Hence it is no uncommon thing to see Apple and Pear trees pushing very weakly, and losing their leaves almost as soon as they are formed. They live, it is true, but they have received a check which they will not recover for two years. Evergreens, too, such as Laurestinus, have been destroyed in the same way, and have presented such an unsightly appearance, that it has been necessary either to cut them over or to remove them altogether. Such things ought not to be if these operations had been performed in a proper manner, and even with the unfavourable season which we have had, not one evergreen in fifty ought to have failed. With regard to fruit trees, the root-pruning was intended to check over-luxuriance, and to throw them into a state of fruit-bearing. By doing this, in the first instance, in a judicious manner, and by afterwards watering, during dry weather, in the way which I formerly described, the trees will now be forming short stiff shoots, instead of the long luxuriant ones of former years, and, in many instances, they will be showing other signs of fruitfulness. Thus, by proceeding with caution and discretion, the trees will be prevented from being unsightly or from dying, and the object will be sooner gained. This is the test then by which the amateur must try the soundness of his practice.

In what state are the tender summer flowering things which have been transplanted or sown in the clumps or borders? The self-sown annuals, which last spring were directed to be thinned and attended to, ought with scarcely any care to have flowered in high perfection. The spring-sown ones, in most places, have come up badly, and, in many instances, have never appeared at all. This failure has been owing to the excessive dryness of the soil and air; and the bad effects in this respect could only be counteracted by frequent watering, and at the same time shading the ground, in order to prevent evaporation from going on so rapidly. If the amateur has failed in this part of his management he may forgive himself, for many good gardeners have done the same, and the warm and seasonable showers which have fallen lately, will soon cause his seeds to germinate, and his garden will yet be gay with their beautiful flowers. Pelargoniums, Heliotropes, Verbenas, and other things which were turned out about the middle of May, ought now to be flowering well, although not in such perfection as may be expected a few weeks hence.

How does the greenhouse look? Although the greater number of the floral beauties of New Holland are now gone by, is it still gay with flowers? Such plants as Balsams, Hydrángeas, Fúchsias, Phlox Drummondi, Rhodanthe Manglésii, late-flowering Pelargóniums, and various other plants, are well adapted for this purpose, and they are not much injured by being grown under the shade of Vines; so that the amateur, who has only a small greenhouse, with the rafters covered with Vines, may still contrive to have the shelves filled with flowering plants.—*R. F.*

HOME CORRESPONDENCE.

Summer Watering in the Open Air.—Although the principles of watering out-door plants has been so fully explained in the "Theory of Horticulture," and also more recently in the *Chronicle*, by Mr. Fortune and Mr. Whiting, it is lamentable, in the present scorching weather, to see how very inefficiently, I might say foolishly, this operation is performed, even by those from whom much better things might be expected. Not only is water of the very worst description used, but that in a far too small quantity to do any good to the plants watered. Watering under any circumstances with water that is much colder that the soil can do little good; because although it may refresh the plant a little, it must be recollected that by reducing the temperature of the soil, it paralyses, to a certain extent, the energy of the plant, and consequently the fruit is but little increased in size; and by watering daily in small quantities this check is periodical, so that the alternate excitement and enervation do the plant more harm than good. The temperature of the ground at this time, if it is at all porous, will be at least 60 deg., and that of spring-water about 46 deg. Now to give the soil a sufficient watering with water at that temperature, would, no doubt, reduce it to the mean temperature of the two, namely—53 deg., and the plants would thereby sustain a check; but if the temperature of the water, fully exposed to the solar influence, was 70 deg., the soil would be raised to the mean of the two, viz.—65 deg.; so that instead of being reduced 7 deg., it would be raised 5 deg., and consequently the plant much accelerated in growth. Hence the preference of pond to spring water, and the importance of using it in sufficient quantity to give the ground a thorough soaking. The object of this paper, however, is to direct the attention of amateurs to the watering of plants adversely situated. Mr. S. Taylor, of Stoke Ferry, in the "Gardeners' Magazine" for 1840, recommends the use of bottles, with two small holes in the sides, near the bottom, for watering plants. The bottles are buried to the neck near the roots of the flower which requires watering; and after being filled and corked, the water is allowed gradually to exude through the holes. This, though undoubtedly an ingenious method, is objectionable, because the roots of the plants are liable to be injured in plunging the bottles, and that it would require so many of them, where copious watering was necessary. A better plan is to take moderate-sized flower-pots, and having placed an inch or two of rough gravel in the bottom of each, to place them round the plant to be watered, and fill them with water, which as it percolates gradually through the gravel, will soak into the ground. For plants, such as Standard Roses, Rhododendrons, &c., closely turfed over on lawns; or for anything in a sloping situation this a most excellent plan, as the pots filled with water may be placed at night and removed the next morning, so as not to become an eyesore. Watering plants in flower-beds is at all times a difficult matter, because if the borders are sufficiently full of soil to give them a convex form, which they always ought to have, the water runs to the sides of the borders as fast as it is poured on. In such cases it will be found advisable to perforate the beds as thickly as possible, without injuring the roots, to the depth of six or eight inches, with a stick one inch in diameter, and by filling these ten or a dozen times the ground will become thoroughly soaked. With Annuals, Verbenas, and other grouping plants, I have found this a most excellent method. In connexion with the watering of Strawberries, a radical improvement is required; for although gardeners are pretty liberal with the limpid fluids over the heads of the plants, they are not good conservators of the quality of the fruit. It is true by copious watering both the size and quantity of the fruit is much increased, but it is equally true that if water is used over the plants, after the fruit is half grown, the latter will be much deteriorated in quality. We all know that Strawberries in a wet season are never so high flavoured as they are in a dry one, and what is the reason? Why, because there is a superabundance of aqueous matter in the fruit; and so it is with plants, copiously watered over-head in dry seasons. In truth it may be laid down as a rule, if fine-flavoured fruit be a desideratum, water ought never to come in contact with it after the saccharine or maturing assimilation commences. Hence in watering Strawberries, let it be poured from the spout of the watering-pot upon the soil, but on no account let it touch the fruit; or what will be better, fork the ground over between the plants, give it a good soaking to at least the depth of a foot, and cover it two or three inches deep with clean straw. This will both prevent the evaporation of moisture, and the radiation of terrestrial heat; and as the straw from its colour and non-conducting qualities will reflect, instead of absorbing, the heat, the fruit being subjected to increased temperature, will in consequence be improved in flavour. If water is required after the straw is placed on the beds, let it be applied through pots, placed one foot apart, as recommended above for plants on a lawn.—*W. P. Ayres.*



Wall-Trees.—If those who regard neatness in training their Wall-trees will adopt Mr. Hayward's method of fixing the branches, they will find it to be far preferable in many respects to trellis, or nails and shreds. It is as here represented: nails are driven into the wall at equal distances, regulated by a plumb-line, and small wires are fixed and drawn from nail to nail up and down. For Peach-trees the wires do well at six inches apart. If both the nails and the wire are of copper, it may be difficult to calculate how long they will last—probably for ages. The branches are tied to the wires with small twine; and if the twine be once passed round the wire before fixing the branch, it will prevent its shifting up and down.—*Lyme, May*, 1842.

Heating by Hot Water.—In reference to the simple plan of heating by hot water, described by M. Beaton (p. 348) and Mr. Weestove (p. 380), I may observe that I witnessed the plan in most successful operation at Sudbury Hall Gardens, as adopted by the intelligent gardener, Mr. Mitchell. Simpler means than those he showed me could not be devised, and the surprising luxuriance and extraordinary health of the plants in the Cucumber and Melon frames, where the method was applied, announced, with emphasis, its excellence. I am persuaded this plan far exceeds any other method ever devised, not to mention that it puts it in the power of individuals of moderate means to carry it into practice; the expense being a mere fraction of that of the system of pipes, which require a safety tube; and even with that appendage, if accidentally neglected or forgotten, might, from the expansion of the included water in the act of freezing, burst the pipes and produce havoc and devastation—a circumstance that happened to Mr. J. Clark, jun., of Birmingham.—*J. Murray.*

Management of Vines.—In the forcing and management of the Vine there are two practices prevalent among many of the gardeners of this country, against which reason exclaims, and which cannot be defended by any of the laws that govern the vegetable kingdom. In the first place, syringing Vines through all stages of their growth, under the idea that leaves cannot be preserved in a proper state to perform their functions, nor kept from the ravages of the red spider without it, is a complete absurdity. The functions of leaves are those of respiration, perspiration, and digestion. Let me ask, how far does syringing preserve or insure any of those offices unimpeded to the plant, as some persons suppose? The contrary is very often the result, especially if the water used is not thoroughly devoid of dirt, or matter that may settle on the leaves, close or choke up the stomates, and thereby render them unfit to perform those functions that were intended to be preserved by syringing. But if the water be ever so clear, how it can be of service I am equally at a loss to know. I have always observed that a very small portion of each leaf retains any moisture. Immediately on pouring water upon a leaf, large patches will become dry, as if the surface were oiled in several places and the intermediate parts have an attractive power; even plunge a leaf wholly in water and the results will be the same. It would, therefore, follow, that if syringing is of service, the parts retaining the water would derive most benefit, causing a visible difference in the appearance of those parts which retained the water and those which did not, but no such difference appears; one part seems as healthy as another, thereby plainly showing its inutility, and that it may be safely dispensed with. If we merely do it for the prevention of the red spider, we plunge into double the absurdity. A humid atmosphere will prevent the appearance even of this pest; and to insure the preservation of all the above functions in a Vine, humidity alone is sufficient. Air charged with moisture continually coming in contact with a leaf, does more than syringing towards keeping it in a fit state for the performance of all its functions. Water should be thrown copiously on the paths, pit (if there be one), or floor. If the house is heated by hot water, troughs should be placed on the pipes; or if by flues, pans containing water should be placed over them, which will be continually evaporating, and filling the air with watery particles. All persons agree that moisture is essential to the proper development of the grapes, and that without it they never swell properly. In this I agree with them, but it cannot be effected by syringing alone. If the floor, paths, flues, &c., are watered about 6 o'clock in the morning, this will keep it damp till breakfast time, and again occasionally during the day; a constant supply of moisture will be the consequence. When the house is closed, another good sprinkling should be given, and again before leaving it for the night. This I can from experience say, will keep the atmosphere damp, the leaves free from dirt, or any other deleterious matter, and will insure good berries. The only time syringing is at all necessary, is before the buds push, when no doubt it will be of service, as the water thrown on the stem will be imbibed and distributed through the system, causing the sap, which is at rest during the winter, and which is of a denser nature than the water taken in, to become thinner, and flow with greater rapidity; but as soon as the buds are fairly burst it may be dispensed with for the remainder of the season. The second practice or operation is that of stopping the fruit-bearing branches, at one eye above the bunch, and which is adopted by almost every gardener. If this is not done, they say the resources of the plant are exhausted and that it causes barrenness. Does this agree with what physiologists say and teach? And if any practice exists repugnant to physiology, it cannot be relied on; and nothing in the world can be more opposite to what it teaches than fore-shortening. Is it not an established fact, that "the more leaves over a given part, the more that part will increase in diameter, and the more secretions will be formed for fruit;" and if the leaves over a fruit, or a bunch of fruit, or opposite to it, be taken away, it never comes to perfection; which shows plainly that without leaves we should have no fruit. And is there any difference between the leaves at the base of a shoot and those on the top, or do they form different secretions; if they do, then fore-shortening is correct; if not, the practice must be wrong. And again, the knowledge we have of the functions of a leaf shows plainly that every leaf contributes its moiety for the above purposes; and has not a leaf, placed at the distance of a yard above a bunch, the same power of doing this as the one directly opposite? And will not the quantity of matter contributed by one leaf, be increased in a ten-fold proportion by ten leaves? Undoubtedly it will, for we have no proof to the contrary. I am not for allowing them to run to their full length, as by so doing the leaves might become too crowded, and be deprived of the influence of light, without which they become worse than useless; but I am for preserving as many of them as can possibly be exposed to the light. I could give many reasons for not cutting them back to one or two eyes above a bunch, did I not consider what I have said sufficient to show its evil results.—*A Tyro.*

The Tendril.—You define the tendril to be an abortive inflorescence! that is to say, according to these eminent authorities, Johnson, Sheridan, and Walker, an untimely flower; and you add that it may be expected occasionally to produce flowers. Are we to understand that a tendril is a gratuitous appendage, and of course worse than useless? I, on the other hand, believe that tendrils are destined to subserve a particular purpose in relation to those plants of which they form an integrant part: and I therefore regard them as a distinct evidence of design. Is it correct to say that an untimely flower may produce a mature inflorescence? If such inferences belong to the dialectics of morphology, I can only say it is an inversion of the logic in which I have received my rudiments of reason.—*J. Murray.* [Is our correspondent serious in referring to these literati as authorities in matters of natural history? It would be idle to raise an argument upon their definitions. We must refer for the dialectics of morphology to morphological writers.]

To stop the Bleeding of Trees.—I strongly recommend your correspondent, who complains of being unable to stop the bleeding of a favourite tree, to try the following plan:—With a sharp knife cut out any part of the wound which appears diseased, and, having well cleaned it, apply a red-hot iron, and sear it well; this will in all probability close up the injured vessels, and revive the drooping foliage, which flags from exhaustion.—*W. W.*

The Seeds of the Laburnum.—Allow me to thank you for your notice in the *Chronicle* of 11th inst., respecting the deleterious effects of the seeds of the Laburnum on cattle. Your opinion, however, being by no means positively expressed, since you say "the action of these seeds may possibly not be dangerous, though, from their powerful principles, it is probable they would be fatal to animals as well as man," my question still remains unsettled. I should, therefore, like to have it put to your readers, whether any have Laburnum trees growing in plantations to which sheep and other cattle have access, and whether they have known any evil to have happened from this cause.—*Omikron.*

The Seeds and Flowers of the Laburnum.—I believe both of these are poisonous, as well to man as to inferior animals. In the house of a friend of mine, about a fortnight ago, one of the inmates had given some flowers of the Laburnum to a parrot, a very fine bird from Sierra Leone. These flowers the parrot greedily devoured, and became soon afterwards extremely ill, and appeared dying; I directed three tea-spoonfuls of very much chloride of lime to be given it; the [illegible] ered.—*J. Murray.*

Honey Dew.—Some plants in my greenhouse were much infested with aphides, but no honey dew appeared on them until the morning after the house was fumigated, when a spot of it appeared where, I suppose, an aphis had been. Does not this look as if the leaf had been punctured and the sap was escaping? The leaves are now thickly spotted with this clammy substance.—*Hibernia.*

Oxalis acetosella.—In allusion to the remarks made by your correspondent, Mr. P. M'Kenzie, in a former number of the *Gardeners' Chronicle*, regarding the Oxalis acetosella, as a substitute for turf-edgings under the shade of trees, I stated, through the same medium, that, "It is pretty well known to gardeners that the leaves of the Oxalis acetosella disappear about the end of November, and are not seen again till the month of April." By the sides of the walks in the woods here, where I have had occasion to pass almost daily for at least 13 years, there are thick patches of the Oxalis acetosella, the leaves of which began to disappear in December last, and by the middle of January I considered them quite unfit for an edging; about the middle of February they vanished altogether, excepting a few straggling leaves here and there; and it was not until the middle of April that the young leaves were produced. I still maintain, therefore, that the Wood-sorrel (at least so far as my observations go,) "on account of the perishable nature of its foliage, is objectionable as a permanent edging." At the same time, small distorted tufts of this plant may be seen in certain situations, at all seasons of the year; but this, in general, is far from being the nature of the plant. In Loudon's "Encyclopædia of Plants," it is stated that "all of them are without the leaves half the year." If Mr. M'Kenzie misbelieves the above statements, he may satisfy himself of the truth of them by visiting the groves at Blair-Drummond any time during the summer months, and afterwards in January, February, or March. I have planted an edging with the Vinca minor, 18 in. broad, and more than 200 yards long, under the shade of evergreen trees, which answers the purpose and looks exceedingly well. I have an edging in a similar situation, planted with Myosotis scorpioides, another with the Claytónia sibirica, and Saxifraga umbrosa; several pieces with Polytrichum commune, and P. undulatum; some natural pieces with Polytrichum undulatum, and Oxalis acetosella, the last of which disappears as stated above, while the species of Polytrichum remain, with their leaves rather shrivelled, during the spring months.—*James Drummond, gr., Blair-Drummond.*

The Megachile centuncularis.—In your answer to Mr. Page last week, you observe that you have not heard of the Megachile centuncularis having attacked Pelargoniums. The following account may not be uninteresting. During the hot weather, in the week before last, I observed some of the petals of my Pelargoniums with large elliptical pieces cut very cleanly out of them, and at first was disposed to attribute it to the honey-seeking bees, who will impatiently cut open the bud before the flower is expanded, to reach the hidden sweets within; but as the disfigurement of my flowers increased alarmingly, so much so that in a small house I had at least half the plants more or less injured, I was induced to examine more closely into the source of the mischief, and was not long in detecting a different enemy at work, viz., the Megachile, as I suppose. The rapidity with which the little animal despatched its work, to the no small detriment of a flower, was remarkable; but there is an excellent account of its proceedings, which you have doubtless read, in Kirby and Spence's Introduction. Just as is there said, "nothing can be more expeditious; she is not longer about it than we should be with a pair of scissors." I was surprised at the large pieces which the insects flew away with, as long as their whole body, and which they easily supported while hovering under the exterior awning, seeking an aperture to escape at. The bees (as I imagine I am not wrong in attributing the work to the same bee as Mr. Page refers to) have disappeared since the weather has become cooler. My plants have been so completely disfigured this year by these little carpenters, whose ingenuity one cannot but admire, that I must have recourse to what I believe will be the only remedy, viz., gauze curtains, running on wires, within the house, and have some contrivance also for the doors; for if I had wished at the time, it would have been impossible to have exhibited a single plant, unless, indeed, it had been at an entomological society.—*Apis.*

Bees.—A lady, who has one of Nutt's bee-boxes, with a very strong stock of bees, and the middle and one side box full of honey, would be obliged, by a hint from some one who has succeeded, respecting the best plan to take the honey from the side box. A friend tried Nutt's plan of ventilation, and taking it early in the morning; but found considerable difficulty in dislodging the bees. Would it be better to take it in the middle of the day, when a much larger proportion of the bees are absent than at night or early, when the box is crowded? Perhaps it may not be uninteresting to those who are novices, like herself, to mention that her bees swarmed a fortnight ago, supposed to be owing to the heat of the hive, from imperfect ventilation. The swarm was taken in an empty hive, and in the evening the edge of it was placed level with the entrance of the box, to which all the bees returned. This occupied at least two hours, and even in the morning there was a considerable number out; but since that, by shading the box with a mat, and occasionally covering the front and sides with wet woollen cloths, when the sun was very hot, the temperature of it has been reduced, and the bees have worked most industriously, having shewn no inclination to swarm since.—*Westbury.*—On the 6th ult. I hived a swarm of bees into a square box, which is large enough to contain a much more numerous colony. Would any of your correspondents inform me which is the best way of uniting another swarm with them? A little tract, which was published a few years ago at Oxford, recommends that the intruders should be smoked with a stupifying fungus, and their queen taken away. Is this necessary? If so, what is best to use for the purpose? Would tobacco do? Or would it not be a good plan to collect a number of bees from hives that are taken in the usual way in autumn, and distribute them among one's weak stocks? My box has an aperture closed by a slide of tin, by which a communication can be opened with another box by the side of it; and if the new swarm were hived into that, both colonies might be compelled to use the same front entrance, which is cut out of the bottom board, six inches long, and capable of being divided in two by a slip of tin which runs through the bottom-board from front to back. But I fear it would be found, as in insects of a larger size, that "the nearest neighbours are not always the best friends." Any information on the subject will be thankfully received.—*Rusticus.*—[Excellent advice upon all these points is to be found in Mr. Cotton's bee-books. He recommends smoking bees with dried puff-balls, or with linen rags soaked in nitre; this stupifies them, and renders it easy to manage them. Joining weak stocks to strong ones, taking away the queen of the former, he also advocates. If the queens are left their subjects will quarrel; but under one sovereign they behave themselves peaceably, and work as bees *should* work.]

House Crickets.—I destroyed house crickets, which annoyed me in my sitting-room, as they have done your correspondent of last week, by mixing arsenic with roasted apple, and leaving it all night on a sheet of paper in the room.—*Laffarge.*—If "J. O." will well sprinkle his kitchen floor, and the crevices about the fire-place and oven, at night, with spirits of turpentine, he will soon be free from the nuisance of which he complains. I found this remedy perfectly effectual, under similar circumstances, seven years ago, since which time I have never seen a cricket in my house. The turpentine causes instant death if it touches the insect. Will "J. O." be good enough to give us the result of his experiment?—*W. S. B., Grove Parsonage, Wantage.*—If your correspondent "J. O." will use the arseniated potatoe, as recommended by me for the destruction of cockroaches, beetles, &c., his crickets, no doubt, will soon disappear. The natural habits and food of the cricket and cockroach are similar, and I fear not but they are both equally fond of potatoe sweetened with arsenic.—*F. S. Horner, Hull.*

The Turnip Fly.—I lose no time in communicating to you an unexpected discovery, by means of the microscope, of one of the causes of the failure of Turnips; for the fact is of some importance. The farmers' two "enemies" are the fly and the mite. The latter, "tam fera quàm minima," as mischievous as minute, is described by Baxter as "a little larger than the cheese mite and but seldom observed." Numbers of them attack the stem of the infant plant at the surface of the ground, and by extracting the sap, soon destroy it. The farmer sees his crop disappear, and is at a loss to account for the cause. "This insect," adds Baxter, "is most prevalent in newly enclosed land." My own crop of Turnips this year would certainly have fallen a sacrifice to the mite, and the "newly enclosed land" would, of course, have been condemned, had I not fortunately discovered by the microscope, that the almost impreceptible dust, which was thickly sprinkled over the seed, was the very enemy in question. I immediately turned to Baxter, who describes the mischief accurately enough, but is very far from supposing that the sower is to blame; yet this is just the fact, and thousands of mites placed upon a slip of glass, and millions of eggs, to be hatched just in time for the common work of destruction, may give the farmer a lively idea of looking well to his seed before he condemns his land. The process of cleansing the seed is very simple. All that is necessary is to shake the seed rather briskly in a rough linen bag, and then to place it upon a hair sieve, under a stream of water from the pump. The mites, previously killed by friction in the bag, as well as the eggs, are entirely washed away; and the seed, after being placed in the sun to dry, may be drilled without the slightest chance of an attack from the mighty slain.—*J. B. Reade, Stone Vicarage, Aylesbury.*

Guano.—I have been closely examining my Camellia plants, which I had previously shifted into a compost of yellow loam, heath mould mixed with sand, and well decomposed leaf mould. Into the compost, which I put immediately over the drainage, which was at least 2 inches deep, I had added a small quantity of guano. I never saw my plants so strong and healthy; the foliage is a very dark green, remarkably firm and glossy, and the plants have every prospect of a good bloom next spring. Few experiments have yet been made with guano, as a substitute for rotten dung; I therefore trouble you with this, as I have no doubt that with care it will be found very beneficial.—*J. Wedgwood, Seabridge.*

Guano.—Having heard a good deal of the effects of guano as a manure for greenhouse plants, we procured some of it and applied it at the rate of about a small teaspoonful dry to each plant, watering immediately; those to which it was applied now appear of a darker green, more vigorous and healthy.—*Hibernia.*

Asphalte Mortar.—Your directions for the preparation of an Asphalte Mortar, coincide with a conversation I had with my gardener, on the best means of preventing the roots of Wall-trees from striking downwards, and finding their way into a retentive loam, which formed the substratum of my garden. To this cause I attribute their unhealthy state, and their failing to ripen their wood in autumn; owing to the abundant moisture they imbibe from the soil. To remedy this, I was suggesting an Asphalte preparation, resembling the one you have described, which, if laid at a given depth and made the foundation on which the trees are to be planted, would seem to oppose an effectual barrier against the downward tendency of the roots. Before trying this experiment, I would wish for your opinion; whether you think it likely to prove efficacious, and whether the Asphalte preparation contains any qualities prejudicial to the roots of Peach and Nectarine trees, should they come in contact with it.—*Omikron.* [We are of opinion that the material in question will answer the purpose perfectly, if the trees are not planted over it till its smell has gone off.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

June 21.—R. W. Barchard, Esq., in the chair. G. Clive, W. Hackblock, Alex. Murray, G. Tomkins, Esqs., and Mrs. E. Whatman, were elected Fellows. A paper was read from Mr. Rendle, of Plymouth Nursery, upon an economical system of heating propagating and other houses, lately introduced by him, without the aid of flues, hot-dung, or other fermenting substance. The following is a brief description of the plan:—In a house 24 feet long, and 8 feet wide, at about 20 inches from the exterior walls, another wall is raised to the height of 3½ feet; upon this a wooden tank 4 inches deep, is placed for the reception of water. This tank is in connexion with a boiler, and is divided along the centre by a partition, excepting a space left at the extremity farthest from the boiler for the passage of the water as it circulates. As soon as the fire is lighted, the water passes from the boiler into the tank, by means of a small pipe, and circulating round the partition, returns as it cools, by another pipe, into the boiler; thus a regular circulation is maintained. Slate slabs are placed over this tank, upon which a layer of sand or sawdust is placed. The heat of the water is communicated to the sand, and passes from thence to the roots of cuttings or any plants which may be placed upon it. A genial and temperate bottom heat is thus kept up at a trifling expense all the year round. This method of heating, although different from any hitherto described bears nevertheless considerable resemblance to the open gutter or trough system, which is now coming into general use.—Mr. Jackson, of Kingston, sent a collection of well-grown Ericas, consisting of E. gemmifera, covered with a profusion of wax-like blossoms; E. Plukenettii, a singular variety, with drooping, reddish-green flowers, from which the brown stamens protruded in a remarkable manner; E. Bergiana; E. halacacaba, with curious large green flowers; E. jasminiflora alba; E. elegans; and a seedling, bearing considerable resemblance to E. ampullácea. A Banksian medal was awarded for these. From Mrs. Lawrence, a large collection of Orchidaceous and other plants, amongst which were Oncídium pulvinatum, producing a slender raceme of yellow and light brown flowers; Maxillária stapelioides, the blossoms of which are dull green, curiously banded with brown; Aristolóchia ciliosa, a singular climber, having the flowers surrounded with long green fringes, curved inwards; Schweiggera pauciflora, from Cuba, the blooms of which resemble those of the white Violet, and a pretty herbaceous plant, from the East Indies, which appeared to be a species of Aikínia, with violet coloured flowers, having the throat spotted with white: for the latter a Banksian medal was awarded. From Messrs. Rollison, two varieties of Stanhópea tigrína, varying considerably in the size and marking of their flowers: a certificate was awarded for these. From Mr. Appleby, of the Fence, an Aspásia from Brazil, called A. lunata; the flowers are green, spotted with brown, labellum dirty white, slightly tinged with purple; it is, however, far from being a showy variety. From Mr. Beck, of Isleworth, two seedling Pelargóniums; one grown in a slate pot, the other in a common porous garden-pot, to show the error of supposing that plants will not grow as well in a solid as in a porous material: from a register kept by Mr. Beck, it appears that the plants were, when potted on the 9th of February, as much alike as possible; the one in the clay pot has since been watered 19 times, while that which was grown in the slate pot has only required to be watered twelve times; thus proving the great quantity of water evaporated through the former. They have since potting received the same treatment; and the plant grown in slate certainly at the present time appears the most healthy of the two. From Mr. Hooker, a collection of Roses, some of which were raised from seed; a certificate was awarded for them. Mr. Lane, of Berkhampstead, sent a seedling Fúchsia, which partakes of the short bushy habit of F. fulgens to a great degree. From Mr. Piper, of Chiswick, a Moss Rose, sporting to the Provins, one of the shoots being covered with Moss, while upon the other, it was nearly, if not entirely, wanting; giving satisfactory evidence that the Moss Rose was originally raised from the Provins. From Mr. Henderson, Coleorton Gardens, a collection of seedling Verbenas; some of these were good, but not sufficiently distinct from other varieties in cultivation. From Mr. Parsons, gr. to A. George, Esq., a plant of Gloriosa superba, four Queen Pine-Apples, of the respective weights of 2 lbs. 14 ozs., 2 lbs. 12 ozs., 2 lbs. 10 ozs., 2 lbs. 10 ozs.; and a dish of handsome seedling Strawberries. From Mr. S. Rylance, gr. to S. B. Glegg, Esq., two Montserrat Pine-Apples, weighing respectively 2 lb. 1 oz., and 1 lb. 11 ozs.; some fruit of Passiflora edulis, and some fine Nectarines, called the Brinnion, but which appeared to be nothing more than well-ripened Newingtons; for these a Banksian medal was awarded. From S. Solly, Esq., a small, highly-perfumed Caboul Melon, raised from seed brought over by Dr. Royle. From Mr. J. Roberts, gr. to M. Wilson, Esq., a brace of Melons and some well-ripened Peaches; for the latter a certificate was awarded. From Mr. Myatt, of Deptford, some exceedingly fine fruit of his British Queen and Prince Albert Strawberries, for which a certificate was likewise given. From Mrs. W. Phillips, of Streatham Common, some white Cucumbers, a kind seldom seen, and principally used for stewing. From the Gardens, a large collection of Orchidaceous, and other plants; including the curious Catasetum maculatum, Oncídium Wentworthianum, from Guatemala, with light brown and yellow flowers, approaching closely to On. altissimum; a box filled with well-grown plants of Achímenes longiflora, Brachycome iberidifólia, with beautiful violet star-like flowers; Lobélia ramosa, an annual from Swan River, the blossoms of which are of the brightest blue; these are produced freely, and close early in the afternoon; Milla biflora, a bulbous plant, with dead white flowers, not so much cultivated as it deserves to be; and Loasa Pentlándica, covered with numerous hairs, which sting violently. There were also a collection of Roses and cut flowers of Pæónia albiflora fragrans, and P. Húmei, two good late-flowering pink varieties.

Horticultural Society's Exhibition.—Having seen in your report of the Exhibition of the Horticultural Society, that some Grapes were exhibited by Mr. Short, of Bawtry, I shall thank you to contradict the statement, as T. Short, Esq., of Martin Hall, near Bawtry, did not exhibit anything at the gardens, but the Grapes were shown by me.—*T. Short, Market Gardener, Worksop.*

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

June 15.—W. Miles, Esq. in the chair. C. A. Knight, Esq., was elected a Governor, and 56 gentlemen Members.—Col. Challoner gave notice that he should move at the next monthly council, that the secretary collect all the communications that have been presented containing agricultural or other information, and file them in such order that they may be referred to in furtherance of the objects of the society. Mr. Shaw gave notice that he should move at the next monthly council that a committee be appointed to report to what extent the proceedings of the council should be reported, and what papers read at the meetings, but not intended for publication in the Journal, should be published weekly in the Agricultural Papers. A report was read from Mr. Manning on the progress of the works at Bristol. The Duke of Richmond transmitted a hydraulic copying press, and Luccock's Work on Wool; Col. W. Vaughan his work on the Agriculture of Sicily; Mr. S. Taylor, copies of the first and second Annual Reports of the Stoke Ferry Farmers' Club. Communications were received from Mr. Grey, respecting the lecture to be given at Bristol; from Mr. Lance, requesting a lecture-room at the meeting; from Mr. G. Drake, on the standard points by which the judges are to decide on the merits of prize animals; from The Hon. W. H. B. Nugent, on improvement in the quality of stiff clay land effected by his new subsoil plough; and from Mr. Muskett on liquid manure. Mr. Stott transmitted a sample of his soluble and concentrated saline ammoniacal manure, which Sir C. Lemon, at the request of the council, undertook to get analysed by Mr. Edward Solly, of the Horticultural Society, to ascertain whether the manure contained elements essential to the support of vegetable life. Mr. Morton submitted the model of his new reaping machine. The Marquis of Downshire communicated Mr. Turner's Report on Furrow Draining to the Rugeley Farmers' Club; and Mr. Marmont transmitted from Bristol a form of agreement from the Committee of the Victoria-rooms, to be executed by the council in pledge that no damage would be done to that building during the meeting.

LINNEAN SOCIETY.

June 21st, 1842.—Edward Forster, Esq., in the chair. John Bright, Esq., was elected a fellow. Mr. Yarrell exhibited a specimen of the Auguilla acutirostris, sharp-nosed eel, of a yellow colour, which was caught in the river Kennett, and sent him by Mr. Winterbottom. A paper was read by A. H. Hassell, Esq., on the growth and reproduction of Enteromorpha intestinalis. The author had observed this plant during its growth, it consisted of filaments like the Confervæ, but it increased by a division and increase of its cells, as the Ulvæ. Hence he assigned it a position between the two genera. The author objected to the pleonasm conveyed in the specific designation intestinalis, and proposed to call it E. lacustris. The remainder of Mr. Clarke's paper on the Lodoicea sechellarum was read. The flowers are seated on long spikes or racemes and are very slow in developing, so that it is not uncommon to see fully ripened fruit, with all the degrees of ripening from the undeveloped bud, upon the same spike. The fruit is also a long time in coming to perfection; a female flower that was impregnated artificially in 1839, did not ripen its fruit till 1841. The fruit is very large, the embryo and albumen are eatable, the husk of the fruit is made into bonnets, and a variety of other uses are made of it by the simple inhabitants of the islands on which it grows. The meetings of the society are adjourned till the month of November. We were sorry to find a long list of defaulters in payment for above three years, hanging up in the room. We hope, in many instances, that this has arisen from thoughtlessness, and that these names will yet be retained on the list of fellows.

FLORICULTURAL SOCIETY.

June 21,—The third exhibition of the Floricultural Society of London was held at the Crown and Anchor Tavern, Strand. The principal attraction among florists was the Pink, of which there was an excellent display. The seedlings from Mr. Brown, of Slough, were very fine, and there is an evident improvement going on; the serrated edge is disappearing, and the grand desideratum, viz., the approach to the smooth rose-leaf petal, is conspicuous. The Roses were not so numerous, nor so fine, as we anticipated. For the silver cup, offered by D. Sheares, jun., Esq., for the best collection of 36 blooms, which we expected would have brought more competitors, only 3 collections appeared. The prize was awarded to Mr. Paul, of Cheshunt. *Amateurs*, 12 varieties, single blooms: 1, Mr. Selden, of Brixton; 2, Mr. Bridges. *Professional Florists*; 24 varieties: 1, Messrs. Lane, of Berkhampstead. PINKS.—*Amateurs*; stand of 12: 1, Mr. Bridges, of Carshalton; 3, Mr. Bragg, of Slough. *Professional Florists*: 1, Mr. Norman, of Woolwich. *Open to all classes*: best red-lace, Mr. Norman, for Creed's President; best purple do., for Keyne's Ne Plus Ultra. PELARGONIUMS.—*Amateurs*: collection of 6: Mr. Edmonds. RANUNCULUSES.—*Amateurs*; stand of 12: Mr. Dowler. HEARTSEASE.—*Amateurs*: collection of 24, 1, Mr. Edmonds; 2, Mr. Bridges. *Professional Florists*; 36 varieties: 1, Mr. Brown; 2, Mr. Cook, of Longwick. Several Seedling Pinks, Pansies, and Pelargóniums were exhibited, the result of which will appear from the following account:—SEEDLING PELARGO'NIUMS: There was no Seedling sufficiently fine to merit being placed as a first-class flower. *2nd Class*, *Omega*, (Catleugh), a bright, clean, pink ground, with a small intense spot, clearly defined in the upper petals; *Pride of Surrey*, (Gaines), a large, well-formed, rose-coloured flower, with broad under-petals; *Oberon* (Hodges), white under-petals, the spot covering the upper part of the flower, with the exception of a narrow margin of white round the top petals. Several Seedlings were exhibited, some of which had been too much shaken to allow of any opinion to be passed on them; others wanted novelty, being too much like varieties already out. SEEDLING PINKS, 1842, *1st Class*: Brown's *Eclipse*, a fine full-sized, dark-laced pink, with fine crown, good rose petal, and perfect lacing; Brown's *Model*, large flower, good petal, and perfect lacing. *1st Class*, 1841, six blooms: Brown's *Garland*, rose leaf, with delicate edging, the white of a very superior quality. *2nd Class*, 1842: Willmer's *Black Prince*, *Maid of Middlesex*, and *Attila*. *2nd Class*, 1841, six blooms: *Prince Albert*, a very large broad-laced red; best red lace, *Creed's President* (Norman), a pink, with perfect lacing, edges very even, but the flower rather thin and small; best purple lace, *Ne Plus Ultra* (Norman), edging very delicate and perfect. SEEDLING HEARTSEASE, *1st Class*, 1841: *Alicia* (Cook), this is a large and finely-formed white, with good eye; the petals are large, finely-proportioned, and of good substance; a valuable and desirable flower, and considered by many growers as the best white that has yet appeared. *Blue Perfection* (Welsh, gr. to E. Edmonds, Esq.), white inside, good eye, top petals deep blue, with a broad band of the same colour continued round the bottom petals; this Heartsease is novel in colour, being of a bright pure blue, without the slightest tinge of purple; it is finely-formed, and perfectly distinct in colour from every variety we have seen. ——— (Lane, Berkhampstead), a large flower, of good form and considerable substance, inside yellow; the lower petals surrounded with a broad band of an indescribable colour, a mixture of purple and yellow; the upper petals of the same singular colour. *2nd Class*: ——— (Lane), a yellow inside, with bronze purple upper petals.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

FU'CHSIA RÓSEA ALBA. Rosy white Fúchsia. (*Half-hardy Shrub.*) Onagráceæ. Octándria Monogýnia.—This is a neat and pretty variety, and flowers very freely. It is not known by whom it was raised; but it is believed to have originated in Norfolk last season. The plant is a free grower, and vigorous. When the flowers first expand, they are white, but gradually assume a beautiful flesh-coloured tinge. It is an interesting addition to this lovely family of plants.—*Flor. Cab.*

MARTY'NIA FRAGRANS. Fragrant Martynia. (*Half-hardy Annual.*) Pedaliaceæ. Didynámia Angiospérmia.—A very beautiful and fragrant plant, received from Mexico in 1840. It is an annual, growing from two to three feet high, and as much in diameter. It produces its lovely flowers in spikes of eight or ten on each. When the terminal flower-spike appears, then numerous lateral ones from the branches are produced, altogether forming a beautiful object, and rendering it worthy of a place in every department where it can be cultivated. It requires, if grown in the open border, to be raised as China Asters, Marigolds, &c., early in the spring, and to be forwarded so as to be strong by May, when, if planted out in a warm and sheltered situation, in a rich soil, it will bloom freely, and the colours of the flowers will be deeper than when grown in pots in the conservatory or greenhouse. When grown in the latter situations, however, the plants become larger, and bloom more profusely. When cultivated in pots, it requires a similar treatment to the Balsam, rich soil and frequent potting amply repaying for every attention. It blooms from May to November, when properly cultivated.—*Flor. Cab.*

FU'CHSIA INTEGRIFÓLIA. Entire-leaved Fúchsia. (*Greenhouse Shrub.*) Onagráceæ. Octándria Monogynia.—Mr. Miers has the merit of making this beautiful Brazilian Fúchsia known to Botanists of this country, and to cultivators, by the introduction of it to our greenhouses from the Organ Mountains, where, as Mr. Gardner remarks, this plant is very common, especially in the virgin forests by the sides of streams, where it climbs to the height of 40 or 50 feet up the stems of large trees, and flowers among the branches, giving the trees, to which it has attached itself, the appearance of being Fúchsias themselves. At an elevation of 5,000 or 6,000 feet, it loses its climbing habit, and becomes a bush, varying from two to four feet high, in which state it has a good deal of the appearance of F. macrostemma, which the flowers considerably resemble. The leaves are generally opposite, frequently ternate, from 3 to 5 inches long, elliptical, subcordate at the base, toothed towards the extremity, glabrous, except in the nascent foliage, deeply tinged with purple beneath and on the mid-rib and petiole, which latter is half-an-inch long, grooved above. The flowers are of a beautiful crimson colour, with the stamens much protruded.—*Curtis's Bot. Mag.*

EPIDENDRUM PHŒNI'CEUM. Purple-flowered Epidendrum. (*Stove Epiphyte.*)—Orchidáceæ. Gynándria Monandria.—Messrs. Loddiges, who have introduced so many noble Epiphytes into this country, and in whose magnificent collection several new ones develope their flowers every month, imported this handsome Epidendrum from Cuba some time in 1840, and it bloomed with these gentlemen in the summer of 1841. Its pseudo-bulbs are large, nearly round, and have an unusually clear and agreeable aspect. The flower-scape reaches from two to three feet in height, and is proportionately strong; it is covered with minute asperities. The flowers, which are scentless, are of a considerable size, and continue opening for two or three months. The sepals and petals are of a light purplish tint, indistinctly mottled with pale green, while the lip is of a delicate pinkish or lilac hue, and has crimson veins. Its appearance altogether is very imposing when in flower, every part being more or less ornamental, and at the same time in character with the rest. It requires the same treatment as others of the genus.—*Paxton's Bot. Mag.*

CANDÓLLEA TETRANDRA. Tetrandrous Candóllea. Dilleniáceæ. Polydélphia Polyándria. (*Greenhouse Shrub.*)—This plant has been mistaken for a variety of Candóllea cuneiformis; it is, however, a different and far handsomer species. The leaves are fully two inches long, and broad in proportion, and coarsely toothed. The flowers are four times as large, much like those of Hibbértia volúbilis, paler yellow, and with the petals, which are flat, not crumpled, considerably larger than the calyx. Moreover the stamens are regularly arranged in bundles of four each, instead of six to nine, as in C. cuneiformis.—*Bot. Reg.*

GESNERA SUTTONI (with white flowers). Gesneráceæ. Didynámia Angiospérmia. (*Stove Herbaceous plant.*)—Messrs. Whitley and Osborn, of the Fulham nursery, have just flowered a white variety of this plant; which is an unexpected and very pretty alteration of the prevailing scarlet in Gesneras. There is the least possible shade of delicate salmon tint upon the flowers, which are otherwise in size and form precisely like those of the original. It was imported from Brazil.—*Bot. Reg.*

CAMPA'NULA GRANDIS. Large Bell-flower. Campanuláceæ. Pentándria Monogýnia. (*Hardy Herbaceous plant.*—This plant is now flowering in the Garden of the Horticultural Society, where it has been raised under this name, from seeds received from St. Petersburg, and is very like a magnificent variety of Campánula persicifólia, with the flowers of C. pyramidalis. Natolia is said by Steudel to be its native country. The flowers are deep blue, of the form of Campánula pyramidalis, and between two and three inches in diameter. There are few hardy herbaceous plants so handsome.—*Bot. Reg.*

MISCELLANEOUS.

Liebig's Organic Chemistry (*Continued from page* 460), *Reviewed by Dr. Schleiden.*—What our author (p. 37) says respecting the value of experiments made for the purpose of refuting other experiments at an earlier period, is no better digested than what we have examined. Each page of the history of chemistry convinces us, that we can only expect a steady advance of the science by subjecting the more ancient and less exact experiments to the controul of others more modern and more exact, to be re-examined, rectified, or refuted. That bad experimenters make bad experiments, and, therefore, do not obtain the results which had been produced by more ancient and more exact inquiries is an observation not remarkable for its value. In every experiment we must look at the skill with which it is made, not at the object to which it tends, and an examination of the experiments of other people has just as much value as any other scientific investigation. It is not an examination of the views of these people, which have been supported by proofs, as Dr. Liebig expresses himself very incorrectly, but an examination of the pretended proofs themselves. If it can be shown that they cannot be relied on, the views which have been founded on them fall to the ground of themselves, without any necessity for another view of the matter in their place. But enough of this: it is not worth while examining such ill-considered matters in all their points. Let us pass on to the following chapters, of which I shall have the less to say, seeing that the previous observations apply to them also in many cases.

Dr. Liebig, in speaking of "the origin and operation of humus," briefly explains the received theory of its formation from woody fibre, but in a very superficial way (as compared with Mulder, in Bull. d. Sc. Phys. et Nat. en Neerlande, 1840, p. 1, etc.). He then gives us a short view of the development of a plant, as he supposes that it takes place. In doing this, he introduces a new law, which, as being full of very deep wisdom, he has caused to be printed in italics, namely, "The size of a plant is in proportion to the surface of its organs, namely, the leaves, which are destined to conduct food into it." How bad then must be the condition of the enormous Cactus, which has no leaves at all, or the gigantic Cecropias and Palm-trees, with the small number of their leaves! Suddenly, however, Dr. Liebig forgets his whole theory, and says, the small Turnip of Teltow attains the weight of several pounds, when planted in a soil where it is forced to take as much nourishment as it can. What has, in this case, become of Dr. Liebig's carbonic acid and ammonia, which exist everywhere in sufficient quantity, and neither of which originates in the soil? The Turnip of Teltow grows near Berlin, in a light sandy soil, and in the islands of the river Elbe, in a marshy ground, which contains much clay and a great portion of humus. But in both these places it is a small root, notwithstanding the great difference of soil and cultivation. I think Dr. Liebig, in speaking of this little Turnip, should have been aware that there are some principles and relations, which he cannot comprehend with all his genius and knowledge. I pass by his explanation of vegetable life, since he there speaks of a matter of which he has not the slightest knowledge. But I must advert to a proposition occurring at p. 49: "The nutrition of both animals and vegetables is inconceivable without a secretion of excrementitious matter." Here again is more confusion. There are many very different things which are conceivable. The secretion of excrementitious matter is in no way connected with the idea of organisation, life, or nutrition. We can only learn by experience, whether or not the introduction of new matter is attended by the secretion of such matter as has become useless. It is not inconceivable that a parasitical plant, for instance, may receive nothing except assimilable nourishment; it is therefore very conceivable that nutrition can exist in plants without a secretion of excrements, more especially if the secretion of gases and aqueous vapours is not considered of that nature. But in treating every problem, not merely chemical, Dr. Liebig cannot penetrate beyond the surface. What follows contains nothing but analogies, with which physiology knows not what to do. Such are the solution of albumen in an infusion (not decoction, as Dr. Liebig says) of the acid of the stomach of a calf, the transformation of starch into sugar by means of a decoction of malt (not barley, as Dr. Liebig says). But who is it that puts a decoction of malt to the germinating grain of rice? Dr. Liebig should know that, if indeed there be in nature operations resembling those of life, they nevertheless differ: and that the physiologists do not look for what is possible and conceivable, but for what really exists. Here, as on other occasions, Dr. Liebig mentions with contempt the "vital force" of physiologists; but he evidently does not know the meaning of the term, or he would speak of it differently. By this expression is implied the fundamental cause of all (all, without exception) the processes of life. Dr. Liebig is always talking, as if vital force was applied only to a few operations related to chemical facts, which, nevertheless, are just those which are most unimportant. The formation of form is the result of vital power, and a most important one; it is obvious that this has no connexion with chemistry. Even where our author treats of mere chemical relations, there is still something in his reasoning which shows that he tries to conceal his superficial propositions behind phrases. He asserts that plants secrete what is not assimilable; but why just what is not assimilable? Why not what is assimilated? In what way does the plant distinguish one from the other? Why does it not secrete fluids through its leaves, and aeriform fluids through its roots! Why, because of their peculiar nature; and it is just this peculiar nature which is called by us vital power, until we shall acquire more just ideas, and be able to express such operations by a better term. Both in organic changes and in the chemical processes of assimilation, superficial people deceive themselves, when they fancy they have succeeded in imitating such processes in their crucibles. Let us suppose that starch is converted into sugar in a germinating plant, in the same way as in a mash-tub; can you, Dr. Liebig, explain the process of fermentation, or do you know anything about the transforming power of yeast, or sulphuric acid? Call such phenomena, then, vital force, specific, dynamic; and be content with terms which you reject with such chemical indignation. We physiologists employ these terms to express phenomena which we cannot explain; and we do not attempt to pass off our ignorance for wisdom, as the chemist does with his catalyse, contra-action, and bodies in activity. But enough. Pursuing the proper subject of this chapter, we find the old observation, that humus contributes to the nourishment of the plants by forming carbonic acid, and then another instance of the carelessness with which Dr. Liebig has formed his notions. He says, charcoal can be used as a complete substitute for mould, for it never forms carbonic acid. I have little doubt that Dr. Liebig, when he was writing this, had in his head the idea that humus condenses carbonic acid from the atmosphere, and thus introduces it into plants, and that in this important quality, which, however, he entirely omits, humus and charcoal agree. This fact, however, we do not learn from Dr. Liebig, but from Lucas, Berzelius, and Mitscherlich.

In the succeeding chapter, in treating of "the assimilation of hydrogen," Dr. Liebig thinks it much more probable that water is decomposed, than carbonic acid, though previously (p. 18) he had declared that the latter was a fact beyond all doubt. In the absence of anything new, I may as well notice the following sentence:—"We do not know," says Liebig, "in what form the constituent parts of organic matter are produced." This knowledge is properly the ultimate object of physiology, but those who apply themselves to this science are not contented with "mere images, having no other end but to render those processes comprehensible;" and they ask, with some reason, wherefore Dr. Liebig, after having produced such a *testimonium paupertatis*, should pour forth his calumnies upon the obstinate and ignorant vegetable physiologists who show such disinclination to feed on the riches afforded them by chemistry.

Next comes "the assimilation of nitrogen," in which nothing material is found, with the exception of the new researches of Boussingault. This is the only subject of which physiology has not yet made use. Before Boussingault's researches, both physiologists and chemists, Dr. Liebig included, were ignorant of the true origin of nitrogen in plants; and since those researches have been published, no work on physiology has been printed.

Then follows a chapter on the "inorganic constituents of vegetation" (p. 85). Here we first have a number of known facts, proving the existence of salts in plants, and next a view, which, indeed, is very ingenious, and which, if pursued, cannot fail to excite great interest. From the analysis of the ashes of two kinds of fir-wood, made by Saussure, and of two kinds of pine-wood, made by Berthier, Dr. Liebig draws the conclusion that every species of plants absorbs from the soil a certain quantity of alkaline bases, containing an invariable proportion of oxygen, in order to saturate a quantity of vegetable acid, likewise constant, which is produced by the process of vegetation. This idea strikes the mind forcibly, and certainly deserves to be investigated by exact and very comprehensive analyses. But unhappily for Dr. Liebig, he soon afterwards states, that in Lichens oxalate of lime is to be considered as a substitute for the woody fibre, which is absent. It is hardly possible to keep one's temper in speaking of such nonsense. Woody fibre consists of elongated tubes, and oxalate of lime occurs only *within* cells, which are usually of a roundish shape; and it occurs moreover not only in Lichens, but also in other plants, as in many Cacti, which contain as much as 85 per cent. of this matter; a much larger quantity than is found in any kind of Lichen. This fact is known to every chemist's apprentice, who has attended lectures on botany. I must leave the reader to discover the value of Dr. Liebig's speculation. Our author (at p. 74,) asserts that it can be easily proved that animal manure affects the growth of plants only by forming ammonia; but (at p. 98) he forgets what he said before, and attributes the advantageous effects of cow-dung on the banks of the Rhine to the potash it contains. It must be obvious how little science will be promoted by a book so evidently written without consideration, and, in fact, made up of unconnected accidental conceptions.

(To be continued.)

GARDEN MEMORANDA.

Messrs. Lane and Son's Nursery, Great Berkhampstead.—The Roses here are in excellent health, and, notwithstanding the great quantity grown, there is hardly a trace of the Green Fly to be seen upon them. The late heavy rains have damaged some of the most forward blooms; but this is of little consequence, since they will cause the succeeding buds to burst forth with greater vigour. It would be an endless task to comment upon each flower, where every step we took, brought us in contact with one equally deserving of such distinction; we shall, therefore, endeavour to select a few of each class which struck us as being particularly beautiful. MOSS ROSES: Carnée, a delicate blush colour, very double and globular; Celina, deep carmine, a large flower, and a decided improvement upon Rouge de Luxembourg; E'clatante, bright rose, large and globular, one of the best of this class; Mousseuse partout, rose-coloured, having the surface of the leaves as well as the stems covered with a mossy appearance; Prolific, delicate pink, a good double flower, and an abundant bloomer; Pompone, a pretty small-flowered blush variety; Scarlet Pompone, a handsome rosy pink, well-cupped, but far from being a scarlet; Unique de Provins, a fac-simile of the favourite old White Provins, but the calyx is prettily studded with moss-like appendages; White Bath, a pure white, very compact and double; Crested Moss, rose-coloured, very large, and double, the segments of the calyx being curiously fringed, so as to resemble a crest. PROVINS, OR CABBAGE: Illustre Beauté, light rose, a good compact and double flower; Reine de Provence, pale blush, large and globular; this and the preceding appear to be the best in this class; Unique Striped, a remarkably pretty white flower, with pink stripes, and in this soil it comes very true to its character; Wellington, rosy carmine, bloom large. ROSA GALLICA, OR FRENCH ROSES: Aurelie Lamarc, delicate rosy lilac, large and well-cupped; Létitie, crimson, mottled with pink, cupped and very double; D'Yebles, exterior petals lilac, centre bright rose, a large and very double variety; Bizarre maitre, a first-rate flower, mottled crimson, the outer petals frequently coming edged with white; Chapeau noir, lake, shaded with dark purple, form good and distinct; Comte Foy, bright rose, flowers exceedingly large; Colbert, purple and dark crimson shaded, a superior variety; Cynthie, light blush, large and globular; Louis Philippe, crimson, shaded with purple, fine compact habit; Boule de Nanteuil, reddish crimson, beautifully cupped and very double; D'Aguesseau, a bright crimson, imbricated, a splendid flower; Fanny Parissot, an old but extremely pretty pale blush variety; General Foy, crimson, one of the brightest and best shaped varieties; Rosamond, carmine, nicely cupped, but rather small; La Calaisienne, delicate rose, large and excellent shape; Reboul, reddish crimson, compact and large, one of the best of its class. ROSA ALBA: Achille, rosy blush, very compact; Blanchefleur, white, with a pinkish centre, remarkably double; Félicité Parmentier, white, blush centre, finely cupped; Princesse de Lamballe, pure white, a very free bloomer; Sophie de Marsilly, white, rosy centre, large and cupped; Petite cuisse de Nymphe, delicate flesh colour, well cupped and a free bloomer. HYBRID PROVINS; Aspasie, delicate blush, very double; La ville de Londres, deep pink, a very large and expanded flower; Melanie Walder, a good cupped white; Micalea, pale blush, very compact. HYBRID CHINA: Adonis, pinky lilac, cupped, and large; La Dauphine, white, well cupped; La Grandeur, bright crimson, shaded with purple, a large and first-rate flower; Beauty of Billard, scarlet, good shape and a free bloomer; Coup d'Hébé, bright pink, the interior petals forming a perfect cup; Great Western, crimson and purple shaded; Stadtholder, blush tinged with lilac, a good old variety; Las Casas, bright rose, an excellent globular flower; Madame Plantier, white, very compact; Madeleine, French white, edged with carmine; Richelieu (Duval), pale flesh colour, a first-rate globular flower; Narcisse Desportes, dark rosy crimson, large and very double; Triomphe de la Queue, rosy lilac, large and globular, a first-rate flower; Magna rosea, a very large pink variety, but not compact; Brennus, bright carmine, finely cupped; Vandael, crimson, shaded with purple, very large and compact. HYBRID PERPETUALS: Aubernon, vermilion, very large; Fugorie, bright rose, globular, and remarkably sweet; Gloire de Rosoméne, bright crimson, but not very double; Madame Laffay, crimson, nicely cupped; this blooms freely all the autumn, and is undoubtedly the best of its class; Reine de Guillotiére, red and crimson shaded, a very free bloomer; William Jesse, crimson, slightly tinged with lilac, very large and globular; Julie Dupont, bright rose, well cupped; Alicia, rosy lilac, mottled with white; Rivers, bright rosy carmine, cupped, a free bloomer; Miss Elliott, purplish rose, good shape; Duc d'Aumale, bright carmine; Flora Mac Ivor, light rose, well cupped; Earl Talbot, purplish crimson, very large and globular; Duchess of Sutherland, rosy carmine, cupped, a large flower. PERPETUALS: La Mienne, deep rose; Bernard, salmon and rose; Antinous, dark crimson, and striped Crimson Perpetual, are the best of this class. BOURBONS: A fleur de Nerium, rosy carmine, with flowers resembling those of the double Oleander; Augustine Lelieur, large, bright rose; Bouquet de Flore, reddish carmine, finely cupped; General Martin, bright pink; Clementine Duval, pale Carmine; Coquette de Montmorency, red, shaded with violet; Madame Nérard, pink, with a whitish margin; Thérésita, bright carmine; and the Queen of the Bourbons, a delicate salmon colour, cupped, and one of the best autumnal bloomers. CHINA: Abbe Mioland, crimson; Archduke Charles, rose, shaded with crimson, globular; Cramoisie supérieure, reddish crimson; Etna, pink, shaded with crimson; Fabvier, fiery crimson, striped with white; Infidélité de Lisette, a beautiful white; Napoleon, shaded blush; and Thérésie Stravius, pale flesh colour. TEA-SCENTED: Bougére, rosy bronze, a very large flower; Caroline, delicate pink, rosy centre; Claudia, cream colour, tinged with pink; Delphine Gaudot, beautiful white; Goubault, pale salmon, shaded with rose, and remarkably sweet; Le Pactole, pale yellow; and Mac Carthy, pink, nicely cupped. NOISETTES: Aimée Vibert, pure white, an abundant bloomer; Cuisse de Nymphe, delicate French white; La Biche, pale rose and white; and Madame Jouvain, shaded rose. DAMASK: Arlinde, a rosy blush, cupped; and Madame Hardy, an exceedingly good white, very large, and cupped. Mr. Lane also pointed out a good and distinct seedling Fuchsia, called F. Laneii; the sepals are bright carmine, somewhat reflexed, the petals purple, the stamens and stigma white, much exserted; it appears to be a bushy and free-blooming variety.—*R. A., June* 20.

Reviews.

A Cyclopædia of Practical Husbandry, by Martin Doyle (How and Co., and Cumming), was published some time since, and met with a very favourable reception—not, however, more favourable than it deserved. It was written by an Irish clergyman, who calls himself plain Martin Doyle, instead of avowing his real name; a piece of concealment quite uncalled for, considering that his writings are all, as far as we have seen them, so useful in their matter, and so excellent in their tone, that any one might be proud to own them. His little book on Gardening is one of the best short treatises we can recommend to those who have nothing beyond a kitchen-garden and a few hardy flowers; and so of the publication now before us. Without any affectation of learning, or parade of fine words, which we too often see employed as cloaks to ignorance, he here gives the result of his own knowledge and experience upon the most important operations in farming, or such other topics as interest the cultivator of land. Although the book is apparently written for small rather than large farmers, yet it contains matter which deserves the attention of everybody. In the second number, for it comes out in parts, there is an excellent article on Bees, which comprises nearly all that the cottager wants to know upon the subject.

The Farmers' Magazine for June is a fair number, illustrated by a portrait of Mr. Paull's prize Devon Bull, and containing a variety of reports of Farmers' Clubs, and some papers chiefly borrowed from other sources. We are so largely plundered by contemporary publications, that we hardly know what would become of some of them if the *Gardeners' Chronicle* were to disappear. It strikes us, however, that although there would not be less dishonesty in such proceedings, it would be at least more straightforward, if those who borrow our property without our leave were to say where their matter comes from, instead of imposing it upon their readers as their own. In this number of "The Farmers' Magazine" the editor has the following articles, borrowed without the least acknowledgment from our columns, viz., New Clover, p. 429; New Mowing Machine, p. 440; Manures among the Chinese, p. 452. Respectable people *should* be above such proceedings.

Mrs. Loudon's Botany for Ladies is written, the authoress tells us, to meet the wants of those, who, like herself, may be unable to comprehend works of strict science, in which the characters of the natural orders of plants are formally described, or even such elementary books as Dr. Lindley's Ladies' Botany. The book is written with the usual tact of the authoress, and we trust will find favour in the eyes of the class of readers for whom it is intended. Better wood cuts and greater care in spelling the Botanical names, would have rendered it more useful.

Reid's Elements of Astronomy, although not within our limits, may be mentioned favourably, as a well-arranged, cheap, and useful little work, containing all that nine-tenths of the world require to know respecting the heavenly bodies. It is well printed, and the diagrams, 46 in number, are clear and good.

Chatwin's Catalogue of Potatoes is the best arranged list of varieties of this important plant which we have seen. The properties, appearance, colour, size, form, habit of growth, and other attributes of about 150 varieties, are described in it.

CALENDAR OF OPERATIONS *for the ensuing week.*

IT was stated in a previous Number, that "there is much to learn respecting the summer management of wall-trees;" and in proof of this, it is only necessary to refer to the majority of gardens, in which Pear, Plum, and other spur-bearing fruit-trees are 20 years old and upwards. It will be found that in lieu of fruit, these, for the most part, present a luxuriant thicket of unmanageable shoots, which are suffered to grow unmolested till they have formed perfect leaf-buds and vessels to feed them, and are then cut off, leaving several inches of the base, from which, if early enough in the season, another strong shoot or two will push; or otherwise, the leaf-buds will remain dormant till the following spring, then to burst with increased vigour into another wilderness of barren breast-wood. In this way, the unsightly excrescences, miscalled "spurs," are progressively formed, and from these it is vain to expect good fruit, even should they produce any at all. The radical remedy of cutting off the supplies is the only effectual one to change this perverted habit; but on that subject more will be said at the proper season. The object of all who have young trees under their care should be to prevent the evil here alluded to. Unfortunately, however, a system of management, by which, in conjunction with well-made borders and other requisite conditions, spur-bearing trees may be retained in a fruitful and yet sufficiently vigorous state through successive years, remains to be discovered by close observation and extended experiment. As a mere suggestion, it might be mentioned here, that perhaps a better way of disposing of the summer shoots upon young trees would be, to cut all the strongest quite out, so as to leave no stump for the after production of similar vigorous shoots; while the weaker spray might remain untouched till after Midsummer, and then be shortened in the usual way, when some of the buds would possibly undergo a change, and advance one step towards fruitfulness. It may also be worth while to try the effect of checking the development of shoots that are not wanted, by pinching them off when quite young and tender, and thus directing the sap into other different channels.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Plants that are swelling off their fruit should be kept in a state of luxuriant health by judicious treatment, that the fruit might attain the highest perfection of which it is capable. A healthy system of roots is essential to this; these, therefore, must be carefully guarded against great and sudden variations of temperature, and be regularly, but moderately supplied with water. Encourage the production of young roots, rather than give those which exist an unnecessary quantity of stimulating manure. If practicable, collect all plants in fruit into one house, where, in a humid atmosphere, the temperature should range from 70° in the morning to 90° or 95° (with air) during the day—which last point the bark-bed ought not to exceed, if the pots are plunged. If the weight of the fruit causes any of the stalks to bend, they should be supported by sticks in an upright position, or the crowns will grow on one side.

VINERY.—Vines trained on the long-rod system will require frequent dressings and tyings. When the fruit in the late house is all thinned, and the plants properly dressed by shortening all lateral shoots, give the leaves a good washing with a fine-rosed syringe; this should be repeated daily, if any red spider is found. Do not suffer the leaves of other plants to touch the Vines, particularly Kidney-Beans, which should now be taken out of the houses.

PEACH-HOUSE.—Take the lights off the early house at any convenient time, but continue to wash the trees occasionally till the leaves fall, and do not permit any lateral shoots to grow upon the young wood; the borders will also require watering now and then in very dry weather.

FIG-HOUSE.—The first fruit will now be nearly, or quite, over; particular attention must, therefore, be paid to the second crop, which a little neglect at this time would destroy. Maintain a regular state of moisture in the borders, and in dry weather syringe the leaves twice a-day.

CUCUMBERS AND MELONS.—Old Cucumber-plants which have become unproductive, should be rooted up, and the frame restocked with young ones, first taking out the exhausted soil, and replacing it with fresh compost. Where heat can be commanded these will bear up to Christmas. The ridge plants may now be let out of the glasses, by raising the latter on bricks. Cover the whole surface of the ridge with short grass.

Out-door Department.

The late rains having been very partial, planting will yet be hardly practicable in many places; those, however, who have been favoured, should lose no time in getting out their winter and spring crops, especially of the cabbage tribe. Retain the moisture about the roots of plants, by slightly earthing up those previously transplanted.

BORECOLE.—Plant a good breadth of this, and likewise of Brussels Sprouts, and Savoys, from the last sowing. If short of ground, these may be put between the rows of early Potatoes, by which they will be beneficially shaded, until they get hold of the ground.

BROCCOLI.—Put out the principal winter crop. If the rows are two feet apart, and the plants in the rows one foot, every alternate one to be removed in autumn, one fourth more plants can be grown upon the same ground, which is an important object at a time of the year, when the whole of the garden is under crops. Where the cabbage grub is prevalent, it would be advisable to try the effect of some fetid mixture, such as spirits of tar, or gas water, mixed with earth to the consistence of mud, in which the roots and stems are to be dipped. The liming process does not appear to be an effectual preventive.

CABBAGES.—Sow a bed to produce Coleworts; this should be done immediately.

CELERY.—Plant out all that is fit. The same nursery bed may be used to prick out the latest plants upon.

KIDNEY-BEANS.—Put sticks, or some other supports, to the runners. The scarlet variety will bear abundantly if kept dwarf by cutting off the twining stems.

ONIONS are in many places a failing crop, owing to bad seed and the prevalence of the Onion grub. In such cases it will be advisable to procure the thinnings of a more fortunate neighbour's beds, and plant them lightly on rich ground.

POTATOES.—Earth up the late crops while the ground is moist.

ORCHARD.—Wall-trees will need much attention, in order to keep them free from injurious insects, of which the increase has been greatly favoured by the late hot and dry weather. The only available check upon the red spider, is repeated washings; and tobacco, in some form, will be found the most effectual destructor of every species of aphis. The leaves of home-grown tobacco, dried and ground to powder, may be used as a substitute for snuff. Thin the shoots of very bushy Currant-trees, to admit light and air to the ripening fruit.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Orchidaceous plants in the cool house, will now require a liberal supply of water, as the greater part of them are growing rapidly; take care not to rot the young shoots. Such plants as Saccolábium, Aérides, in the warmer house, must have plenty of sphagnum or peat tied round the block on which they hang, and this must be kept moist; these things will not succeed unless this point is attended to.

GREENHOUSE AND CONSERVATORY.—The greenhouse plants out of doors should be watered now and then with lime-water, to kill any worms that may have made their way into the pots; and at the same time see that the drainage is not choked up. Shorten the shoots of those plants that are disposed to grow in a straggling manner, and let them have plenty of space to form compact and symmetrical heads. If any plants are suffering from exposure, remove them to the shelter of the greenhouse or pits; but in no case should a sickly or shabby plant be permitted to occupy a conspicuous place in the houses. Use every means to keep down insects.

PITS AND FRAMES.—Chinese Azaleas, New Holland plants, or any others that are making their growth under glass, must be particularly attended to. Let them have plenty of air, shade in very hot sun-shine, and a sufficiency of soft water, with occasional syringings overhead. Remove tall Cacti, whose bloom is over, to a sheltered situation in the open air, where the shoots they make will be shorter, but much more prolific in flowers, than those formed under glass. The pots may be supported on bricks, or inverted flower pans.

Out-door Department.

The seed-vessels of Rhododendrons and Azaleas should be picked off, to strengthen the plants. Also remove the fruit and fading flowers from choice Rose-trees. All trailing plants, as Petunias and Verbenas, ought to have their shoots fastened to the ground, till they cover the surface of the beds. Salvias should likewise be pegged down, and have the flowers cut off for a time. Lupines and other herbaceous plants, that have done flowering, should have the seed-vessels cut off, unless it is intended to save seed from them. Gather Anemone seed, which might be sown immediately.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Cuttings of most kinds of Roses will strike root readily now if planted under hand-glasses, and properly attended. Continue the budding of wild Stocks at every favourable time. Plum and other stocks, intended to be worked, should be pruned in readiness. Whenever the bark separates freely, the buds might be put in.

FOREST AND COPPICE WOODS.—This is an excellent season for trenching and preparing ground for planting, which should therefore be persevered in so long as it continues dry.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending June 23, 1842, as observed at the Horticultural Garden, Chiswick.

June	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.
Friday 17	30.084	30.058	73	51	62.0	E.

The highest temperature during the above period occurred on the 28th June, in 1826—thermometer 91°; and the lowest on the 1st July, in 1837—thermometer 37°.

REPORT ON COVENT GARDEN MARKET,

For the week ending June 24, 1842.

The late genial showers have increased the supplies of out-door fruit and vegetables, the qualities of which are likewise much improved. Trade during the week has been pretty brisk. *Fruit.*—Pines are plentiful, of a good size, from 8*s*. to 10*s*. per lb. Grapes are somewhat cheaper, the Muscats fetching from 5*s*. to 7*s*. per lb.; the Black Hamburgh and other sorts from 3*s*. to 6*s*. per lb. Melons are abundant, many of them being the large Dutch kinds. The Peaches and Nectarines are very fine, from 15*s*. to 30*s*. per doz. Cherries are exceedingly plentiful; the best wall fruit may be obtained for 1*s*. 6*d*. and 2*s*. 6*d*. per lb.; the standard fruit is selling for 5*s*. 6*d*. and 6*s*. per bushel. Strawberries are also abundant, from 6*d*. to 2*s*. per gallon; amongst them are some uncommonly fine samples of Myatt's British Queen and Prince Albert. Ripe Gooseberries are to be obtained at 5*s*. per hf.-sieve. Currants are a little cheaper than in our last account. Raspberries have appeared in rather large quantities, but are smaller than usual, from 10*d*. to 1*s*. per gallon. Apples are entirely over. Cucumbers are plentiful, from 2*s*. to 6*s*. per doz. *Vegetables.*—But very little Asparagus is now to be procured: the best is selling from 4*s*. to 6*s*. per bunch; the inferior, from 1*s*. 6*d* to 3*s*. per bunch. Cauliflowers have increased in size, and their price continues the same as quoted last week. Cabbages are somewhat cheaper, from 8*d*. to 1*s*. 6*d*. per doz. Peas remain much the same. Windsor Beans have also varied little in price since last week, being from 1*s*. 6*d*. to 2*s*. 6*d*. per half sieve. French Beans are much more plentiful, from 10*s*. to 12*s*. per half sieve. The supply of New Potatoes from the open ground has increased considerably; they are selling from 3*s*. to 5*s*. per half sieve; the frame kinds from 6*d*. to 9*d*. per lb. Artichokes are more plentiful and somewhat cheaper, from 2*s*. to 4*s*. per doz. Vegetable Marrows have appeared through the week, at 2*s*. and 3*s*. per doz. Spinage is tolerably abundant, at 2*s*. per sieve. Young Celery is not very plentiful, and its price is the same as in our last report. Turnips and Carrots have much improved of late; the former fetch from 3*d*. to 8*d*. per bunch; the latter from 3*d*. to 9*d*. per bunch. Mushrooms are a trifle cheaper, being from 1*s*. 6*d*. to 2*s*. 6*d*. per pottle. *Flowers.*—We observed a fine collection of Roses, and handsome blooms of Pinks, Picotees, Ericas, Pelargoniums, and Bignónia venusta.

PRICES Saturday, June 25, 1842.—FRUITS:—

Pine Apple, per lb. 8*s* to 10*s*
Grapes, per pound, 3*s* to 6*s*
— Muscats, per pound, 5*s* to 7*s*
Melons, each, 3*s* to 6*s*
Peaches, per doz. 15*s* to 30*s*
Nectarines, per doz., 15*s* to 30*s*
Cherries, wall, per lb. 1*s* 6*d* to 2*s* 6*d*
— standard, per bush., 5*s* 6*d* to 6*s*
Gooseberries, per hf. sve., 2*s* 6*d* to 3*s* 6*d*
Currants, White, per hf. sieve, 4*s*
— Red, for wine, 3*s* to 4*s*
— for dessert, 5*s* to 7*s*
Cucumbers, per doz., 2*s* to 6*s*
Strawberries, per gallon, 6*d* to 2*s*
Raspberries, Red, per gall. (2 pottles) 10*d* to 1*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, per bushel, 16*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 1*s* to 2*s*
Cabbage Plants, per doz., 3*s*
Cauliflowers, per doz., 1*s* to 5*s*
Peas, per sieve, 2*s* 6*d* to 4*s* 6*d*
— per half sieve, 1*s* 6*d* to 3*s*
— per sack, 5*s* to 8*s*
Beans, Kidney, per hf. sieve, 10*s* to 12*s*
— Windsor, 2*s* to 3*s* 6*d*
Potatoes, per ton, New, 140*s* to 200*s*
— per cwt. 7*s* to 10*s*
— per bushel, 3*s* 6*d* to 5*s*
— per hf. sieve, 2*s* to 3*s* 6*d*
Artichokes, per doz., 2*s* to 6*s*
Turnips, White, per doz. bun., 3*s* to 8*s*
Carrots, per doz. bunch, 3*s* to 9*s*
Red Beet, per dozen, 1*s* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* 6*d* to 7*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 2*s*
Chives, per pot, 3*d*
Leeks, per dozen bunches, 1*s* to 2*s*
Onions, Old, per half sieve, 4*s* to 5*s*
— Green, per doz. bch., 2*s* to 4*s*
— Cooking, per doz. bch., 2*s* 6*d* to 6*s*
Garlic, per bunch, 4*d* to 6*d*
Shallots, per bch., 3*d* to 4*d*
Asparagus, per 100, large, 4*s* to 6*s*
— Second or Middling, 1*s* 6*d* to 3*s*
Lettuce, Cabbage, p. score, 1*s* to 1*s* 6*d*
— Cos, 6*d* to 1*s* 9*d*
Celery, young, per bundle, 1*s* to 2*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 4*d* to 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per dozen bunches, 2*s* to 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Mint, per doz. bunches, 2*s* to 3*s*
Marjoram, per doz. bunches, 2*s*
Savory, per doz. bunch., 2*s*
Basil, per doz. bunches, 2*s*
Rhubarb Stalks, doz. bundles, 4*s* to 6*s*
Vegetable Marrow, per doz., 2*s* to 3*s*
Mushrooms, per pottle, 1*s* 6*d* to 2*s* 6*d*

Notices to Correspondents.

Cadwallader.—It is in all probability beneficial to Bones to mix them with sulphuric acid, in the manner recommended at p. 368. They should be reduced to powder, and well soaked in the acid and water. If you allow them to heat for any length of time their ammonia will be lost; but their manuring action will be quicker if they have become slightly putrid before the sulphuric acid and water are added. To renovate your old single specimens of Oak and Ash trees, water the ground near their roots plentifully with nitrate of soda dissolved in water. It is rather late now, but still it may be done; a handful of that salt in four gallons of water will be enough, and each tree will perhaps take half-a-dozen potsfull. If you have not nitrate, use wood-ashes and bone-dust mixed together; they must, however, be applied as far from the main stem as the longest branches extend —it is of no use to apply them near the bole. Woollen Rags, or old carpeting, are an excellent manure, much used in Hop-grounds; they are worth about 5*l*. a ton; they suit most crops, especially Wheat and Turnips. Sulphate of Ammonia may be had of drysalters. The principal subjects introduced into these Notices to Correspondents are indexed at the end of the year.

A. P. V.—We would recommend you to remove all the shoots from your Nectarines which you cannot conveniently lay in, cutting them off quite close to the main branches, to prevent the unsightly appearance of spurs. On the young trees, which have made shoots upwards of a yard in length, leave as much wood as you can, to check their luxuriance, and train in some of the laterals, or side shoots, also. The best work upon the treatment of Wall-trees is "Lindley's Guide to the Orchard." Dahlias are better when left to assume their natural form, without topping the leading shoots; but some of the lateral shoots and buds may be thinned-out, to throw strength into those which are left. The whitish insect which you meet with, enveloped in a frothy substance, is a species of Cicada, and may easily be killed by squeezing it in that state. For the whitish-brown insect which flies rapidly from one Dahlia to another, and perforates the leaves, we know of no remedy. Tobacco-water is far preferable to clay-and-water for dipping the shoots of Roses into, which are infested with the Green-fly. Your question respecting Cucumbers shall be attended to next week.

T. S. P.—The following plants may be added to those already trained against the wall with a S.W. aspect:—Wistária (Glýcine) sinensis, to be planted in the centre and trained each way; Magnólia grandiflora, M. conspicua, M. Norburti; Passiflora cœrúlea; Clématis Sieboldi and C. azúrea grandiflora; Bignónia radicans; Chimonanthus fragrans grandiflora; Jasminum revolutum and Wallichianum; the Yellow and White Banksian Roses; Ceanothus azúreus; and the double-flowering Pomegranate. For the border, 5ft. wide, fronting this wall, the following plants will be suitable:—at the back some of the tallest and most ornamental sorts of Phloxes, Pentstemons, Chelones, Fúchsias, and Verónicas, with Sálvia patens, Alstrœmeria aúrea, &c.; nearer the front, the Dog's-tooth Violet, Winter Aconite, American Cowslip, Hyacinths, Crocuses, Irises, Cyclamens, Fritillárias, and Gentians may be planted. In the summer months the intervals may be filled with Anagallises, Mesembryanthemums, Verbenas, and tender annuals.

Ulmus.—There is no effectual method of destroying Woodlice in stoves; but with perseverance they may be kept under in the following manner:—Put a cold boiled Potato into a small pot, and cover it loosely with moss; place this trap in the corner of the stove which the insects most frequent. This should be looked to every morning, and all the insects collected in it destroyed in boiling water. A few of these traps will soon reduce their numbers. You have probably overlooked the labels in the Horticultural Society's Garden. Specimen plants are named; but the labels are often fixed to the branches of trees, and not stuck in the ground. Duplicates, &c. are not named.

W. G. B. can hardly expect to preserve the petals of his Pelargóniums from falling off longer than two days from the time of their expansion, during such hot weather as we have lately experienced, particularly if he allows the bees free liberty to range his house. These insects, in penetrating to the nectary of the flower, fertilise the stigma, and the office of the flower being then fully performed, the petals drop sooner than they otherwise would. We are not surprised that all the expanded blossoms should drop immediately after fumigation; and as we know nothing respecting the action of Guano-water upon Pelargóniums, we cannot say whether this might not partly be the cause. It is impossible to have six or eight trusses of flowers in bloom, at one time, unless the plants are strong and in *good* health.

J. B.—The white-lipped Orchidaceous flower is Oncidium leucochilum; the other is Maxillària aromática.

H. J.—We have heard of bruised Laurel-leaves being recommended for the destruction of Green-fly, Thrips, and other insects which infest the Cucumber. If you try the experiment, you must shut your frames up warm, and spread the bruised leaves over the vacant parts of the bed; taking care that there are no breakages in the lights by which the confined air may escape.

A Pembrokeshire Gardener's worms are the Polydesmus complanatus, a species of millipede which infests the roots of a variety of plants. We beg to refer him to Vol. 1, p. 196, of the *Gardeners' Chronicle*, where the animal is figured, and the only means we know of suggested for destroying the millipedes.—*R.*

John Kyle.—The Lilium is Thunbergianum, and comes from Japan. The Verbena is handsome and very brilliant: it is no doubt a good variety.

J. M.—There is nothing remarkable in Mushrooms being found under an old haystack. They will grow in dark houses as well as in light; and as to pressure, we have know them bear up paving, and burst through the hard surface of a turnpike-road. Such is the wondrous force of vegetation.

H. M. C. and *S. M. V.*—Letters about planting must now stand over till the planting season. Yours shall find place in the autumn. Remarks upon Summer pruning will be more appropriate to this season.

Hebe.—"Sweet's Greenhouse Cultivator" is one of the best and cheapest works upon the treatment of greenhouse-plants.

Amicus.—Your plants are,—1, Amorpha fruticosa; 2, Colútea cruenta; 3, Symphória racemosa; 4, Hibiscus Syriacus.

G. P. W.—Your Rosa ruga is infested with the Mildew, the best remedy for which is to cut off all the shoots upon which it appears, and to *burn* them immediately. Calla Æthiópica will stand the winter in deep water, but Agapanthus umbellatus had better be removed to the greenhouse for protection. If the Chryseis, which you had sent for C. compacta, is the same as califórnica, it is certainly wrong; the former is much more bushy and compact in habit than the latter.

A Friend.—Your Grasses are, No. 1, Festuca Myurus: 2, Poa trivialis; 3, Agrostis vulgaris; 5, Arundo Phragmites; 6, Aira flexuosa.

Herbaceous.—The plants sent are,—1, Cratægus odoratissima; 2, Verbascum phœníceum; 3, Lobélia Erinus; 4, Geranium nodosum; 6, A'llium moly.

W. J.—Your Rose is the double yellow, and it will not force. Its season of flowering is the present time; does not the plant tell you that?

J. C. will find it more beneficial if, instead of giving air by means of the front and end sashes of his greenhouse, every evening after he has syringed his Vines, he were to close the house immediately, and keep it much warmer than he has hitherto done. If the temperature of the house is 85° when he closes it in the afternoon, it will not injure the Grapes. As soon as he perceives the bunches beginning to colour he must leave off syringing immediately.

S. Buckland.—Your plant is unknown to us. The specimens were unfortunately neglected till they were too dry for examination.

B. M.—Thanks for your hints. We must, however, answer everybody; what has no interest to your friend has much interest to the querists. Depend upon it we do not answer such questions for any gratification of our own.

Lusor.—We plead guilty. Your plants were named by an assistant who is mistaken. No. 1 is Lepídium Draba of De Candolle; it is omitted by Smith and Withering. No. 2 is Lepídium Smithii. No. 3 we do not know. It is a curious plant; can it be a variety of No. 1? Linária triphylla cannot be regarded as wild, considering how long it has been cultivated in gardens.

Inquirer must buy a book on Familiar Chemistry, if he has not our Paper for last year, in the "Rural Chemistry" of which he will find all the information he wants. "Johnson's Elements of Agricultural Chemistry" will suit him; it only costs a few shillings. Rain is measured by an instrument called a rain-gage. Good figures of farming implements are given in "Stephens's Book of the Farm."

J. W. Jones is answered in the last paragraph.

Miles.—The easiest method of propagating the Aza'lea Indica and all the varieties of Came'llia, is by inarching the sorts required upon stocks of less value. The former may likewise be increased by cuttings, and the latter by layering. Any of these operations may be performed at the present time—the sooner the better.

A. L.—Your question, as to whether a wet or a dry season is most troublesome to gardeners, is rather difficult of solution. It is our opinion, however, that a dry season is the least so, although a great deal of watering is required; but it must be remembered that weeds make great progress, and are difficult to eradicate in a damp season; whereas dry weather is a great auxiliary in this very necessary operation.

A Subscriber.—Neither of your Petunias are distinct from some varieties already in cultivation. We do not recommend either breaking or cutting off the tips of Cactus shoots. Train them in a spiral manner round a circular trellis; the bending of the shoots will check the flow of sap sufficiently, and throw them into bloom. The seedling Pelargonium No. 2 is not worth keeping; the under petals are considerably too long and too narrow, showing divisions high up between them; the upper petals are too high and uneven at the edge.

Erinoides.—From the appearance of the leaf sent, it is possible that your plant may be a Loasa.

A Limerick Subscriber.—Cuttings of Alóysia citriodora, or the Lemon-scented Verbena, will strike readily if put in at this season of the year.

P. P. W.—Your Grasses are,—1 and 10, Holcus mollis, 2 Alopecurus pratensis; 4, Cynosurus cristatus; 7, Avena flavescens; 8, Phleum pratense; 11, Alopecurus agrestis. The rest were so broken that it was impossible to determine what they were.

J. Dick's Ferns are,—1, Onoclea sensibilis; 2, Aspídium spinulosum; 3, Aspídium filix mas.; 4, Blechnum orientale: 5, Aspídium oreópterys.

Hibernia.—The seeds of Fu'chsias may be cleansed from the pulp by washing them in water, or by mixing them with sand, which will absorb the moisture: they may be sown immediately. Some varieties of Roses are more liable than others to form leaves in the centre of their flowers; probably this may be the case with Reine des Belges.

G. H. will find it of more advantage to strike fresh cuttings of Pelargóniums, than to cut his plants back to the old wood, because he has allowed them to grow too straggling. If he intends to cut them down, he may do it immediately, but they will never make good plants.

An Amateur.—It is evident from Weestove's paper that the pipes only connect the boiler with his water-trough, and do not pass through the water. A scale is given with Mr. Beaton's paper. Prepare your night-soil, by mixing it in the first instance with weak vitriol and water till the smell is destroyed; then add coal-dust, if you are in a country where it is worthless, or cinder-siftings and sawdust, till it all becomes like mould, and lay it by for a few weeks, when it will be fit for use.

J. A. P.—Pelargoniums are plants with the petals of unequal size, like the Heartsease. Geraniums have the petals all of the same size; the latter are wild flowers, or hardy perennials; the former are the greenhouse-shrubs you admire so much. Pelargoniums have usually only 7 anthers; Geraniums have 10; and Erodiums only 5.

T.—Asparagus next week.

G. H.—Your Pelargoniums are,—1, Spléndidum; 2, Climax; 3, Garth's Perfection; 4, Gem; 7, Lady Mary Hussey; 8, not known.

An Amateur.—No. 1 is the best among your Pelargóniums, both in colour and in substance, and the petals are of a good shape. Further than this we cannot say, as the flower dropped to pieces upon being touched. The remainder of the Seedlings are not worth keeping.

Southamptonia.—Your plants are, 1, Stachys sylvática; 2, Filago germánica; 3, Verónica Beccabunga.

A.—The plant which you find growing in patches in your kitchen-garden, is the Scorzonera, well known on account of its edible roots.

A. S. G.—The Horticultural Society does not defray the personal expenses of exhibitors, nor such charges as would be connected with the plants you describe.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

In France, the pending elections are the exclusive subject of attention, and the journals are filled with comments on the addresses of the candidates. The great question upon which both the candidates and the press appeal to the feelings of the electors, is the threatened imposition of a heavy duty on English thread. This measure meets with unanimous approval; and candidates of all shades of opinion express unqualified hostility towards this country. The result of the elections is expected to give a decided majority in favour of Government. A rumour of the King's illness, in the early part of the week, produced a serious fall in the Funds; but they recovered as soon as it was known that the report was without foundation. In Spain the Ministerial crisis is at length terminated, by the formation of a Ministry under the presidency of General Rodil; but strong doubts are entertained of the stability of the new Cabinet. Renewed disturbances of a revolutionary character have taken place in the provinces; a republic was proclaimed at Barcelona and Figueiras on the 16th, but the movement was suppressed by the military, though not without some show of resistance and a charge of cavalry. Accounts from St. Sebastian state that the Government have shown unusual vigilance in strengthening the posts along the frontier, in consequence of the large number of Carlist and Christino emigrants who had collected there, and that an approaching outbreak in that quarter is generally anticipated.—From Portugal we learn that the treaties with England are still delayed, but that no serious difficulty will occur, as the conditions stipulated by the Duke of Palmella will not be insisted on by the Government, if they should be disapproved by the British Cabinet. The result of the elections has been favourable to the existing ministry, and has entirely defeated the coalition. The Commission on the Tariff has sent in its report, and the new duties are likely to be soon arranged. —From Germany we have little news beyond the account of the projected meeting of Sovereigns on the banks of the Rhine in August, at which the Emperor of Russia is expected to attend. Some disturbances have taken place in Berlin in consequence of a police ordonnance prohibiting smoking in the public streets; and a strong sensation has been produced by the energetic protest of the Chamber of Commerce at Königsberg, against the renewal of the convention with Russia for the mutual surrender of deserters.—In Russia great preparations are making for prosecuting the Circassian war on an enlarged scale; and the Emperor is said to be resolved to bring it to an immediate issue.—An overland dispatch from India has been received by Government this week; its contents have not transpired, but it is believed that the news is not of a later date than that already published.—Advices from New York to the 7th inst. reached town on Thursday; Lord Ashburton is said to have conceded some of the most disputed points of the boundary question, and there is a prevailing impression in New York that the mission will soon be brought to an amicable and satisfactory conclusion.

At home, the royal assent has been given by commission to the Income-tax Bill, which has now become the law of the land. In the Commons, the Tariff has been read a second time; the New Poor Law Bill has been under discussion in committee; several amendments in opposition to the measure have been negatived on a division, and the debate on the continuance of the commission has been adjourned to Monday. Mr. Ward's motion in favour of the ballot has been rejected by a majority of 133. A long debate has taken place on a motion for the production of documents relating to the occupation of Affghanistan, which was negatived by a decisive majority, only 9 voting in its favour. During the debate Sir R. Peel, without giving his approval to the policy of the war, expressed the determination of Government to maintain the honour of our arms, and to allow no instance of perfidy or treachery to pass with impunity. He stated his conviction that the recent disasters will be repaired, and that they will not in the least degree shake the confidence of the people of India in the supremacy of this country.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Buckingham Palace. Her Majesty has taken her accustomed exercise in the Parks during the week. On Monday the King and Queen of the Belgians arrived from the Continent, on a visit to the Queen. Their Majesties are expected to remain in England about a month. On Saturday the Queen visited the Museum of Chinese Curiosities, at Knightsbridge, and in the evening of the same day honoured the Italian Opera with her presence. On Thursday Her Majesty and Prince Albert, accompanied by the King and Queen of the Belgians, honoured the Duke and Duchess of Buccleuch with their company at Richmond. Count Mensdorf and his four sons embarked on Thursday at Woolwich, on their return to the Continent. Prince Albert reviewed the household troops in Hyde Park on Thursday. The Countess of Charlemont has succeeded the Countess of Dunmore as the lady-in-waiting on the Queen; and Viscount Hawarden and Gen. Sir W. Lumley have succeeded Lord Rivers and Mr. Gore, as the lord and groom in waiting on her Majesty.

Gazette Announcements.—Her Majesty has created Gen. Sir Robert Sale, commanding the garrison at Jellalabad, in Affghanistan, a Knight Grand Cross of the Order of the Bath. The Queen has appointed George Graham, Esq., to be Registrar-general of births, deaths, and marriages in England, in the room of T. H. Lister, Esq., deceased. The Queen has approved of M. Herbet, as Consul at Dublin, for his Majesty the King of the French. The Queen has appointed F. Graham, Esq., late Postmaster at Carlisle, to be Her Majesty's Consul at Bayonne.

Foreign.

FRANCE.—*The Elections.*—Public attention appears to be entirely engrossed with the subject of the approaching elections, the result of which is anxiously looked for, though little doubt appears to be entertained that they will terminate by the return of a considerable majority in favour of the Government. The journals are principally occupied with this subject, and publish a number of addresses to the electors from the different parties interested. They, however, present nothing of particular interest, with the exception of one from M. Cormenin, a well-known writer, entitled "Advice to Electors," in which he argues with some force against the claims of the present Government on the support of the country, and resorts to various statistical returns to establish the great increase of taxation within the last twelve years—that is, since the July Revolution of 1830. The publication of this address appears to have produced some sensation. The Legitimist journals of Monday publish the circular of the Royalist Election Committee, suggesting that the Royalists should propose a candidate of their own at the first ballot, which will enable them to estimate their force, and that, in a compromise with other parties, the Royalists shall only give their votes to such candidates of an adverse opinion as may offer personal guarantees of independence and loyalty to promote the general principles of the Royalist party. The elections of Paris appear to be the particular object of interest, and are likely to be closely contested.

The Capital.—A considerable fall took place in the funds on Saturday on the Bourse, owing principally, it is said, to a report that his Majesty was ill. Similar rumours have been in circulation some time past, and the present one is now known to be equally unfounded. It seems that the King, whilst the Bourse of Saturday was reporting him to be seriously indisposed, was presiding at Neuilly at a Cabinet Council. In the afternoon of the same day his Majesty left Neuilly for Versailles, stopping on his way at St. Cloud, where he inspected the works in progress of construction. His Majesty stayed a short time at Versailles, where he was received by the civil and military authorities. He then inspected the alterations and improvements now making in the Palace, and returned to Neuilly in the evening.—Rain fell in Paris on Sunday for the first time during three weeks, and continued the greater portion of that day and Monday.—A Cabinet courier arrived on Sunday from St. Petersburgh, with despatches for Government, which were immediately forwarded to M. Guizot at Auteuil.

The Colonies.—The "Moniteur" contains an official ordonnance, sanctioning certain changes introduced into the customs tariff established in the French West Indies by the ordinance of the 8th Dec. 1839. By the new ordinance several articles hitherto admitted into those colonies on payment of an import duty of 5 per cent. per 100 kilogrammes are prohibited. These are spices, cassia, rocou, cloves, &c., which are produced in them in great abundance. The duty on Teneriffe and Madeira wines is reduced from 100f. per hectolitre to 65f. By another article of the ordinance of 1839, foreign goods proceeding from French entrepôts could not be imported for consumption into the French West Indies until they had been nationalised by the payment, in France, of the duties required by the general tariff. By the new enactment, the merchants are to be relieved from this necessity, and will hereafter pay the duties in those colonies.

The Press.—The Cour Royale has reversed the judgment of the Correctional Police, which ordered the suppression of the "Temps," on account of informality in the names of the responsible publishers, noticed by us in a former number. The Royal Court has also diminished the fine of 80,000f. to 20,000f., and has relieved the journal from the additional fine of 10,000f. imposed on it by the inferior Court. M. Hebert, the Procureur-General, who in his conclusions had demanded the suppression of the "Temps," will, it is stated, appeal to the Court of Cassation against the decision of the Cour Royale.

The Provinces.—The provincial Journals are full of accounts of the damage occasioned by storms in various parts of the country. The Marseilles papers state that a severe thunder storm visited that city and neighbourhood on the 13th instant, which seems to have caused considerable damage to different descriptions of property. A boat in the roadstead, having nine persons in it, was struck by lightning; five were killed, and the boat set on fire; and but for the prompt assistance they received from the shore, the other four persons must have perished. The rain fell in such quantities during the storm that the city and its vicinity was in many places inundated to a considerable depth.—The Lyons Journals of the 15th inst. describe the appearance of the different crops in the neighbourhood of that city as very promising. The rape-crop, which was unusually abundant, had been gathered. The price of wheat showed a tendency to rise, but it was expected if the weather continued fine that a fall would soon take place in the market, as the accounts received from all parts of the country state that the wheat crop was everywhere very abundant. The vintage is also said to promise wine of superior quality, and it is in consequence found difficult to dispose of any of the wines of 1840 or 1841.—The "Sentinelle des Pyrénees" of the 16th inst. states, that on the 7th inst. a Spanish armed trincadour, from Fontarabia, entered the port of St. Jean de Luz and searched a French chaloupe, notwithstanding energetic remonstrances on the part of the captain.—Accounts from Toulon state that the Prince de Joinville embarked at that port on Tuesday in the "Belle Poule" frigate, of which he is commander, for the purpose of joining the squadron under Admiral Hugon.—A letter from Lyons states that the Chamber of Commerce of that city had received a communication from the Minister of Commerce announcing the intention of the Government of the United States to levy the import duty on French silk hereafter by weight instead of *ad valorem*, as formerly.

The Fortifications.—The Journals state that Paris is gradually becoming a fortified town of the most formidable kind; that on the exterior it is enclosed with bastiles and loop-holed bastions, and that in the interior the barracks are daily multiplied. It is added that the Municipal Council and the Minister of War have agreed to convert the former oil stores in the rue de Pontoise and the military storehouse in the rue Cherche Midi into barracks, the first for the municipal guard, and the second for troops of the line.

Algeria.—Government received on Sunday, by telegraph from Toulon, a despatch from Algiers, dated the 15th inst. It was from the Governor General, and stated that the last manœuvre in the Atlas had obtained the submission of the tribes of Beni Sala, Mouzaia, Beni Messaoud, Soumata, Beni Menad, and Chenôua, and all the Hadjoutes; that the division of Oran was on its march to descend the Chelif; and that the division of Algiers, formed into three columns, was preparing to move.

SPAIN.—We have received intelligence from Madrid by telegraphic despatch from Bayonne to the 17th inst. The long continued Ministerial crisis appears to have terminated, and a Cabinet has been formed under the Presidency of Gen. Rodil as follows: Gen. Rodil, Minister of War and President of the Council; Almadova, Foreign Affairs; Zumalacarregui, Justice; Ramon Calatrava, Finance; Capaz, Marine; Torres Solanet, Interior. The Chambers were not to meet before the 20th inst. Apprehensions appear to have been entertained that some rioting would take place in Madrid on the 13th inst. on the occasion of a bull fight; but the spectacle, which had attracted a number of spectators, passed off without any disturbance. The "Patriota," Ministerial organ, announces that the Government has signed a contract with the bank of San Ferdinando for a loan of 15,000,000 reals, destined to the payment of the next half year's dividends of the Three per Cent. Debt, both home and foreign. A courier extraordinary had been dispatched with different remittances, among which were 7,000,000 reals placed in the Bank to the order of Messrs. Rothschild of London, by the representative of that house at Madrid. It was rumoured in the Capital that the Duke of Lucca aspires to the hand of Queen Isabella, and that he is supported by the Courts of Paris and Turin. The Journals state that 4,000 troops are about to arrive in the neighbourhood of Madrid, as a reinforcement to the already numerous garrison of the Capital.—Accounts from Barcelona inform us that an insurrectionary movement took place in that city on the 16th inst. The mob attacked the prisons with cries of "*Viva la Republica!*" but were dispersed by a charge of cavalry. The latest accounts inform us that tranquillity had again been entirely restored in the city. It is stated that certain demonstrations of a disposition to disturb the peace of the country had manifested themselves throughout the province and in the administration. The Carlist bands were becoming more numerous, and had appeared in the neighbourhood of Barcelona. It is also said that a society of 5,000 Republicans had been formed in Lamperdan, having for its leader Abdon Terrados, who was ill at Perpignan. Accounts received from Figueras, in Catalonia, of the 17th inst., inform us that an outbreak had taken place in that town, and that the Republic had been proclaimed. It appears, however, that it did not assume great importance, and was easily suppressed by the authorities. In our two last Numbers we inserted two letters, stated by the "Times" to have been written by the ex-Queen Christina to Don Carlos. In the Royalist print, the Paris "France" of Saturday, Senor Zumarez, Don Carlos's Secretary, has, by order, it is said, of his master, addressed a letter, dated Bourges, June 14, declaring that the letter inserted in the "Times," and said to have been sent to Don Carlos by Queen Christina on the 14th March is an unfounded invention, and that the Prince "has never up to the present moment charged any person with a message of any kind for his august sister-in-law, who, on her side, has manifested the same reserve."

PORTUGAL.—The Lady Mary Wood from Lisbon reached Southampton last night. The election of delegates from the parishes to form the provincial colleges, by which the deputies of each province are nominated, appears to be the chief subject which occupies public attention. The returns for one or two provinces are variously given by the organs of different sides, but no doubt seems to be entertained that the Septembro-Miguelite coalition had been completely defeated. The province of Alentejo, which returns ten members, was the only province in which there appeared a probability of bringing in any of their own partisans. Estremadura sends 24 deputies, and as the Government majority among the parochial delegates is comparatively a small one, it is understood that the coalition will support such candidates of Chartist principles who could not be considered partisans of the existing Government, and thus endeavour to divide the Chartist votes. It is expected that the great majority of the new Chamber will be Chartists, but the proportion of members likely to prove decided partisans of the present administration appears to be still uncertain. Expectations appear to be entertained that some changes in the composition of the Ministry will take place. The company of Queen's Archers, of which the Duke of Palmella is captain, had voted in favour of the opposition candidate in one of the Lisbon parishes. It is understood that the Government has decided upon not allowing the demands lately raised by their plenipotentiary, the Duke of Palmella, referred to in our last, from finally preventing the signature of the commercial treaty, should they not be acceded to by the British Government. The Portuguese commission on the Tariff had presented a report; and an English commission of three members, two from the cotton and one from the woollen trade, was about to be appointed to consider it. M. de Varennes, French Minister at Lisbon, came passenger by the steamer that brought these advices, on his way to France. There was a report at Lisbon that he was likely to be sent as Minister to Madrid. The Indus, British line-of-battle ship, had sailed from Lisbon for the Mediterranean.

GERMANY.—The journals inform us that a great meeting of kings and potentates will take place on the Rhine in autumn; and that the Emperor of Russia will attend.—Accounts from Berlin inform us that his Majesty will set out on the 20th or 21st inst. for St. Petersburgh. During the King's absence the Queen will be at Dresden, where her sister, the Princess John, is said to be still in indifferent health. The King has recalled Count V. Donhoff, Prussian Minister at the court of Bavaria, and appointed him to the post of his Majesty's Plenipotentiary at the German Diet. His Majesty has granted the request of the Minister, Von Schon, to retire from the post of Chief President of the province of Prussia. Private letters from Berlin state that a police ordonnance, interdicting smoking in the streets and public promenades in that capital, produced on the 8th inst. a scene of great disorder. Several persons, it seems, had been arrested and punished for not attending to this injunction, and on the day above mentioned some people, who were smoking near the Hamburgh gate, were also taken into custody, upon which the populace assembled, and rescued them. A reinforcement of the guard was sent for, and these were assailed with stones and other missiles, which was continued until a stronger military force was called in, which soon cleared the streets, and tranquillity was again restored.—A fourth volume of the Collection of Poems, written by the King of Bavaria, has just been published at Munich. It is composed of fugitive pieces, chiefly written in Italy.

HAMBURGH.—Accounts from this city, dated the 17th instant, inform us that the first meeting of the Senate and citizens since the fire took place on the previous day. The Senate proposed the following measures for the consideration of the citizens:—1. The appointment of a commission, consisting of 19 members, 5 of the Senate and 14 of the citizens, for one year. 2. To contract a loan, not exceeding 32 millions of marks banco, to make good the loss sustained by the insurance fund; to pay the interest and principal of this loan, an extraordinary insurance-tax of 1 per cent. per annum, to be paid on the present insurance. All the loan shall be paid off. 3. To fix on a plan for rebuilding the part of the city that is destroyed. 4. To make some regulation respecting the building of the burnt quarters. 5. That the commission, the appointment of which is proposed to depute two of its members to the existing "Board of Relief," and also to agree with the Senate on the principles according to which the funds shall be applied. The Assembly of the citizens agreed to Art. 1 in every point. Art. 2. They approve the loan, but do not approve of part of the means proposed for the repayment. They fully approve of the remaining articles. Among the recent donations for the poor of this city, is one of 10,000 marks banco from the King of Sweden. The Hamburgh papers state that the number of ships that passed the Sound in May, 1842, was:—From the North Sea, 971; from the Baltic, 914: in all, 1,885. Of these there were 410 English, viz., from the North Sea, 248, from the Baltic 162.

Holland.—The papers inform us that the village of Wasserbillig, situated at the conflux of the Sure and the Moselle, in the Grand Duchy of Luxembourg, was destroyed by fire, the church included, on the night of the 11th inst. Only five houses remain standing.

Belgium.—Accounts from Brussels, dated the 16th inst., inform us that the King and Queen, who have since left for London on a visit to her Majesty, received on that day a deputation from Liege, which had proceeded to Brussels to solicit their Majesties to be present at the opening of the railway. Their Majesties promised the deputation that they would honour the *fêtes* with their presence on their return from England. On the 15th inst., M. Dermanet de Biesone, brother-in-law to General Vandermeere, sent to the King his resignation of his seat in the senate. It seems that for several nights lately, strong patrols have traversed various parts of the city in all directions; that some of the principal military posts have been doubled; and that numerous police-officers have also been on duty. It is supposed that these measures have been adopted on account of the rejection of the appeal of the persons condemned for the recent conspiracy. The tranquillity of the city, however, has not been at all disturbed. The journals state, that in a cabinet council on the 14th inst., at which the King presided, the punishment of death, pronounced against Vandersmissen, Vandermeere, Van Laethem, and Varpraet, has been commuted to that of hard labour for life, which, however, includes public exposure in the pillory.

Italy.—The journals inform us that a convention has been agreed on between the French and Neapolitan Governments for the transmission of passengers and letters direct from Marseilles to Naples. The conveyance of letters between those two cities now requires eight days, but by the new arrangement it will be performed in five. The estafettes which ran between Naples and Marseilles during the reign of Joachim Murat performed the distance in five days.—A railroad from Florence to Naples, by the Maremma and Civita Vecchia, is said to be determined on at the suggestion of the Tuscan Government.

Russia.—Intelligence has been received from St. Petersburgh announcing the death of the distinguished diplomatist Count Matuschewitz, which took place in that capital on the 2d inst., of dropsy of the heart.—Accounts received from the Polish frontier inform us that Prince Czernitscheff himself will take the command in chief of the army in the Caucasus, to make an effort to overcome, with a great superiority of force, the insurgents of Circassia and Abchasia. The contest, as it has hitherto been carried on, appears to have been too protracted, and to have cost the Russians too much blood, without any corresponding advantage. Although they have always been victorious in the summer, they have regularly lost every winter by surprise several of the forts erected in the extreme line of operations, and at the opening of every new campaign they have had to employ much time and labour to recover their position of the previous year; and although they have certainly succeeded in confining the mountaineers within narrow limits, it appears to be the general opinion that if the same system of operations were continued, the war might still last several years. Two circumstances are supposed to have led to the resolution to endeavour to end the war at once by the employment of great masses of troops—the state of affairs in South Asia, and the death of Guz Bey, the most dangerous of the Circassian chiefs. The present chiefs, Mansor and Tschannazare, are said to be at variance, so that the present appears to be considered a favourable opportunity to subdue them. Accounts from South Russia state that there is a great movement of troops, who seem to be confident of success. Meantime, to prevent the mountaineers from receiving any supplies of arms and ammunition, Russian ships strictly blockade the whole coast from Sinops, the seat of the English agents, to Anapa, Ickaterinodar, Kawkaskaja, and Stawropol, on the right bank of the Kuban. The Leghrans on the right bank of the Terek are no longer dreaded, but the Abchasians are said to have collected in the neighbourhood of Sochunkule.—The St. Petersburgh journals contain at length the ukase issued by the Emperor, dated the 7th April, for the suppression of the slave trade.

Turkey.—Accounts received from Malta dated the 12th inst., inform us that a steamer had just arrived, having left Constantinople the 11th inst. She was said to have brought an important despatch from the Ambassador, which had been forwarded to England by the Vesuvius to Marseilles. The greatest secresy on the subject was maintained, and no particulars respecting it could be ascertained; but it was believed that this despatch announces the settlement of the Syrian question. The despatch has been received by Government, by special express from Paris; but its contents have not been published. Private letters have been received from Constantinople dated the 1st inst., which throw some light on the probable nature of the despatch. They state that the ambassadors of the five great Powers had a conference with Sarim Bey at the Foreign-office relative to the affairs of Syria, on the 27th ult. It is said that the Ambassadors having proposed to Sarim Bey that the ancient order of things should be re-established in Syria, and that the Schaschah family should be restored to the sovereignty, Sarim replied, that the tranquillity of Syria and the general peace of the country would be infallibly compromised if matters were restored to their former footing; that the British ambassador complained in warm language of the want of good faith of the Ottoman Government in this affair; on which Sarim said that the Porte would not adopt any definitive resolution on the subject, but would refer it to the ambassadors to take the state of affairs in Syria into consideration.—M. Bourqueney was about to leave Constantinople, to be replaced by Count de Pontois.

United States.—By the arrival of the British Queen steamer at Southampton on Thursday we have intelligence from New York to the 7th inst. The British Queen performed the passage in fifteen days. She reports the existence of unusual quantities of ice in the Atlantic. On the 12th inst. in latitude 42 38, and longitude 52 45, the thermometer suddenly fell from 60 to 48, in consequence of her being in the vicinity of great masses of floating ice, which she was continually passing during that and the following day. There is not much news in the New York journals. Private letters, referring to Lord Ashburton's mission, state that the Commissioners from Maine and Massachusetts had passed through New York for Washington, there to settle the treaty about the Maine boundary, and Mr. Webster had left for Washington on the same errand. They add that all the points of this treaty required by Mr. Webster were acceded to some time since by Lord Ashburton except one: and that on this one point his Lordship had received such special instructions from his Government as to enable him to grant all that the United States' Government asks. These letters also state that there is a point in the new treaty by which an arrangement is to be made, yielding to the Americans all that they have desired in regard to impressment and the right of search, which is to be a separate and distinct arrangement from the present treaty on this subject between England and the other European Powers. It appears to be the general impression at New York that the negotiation will end amicably, and that the friendly relations between England and America will not only not be interrupted, but even be placed on a better and more permanent basis by the pending treaty.—The Warspite, 50, Capt. Lord J. Hay, arrived at New York on the 9d inst., to receive Lord Ashburton, when his mission is concluded. Mr. Horsley Palmer, and Mr. Ricardo, had arrived in New York. The reduction of the navy appears to have caused dissatisfaction to some of the journals.—The great printing establishment of Messrs. Harper has been destroyed by fire, occasioned by an attempt to steal a copy of Mr. James's new novel of "Morley Ernstein," for the purpose of publishing a pirated edition.

Van Diemen's Land.—We have received Hobart Town papers to the 4th Feb. Few questions have ever excited so great a sensation throughout the colony as the sudden suspension of Capt. Montagu from the office of Colonial Secretary, and the appointment of Mr. Boyes in his room; the announcement of which appeared in the "Colonial Gazette" of the 2nd Feb. A long account is published in the Hobart Town paper, "the Courier," on the subject of the probable causes that led to this rupture between the Lieut.-Governor, Sir John Franklin, and Capt. Montagu. It appears that Sir J. Franklin charged the latter with general disrespect towards him on several occasions, but more particularly on account of his having countenanced and lent his support to a local paper which, though originally made the organ of Government, had lately published some articles highly disrespectful to his Excellency. A letter on this subject had previously been written by Sir John's private secretary, Mr. Henslow, to Capt. Montagu, which the latter, from some expressions in the letter leading him to regard it as a strictly private communication, answered by declining his interference in the matter. This correspondence was afterwards communicated to Sir J. Franklin, and seems to have been the principal cause, among others of less importance, that led to the misunderstanding which terminated in Capt. Montagu's dismissal. Feb. 1st was the day fixed upon for Capt. Montagu to give up his post; and in the mean time he informed the Lieut.-Governor that he was unconscious of having been disrespectful, and assured him, upon the honour of a gentleman, that he never intended anything of the kind, requesting to be informed what were the passages in his correspondence, and the parts of his conduct, which were considered in that light; and adding, that before so strong a measure was taken against him, he ought at least to have had the opportunity of explaining. It is further stated, that this opportunity was then afforded him by Sir J. Franklin, who, after hearing them, admitted that his explanations were satisfactory, but that he felt he could not carry on his government to his satisfaction with Capt. Montagu as Colonial Secretary, as he was of opinion that during the last three months the public business had been impeded; at the same time, he bore testimony to Capt. Montagu's talents and usefulness in office under any Government excepting in Van Diemen's Land, and stated that he should so report to the Secretary of State. Capt. Montagu then forwarded another communication to the Governor, stating that he had never received any communication, nor had any grounds to imagine that the Governor had been dissatisfied with the management of the public business at any period during the last three months. He assured Sir John that there was no evidence of the public business having been impeded, either in the Colonial Secretary's, or in any other department of the Government; and that he had been suspended from his office without any caution, without notice, and without being heard. He also remarked, that during the period referred to by the Lieut.-Governor, he had received his thanks in the Executive Council for his public conduct, and that those thanks had been repeated in an official document in the Colonial Secretary's Office within the last three weeks. Here the correspondence terminated; and Mr. Boyes having received a commission from the Lieut.-Governor, appointing him Colonial Secretary, Capt. Montagu gave up the office, and has since taken his departure for England. Considerable sympathy appears to be felt by the public for Capt. Montagu, and a meeting had been held in Hobart Town for the purpose of presenting him with a service of plate.

India.—By a telegraphic despatch, communicated from Marseilles to Paris, published in "The Times" of Tuesday, intelligence has been received that an English packet-boat has arrived at that port from India with despatches for the English Government. A British officer, who came passenger by her, started immediately on her arrival for London. This mail is said to have brought no news.

Cape of Good Hope.—We have received papers from this colony to the 23rd April. They are chiefly occupied with the discussion of the "border policy," some alarm having spread through the colony on account of movements observed among the Caffre tribes. It appears that besides the depredations of the aborigines having increased to a great extent, they have exhibited symptoms of restlessness which leads to the belief that they meditate a descent upon the frontier districts. It is asserted, that with this view they have collected strong forces, that they have had consultations on this subject, and that it had been determined among them, that the period of the occupation of Natal by the Government troops would, as it had attracted the greater part of the military force of the colony to a distant point, be the most favourable opportunity for the execution of their enterprise. The subject appears to have created a good deal of anxiety and alarm in the colony. The Lieut.-Governor had protracted his stay at Fort Beaufort. The chief Taylia was dying under a pulmonary attack, and the Lieut.-Governor's presence there was considered necessary to subdue any refractory feeling when the chief's dissolution took place. At Fort Peddie and Mancazana, the fears of the farmers on the subject of a Caffre war appear to be very general, and they were, in strong terms, asking protection for their lives and property. A communication has been received from Fort Peddie stating that guns of a superior description had lately found their way into Caffreland, and that a great many of them were already in the hands of the Caffres, who have found that the common musket soon gets out of order. The report adds that at a late meeting of Pato's and Kama's people to settle a dispute, not less than 500 guns were mustered. Another fact, mentioned as corroborative of the supply of ammunition among the tribes, is, that two Caffres had been killed on the spot by the accidental discharge of a quantity of gunpowder. In the meantime news had arrived from the Umzimvoobo, that the troops on their march to Natal had passed over that river all well. The last accounts from the Natal emigrants were that they had decided on settling the question in a pacific manner, those who had wished the contrary having been forced, by the majority against them, to resign their temporary power. At the Cape local improvements were making way; a road across the Cape Flats was to be constructed, to increase the facilities of traffic and otherwise render that part of the suburbs available for business. The master and four of the crew of the Georgia, bound to London from Calcutta, destroyed by fire at sea some time since, noticed by us in a former number, had arrived in Algoa-bay, having been landed from an open boat on the Caffreland coast, 300 miles further eastward. They had been five days without water and food, save about a dozen pumpkins and a few heads of Indian corn. Intelligence has been received from Cape Town from Lord Saltoun, commanding the reinforcements now on their voyage to China. The letters are dated March 17. On the 9th Feb. the squadron had experienced a heavy gale of wind, with thunder and lightning, and parted company with the Apollo troop-ship, but they afterwards fell in with her off the little island of Tristan d'Acunha. The troops are stated to be all in good health.

Parliament.

HOUSE OF LORDS.

Saturday.—The royal assent was given by commission to the Sugar Duties Bill, the Pentonville Prisons Bill, the Witnesses' Indemnity Bill, the Fines and Recoveries Bill, the Capital Punishments (Ireland) Bill, the Civil Bill, the Decrees Bill, and several Railroad and other private Bills. Several other Bills were forwarded a stage. The remainder of the sitting was devoted to hearing arguments on writs of error.

Tuesday.—Lord Clarendon presented a petition from the inhabitants of the Cape of Good Hope, praying that the government of that colony might be in some degree assimilated to the free institutions of the mother country.—Lord Ripon pointed out the difficulties of engrafting a representative system upon a population of mixed origin, and of such conflicting habits, as that of the

Cape, and was supported in this view by Lord Brougham. Lord Howden, however, maintained the right of the colony to a constitution.—After some further conversation, during which the Earl of Ripon stated that the subject is now occupying the attention of the Secretary for the Colonies, the subject dropped.

Their Lordships then passed to the order of the day for the third reading of the Property-tax. The Marquis of Clanricarde opposed it. He said, the more time he had had for reflecting upon this bill since the last discussion, the stronger was his conviction that it was a measure which ought not to pass. It might be said, that at this stage it would be improper for this House to reject the bill. That was an argument which could be suggested only by a weak Government. That House did not sit to register the edicts of the House of Commons. He hoped that, from a due sense of the dignity and independence of this House, such an argument would not be urged. He contended that the bill was obnoxious to the nation, degrading to the character of the people, and repulsive to their feelings. He concluded by saying that the Government measures, so far from relieving the distresses of the country, would rather increase them. Government, in dealing with the financial difficulties of the country, had merely endeavoured to ascertain how easily they might obtain money, neglecting to provide a permanent remedy for the evils under which the nation suffered. He begged to move that the bill be read a third time that day three months.—The Earl of Wicklow regretted that Ireland had not been included in the operation of the measure. He wished to see similarity of legislation, similarity of taxation, and similarity of benefits, existing in both countries; and when such taxes as this were imposed, he was desirous of seeing them applied to Ireland, because he wished to see that county fit to bear them.—Earl Stanhope said he would support the amendment. He was decidedly of opinion that the measures of Government were most detrimental and destructive to the agricultural interests of the country, and he could not give them his support. When the new Tariff was brought before the House, he would consider it his duty to vote for the rejection of that measure also.—Lord Beaumont expressed his intention of voting against the amendment, and was followed by

Lord Fitzgerald, who strenuously asserted the necessity of the tax proposed by Government, from the exhausted state in which, when entering on office, Ministers had found the national finances. He concluded by saying that the advisers of the Crown had preferred a property tax to any measure of a merely speculative character—they had preferred it to any transitory or uncertain scheme of temporary finance. It was believed that they had done so with the full approbation of that as well as the other House of Parliament; and they felt that they had not deceived themselves when they reckoned upon being supported by men of property with the same spirit which their ancestors displayed in times of similar financial difficulty.

Lord Monteagle entered into a lengthened defence of his own financial administration, and contended that no necessity had been made out for such a measure. In opposing this property tax, he said he did so on the same principles on which he had opposed it when he had the honour of being a Minister of the Crown, because he thought it unwise, unjust, and that it would be ineffective.

The Earl of Ripon defended the Government measure. He said that the question was a very simple one; and all the arguments of the noble Lords who had addressed the House against this measure resolved themselves into this question—"Is there or not a case of financial necessity to justify it?" Government did not dispute that the property tax must be liable to very grave objections, and he had stated that it was only to be justified by very strong necessity. He concluded by saying that he considered it was the duty of their Lordships to adopt the bill now before them, with a view to meet the present emergency.—Their Lordships then divided, when the third reading of the Bill was carried by a majority of 70: the numbers being—For the amendment, 28; against it, 98. The Bill was then read a third time and passed.

Wednesday.—The royal assent by commission was given to the following bills:—the Property-tax Bill, the Australia Waste Lands Bill, the Metropolitan Wooden Pavement Company Bill, the Ferrybridge and Boroughbridge Road Bill, the Charter-house Estate Bill, the Britwell Salome Inclosure Bill, and the Kilmington Inclosure Bill. The commissioners were the Lord Chancellor, the Earl of Shaftesbury, and Lord Wharncliffe.

A number of private bills on the table were advanced a stage.—On the motion of the Earl of Shaftesbury, the Commons' amendments to the Justices Jurisdiction Bill were agreed to.

Thursday.—The House sat for a short time only, on appeals, and advanced two private Bills a stage.

Friday.—The Marquis of Londonderry presented a petition from the coal owners of Durham, &c., against hasty legislation on the employment of women and children in coal mines. He denied the statements of the Commissioners, and said that "the children were as happy as the day was long, and no young class of workpeople were so jolly and so joyous."

The Duke of Wellington, in reply to the Earl of Belhaven, said that Government had prepared a measure with the view of settling the questions at issue in the Church of Scotland, but had abandoned it on finding that it would not satisfy both parties. Government, however, would still give their attention to the subject.

The Copyright Bill was read a third time, and passed.

HOUSE OF COMMONS.

Saturday.—The House was occupied in considering the Railways Bill in committee. When the order of the day was read, Mr. Hardy inquired what precautions had been taken on the occasion of the Queen's late passage by the Great Western Railway from Slough to London, and was informed by Mr. C. Russell, chairman of the company, that two carriages had been interposed between that of her Majesty and the engine, so as to obviate all risk of collision. A clause moved by Mr. Palmer, of Berkshire, empowering the Board of Trade to require fences in certain situations where railways might run near common roads, was withdrawn by its proposer, after some discussion, and an explanation from Mr. Gladstone, who stated that the particular railroad acts were sufficient for this purpose. A motion was then made by Mr. S. O'Brien, to prevent the locking of the doors of passenger carriages on the side nearest to the station. Mr. C. Russell showed, from a return of the accidents which had actually happened on the Great Western Railway, that they had almost all occurred to persons jumping in and out while the train was in motion, and that not a single misadventure had happened in consequence of the locking of the doors.—Mr. Gladstone objected to this kind of minute legislation, and to the responsibility which it would cast upon Government in matters of which the regulation ought to devolve upon the directors alone.—Sir R. Peel thought that public opinion would supply the best control; and if there were any old ladies or ecclesiastics who were afraid of being locked up, the directors and those people might settle it between them.—The clause, on a division, was rejected by 92 against 69.

Mr. Plumptre next proposed a clause forbidding the use of railways on a Sunday, except "in cases of charity or necessity."—Mr. Macaulay asked why, when other Sunday conveyances were allowed, a prohibition should be imposed on that particular mode of travelling which caused the least exertion both to man and beast.—Other members objected to this kind of legislation, which Mr. G. Berkeley characterised as puritanical; and Sir R. Inglis concurred in recommending the withdrawal of the clause.—It went, however, to a division, and was negatived by 105 against 8.

Lord R. Grosvenor proposed a clause, the object of which was to give a controlling power over railway companies having a common terminus, or using rails in common, so that unfair advantage should not be taken or given by one company to the prejudice of another.—Mr. Gladstone, without denying that this subject, which involved important proprietary rights, was one for the adjudication of which it might be proper to constitute some tribunal, did not consider that the powers proposed could be satisfactorily exercised by the Board of Trade; and hoped the clause would not be pressed. It was brought, however, to a division, and negatived by a majority of 41 to 40.—The remaining clauses were then agreed to.

The Customs' Act Bill (the new Tariff Bill) was read a second time.

Monday.—After the presentation of petitions, Sir J. Graham intimated that it was not the intention of Government, during the present year, to interfere with the present system of English registration of Parliamentary voters, but that they would introduce a bill before the close of the present session, in the hope of carrying it early in the next session.—Sir R. Peel, in reply to Lord J. Russell, said that Government did not at present intend to interfere with the question of Irish registration.

On the order of the day for committing the Poor-law Amendment Bill, Mr. C. Buller called the attention of the House to the recent proclamation respecting the gold coin. He thought it highly unjust that the whole loss of 25 years' wear should fall on the accidental holder. That loss was a heavy one to poor individuals, but would not have been heavy to the nation at large, for the whole amount of light gold was but about 6,000,000*l.*; and the loss on this amount, according to the Chancellor of the Exchequer's own estimate of 1½ per cent., would have been only about 90,000*l.* He then cited precedents, to show that, on former recoinages, the holders of coin. depreciated merely by reasonable wear, had always been protected; but here there was no protection at all, and Government had not even adopted any sort of precaution against the evil which it was obvious would ensue. The period, too, which Government had chosen he thought was exceedingly unpropitious—a period of great public distress; and the injury inflicted on the public by this measure would be productive of more damage in a fortnight than the Tariff could compensate in a year.

The Chancellor of the Exchequer deprecated this mode of bringing on important questions. The law authorised all individuals to refuse gold coin, which was below the weight required, as a legal tender. He admitted that it would have been better if the public had been more frequently warned of the effect and operation of the law; but, passing over this, he declared that the intimations which Government had received of the evil of the depreciation of the present gold coinage required some executive interference; and they had therefore selected that seasonable moment for interference, which they believed, if neglected, would not soon occur again. Government had adopted this measure with a view of relieving the pressure on the monetary interests, which were ultimately the interests of the whole community.—After some observations from Mr. Hawes, Mr. F. T. Baring thought it his duty to declare that the time selected for this operation was a fit and favourable one; and he agreed that the loss had been properly divided between the private holders and the public revenue.—Mr. Bernal made a few remarks, disapproving of the course pursued by Government; after which,

Sir R. Peel said, that under existing circumstances no other course was open to the Executive than the one they had adopted. It was a matter in which to have given notice, directly or indirectly, to any man or set of men, would have been a great injustice to the public. Ministers would have been much to blame if, after the numerous representations made to them from the highest authorities, of the growing evil of depreciation, they had not availed themselves of a season of favourable exchanges to correct it. It was now said that the Treasury ought to have borne this loss. The Treasury was to bear that part of the loss which would arise from the re-coinage; but the loss on the depreciation was not improperly borne by the public. Any other course taken to remedy such an actual evil would have led to a positive depreciation of the coinage more severe than that which now existed, and which, by providing a market for "clippers," and other depreciators of the coinage, would have materially enhanced the grievance felt by the public. There was no safe protection against so profligate a waste of public money, but the sort of direct and sudden proclamation which had been issued in this instance.

Mr. Hume approved of the course adopted by Government, but was of opinion that they might have obtained their object with less loss to the commercial and trading classes, who were suffering severely from the effects of the proclamation.—Capt. Berkeley complained that light sovereigns had been paid by Government to the men in one of the dockyards since this very proclamation.—Sir G. Cockburn doubted the fact, which he said appeared to be contradicted by accounts from the Admiral on the spot. After some further conversation, in which Lord Ebrington and Messrs. Attwood and Turner joined, the subject dropped.

The motion was then put for going into Committee on the Poor Law Amendment Bill, on which Col. Sibthorp recommended the total cessation of the Poor Law Commission, and the transfer of its powers to the Poor Law Guardians, controlled by the Home Secretary. With the view to take the sense of the House on this vital point, he would move that the bill should be committed on that day three months.—Mr. Wakley supported the amendment at great length. He believed that any obstacle to the progress of the bill would be a benefit, for the bill was calculated to sow the seeds of revolution in the country. He opposed the bill on the various grounds of its unconstitutional nature, its despotic powers, its inhumanity, and its tendency to destroy the liberties of the people of England. Both of the great political parties, the Tory and the Whig, were responsible for this measure, against which the entire country prayed.—Lord Courtenay was induced, by the experience of several years, during which he had acted as a guardian, to give his cordial support to this bill. The present system was not justly appreciated without some reference to the evils of that which had preceded it; those evils it had effectually removed.—Mr. Lawson strongly opposed the bill.—Sir R. Peel declared that the measure was the measure not of any individual, but of her Majesty's Government. He was not a member, but an opponent of the Government which originally proposed this measure; and, in supporting it in this matter, he had seen nothing to change his opinion during the interval. He then read an official report made by Commissioners, among whom were the Bishops of London and Chester, setting forth the wretched and vicious state of the country workhouses in general before the new law, and the London workhouses, for the most part, were no better. If Government had wished for a little popularity, they might have now proposed the discontinuance of the Commission; but they believed that the Commission could not be safely superseded in less than five years. It would require that time to mature the contemplated improvements; but it would not at all follow that the Commission must be made a permanent one. He was convinced that the vices of the old system were too inveterate to be otherwise rooted out, and he, therefore, should give his cordial support to the bill before the House. The House then divided, and the amendment was rejected by 219 to 48.

Mr. Ferrand, after some observations, moved the adjournment of the debate for a week.—Mr. Fielden seconded the motion; warning the House against granting the unconstitutional powers proposed to be perpetuated by the bill to the Commissioners.—Mr. Mark Philips supported the bill, and attributed much of the resistance against it to the vanity of guardians unable to brook the control of a superior authority.—Sir J. Graham called in question some statements by Mr. Ferrand, relative to the conduct of the guardians of the Keighley Union, which he said he was quite willing to submit to the investigation of a select committee. After some further debate, a division took place, when Mr. Ferrand's motion was lost by 255 to 18. Some further discussion ensued, and the bill went into committee *pro formâ.* The other orders of the day were then disposed of.

Tuesday.—After the presentation of several petitions, some conversation took place on the subject of the coinage, in the course of which Mr. Gladstone stated that the extraordinary demand for silver coin had arisen from the discredit of the half-sovereigns. This would be speedily remedied by a new issue of the latter description of coin.—In reply to Sir C. Napier, on the subject of Capt. Warner's invention, Sir R. Peel said he had offered to refer the subject to Officers to be appointed by the Master-General of the Ordnance, and that the public should bear the expense of the experiments. It was necessary that Government should proceed cautiously in affairs of this sort, as there would not be a guinea left in the Treasury if the claims of every man should be implicitly acknowledged who thought he had made a valuable discovery.

On the motion of Lord J. Russell, the Bribery Bill was read a second time *pro formâ*, with an understanding that the discussion should take place in committee on Tuesday next.

Mr. Ward, pursuant to notice, then brought forward his motion on the subject of the ballot. He enlarged on the bribery practised at the last general election, which he admitted to have been quite as widely and grossly perpetrated on his own as on the opposite side of the House. But bribery was not his only complaint; influence and intimidation were still greater evils; and through these means the tenantry of England were now sunk into a state of slavery. He believed the ballot would get the better of all this mischief, and cure what the law could not reach. He concluded by moving, "That, in all future elections for Members of Parliament, the votes be taken by way of ballot."—Mr. H. Berkeley seconded the motion. He said, the evil, as proved to exist under the present system, was too great to allow a possibility that any statement of it could be an exaggeration. Ballot was the proper cure for it; and how could that resource be objected to as un-English in a House, 500 of whose members belonged to clubs employing the ballot box? In all elections there were screws. The hop-merchant was the screw on the brewer, the corn factor on the corn-grower, the cheese-factor on the dairy farmer; but the great screw of all was the banker screw. He then entered into some details respecting the late elections in support of his arguments, and concluded by saying he should give the motion his decided support.—After a few remarks from Capt. Layard and Mr. Christie, in support of the motion, Mr. Granville Vernon spoke on the opposite side. He believed that the generality of voters would disdain the proposed disguise, and be forward in publishing their votes.—Capt. Berkeley desired to justify himself for now voting in favour of ballot, which in former sessions he had resisted; but Lord John Russell on introducing the Reform Bill, had stated one of the main objects of that bill to be the diminution of bribery; whereas the actual effect of the Reform Bill had been enormously to increase it. He now saw no other remedy than the ballot.—After some remarks from Capt. Bernal, in favour of the motion, Mr. Milnes admitted the advantage afforded to the advocates of ballot by the recent exposures; but yet he believed that fewer votes were bought with hard money at the last than at any former severe struggle. He did not believe the ballot would operate against the higher classes, but he objected to it in principle; and the few persons who had a disposition to punish electors for their votes, were, in his opinion, quite as likely to indulge their violence upon suspicion as upon positive knowledge.—Mr. Ponsonby advocated the ballot as a barrier to ulterior changes.—Mr. Byng opposed it. He thought it would injuriously alter the character of the House. Besides, true Englishmen would never be able to conceal their votes; for they were bred to truth, and they could not disguise it.—Mr. M. J. O'Connell supported the motion, and Lord J. Manners opposed it, observing that he was convinced that the nation did not desire the ballot.—Mr. Sheil was anxious to have it understood that there had been no engagement on the part of Lord Grey's Ministry at the date of the Reform Bill to exclude the ballot throughout all time to come. On the contrary, it had been expressly arranged among those Ministers, and it was announced by them to Parliament, that on this subject no final decision was then to be taken by that Cabinet. Lord Althorp, Lord Wharncliffe, and others, had then predicted that the effect of the Chandos clause would be to create a demand for the ballot. Lord Stanley himself had also then declared that if, after that enactment, a few leading gentlemen of a county should meet and agree upon a candidate, there would be little doubt about the result of his canvas. Intimidation thus became the great evil to be remedied. He denied that the ballot would diminish the influence of property, or that it would produce hypocrisy and breach of faith. In general promises would be kept; and if extorted ones were broken, the sin of the breach was not greater than the sin of the extortion. It was urged that the ballot was un-English! No doubt duplicity was un-English, but tyranny was un-English too. But public opinion was relied on as a sufficient check. Now, public opinion had declared itself against bribery, but against intimidation there was no effectual exhibition of feeling; and your great men openly claimed their right to do as they pleased with their own. For this the only redress was the ballot, and he besought the House to adopt it.

Sir J. Graham gave some explanations of the views entertained by Lord Grey's Government on the subject of the ballot, and quoted a declaration of Lord Althorp, who, though individually favourable to ballot, opposed Mr. Grote's motion for it, on the express ground that the Reform Act had been introduced by Lord Grey's Cabinet as a final measure. That declaration it was which gave birth to the modern word "finality." He denied that the ballot would be a barrier to ulterior changes; on the contrary, when the people at large should be precluded from seeing the way in which that trust was exercised, they would loudly demand admission to exercise the franchise for themselves. He would repeat that the ballot could afford no useful protection. There were other passions besides fear of tyranny—there were envy, revenge, hatred, and all the bad feelings which connected themselves with cowardice. He felt deeply on this subject, and he trusted the House would concur with him.

Mr. Murphy supported the motion, and was followed on the same side by Mr. O'Connell, who said that when all undue influences should have been abolished by the ballot, there would be but one influence for ambition to rise by—the influence of character. The present discussion would at least evince that a majority of this House thought so modestly of their own merits as to decline such a test.

Lord J. Russell said that his recollection did not materially differ from that of Sir J. Graham respecting the discussions which had taken place among the members of Lord Grey's Government. He had himself at that time, as he had also subsequently, opposed the suggestion of ballot. He had stated to Parliament, and therein he had differed from Lord Althorp, that he considered it open to the late Government to go beyond the Reform Bill, should such ulterior measures become expedient for the state. But he felt serious objections to the present proposal. It would prevent the detection of bribery; and it would aggravate the dissatisfaction of the non-electors. The very Chartists had declared against ballot, unless accompanied by the other measures which they required. What other measures the proposer of this motion contemplated were not apparent; but it was apparent that he contemplated some; and the House, until they should know what these were, would not properly judge of the proposal before them. This he knew, that the logical, natural, and necessary consequence of ballot would be an extension of the franchise. His Lordship then referred to the effects of the ballot as exhibited in other countries, from which he concluded that it would prove inefficient, and, in many respects, highly objectionable in our own. He concluded by saying that, at all events, before he would vote for such a change as this, he must have before him the entire plan of its proposers. To the present measure he would again, as before, record his decided opposition.

Mr. Wakley endeavoured to show that ballot would not lead to an extension of suffrage.—Mr. Ward briefly replied, and the House divided, when there appeared—Against the motion, 290; for it, 157: majority against the ballot, 133.

Upon Mr. Roebuck's motion, Mr. W. Miles and Sir W. Heathcote were discharged from their attendance upon the Election

Compromising Committee, Mr. E. Yorke and Mr. W. Patten being added in their room. The other orders were then disposed of.

Wednesday.—After the presentation of several petitions, the Chancellor of the Exchequer stated, in reply to Mr. Hume, on the subject of the present reported deficiency in the supply of the silver coinage, that it was not quite three weeks since representations had been made to him, by persons most competent to judge of the matter, that there was an excessive quantity of silver, and Government was applied to to take some of it out of circulation. He had, therefore, no reason to apprehend that there would be so soon a deficiency in the supply. That day, however, it had been represented that there was a deficiency, and application was made to Government to supply it. Government, accordingly, would adopt such means as were in their power to procure, at the earliest period, an additional supply. He might further state, that there was an ample supply of gold coin to replace what might be taken out of circulation, and he hoped that would, as far as possible, abate the necessity of adding to the silver coinage.

Several bills were forwarded in their respective stages. On the motion for the Speaker's leaving the chair, on the order of the day for the committee on Lord Ashley's bill respecting mines and collieries, Mr. Scott (of Walsall) made a statement, tending to show that, as far as related to the collieries of Staffordshire, there had been some exaggeration and misapprehension about the apprenticeship of lads, and the hardships endured by children. He was desirous that the legislature should at present pass only that part of the bill which prohibited the employment of females, postponing the other clauses till a future session.—Mr. Aldam wished for a fortnight's delay, which was opposed by Mr. Ward.—The House then went into committee, and the first clause, prohibiting the employment of females, was passed without opposition.

On the clause limiting the employment of boys, Lord Ashley said that, in pursuance of an arrangement made with several experienced and humane persons representing the mine owners, he should propose a modification, lowering the minimum age from 13 to 10, but providing that the boys under 13 should work but three days a week.—Mr. Hume wished for some enactment making it compulsory that the three off-days should be devoted to schooling.—Lord Ashley wished to see such a devotion of time; but feared it could not be at present made compulsory, inasmuch as there were not yet sufficient schools in existence.—After a few remarks from Messrs. Lambton, Hardy, and Bell, Mr. Ainsworth said, this clause would throw many of the thin mountain mines of Lancashire out of employ, and he hoped Lord Ashley would reconsider this proposal.—Mr. Protheroe regretted that Lord Ashley had assented to any reduction of the age below 13; and protested against compelling boys to go to school at all on the working days.—Col. Rolleston, Messrs. Walker, Brotherton, V. Smith, and others, maintained for some time a discussion respecting the relative merits of the daily and of the alternate system.—Lord Ashley said, it would be impracticable to make exceptions of particular districts, or to entrust parents with any discretion in the employment of children.—The clause was then carried as proposed by Lord Ashley.

Mr. Villiers doubted the necessity of the clause forbidding apprenticeships. It was necessary, he said, that in some way the workpeople should learn their business.—Messrs. Bell and Protheroe bore their testimony that no such practice existed in the collieries of Northumberland or Gloucestershire.—The clause was carried; as was also the clause requiring that the charge of all engines for lowering or raising the workpeople into or out of the mines, should be entrusted only to adults.—The other various clauses of the bill having been agreed to without alteration, the report was ordered to be brought up on Friday.

On the report of the Sudbury Disfranchisement Bill, Mr. Blackstone moved that it should be recommitted, in consequence of an error in the service of the requisite notice to the returning officer.—Mr. Redington opposed the motion, which, after some conversation, was negatived by a division: the numbers being 48 to 19.

The other orders of the day were then disposed of.

Thursday.—Mr. O'Connell, pursuant to notice, moved that the committee of inquiry into corruption at Belfast be empowered to appoint an agent to each party.—Sir R. Peel opposed it; and after a short conversation, the motion was withdrawn.

Mr. H. J. Baillie, pursuant to notice, moved for copies of the correspondence of Sir A. Burnes with the Governor-General of India during his mission to Cabul, in the years 1837 and 1838, with other documents connected with the occupation of Affghanistan. Mr. Baillie spoke at considerable length in support of his motion, the object of which was to elicit information on the subject. He condemned the occupation of Affghanistan as a great political mistake, an opinion which, he affirmed, was a universal one; and expressed what he considered to be a general sentiment, that it would be a fortunate circumstance if we could withdraw our troops from that country without a stain on our national honour and lowering our military reputation. But though strongly condemning the conduct of the Indian Government in entering on this war, and deprecating the circumstances attending it, he admitted that there was now a necessity for maintaining our honour and our reputation, if we wished to maintain our Indian empire.—Mr. D'Israeli seconded the motion. In a speech of considerable length, he reviewed the circumstances under which we held sway in India, and argued from thence that it was quite unnecessary for us to raise a barrier against Russia for the protection of our Indian territories. He described the whole foreign policy of Lord Palmerston as characterised either by a fatal inertness, or a more terrible energy; and said that the noble Lord's policy usually commenced by neglect of his own duties, and terminated by violating the rights of other nations.—Sir J. C. Hobhouse deprecated the unfairness and partiality of the statements of the mover and seconder of the motion, and defended the late Governor-General of India, Lord Auckland, from their aspersions. He said that, in all the attacks made on the late Government by the then powerful opposition, the Affghanistan war had not formed a staple subject of assault; an assault which was now dictated by the course of events, implicating a policy which had received the sanction of the East India Company. He then entered into a lengthened defence of the policy of the late Government with respect to this war, which he said had been entered on after the fullest consideration, and consultation with competent authorities, who had advised them, as their best Indian security against the encroachments of Persia, under the active guidance of Russia, to secure the mastery of that important part of Central Asia. It was not true, he said, as had been asserted that Sir A. Burnes had been opposed to the policy of Lord Auckland. He concluded by saying that he did not believe that any Government would dare materially to modify Lord Auckland's policy, which, if persevered in, would, he thought, not only enable us to repair the late melancholy disasters, but secure our Indian empire.—Lord Jocelyn followed, and expressed his conviction that we should pause before we attempted the reconquest of Affghanistan.—Mr. Hogg said that though he had been alluded to by Sir J. Hobhouse as having done so, he had neither approved of the Affghan war, nor were the Directors of the East India Company at all favourable to the policy which led to it. But he did not think that this was the proper time for idle declamation on that policy. We had disasters to repair, wrongs to be avenged; and he, for one, would not at this moment seek to paralyse the energies of this country.—Mr. Hutt briefly vindicated the policy which led to the war.—Sir R. Peel said that having formed his conclusions on public grounds, he had come to the decision that, in the present state of our Indian affairs, it would not be expedient to grant the papers asked for by the motion. The Russian Government had disclaimed all desire of disturbing our Indian empire, and nothing had since occurred to discredit these assurances, which had been accepted by this country as entirely satisfactory. The present position of affairs in India disposed him to deprecate all discussion on the subject, and to oppose the production of the papers asked for. "It appears to me," he said, "and I trust it will be so, that whatever course Government may think best to pursue, it will not be forgetful of the influence which it must have on our possessions in India, to show that the honour of British arms will be maintained, and that no instance of gross perfidy or treachery shall be allowed to pass with impunity. It has been represented to the House that a disaster has taken place in Affghanistan. It is true that we suffered a great military reverse, but we are strong enough to admit it; and if we have suffered a military reverse in Affghanistan, it is not a disaster of a nature to affect our dominion in India. If we have suffered a disaster, it is impossible to see the examples of fortitude and valour which that disaster called forth, and to permit ourselves to despair. When we think of the patient endurance and the surpassing valour of Sir Robert Sale, or when we witness the heroism of that lady who shared his dangers—and when we think upon the effect which such an example must have—we cannot permit ourselves to be cast down for one moment. There has been a great military reverse; but it has not been greater than reverses which we have met with before: and I am confident that, through the valour and fortitude of British arms, those disasters will be repaired, and that they will not have the effect of in the slightest degree shaking the confidence of the people of India in the supremacy of our arms, as I trust their confidence had never been shaken in the justice of our civil Government.

Lord Palmerston retorted on Mr. D'Israeli his accusation of supineness, though he could not add that he had followed up that supineness with "terrible energy." Reviewing the transactions connected with the occupation of Affghanistan, he contended that all the competent authorities connected with India had considered that active remedial measures were necessary to protect our Indian frontier; and expressed his conviction, that even now the Indian Government were replacing us in the same commanding position with Affghanistan which we held last year. He deprecated the sentiment, that we should send an army into that country with the mere purpose of avenging ourselves on the inhabitants, and then to abandon it; he hoped rather that Government would pursue the policy which had led us to consider it as a secure barrier for our Indian possessions, and which in our own hands would render them impregnable on that quarter. The noble Lord concluded with a few observations defending the general foreign policy of the late Government.—After a few observations from Mr. Hume, Lord J. Russell said that the late Government had no objection to make to the production of the papers, though he considered the reasons assigned by Sir R. Peel to be sufficient for their being withheld. His opinion on Lord Auckland's policy had not been in the least shaken by what had since occurred; and he was glad to find that those who had reserved their attack till misfortune had clouded their own arms, had made out so weak a case as they had done.—Mr. Baillie replied, and said he was willing to withdraw his motion (the debate having lasted from before five o'clock till half-past one), but Mr. Hume objected to the withdrawal, and a division took place, when there appeared 75 against the motion, and 9 for it.

Sir J. Graham obtained leave to bring in several bills—the first to encourage the establishment of district courts and prisons; the second, to amend the laws concerning prisoners; the third, to continue, until the 1st Oct., 1843, the exemption of inhabitants of parishes, townships, and villages, from liability to be rated as such in respect of stock in trade or other property to the relief of the poor; and the fourth, to amend and continue for one year the Acts regulating the police of Manchester, Birmingham, and Bolton.—Mr. Gladstone moved in committee on the Customs Bill, "That it is expedient to permit foreign wheat to be delivered, under certain regulations, from the warehouse, or from the ship, duty free, upon the substitution into the warehouse, or the delivery for exportation, of equivalent quantities of flour and biscuit." The motion was agreed to. The House then resumed, and the other orders of the day were disposed of.

Friday.—On the motion for going into committee on the Poor Law Amendment Bill, Mr. Fielden said he would avail himself of all the forms of the House to oppose it.—Mr. T. Duncombe moved that a temporary measure should be passed, as the present session was too far advanced to allow time for deliberation.—Sir J. Graham thought the motion a very proper one, and hoped the House would give a decided opinion.—Mr. Ferrand contended, that if the Government passed this bill, Sir R. Peel would totally destroy his present influence and power in two years.—Mr. Roebuck said that the honest and industrious labouring classes had received more real benefit from the Poor Law Commissioners than from any other scheme that had ever been devised.—Sir R. Peel protested against a factious opposition, and, after vindicating himself from the charge of allowing the Poor-law to be made a party engine, took a general review of the whole question, from the Act of Elizabeth to the passing of the present Law.—After a long discussion, the adjournment of the debate was moved by Mr. Fielden, and negatived by a majority of 297 to 29.—Sir C. Napier then moved the adjournment of the House, to which Sir R. Peel yielded; and the House adjourned to Monday.

CITY.

Money Market, Friday.—**Consols for the account closed $91\frac{3}{8}$ sellers; Bank Stock, $166\frac{1}{2}$ to $167\frac{1}{2}$; Three per Cents. Reduced, $91\frac{1}{2}$ to $\frac{5}{8}$; Three and a Half per Cents. Reduced, 100 to $\frac{1}{4}$; India Bonds, 24s. premium; Exchequer-bills, 2d. issue, 40s. to 42s. premium; and ditto, $2\frac{1}{4}$d. issue, 45s. to 47s. premium.**

Metropolis and its Vicinity.

Anniversary of the Queen's Accession.—Monday being the anniversary of the Queen's accession to the throne, the day was ushered in by peals of bells from all the metropolitan churches, the royal standard was hoisted on different steeples and public buildings, and the Park and Tower guns fired double royal salutes at one o'clock. In the evening her Majesty's tradesmen illuminated.

Common Council.—On Thursday, a Court was held for the election of a town clerk of the corporation, and for the despatch of a great deal of public business. The Court was numerously attended. The subject of the distress prevailing throughout the country first occupied the attention of the meeting. Mr. R. L. Jones moved that the Court subscribe the sum of 500*l.* in aid of the funds arising from her Majesty's letter for the relief of the distressed manufacturers of England and Scotland. Mr. Stevens seconded the motion. Mr. P. Taylor said he could not give a silent vote upon such an occasion, and in strong language reprobated the conduct of those who supported the Corn Laws, which he considered to be the cause of all the existing misery. He concluded by moving, as an addition to the proposition of Mr. R. L. Jones, "That the Court recommended that the money to be granted in aid of the manufacturers be laid out in the purchase of corn to be admitted free of duty, and that Government be petitioned by the Court for that object." After some discussion, Mr. Taylor's amendment was negatived, and the original motion carried. Some conversation ensued on the subject of the Income Tax, and the ordinary and extraordinary receipt and expenditure of the City cash, which presents no feature of particular interest. Some discussion followed on the subject of a projected viaduct from Holborn-hill to Skinner-street. Mr. R. L. Jones said that there were no ways or means of accomplishing the object, and that, at last, Parliament must decide upon the question. Mr. Anderton then made some observations upon the instances of bribery and intimidation lately exposed elsewhere, and concluded by moving a resolution, that in the opinion of the Court there were just grounds for believing that bribery, corruption, and intimidation were committed at the late general election; that, therefore, the Court do petition the Legislature to institute a public and full investigation into the subject; and if such practice shall be found to have existed, to adopt such measures as will prevent it in future. After some debate the resolution was adopted unanimously. The Court then proceeded to the election of a town clerk in the room of Mr. Woodthorpe deceased. The votes were taken, and at the close the Lord Mayor declared Serg. Merewether the successful candidate, the numbers being—for Serg. Merewether 106, for Mr. Pritchard, 80, majority 26.

Public Meetings.—On Tuesday, a public meeting of the African Civilisation Society was held at Exeter Hall, Lord Ashley in the chair. Among the gentlemen on the platform, were the Earls of Chichester, Harrowby, Euston, Fortescue, Lords J. Russell, Grosvenor, Fitzroy, Mahon, Teignmouth, and Sandon, Sir Robert Inglis, the Bishops of Gloucester and Norwich, and several other distinguished individuals. The report of the committee was read by the Rev. Mr. Dealtry and Sir R. Inglis, from which it appeared that the Niger Expedition, though partially unsuccessful, had led to the conclusion of treaties with two of the native chiefs, but that, having ascended nearly 300 miles, the "river fever" obliged it to return, though not before arrangements had been made for the purchase of a tract of land at the confluence of the Niger with the Chadda, on which to carry on future agricultural and other civilising experiments. The expedition, the report said, had also considerably increased our knowledge of the navigation of the river, and enabled the officers on board to make a more perfect chart of its course; and it had led to a further acquaintance with the habits, dispositions, and varied dialects of the native population on its borders. Though the sacrifice of life was great, it bore no comparison with what is yearly sustained in enterprises of national aggrandisement or private gain. With regard to the abolition of slavery, the report set forth that this country had concluded treaties for its suppression with every Power in Europe having a maritime flag, except Belgium, Greece, and Hanover, and that there was no reason to doubt the accession of these Powers to similar engagements; that she had entered into treaties with every Power in America excepting the United States, the Equator, New Grenada, and Peru, and with the three last Powers treaties were under negotiation. Conventions had been signed with several of the most influential chiefs on the coast of Africa, viz., the Chiefs of the Bonny, of the Cameroons, of the Timmanees, and more recently with the Chiefs of Eboe and of Egarra. And that orders had been issued to British Governors in the African settlements, and to the Commanders of the British naval forces there, to take every opportunity of negotiating with other native chiefs for the same purpose. The influence of Great Britain had induced the Bey of Tunis not only to abolish the slave trade, but to emancipate his own personal slaves; and it had persuaded the Pacha of Egypt to formally abolish the slave trade in the provinces under his government, although it was feared that the practice was not entirely extinguished. The report concluded by recommending increased exertions in pursuing the objects of the society, to promote the cultivation of the soil, commercial intercourse, and the establishment of the Christian faith on the continent of Africa. Lord J. Russell moved the adoption of the report. He said that the society pledged itself to persevere in their efforts, and that they would not allow the clouds which had darkened the dawn of this enterprise, to prevent them from pursuing the holy work they had commenced. His lordship then proceeded to speak on the general subject of slave trade and the efforts made by this country for its suppression. With respect to the Niger Expedition, he said that when a Minister of the Crown, he had felt it to be his duty to fit it out in the very best manner, though none were employed in it except those who voluntarily offered themselves. Great as had been the failure of a part of that expedition, it was by no means to be considered as a complete failure. It had shown the flag of England, under the authority of England and of the Sovereign, engaged in putting down the slave trade, and introducing civilisation into the centre of Africa. His Lordship concluded by saying that he felt satisfied, though this attempt had failed, that the spirit of universal emancipation, aided by the spirit of the Christian religion, would ultimately obtain for them the happiness and the civilisation of millions. Archdeacon Wilberforce seconded the motion, which was carried unanimously. Lord Sandon moved the second resolution. He said they had gained no small object when they saw that the flag of England had been seen in the heart of Africa, abolishing that trade which formerly it was employed in protecting and encouraging. The losses sustained in the pursuit of commerce were greater far than that which had occurred in the Niger Expedition. The substance of the resolution was, that whilst sharing in the sorrow which some of the circumstances connected with the expedition were calculated to inspire, the meeting rejoiced in the conviction that the extinction of slavery had been promoted by it. It was seconded by Earl Fortescue, and carried unanimously.

The Bishop of Gloucester moved the third resolution, which expressed the approbation and admiration of the meeting of the zeal and conduct of Capt. Trotter and the gallant individuals who accompanied him, and its sympathy with the friends of those who had fallen in the enterprise. This resolution was passed unanimously, as was also another proposed by the Bishop of Norwich and seconded by Mr. Buxton, pledging the society not to relax in the prosecution of their project of the entire extinction of the slave trade. After several speeches had been delivered, the treasurer announced the state of the society's funds, from which it appeared that from June 1841 to June 1842 there was received the sum of 1,729*l*., which, with the balance of the preceding year, made 3,592*l*.; the expenditure this year was 2,453*l*., being a balance up to this time of 1,238*l*., which was only enough to meet the liabilities and engagements of the society.

East India House.—On Wednesday the half-yearly general court was held of the proprietors of the East India Company. The court was made special to consider the subjects of the deportation of the Hill Coolies to the Mauritius, and also to take the opinion of the proprietors whether the expenses of the war in Affghanistan ought not to be borne by the British nation—not by the natives of India. The court was well attended. The Chairman, Sir J. L. Lushington, took the Chair, and after some preliminary business had been transacted, and a long communication read from the Board of Trade on the subject of the New Tariff, and the duties about to be imposed upon the produce of the East Indies, the question of the deportation of the Hill Coolies was brought forward. After the subject had been briefly introduced by the Chairman, Mr. Weeding rose to call the attention of the court to the papers that had been presented relative to this important subject, and said he had to express his regret that there was a feeling on behalf of Government to encourage the emigration of the hill coolies from the East Indies to the Mauritius. He then proceeded to argue at considerable length against the proposed practice; and concluded by moving a resolution, the substance of which was that the court recommend to the Directors to abstain from sanctioning the measure contemplated by Government, of authorising and facilitating the deportation of Hill Coolies from the East Indies. Mr. C. F. Brown seconded the motion, and after a long debate, in which several proprietors joined, the court divided, when there were, for the motion, 22; against it, 54. Mr. D. Salomons then rose to bring forward the motion of which he had given notice relative to the war in Affghanistan. He said the expense of this war ought not to be thrown on the natives of India, but ought to be defrayed out of the Exchequer of the United Kingdom. He entered at great length into the subject of the present state and condition of our Indian affairs, and concluded by moving, "That upon the consideration of all the circumstances connected with British intervention in the affairs of Affghanistan, as they appear from the papers already laid before Parliament, it is the opinion of this court that the expense of that war ought not to be thrown upon the people of India, but that it should be borne by the Exchequer of the United Kingdom." After the resolution had been seconded by Mr. Lewis, Major Oliphant moved the adjournment of the debate till Monday, which, after a short conversation, was put and carried.

Waterloo Banquet.—The anniversary of the Battle of Waterloo was celebrated, on Saturday, by the customary banquet at Apsley House, given by the Duke of Wellington to the officers engaged in that memorable battle. Prince Albert was present, attended by the Marquis of Exeter, being the only individuals in the party who had not been actually engaged in one of the actions of the 16th, 17th, or 18th June, 1815. Covers were laid for 80 guests, and the whole entertainment was of a sumptuous character. On the table was the beautiful silver plateau, presented to the Duke by the Portuguese nation; and on a beaufêt, at the northern extremity of the gallery, was a costly display of gold plate, with the Shield of Achilles, designed by Flaxman, and presented to his Grace by the citizens of London. The apartment was brilliantly lighted, and the *coup d'œil* was grand and imposing. The usual loyal toasts were given by the noble host, whose health was proposed by Prince Albert. A number of other toasts were given, including "The heroes who fell at Waterloo," which was drank in solemn silence. The party broke up soon after 10.

Review of the Household Troops.—A review of the troops forming the Household Brigade, consisting of the first and third battalions of the Grenadier Guards, and the two battalions of the Scots Fusilier Guards, took place on Thursday morning in Hyde Park, in the presence of Prince Albert, the Duke of Cambridge, Prince George, the Duke of Wellington, Lord Hill, and a numerous staff of general officers. The ground was kept by the 2d Life Guards, and a numerous assembly collected in the Park to witness the spectacle. It had been generally reported that the Queen would be present, but this proved to be incorrect. Some disappointment was also experienced by the spectators, in consequence of his Majesty the King of the Belgians not being among the distinguished personages present. The appearance of the troops, and the manner in which they went through their various evolutions, elicited the approbation of the distinguished officers present.

Chinese Exhibition.—A spacious building, called the Chinese Museum, has been recently erected on a piece of ground contiguous to the White Horse Tavern, formerly occupied by the Foot Guards' barracks. The approach to it, which is from Hyde Park-place, is through a "Chinese summer house," being a copy of the model of a summer residence, made in China, and brought from thence. The unique appearance of the entrance to the Museum has attracted many observers. The collection, which is said to be of an interesting character, was not opened to the public until Thursday, the proprietor delaying to do so until it had been visited by the Queen. On Saturday, her Majesty, accompanied by Prince Albert, Count Mensdorff, and his sons, visited the Museum. The room in which the curiosities are collected, is 225 feet in length and 50 in breadth, and its general appearance is that of China in miniature, there being nothing in it foreign to the subject. There is a rich screen work at either end of the room, elaborately carved and gilt; and there are a number of variegated lanthorns suspended from the roof, together with native paintings, maxims adorning the columns and entablatures, gaily embroidered silks, every variety of domestic furniture, models of bridges, junk-houses, river boats, and a great number of implements of husbandry and manufacture. Mr. Dunn, the proprietor, is said to be an American gentleman, who resided upwards of twelve years in Canton, during which time he succeeded in forming so close an intimacy with the great officers of the Government and the Hong merchants, as to be able to obtain a collection of Chinese rarities hitherto unknown in this country. The Queen inspected the whole of the curiosities, and after remaining upwards of an hour took her leave, having expressed to the proprietor the gratification she had derived from the inspection of the exhibition.

Death of Mr. Yates.—The daily papers announce the death of Mr. Yates, the performer and manager of the Adelphi Theatre. His decease took place suddenly on Tuesday afternoon, in Euston-square, Mr. Yates having just reached town by the Birmingham railway. It seems that he had once or twice ruptured a blood vessel, and had for some time been in a declining state of health.

Mortality in the Metropolis.—The following are the number of deaths that have occurred in the Metropolis from all causes, registered in the week ending Saturday, the 11th inst.:—Males, 447; females, 400; total, 847. Weekly average 1838-9-40-1, males, 467; females, 445; total, 912.

Camberwell.—It is stated that all the difficulties which have prevented the erection of a new church on the site of the old edifice, destroyed by fire in Feb. 1841, have at length been removed, after repeated discussions in the parish for a period of 18 months, and that a new church will now soon be raised on the spot where the ancient one stood. A number of men are already employed in making the necessary arrangements in order that a proper foundation may be formed. The new church is to contain accommodation for 1,500 persons, and the cost is not to exceed 16,600*l*.

Islington.—On Monday this neighbourhood was again much excited, in consequence of a report that a female had been murdered by her husband, who had afterwards attempted self-destruction, and subsequently effected his escape. The reports, however, appear to have been exaggerated, and the following are the correct particulars of the affair:—deceased, whose name was Martha Carter, the wife of a labouring man, had for some time been in a state of ill health, and her husband had for several nights watched by her bedside in attendance upon her. On Sunday, however, at her request he went to bed, but, on awaking early in the morning, he found that his wife had disappeared, upon which he proceeded to search for her, but for a long time without success. He at length discovered that the covering of a well, a short distance from his cottage, had been removed; and as he had himself secured it the previous evening, he suspected that his wife had committed suicide by throwing herself into it. He immediately gave an alarm, and the well being examined, the dead body of deceased was found in it much mutilated. On the body being removed to his cottage, the husband became much excited, and it was considered necessary to remove him from the spot. It seems that he afterwards made an attempt to destroy himself by cutting his throat. In this, however, he did not succeed, and he then ran away from the cottage, but again returned in the evening. An inquest has been held, at which the husband and niece of the deceased were examined, who proved that she had been for some time in a disturbed state of mind, and the jury returned a verdict, "That the deceased destroyed herself, being in a state of unsound mind, and that there was not the slightest suspicion attached to the husband of the deceased."

Woolwich.—On Monday, their Majesties, the King and Queen of the Belgians, who were expected to have arrived on Saturday, landed at this dockyard from the continent, on their way to town, on a visit to the Queen. Their Majesties did not arrive till 10 o'clock at night; and the guard of honour, and other preparations that had been made for their reception, were consequently dispensed with. Their Majesties, however, were received, notwithstanding the lateness of the hour, by a large concourse of spectators, by whom they were repeatedly cheered. Their Majesties and Suite proceeded immediately to Buckingham Palace.

Richmond.—On Thursday the Duke and Duchess of Buccleuch gave a brilliant entertainment at Queensbury Villa, to her Majesty and Prince Albert, the Queen Dowager, the Duchess of Gloucester, the King and Queen of the Belgians, the Duke and Duchess of Cambridge, the Duchess of Kent, and other members of the royal family. Five hundred of the leading persons in high life were also invited to the entertainment. Her Majesty, who arrived about half-past three, was received by the inhabitants of this town with every demonstration of loyalty and attachment. The Queen Dowager was also loudly cheered. Previously to entering the Lower Road, the royal party passed under a triumphal arch of great height, formed entirely of flowering shrubs, surmounted by the words "The Queen and Prince Albert—God bless them!" On the right, "The Prince of Wales;" on the left, "The Princess Royal." Under the portico of the Villa the Queen and the Dowager Queen were received by the noble host and hostess, and, after passing through the saloon, the Queen and Court visited the lawn, and inspected the preparations for the fête, the band of the Blues playing the national anthem. There were a great number of pleasure-boats on the river, and at the water's edge were moored the barges belonging to the Queen and the different Companies, with those belonging to the Admiralty and the Trinity. In the back ground appeared a vessel, the masts covered with flags, all national emblems. Under a covered way the Queen and Court visited the subterranean arch, through which her Majesty went to the grand tent, where a banquet was laid out with covers for 480 persons. The Queen then visited the marquee, where the royal table was placed for 64, ornamented with delicate festoons of white roses. The tent was erected near the left wing of the pavilion, on the most picturesque part of the lawn. At 7 o'clock the royal party sat down to a banquet of great splendour. At 9, there were preparations for a display of fireworks, which commenced soon after, and were very brilliant, a battery being erected on the opposite shore. At the same time the whole of the lawn, the trees, and the shrubberies, became suddenly illuminated; and thousands of variegated lamps, placed on the ground in every vacant place, were lighted up, whilst festoons were suspended along the line of the mansion down to the water's edge, forming a sort of barrier to the boats which invested the shore. It is stated that a scene of greater grandeur or beauty was never before seen in any country. The Queen and royal party remained until it was nearly midnight, and then retired, expressing their delight at the gratification they had experienced.

Provincial News.

Braintree.—It seems that the Poor-Law Commissioners recently issued an order to the Board of Guardians of this place, directing "that their clerks do transmit to the Assistant-Commissioner of the district, after every ordinary meeting of the Guardians, a copy of any special minute made, or notice of motion on the books." The Board of Guardians forwarded a strong remonstrance to the Central Commissioners against this order; and on Monday they held a meeting for the purpose of taking the reply of the Commisssioners to the remonstrance into consideration. As the Commissioners vindicated the legality, and defended the expediency, of the obnoxious order, and expressed their determination to enforce it, the chairman of the board, the Rev. J. P. Wood, resigned his office; and the board, having first passed a resolution of thanks to Mr. Wood for his conduct as chairman of the board, and another, declaring the order unnecessary and arbitrary, also resigned, leaving the business of the Union in the hands of the clerk and the relieving officers.

Brighton.—Some excitement has lately been caused in this town, by a report that a child, named Shoosmith, aged six, had been starved to death in one of the Poor-Law Unions in this county. It seems that the child was brought to this place about three weeks ago from the Ringmer workhouse, which is under the Chailey Union, in an emaciated state, and unable to stand. He had the attendance of a surgeon, but a few days after he sunk under extreme debility, and died. The fact was communicated to the parish authorities in this town, who caused an inquest to be held. The inquiry lasted a considerable time, and a number of witnesses were examined, whose evidence was somewhat contradictory; and ultimately the jury returned a verdict—that the child died in a natural way, but that the death was accelerated, if not caused, by the dietary of the Union workhouse at Ringmer, which the jury thinks not sufficiently nutritious for growing children. They were also of opinion that the deceased did not receive that medical attention in the workhouse which his case required.

Bristol.—Within the last few days a number of daring highway robberies have been perpetrated in this neighbourhood. They seem to have been all committed by the same party of men, seven in number, armed with pistols and other weapons, who have robbed and seriously maltreated a number of persons within a short distance of the city. On Saturday evening they stopped a farmer's wife, returning home from market to Almondsbury, accompanied by another woman, a man who was driving, and his son; and after robbing them of all they possessed, beat them so severely with the butt ends of their pistols, that fears are entertained for their recovery, and the man's case is considered hopeless. On the same evening they stopped two labouring men, and treated them in the same manner. A reward has been offered for their apprehension, and the police are using every endeavour to trace them.—Some excitement was also occasioned in this city on Monday, by a serious affray which took place on that day between a party of Irishmen and the police, in which one of the latter was so severely wounded, that he died shortly after. An inquest has been held, and from the evidence adduced it appeared that the Irishmen having attempted to rescue a prisoner whom deceased had in charge, the latter resisted, when he was knocked down by one of the party, and then beaten, while on the ground, by six or seven persons, all armed with bricks, until an accession of force enabled the police to save their comrade from further violence; but he was then so severely injured that he died soon after. After a long investigation the inquest was adjourned. Six Irishmen, all identified as having been of the party who attacked deceased, are in custody.

Bury.—A serious fire has occurred in this town, whereby the large cotton-mill, belonging to Mr. J. Whitworth, has been almost entirely destroyed. Several engines were soon on the spot, and every exertion was used to subdue the flames, but for a long time without success; and it was with difficulty that the adjoining mill, belonging to Mr. Openshaw, was saved. The cause of the fire is not known. It is said that a boy, who worked on the premises, was buried in the ruins. About 250 hands have been thrown out of work by the destruction of this mill.

Carmarthen.—The local papers detail at great length the damage caused in this place and neighbourhood by the severe thunder-storm, which seems to have prevailed very generally throughout the country on Sunday, the 12th inst. The lightning was very vivid, and the injury occasioned by it, and by a heavy fall of hailstones, has been considerable. A young girl at Llandissil was struck dead by the lightning, and several horses were killed in a field in the vicinity of this town. The lightning tore up the pavement for some distance; and the rain fell in such quantities, that it nearly inundated several houses in this town, the water in some cases being 21 inches deep. The storm did great damage in the vale of Towy, and also at Taliaris, the seat of Mr. W. Peel. At Cwmceilog, a farm belonging to that gentleman, the lightning descended through a hayloft, passing through a large quantity of hay and straw, which however it did not damage, and killed three calves in the stalls beneath. At Courthenry, the seat of the Rev. G. W. Green, a large tree was uprooted, and the fine oaks in Dynevor Park were many of them much injured. At Llanthermawr the hailstones are said to have been an inch and a half in circumference, and about a foot in depth on the road, and considerable injury was done by them to young plantations, and to hot-houses and all garden ground generally.

Colne.—On the 15th inst., about two o'clock in the morning, the cotton spinning mill belonging to Mr. Sagar, of Carry Bridge, near this town, was discovered to be on fire; and so rapid was the progress of the flames, that the whole building was soon involved. Several engines were soon on the spot, but they were unable to subdue the flames for several hours, by which time the mill was entirely destroyed. Nothing certain appears to be known as to the origin of the fire. It seems that the men left work at half-past five on the preceding afternoon, and the mill was accidentally seen by the proprietor at half-past ten that evening, and by three other persons who passed it as late as twelve o'clock, when all appeared safe. In the forenoon of the day when the fire broke out, a box with some lucifer matches was found about 50 yards beyond the mill; which gives reason to suspect that the fire was the work of an incendiary.—This town and neighbourhood is reported to be in a very unsettled state, from the great distress prevailing generally among the working classes; and fears appear to be entertained for the preservation of the peace of the district. Several Chartist meetings, numerously attended, have been held in the neighbourhood; but the proceedings have hitherto been conducted peaceably. A great many of the operatives, it is said, have taken to the roads, and are pursuing a system of highway robbery to procure themselves the means of sustenance. Considerable alarm has been created in this and the neighbouring towns by the fact, that a number of persons have lately been stopped on the highway, and compelled to deliver up all the money they had about them. On Tuesday, it is said the neighbourhood of Barnaldswick was in a state which rendered it necessary to apply for military aid, and a troop of soldiers was sent from Burnley. The latest accounts, however, from this and the neighbouring districts inform us that no further disturbances had taken place.

Deal.—It is stated that great progress has been made in the important undertaking of erecting a lighthouse on the Goodwin Sands. It will perhaps be remembered by our readers that several attempts, noticed in this Paper at the time, were made last year to effect this object, and that the undertaking was at length obliged to be suspended, in consequence of the stormy weather and the approach of winter. It appears that the caisson has now been placed perfectly air and water tight, at low-water mark, and that as soon as the tide will allow, it will be floated to its place.

Falmouth.—On Wednesday the royal mail steam ship Medway, Lieut. Smith commander, arrived at this port from the West Indies, with mails from all the colonies and stations, which were delivered too late for notice this week. She brought about 60 passengers, a million of dollars, 150 serons of cochineal, and 30 supernumeraries, lately belonging to the Medina. The Medway left Havannah on the 1st, Nassau 3d, Bermuda 7th, and Fayal 16th inst. H. M. brig Pilot arrived at Havannah 24th May, and sailed 26th, with mails for Belize. On the 27th, the royal mail steamer Teviot arrived at Havannah, from the Gulf of Mexico, with mails and specie; and the Trent also arrived there on the 31st following. The Isis was passed near Nassau by the Medway.

Helston.—Sir R. Vyvyan has addressed a long and ably-written letter to the electors of this borough, in which he enters at great length into the general policy adopted by the present Ministry since they came into office, and denounces the whole financial scheme of Government. He states that Ministers have generally deceived the constituencies by whose suffrages they have been raised to power, or, at least, that they allowed them to deceive themselves; that the electors, particularly those of the counties, never contemplated such a decided recognition of free-trade principles as Government are at present advocating; and he concludes by saying that he looks upon the passing of the Tariff as a fatal blow to the general welfare and prosperity of the country.

Manchester.—In pursuance of the resolution adopted at the preliminary meeting of tradesmen and shopkeepers, held in this town a few days since, reported in our last, another public meeting of a similar character has been held "for the purpose of publicly making known the exceedingly depressed and alarming state of their trade," and adopting such measures as might be deemed advisable to remedy the evil. The meeting was numerously attended. The chairman, Mr. G. H. Winder, opened the proceedings by reading the advertisement convening the meeting, and briefly explained its objects. He was followed by Mr. Heywood, who concluded a long speech, detailing the seriously distressed circumstances of many of the shopkeepers in this town, by moving the following resolution: "That we, the tradesmen, shopkeepers, and retail dealers of Manchester, assembled in public meeting in the Town-hall of this borough, this 16th day of June, 1842, feel called upon solemnly to declare, that the existing distress among our body is greater than was ever before experienced; that trade has fallen off to an extent without parallel; that the profits on such restricted trade have also been greatly reduced; that, nevertheless, the taxes, both national and local, have very materially increased; that confidence in trade transactions between man and man is well nigh destroyed; and that we cannot reasonably anticipate, without an immediate legislative interposition, other results than rapidly progressive decay, and early and general ruin." The resolution was passed, but some confusion arose in consequence of a demand on the part of several chartists in the meeting to adjourn to Stevenson's square. This was ultimately acceded to, and the meeting, considerably increased in numbers, reassembled shortly after in that place. The proceedings were then resumed, and Mr. Moody came forward to move the second resolution, "That we attribute the great and grievous distress now existing among our body, first, to the general want of employment by our industrious population; secondly, to the totally inadequate remuneration of those yet in partial employment; and, thirdly, to the deficient supply of food, and its consequent high price." He then delivered a long speech on the reduced condition of the trading classes and shopkeepers. Mr. W. Birch, after an address of a similar character, moved the third resolution:—That we are firmly convinced that there is no remedy for this appalling distress but in the removal of all legislative restrictions on commerce, and (its inevitable consequences) an extension of the markets, both home and foreign, for our manufactured goods, and an abundant supply of the necessaries of life from the best and cheapest markets in the world." The Rev. W. V. Jackson then came forward to move an amendment. He said he fully agreed with all that the previous speakers had stated, and with every resolution that had been proposed; but he thought they did not go far enough. His amendment was—"That it is the solemn opinion of this meeting, that the only method by which the present alarming distress can be removed, our home and foreign trade increased, permanent employment and good wages secured to the whole of the industrial classes, and security for all classes firmly established, is by causing the document called the people's charter to become a legislative enactment." After some discussion, the amendment was put, and carried almost unanimously. Another resolution was then proposed, the object of which was to call upon the tradesmen, shopkeepers, and retail dealers of the other towns of the empire to meet for the prompt consideration of their distressed condition, and to co-operate with the present meeting in their efforts to obtain immediate relief. This, however, was met by another amendment on the part of the Chartists, similar to the former one; and after a long debate, although it was stated that all the arrangements of the meeting would be interfered with by the adoption of the amendment, the Chartists still persevering in pressing it, it was ultimately arranged that neither the resolution nor the amendment should be put to the meeting, which then broke up.—It is stated that a number of gentlemen have proceeded to London from this town and other manufacturing places in the north of England, for the purpose of placing before Government and the Legislature facts connected with the present serious state of this portion of the kingdom. It is added, that they have already had interviews with Sir R. Peel, and several of the leading Members on both sides of the House of Commons; and that a committee has been formed to inquire into the subject.—It has been announced that a large paper factory in the neighbourhood of this town has stopped payment; the engagements are said to amount to upwards of 200,000*l.*, one of the local banks being a principal creditor. A great number of hands will be thrown out of work by this event.—On Thursday night, the 16th inst., an attempt was made by some person or persons to set fire to a quantity of cotton deposited in the yard attached to Mr. Chappell's mill, at Beswick, near this town. It seems, however, that the injury done to the cotton was not considerable. A reward of 50*l.* has been offered for the apprehension of the incendiaries.—The British Association commenced its sittings in this town on Thursday morning. The proceedings as yet present no feature of particular interest; and it is said that the number of members attending is not so numerous as was expected.

Plymouth.—A local paper states, that a few days since, whilst two sawyers were engaged in cutting a log of rough elm timber, upwards of three feet in diameter, to make the gripe (a piece of wood that is fixed at the lower end of the stem and forepart of the keel, and materially helps the ship to work to windward) for the Albion, 90, building at this dockyard, there were discovered five pieces of oak, about two inches thick by four inches wide, and each piece about one foot in length, lying in a direction towards the centre of the log; the pieces were firmly and closely united to the tree, and quite sound, and overgrown by the bark, so as to render them entirely hid from sight.

Radnor.—On Sunday this county was visited by a storm of thunder, lightning, and rain, which has been very destructive in its effects. The lightning is represented to have been very vivid; while the rain, which came down in torrents, and was accompanied with hailstones of large size, poured down the mountains, and collecting in the plains, overflowed many hundred acres of ground. It is said that several farmers have lost a number of cattle. In a field belonging to Mr. Lloyd, of Llandive Hall, 15 head of cattle had sheltered themselves under an oak-tree in the centre of a field, which was struck by the lightning and shivered to pieces, and all the beasts killed on the spot. Several similar casualties are reported: many fields had the seed in them washed away, while a large quantity of glass was broken by the hail; and the injury done to gardens and conservatories was very great.

Romsey.—The local papers inform us that a severe thunder-storm occurred in the neighbourhood of this town on the 14th inst., attended with loss of life. It seems that two lads, who had been fishing near Lord Palmerston's seat, Broadlands, sought shelter beneath a tree during the storm; when the tree was struck by lightning. One of the lads was killed on the spot, and the other severely injured. The same papers state, as a singular fact, that there has been no storm in Hampshire for many years past which has not been more severely felt in the neighbourhood of this place than in any other part, and that in every instance some fatal accident has resulted, or some considerable destruction of property.

Stamford.—The local papers are occupied with long accounts of the damage occasioned by a severe thunderstorm, which occurred in this town on the 14th instant. When the storm was at its height, the lightning struck the spire of St. Mary's Church, about six feet from the top, displacing nearly 2 cwt. of the stonework, which fell in numerous fragments, fortunately doing no injury. It is thought that it will be necessary to remove and rebuild some feet of the upper part of the spire, the expense of which will be considerable. The lightning also struck the house of Mr. Mortlock, High-street, perforating the roof, and doing considerable damage to the interior of the house. In the next dwelling it struck one of the chimneys, displacing many of the stones, and otherwise injuring it; it then entered the house in several places, tearing down the bell-wires in its course, and doing other damage. It is stated that for some time before and after the storm was at its height, the atmosphere was tainted with a sulphurous effluvium. Fortunately no loss of human life was sustained, but the gardens in the town and neighbourhood suffered considerably from the hail.

Windsor.—On Sunday evening, this town and neighbourhood were visited by a severe thunderstorm, accompanied by a heavy fall of hail and rain. The hailstones which fell in many places are said to have been upwards of half an inch in diameter. The damage done by the storm does not, however, appear to have been great, though some cattle are reported to have been killed.

Wolverhampton.—A serious explosion, attended with great loss of life, occurred on Monday, in the shaft of a pit at the Cleveland Colliery, situate between this town and Portobello. It seems that the men and boys belonging to the pit, amounting to 13, assembled at the usual hour for the purpose of going to work. The engine was set to work, and the whole 13 proceeded to descend the shaft in a single skip. The mine, which had not been worked since Saturday, was not tried with a safety-lamp, and the party took lighted candles with them for the purpose of lighting themselves while at their labour. They had not, however, descended far, when they came in contact with a body of foul air, which had accumulated in the shaft. An explosion took place, and seven of the men and boys were thrown from the skip to the bottom of the shaft, and all killed on the spot. The remaining six retained their hold of the skip, and were fortunately drawn back again to the mouth of the pit. Some of them, however, were so seriously burnt, that doubts are entertained of their recovery. The accident was owing to the adoption of common candles in place of the safety-lamp.

Railways—The following are the receipts of the principal Railways during the past week:—Blackwall, 1,151*l.*; Greenwich, 827*l.*; Croydon, 523*l.*; Brighton, 3,406*l.*, Eastern Counties, 1,006*l.*; Northern and Eastern, 1,362*l.*; South Western, 6,395*l.*; London and Birmingham; 16,637*l.*; Manchester and Birmingham, 474*l*,; Birmingand Gloucester, 1,733*l.*; Birmingham and Derby, 1,196*l.*; Hull and Selby, 913*l.*; North Midland, 4,057*l.*; Midland Counties, 2,558*l.*; York and North Midland, 1,524*l.*; and Edinburgh and Glasgow, 2,018*l.*—It is stated that the works on the Eastern Counties Railway are now in a forward state. The bridge at Widford, said to be one of the most perfect works on the line, is finished, and the Chelmer viaduct is completed, and the earth waggons are expected to pass over it in a few days. A number of men are employed in erecting the viaduct over the river Cann, which is to be 50 feet high, and 700 feet in length; 13 abutments are already completed, and the centres for four of the arches are finished. The centres for the principal bridge over the road in Duke-street are also in a state of preparation, and will, it is said, be put up in the course of next week. The ten arches connected with this bridge are approaching to a state of completion, four of them having their centres struck. It is calculated that the bridge will be built in about a month.—It is stated that the distance traversed daily by the passenger trains alone, on eight of the principal railways, amounts to 10,508 miles, and the yearly distance to 3,562,238 miles. The lines are the Great Western, London and Birmingham, Grand Junction, Birmingham and Derby, Midland Counties, Manchester and Leeds, South Western, and Brighton; and it appears by the Parliamentary returns that during the year 1841 the number of passengers conveyed on these lines amounted to 4,600,000, and that during that period the total number of persons injured was 56, of whom 22 were killed.

IRELAND.

Dublin.—Rumours have for some time been in circulation, which appear to have obtained some degree of credit, that Earl de Grey is about shortly to resign the office of Lord Lieutenant. It is also reported that his Excellency's successor will either be the Duke of Buccleuch or the Earl of Jersey. Another report states that his Excellency, accompanied by the Countess De Grey, intend leaving Ireland the first week in July, *en route* for the German spas, which have been recommended by his physicians for his Lordship's health.—The anniversary of the battle of Waterloo was celebrated on Saturday by a general review of all the troops in garrison. The Lord Lieutenant and a numerous suite was present, and a great number of persons assembled in the Fifteen Acres, where the review took place, to witness it. The General Commanding the forces, and his Lady, gave a ball and supper in the evening, in commemoration of the event. Their Excellencies the Lord Lieutenant and the Countess De Grey honoured the festivities by their presence.

Maynooth.—A correspondent has sent us an account of the violent thunderstorm which occurred in the village of Lelbridge and its neighbourhood on the 13th inst., and which seems to have been very generally experienced all over the country, as will be seen by reports given of it above and in other parts of our paper. In this neighbourhood our correspondent informs us the storm was ushered in by a hot and sultry state of the atmosphere; the thunder and lightning were very severe, but no loss of life seems to have been occasioned. The chief damage was caused by a heavy fall of hailstones. At Castletown, the seat of Col. Conolly, M.P., the storm was very severe, and the hail in a short space covered the ground to the depth of a foot, some of the hail stones being as large as a crown-piece. The destruction of glass in hot-houses was very great, almost every pane in the fine ranges of vineries and peach-houses being demolished, and all the crops of fruit and the garden generally being much injured. The storm lasted altogether about an hour.

Ennis.—An inquest has been held on the two persons who have died, as noticed in our last, of the wounds received from the fire of the police during the late riots in this town. The investigation lasted three days, and great excitement was manifested by the mob, who assembled in considerable numbers in the neighbourhood of the court. Several witnesses were examined, amongst whom were two of the policemen who were on duty on the evening of the affray, and who deposed that the word "Fire" was given by Capt. De Ruvynes, commanding the police force, echoed by the county inspector, and followed up by Mr. Fitzsimon with the expression "Fire, fire." With the exception of this testimony, the general features of the case were the same as have been previously published. During the time the jury were deliberating on their verdict, the crowd outside conducted themselves with great violence, making use of abusive language, and throwing stones through the windows. The jury returned a verdict that the deceased came by his death from the effects of a gun-shot wound inflicted by one of the party of police, consisting of 16 men, stationed on the Mill-road, for the protection of Mr. Bannatyne's property; but by whom of said party said shot was fired, there was no evidence. They also found that the people were in the act of retiring when the shot was fired; that no necessity existed for firing; that the word "Fire" was given to the police by Mr. Browne and Mr. Fitzsimon, immediately after Capt. De Ruvynes said "If you don't disperse, the men must fire;" but they considered his saying so no justification for the order so given. When the verdict became known the mob testified its disapprobation that Capt. De Ruvynes was not included in it with the others. They at length, however, separated, without committing any serious disturbances. In consequence of the different verdicts returned by the juries, at this and the former inquest, the police being exonerated by the one and implicated by the other, the Coroner has referred both findings to the law officers of the Crown, requiring advice as to the course to be adopted respecting all the parties. In the meantime Mr. Browne, the county inspector, and Mr. Fitzsimon, the sub-inspector of constabulary, have been committed to gaol, under warrant of Mr. Whitestone, the city coroner, upon the charge contained in the verdict of the last inquest. Two of the policemen who were stationed in Mr. Bannatyne's yard during the riot have been admitted to bail by consent of the law officers of the Crown. The Government inquiry still continues, and is likely to last some time longer. Nothing of importance has transpired relative to the proceedings. Some disturbances of a similar description to those which have occurred in this town have taken place at Kilrush, in this county. A mob, it seems, collected, and were proceeding to attack some provision stores; but were prevented by the Rev. Mr. Kenny and his curates, who promised with others to wait on the magistrates, and have subscriptions opened to relieve the immediate wants of the poor, who are in much distress.

Waterford.—It is stated that Government has decided on giving to this city the benefit of a new corporation, as speedily as possible.

SCOTLAND.

Glasgow.—A few days since, a man of the name of M'Kellar, employed as a supernumerary driver on the Glasgow and Kerkintillock Railway, lost his life in attempting to save that of his horse, at a point of the railway near to Gartsherrie iron works. It being Airdrie fast-day, extra waggons, horses, and drivers were required to convey the throng along the line; and M'Kellar, in his anxiety to keep up with his horse, which had become restive, fell under the wheels of one of the trains, and was killed on the spot.

Greenock.—Intelligence was received on Monday of the total loss of the emigrant ship Kent, Capt. Gardner, on the night of the 8th ult., in the Western Ocean, off the Seven Islands, during a heavy snow-storm. The vessel belonged to this port, and was bound for Montreal, having seventy emigrants on board. The disaster, it is said, occurred between 11 and 12 o'clock by the ship running on a mass of sunken rocks, a short distance from the coast. Owing to the severity of the storm which prevailed, it was for some time expected that she would fall to pieces. Providentially, however, she held together until daybreak, when the whole of the emigrants were safely landed on the coast, though in a very distressed condition, many of them having lost everything they possessed.

Miscellaneous.

Gold Coinage.—The confusion occasioned by the recent proclamation relative to the light gold coinage, has been but little relieved during the past week, and sovereigns of full weight have so generally been refused by tradesmen without some deduction, that the Chancellor of the Exchequer has thought it necessary to announce in Parliament, that any person refusing gold coin of the required weight, commits a breach of the law and is legally punishable. The inconvenience occasioned by this measure of Government has been still further increased this week by the refusal of the Bank of England and all private banks to issue any silver; and applicants at the bank requiring change for their notes can only receive it in gold. The subject, however, has engaged the attention of Government, and steps have been taken to meet the difficulty by an immediate issue of new half sovereigns. New sovereigns have already been issued from the Mint. The Bank has announced, with the view of further accommodating the public, that they will receive and exchange light sovereigns in any sums above 20*l.*, instead of, as at first announced, above 50*l.* In consequence of the impositions practised by speculators on the ignorance of the working classes as to the real weight that the gold ought to be, and making use of weights and scales not stamped, the Master of the Mint has issued a notice, stating that whereas it is provided by Act of Parliament that all weights to be used for weighing the gold and silver coin of the realm shall be regulated by the standard weights at the Royal Mint, and stamped with the stamp, or mark approved of by the Master of the Royal Mint; any person counterfeiting or selling such counterfeit weights subjects himself to the penalty of 50*l.* or three months' imprisonment. Pocket-balances intended to ascertain the weight of coin, which are constructed so as to be used without weights stamped as before-mentioned, cannot be considered in law of any effect in determining the weight of coin, neither can any person legally refuse coin as light except it is determined so by the aforesaid legal weights. All money weights stamped as appointed by the Master of the Mint have on one side her Majesty's crest (a crown surmounted by a lion), with the words 'Royal Mint,' and the date 1821; and on the other side the current weight of the denomination of the coin. On Wednesday, the jury of the Pix assembled and were occupied during the whole day in witnessing the assay of the different coins of the realm. At the conclusion, they proceeded to the residence of the Lord Chancellor, and delivered the following verdict to his Lordship:—"That they, the jury, found, in one or two instances, a slight deviation from the weight prescribed, but it was within the allowance made in the Mint Indenture, bearing date April 17." The Lord Chancellor then ordered the verdict of the jury to be recorded in the usual form. The foreman of the jury said he was requested to suggest that as the Master of the Mint was on his trial on these occasions, the scales used during the assay, should not in future be supplied by the Mint, but from some other quarter, although they had no doubt of their accuracy. The Lord Chancellor said he was glad the jury had made the suggestion. The propriety of having them furnished from another quarter was evident, and the subject should be attended to.

Law.

Vice-Chancellor's Court.—*Beatson* v. *Nicholson.*—His Honour gave judgment in this case. The question turned upon the construction of a covenant in a lease, whereby the defendant agreed to take a house of the plaintiff for three years certain, at 50*l.* per annum, and after the expiration of such term he was to be at liberty to have a further lease, determinable at 7, 14, or 21 years, on giving notice in writing of his intention within three months after the expiration of the three years. The defendant occupied the premises, and afterwards notified his intention to take them. It did not appear whether this notice was in writing. The bill alleged that the plaintiff had consented, and that steps were taken to prepare the lease; but a dispute arising as to a covenant to repair, whether it should be unconditional or qualified by an exception in the case of fire, the defendant refused to execute it, insisting; first, that his option continued, notwithstanding the notice; next, that the demand for the subsequent lease not appearing to be in writing, the Statute of Frauds would protect him; thirdly, that the written demand was a condition precedent to the subsequent agreement, performance of which was now sought, and that it lay on the plaintiff to prove that it had been strictly performed; and, lastly, that the terms of the lease now sought to be enforced varied from those agreed upon by his professional advisers. His Honour overruled the objections, and directed a reference to the Master to ascertain the terms of the draft agreed upon, and whether they were conformable to the original agreement; if not, then to settle a draft in conformity thereto.

Nonelay v. *Balls.*—This cause, which had been before the Courts on a former occasion, was instituted for the purpose of a construction being put upon a bequest in the will of a gentleman named Steel, who died in the year 1807. The plaintiff was his daughter, and had enjoyed the income for a period of 35 years, and the question now was as to a limitation in default of her children. An objection had been taken that although there was a representative of the surviving trustee, a defendant to the bill before the court, yet there was no representative of the testator himself, Mr. Steel, on the record, which, it was submitted, was requisite, notwithstanding the lapse of time. The objection prevailed when the case was before heard by his Honour, but the Court on that occasion had said, that if the plaintiff would procure letters of administration *de bonis non*, with the will of Mr. Steel annexed, he would not put her to the expense of amending her bill. The Counsel stated that this had been done, and trusted that as the Court had already saved expense by the course adopted, it would, after so long a lapse of time, feel justified in directing the income to be continued to be received by the daughter, without any reference to the Master to inquire as to the existence of any debts due from the testator's estate. His Honour said, that as the bill had not been amended in the particular referred to, the decree must specially mention the granting of the letters of administration. He would also direct that the income of the funds, which were to be brought into court until further orders, should be paid to the plaintiff, she having indisputably enjoyed the same for so long a period of time.

Central Criminal Court.—On Saturday Thomas Cooper was tried for the murder of the policeman, Timothy Daly, at Highbury, the circumstances attending which were given at length in our paper at the time. It will be remembered that the prisoner had been suspected of being concerned in several highway roberies in that neighbourhood, in consequence of which he was watched by a policeman who saw him follow a gentleman across the fields in a suspicious manner. On perceiving that he was followed, the prisoner turned round on the policeman and discharged a pistol at him, wounding him in the arm; he then made his escape across the fields, but being closely pursued, was overtaken at Highbury Barn, where he offered a determined resistance to his captors, and on the deceased attempting to seize him, he shot him dead on the spot, and with another pistol seriously wounded another man. All these facts were established by the evidence of a number of witnesses, and were not disputed by the prisoner's counsel, by whom, the only defence set up, was that the prisoner was the subject of insanity, and therefore, not accountable for his actions. Mr. Justice Patteson having summed up, the jury returned a verdict of "guilty." The sentence of death was then passed upon the prisoner, who was removed from the bar, after behaving very violently, and uttering threats against all the witnesses who had given evidence against him.

TATTERSALL'S, Thursday.—The attractions of Newcastle and Bibury Meetings rendered this a blank day. The attendance was unusually thin, and the little business done was confined to the Goodwood Stakes at 6 to 1 agst Scott's lot (Knight of the Whistle and Rhodanthe), 20 to 1 agst Mr. Griffith's Tupsley, and 20 to 1 agst Mr. Treen's Una.

The Late Derby.—With respect to the settlement of the accounts on this race, for which we have before stated there were several defaulters, it has been announced that a payment of 8*s.* in the pound has been paid by some of them.

MARK LANE, Friday, June 24.—Although we have had a continuance of stormy weather since Monday, particularly last night, we are unable to announce any improvement in the Wheat trade; the supplies of English have been limited in the extreme, and being held firmly, realized Monday's prices.—Old free Foreign is much neglected, but the new finds buyers on fully as good terms.—There was a little inquiry for bonded, but the transactions are of trifling amount, without improvement in value.—Spring Corn of all descriptions is dull at Monday's quotations, and Oats must be written 6d. cheaper; the demand in bond has almost entirely subsided.

GAZETTE OF THE WEEK.

BANKRUPTS.—W. J. Burgie, Beer-lane, Tower-street, carpenter—J. J. Grant, Gloucester-street, Bloomsbury, ale-merchant—G. E. Cartwright, Marlow, Buckinghamshire, chemist—E. T. Gough, Strand, patent-agent—J. G. Bourne, Clapham, carpenter—J. H. Clark and H. C. Farrow, King William-street, wine-merchants—W. Mainwaring, Dudley, Worcestershire, coal-master—R. Cockrill, Kirton-in-Lindsey, Lincolnshire, grocer—P. Walters and M. Llewellyn, Neath, Glamorganshire, timber merchants—W. Belton, Deeping St. James, Lincolnshire, draper—M. Thomas, Manchester, Lancashire, innkeeper—T. Pitcairn, Liverpool, merchant—John Ormrod, Hulme, Lancashire, builder—J. Swann, Loughborough, Leicestershire, currier—J. Pulman, Settle, Yorkshire, wine-merchant—W. Watts, King's Lynn, Norfolk, grocer—J. Batstone, Tooley-street, Southwark, builder—W. Bilton, junior, Kingston-upon-Hull, wine merchant—G. Gibson, Liverpool, stock-broker—Mark A. Hartnell, Rodborough, Gloucestershire, carrier—E. Hilton and N. Walsh, Over Darwen, Lancashire, paper makers—W. Goode, Monmouth, draper—S. Life, Cherlton-upon-Medlock, Lancashire, milliner—Jas. Sanderson, Crashaw Booth, Lancashire, cotton-manufacturer—P. Nevins, Leeds, cloth-manufacturer—J. and G. H. Fisher, Manchester, merchants.

SCOTCH SEQUESTRATIONS.—J. Neilson, Paisley, printer—J. Douglas and Son, Greenock, watchmakers—W. Greig, Glasgow, cabinet-maker.

BIRTHS.—On the 21st inst., at Clapham, Mrs. S. Johnson, of a daughter—On the 21st inst., at Norwood, Mrs. J. H. Rowland, of a son—On the 21st inst., at Heathfield Park, the wife of E. B. Curteis, Esq., of a daughter—On the 18th inst., at Hillingdon, Middlesex, the lady of J. Garratt, jun., Esq., of a son—On the 17th inst., at Sholden lodge, Deal, the lady of E. Banks, Esq., of a daughter—On the 20th inst., at Brookfield, near Ryde, the wife of the Rev. A. Hewitt, of a son—On the 20th inst., the lady of T. Duffield, Esq., M.P., of a daughter—On the 13th inst., at Montagu-place, Bryanston square, the lady of Edm. B. Ray, Esq., of a daughter—On the 21st instant, in Great Russell-street, Bloomsbury, Mrs. J. Aldridge, of son—On the 15th inst., the lady of Thomas Hennah, Esq., of Brixton, of a son.

MARRIED.—On the 21st inst., at Isleworth Church, R. Rankine, Esq., late of the Hon. East India Company's Bengal Medical Service, to Ann, relict of the late R. Hope, Esq., of Smallberry-green, near Hounslow, Middlesex—On the 18th inst., at Christchurch, St. Marylebone, R. Hassell, Esq., of Cheshunt, to Mary Ann, relict of the late W. T. Gibbons, Esq., of Richmond, Surrey—On the 16th inst., J. Sewell, Esq., of Cirencester, 2nd son of Benj. Sewell, Esq., of Clapham common, to Anne Elizabeth, eldest daughter of J. Hudson, Esq., of Castle-acre, Norfolk—On the 21st inst., at St. Olave's, Hart-street, Wm. Boyd Buckle, Esq., of the Hon. E. I. Company's Bengal Civil Service, to Mary, only daughter of the late M. D. Easnm, Esq.

On the 21st inst., at the residence of Sir C. Morgan, Bart., 70, Pall Mall, the Right Hon. George Lord Rodney, in the 61st year of his age—On the [illegible] inst., aged 77, at Brompton-hall, Middlesex, S. W. Halliday, Esq., only son of the late S. Halliday, Esq., of Westcombe-park, Kent—On the 21st instant, aged 23, F. W. Edward, eldest son of C. Freeling, Esq., of York-place, Portman-square—On the 19th instant, at Dorking, in his 77th year, John Todhunter, Esq., of Brighton, formerly of Clapton, Middlesex.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 25, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 27—1842. SATURDAY, JULY 2. PRICE 6*d.*

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Amateur's Garden . . . 420 *c*
Ash-trees, to renovate . . . 425 *a*
Asphalte Mortar, for the bottoms of borders . . . . 422 *b*
Bees, to obtain their Honey . 422 *a*
Bones, as a manure . . . 425 *a*
British Association at Manchester . . . . . 419 *c*
Campanula grandis . . . 423 *b*
Candollea tetrandra . . . 423 *b*

Reid's Elements of Astronomy, rev. . . . . . 424 *b*
Rose, Bankaian, its treatment . 419 *c*
Tendril, its definition . . 421 *c*
Trees, to stop their bleeding . 421 *c*
Turnip-fly, to eradicate . . 422 *b*
Vines, management of . . 421 *b*
Walls, a protection to plantations . . . . . 419 *a*
Wall-trees, to train . . . 421 *b*
Watering in the open air during summer . . . . 426 *a*
Wood, incombustible . . 419 *c*
Woodlice, to destroy . . 425 *b*

PELARGONIUM SOCIETY.

NOTICE IS HEREBY GIVEN, that at the next Exhibition in the Garden of the Horticultural Society, on Saturday, July the 9th, the following SPECIAL PRIZES for Seedling Pelargoniums of 1842, are placed at the disposal of the Judges, viz —Four Prizes of 2*l.* each for first-class Flowers, and Four Prizes of 1*l.* each for second-class Flowers; provided among those exhibited so many shall be found to deserve the distinction.

CHARLES FOX.

ORNITHOLOGICAL SOCIETY OF LONDON.

ESTABLISHED 1837.

IT is presumed that the Public may be ignorant of the fact that the Aquatic Birds upon the Lake in St. James's Park have been collected by a very small Society of Gentlemen, calling themselves "THE ORNITHOLOGICAL SOCIETY OF LONDON." This Association, whose Members contribute the moderate sum of One Guinea each annually, has been able, under the active protection and assistance of Her Majesty's Commissioners of Woods and Forests, to form and maintain an extensive and interesting Collection of Birds, and thus to contribute largely to the information and amusement of the Inhabitants of the Metropolis. The Council of the Society are desirous of extending their Collection to the Water in Hyde Park and Kensington Gardens, as well as to increase it generally, but are restrained by their limited funds. It is hoped, therefore, this statement of their exertions and objects may have the effect of enrolling among their contributors all who feel an interest in their pursuit, and in the amusement and gratification of the Public generally, more especially of the youthful portion of Society.

Prospectuses may be obtained at the Cottage of the Society, in St. James's Park, and of the Keepers at the Lodge, Victoria and Kensington Gates, Hyde Park.

THANET FLORICULTURAL and HORTICULTURAL SOCIETY.—A Prize of 10*l.*, open to all England, will be awarded at the Exhibition, to be held July the 14th, at the Ranelagh Gardens, St Peter's, (Two Miles distant from Margate,) for the best Miscellaneous Collection of Flowering Plants. Nurserymen, Gentlemen's Gardeners, and others, desirous of exhibiting are particularly requested to signify their intention to the Secretary, on or before the 7th of July.

Vicarage, St. Peter's, near Margate, June 6th, 1842.
J. G. HODGSON, Hon. Sec.

N.B.—No Plants admitted for competition after 11 o'clock.

THE ANNUAL FLORICULTURAL and HORTICULTURAL EXHIBITION, in the Grounds of the YORKSHIRE PHILOSOPHICAL SOCIETY, will be held on THURSDAY, the 4th of AUGUST next, under the patronage of the Principal Nobility and Gentry of Yorkshire, and upon the same scale as in former years.

The Grounds will be open at One o'clock. Admission, until Three, 2*s.* each; and from Three until Five, 1*s.*; Children under 14 Years of Age, Half-price. The Exhibition will close at Five o'clock.

The Schedule of Prizes may be had after the 1st July, on application to Mr. W. HARTLEY, Fossgate, Secretary to the Committee of Management; or to Mr. H. BAINES, at the Museum.

The Museum will be opened during the Exhibition. Every attention will be paid by the Committee of Management to the comfort of the Exhibitors and Visitors.

The Committee pledge themselves to use their utmost exertions to restore the different specimens sent for Exhibition, with the least possible injury.—Museum, York, 23d June, 1842.

NEW AND SPLENDID FUCHSIAS.

MESSRS. YOUELL have much pleasure in referring the admirers of the above beautiful tribe to their list as advertised in the *Gardeners' Chronicle* of the 18th June, which they continue sending out per post, free, upon the terms there named.—Great Yarmouth Nursery, June 23, 1842.

THE PASSIFLORA MIDDLETONIA OR FRAGRANS.

MESSRS. MARNOCK and MANLEY beg to inform their friends and the Public that flowers of this beautiful new Climber will be exhibited during the next fortnight at Messrs. Warner and Warner's, 28, Cornhill, by whom orders will be received.—Nursery, Hackney, June 24th, 1842.

LILIUM LANCIFOLIUM.

H. GROOM CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, Album, and Punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

STANHOPE NURSERY, GLOUCESTER ROAD, OLD BROMPTON.

JAMES RIGBY, NURSERYMAN, FLORIST, and SEEDSMAN, has for SALE several PLANTS, from 1½ft to 2ft. high, of that splendid Ornamental Evergreen the ARAUCARIA BRAZILIENSIS, raised from seeds collected in the Mountains of Brazil.

J. R. takes this opportunity of respectfully soliciting an inspection of his Stock of Greenhouse Plants, Dwarf and Standard Roses, now in bloom, and a variety of Plants and Shrubs suitable for ornamenting Gardens and Pleasure-grounds.

An assortment of CAMELLIAS, HEATHS, and other GREENHOUSE PLANTS for EXPORTATION.

SPLENDID SALE of the WOODHALL COLLECTION OF EXOTICS.

There will be Sold by Auction, within the Gardens of Woodhall, in the parish of Bothwell, and County of Lanark, lying 10 Miles east of Glasgow, between Airdrie and Holytown, on THURSDAY, the 28th day of JULY next, and following day, commencing at 11 o'clock each day, the whole of that extensive and celebrated COLLECTION of HOTHOUSE and GREENHOUSE PLANTS, consisting of numerous rare and valuable species, among which are many magnificent specimens of Camellias, Heaths, Epiphyllums, Citrons, Oranges, Shaddocks, Zamias and other Palms; with a very extensive and superior variety of Pelargoniums (Geranium), Indian Azaleas, and other miscellaneous Greenhouse and Stove Plants; of which Catalogues may be had by applying to Mr. Murray, of the Botanic Gardens, Glasgow; Messrs. Austin and M'Aslan, Nursery and Seedsmen, Trongate, Glasgow; Woodhall Office, 33, Buchanan-street, Glasgow; or to the Gardener by Holytown.

The collection of Camellias is well known as not surpassed by any in the Empire, the specimens being of the very finest growth, many of them from 15 to 20 feet in height. The Heaths also afford numerous specimens of the finest sort, which for size and furnishing, it is believed, far surpass any collection ever shown.

The whole of the Plants are in the very best state of health; and as the operations of the mineral workings on the estate have already encroached upon the garden, they must be sold off, as it is, in consequence of the said operations, to be entirely broken up; therefore, great bargains may be expected. The Plants will be set up in Lots to suit purchasers, beginning with the Camellias, Heaths, Epiphyllums, &c.

The collection may be viewed any day prior to the Sale, by applying at Woodhall Garden. Further information learned, and particulars given, on applying to the Factor, Woodhall-house, Holytown.

BARCLAY and SKIRVING, Auctioneers.
Woodhall-house, May 1842.

BRITANNIA LIFE ASSURANCE COMPANY,

1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l.* for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.

PETER MORRISON, Resident Director.

A liberal commission allowed to Solicitors and Agents.

WESTERN LIFE-ASSURANCE SOCIETY.—

OFFICE—49, PARLIAMENT STREET, WESTMINSTER.

Capital 500,000*l.*—10,000 Shares, 50*l.* each.

Deposit 5*l.* each Share.

This Society is established for the Assurance of Lives, upon principles combining economy with perfect security.

Directors.

Henry Edgeworth Bicknell, Esq.
William Cabell, Esq.
Thomas S Cocks, jun., Esq.
George Henry Drew, Esq.
William Evans, Esq.
William Freeman, Esq.
Francis Fuller, Esq.
James Hunt, Esq.
John Arscott Lethbridge, Esq.
Edmund Lucas, Esq.
George Kennet Pollock, Esq.
James Lys Seager, Esq.
John Bazley White, Esq.
Joseph Carter Wood, Esq.
Henry Wrench, Esq.

Trustees.—William Whateley, Esq.; L. C. Humfrey, Esq.; George Drew, Esq.

Auditors.—Ormus Biddulph, Esq.; John Freeman, Esq.; John Bazley White, jun., Esq.

Consulting Counsel.—William Page Wood, Esq.

Conveyancing Counsel.—Samuel Jay, Esq.

Physician.—William Richard Basham, Esq., M.D., 17, Chester-street, Grosvenor-place.

Surgeons.—Alfred Leggatt, Esq.; George David Pollock, Esq.

Bankers.—Messrs. Cocks, Biddulph, and Co., Charing Cross.

Solicitors.—Messrs. J L. Bicknell and J. C. Lethbridge, 25, Abingdon-street, Westminster.

TABLE OF PREMIUMS to assure £100 for the whole term of Life.

Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.
20	1 14 2	35	2 11 0	50	4 3 3
25	1 18 11	40	2 19 6	55	5 5 4
30	2 4 8	45	3 9 1	60	6 15 3

The object of this Society is to afford to the Assured all the benefits of Life-Assurance, at a great reduction in the rates of Premium.—FOR EXAMPLE—A person aged 30, may with this Society assure his life for 500*l.* by the annual payment of 11*l.* 3*s.* 4*d.*, which in a Society where the bonus is held out as a main inducement, would cost him 13*l.* 7*s.* 4*d.*, or, in other words, for the same annual premium he could at this Office assure very nearly 600*l.*, whereby he derives AN IMMEDIATE AND CERTAIN BONUS OF 100*l.*

All particulars as to Shares, Loans, Assurances, &c., may be obtained on application to the Secretary; and, if required, forwarded to the country.

Parties in the country eligible for undertaking Agencies are requested to apply.

A very liberal Commission allowed to Solicitors and Agents.

EDW. T. RICHARDSON,
Actuary and Secretary.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, moveable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s.*, 3*s.*, and 4*s.* per yard.

N.B.—Wayte's New Patent Land-pressers and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the considerntion of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

NUTT'S BEE-HIVES.—GEORGE NEIGHBOUR begs to announce that he has prepared for the present season a large stock of Nutt's Improved Bee-Hives, in which are embodied all recent improvements; and being the only authorised agent for their sale, cautions Apiarians and the Public generally against purchasing Hives which they may conceive to be made in accordance with the exact principles of the Inventor, from parties who unauthorised use his name; in such cases purchasers are invariably deceived and disappointed, the apparatus being imperfect and incomplete Geo Neighbour has also a variety of improved Cottage Hives, Glass Hives, &c. &c, which are very tastefully made, and ornamental to the garden, from each of which the honey may be taken at any time of the season without destroying the Bees.

Apiarian Depôt and Honey Warehouse, 131, High Holborn, London.—Letters relative to the above must have postage-stamps enclosed.

*** NUTT ON BEES (5th edition) now published.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

GARDEN SEATS, FLOWER STANDS, WIRE WORK, GREENHOUSES, &c.

J. CRIPPS, No. 11, MARKHAM PLACE, KING'S ROAD, CHELSEA. Wire Worker by special appointment to her Majesty Queen Victoria, the Dowager Queen Adelaide, and her Royal Highness the Duchess of Kent, begs respectfully to inform the Nobility and Gentry that he has at present on hand, the largest stock in London of Rustic and other Garden Seats, Chairs, Stools, Tables, Flower Stands, Mignonette and Plant Boxes, Wire Work of every description, as Arches for walks, Flower Bordering, Trainers for plants, &c. &c. J. C. also constructs Forcing Houses, Conservatories, Greenhouses Verandahs, Alcoves, and Summer Seats, Invisible and Hare-proof Fences, Gates, &c.; in short, almost every decorative appendage to the Rural Residence.

Plans and Estimates submitted for works in contemplation. Blinds of every description made, repaired, altered, or painted.

EXCHANGE OF PLANTS.—Any Gentleman wishing to make an Exchange of Plants, may see a List of Greenhouse and Stove specimens on application to Mr. WILLMER, 72, Seymour-street, Euston-square, who will receive and forward the exchange-list to the Advertiser.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY.

The Number for June, 1842, contains highly-finished drawings of *Epidendrum phœniceum*, *Fuchsia cordifolia*, *Lobelia heterophylla* var. *Major*, and *Clerodendrum splendens*: likewise Papers on Gardening as a science; Advantages of removing decaying Flowers; Tender Climbers for Summer Purposes; Floricultural Notices of new or beautiful Plants figured in the leading Botanical Periodicals for May, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

THE QUARTERLY REVIEW, No. CXXXIX., is published THIS DAY.—Contents—

1. Paris—the Dangerous Classes of its Population.
2. History and Completion of the Encyclopædia Britannica.

IMPORTANT TO AGRICULTURISTS, &c. &c.
Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1s.,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. Potter, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15s. per cwt. cash.—Chemical Works, Upper Fore-street, London.

Just published, price 20s., dedicated, by permission, to His Grace the Duke of Portland,

A TREATISE on the ACACIA TREE (Robinia pseudo Acacia.)

By W. Withers, of Holt, Norfolk, author of a Memoir, addressed to the Society of Arts, on Planting and Rearing Forest Trees, &c. &c.

The Work contains a complete detail of the History, Character, Growth, Qualities, and Uses of the Tree, with the most approved Methods of Cultivating it; and an Inquiry into the strength and durability of its truly-valuable Wood, when applied to the purposes of Machinery, Ship-building, Farming Implements, &c.

To which is added a Treatise on Planting, Manuring, and Pruning; comprehending all the particulars required by the Planter in the early and later growth of Forest and Ornamental Trees, choice of Varieties, nature of Soils, and the Diseases and Laws to which Trees are subject.

Longman and Co., Paternoster-row.

BRITISH FARMER'S MAGAZINE.
Just published, price 3s.,

THE BRITISH FARMER'S MAGAZINE, No. 22,

for July, 1842: comprising a series of Scientific Papers on Agriculture; Examination of New Theories; Strictures on New Projects; and other useful information for Landowners and Tenants. The articles are supplied by eminent practical Agriculturists, and matters calculated to benefit the Farmer are carefully compiled and inserted.

The select circulation of the British Farmer's (Quarterly) Magazine, a publication which has been established FIFTEEN YEARS, renders it an excellent medium for advertising. Publishers, Manufacturers of Agricultural Implements, and Seedsmen in particular, will find it advantageous to insert their advertisements in the advertising sheet of this publication.

Advertisements should be sent to the Publishers, Messrs. Ridgway and Sons, Piccadilly, London, as early as possible, in the last weeks of March, June, September, and December.

Just published, in 2 vols. 8vo. cloth, price 24s.

Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1s. 9d.

London: W. S. Orr and Co.; and W. and R. Chambers, Edinburgh.

THE 'FRANKLIN MEMORIAL.'—The existence of the identical press at which Dr. Franklin worked as a journeyman printer when in London (in 1726) having been mentioned in the "Athenæum," many persons were induced to visit the warehouse of Messrs. Harrild, in whose possession it then was, and among them Mr. J. B. Murray, of New York, who expressed a desire that the venerable relic should be preserved in the Museum of the Philadelphia Philosophical Society, as a memorial of his illustrious countryman. To this national good feeling Messrs. Harrild cheerfully responded, declining any price, but, wishing to make it instrumental in forwarding a work of charity in favour of decayed printers, proposed that a donation should be made for that purpose. The Society's constitution precluding any such arrangement, it was at once given unconditionally, and the press is now on its way to America. On its arrival at Liverpool, Mr. Murray, being anxious to carry out the benevolent intentions of the donors, caused it to be exhibited, and a public Lecture was given by the Rev. Hugh M'Neile, on the Life of Franklin. The result was a net sum of 150*l.* So unexpected and welcome an issue has led to the proposal of founding a Memorial of the philosopher, and to make this sum the nucleus of a subscription for the establishing of a pension or pensions bearing his name, in favour of indigent printers. It is proposed to found two pensions, if the funds will admit, one of 30*l.* for a decayed master-printer, whom misfortune has "reduced to the ranks," and one of 20*l.* for a decayed overseer who has served five years in an office with credit, or, failing any such applicant, a journeyman who has retained a situation for the same period—to be called the "Franklin Pensioners." Thus, as was observed by Mr. Murray, "each country will be put in possession of a new Memorial of Franklin: America of her citizen's Press, and England of an endowment bearing his name; directly resulting from the fact of his having worked at an English press; and in accordance with his benevolent and provident disposition." The above-named Lecture has been published, and the proceeds of the sale in England and America, and further subscriptions, will be added to the fund; and contributions, not only of the English public, but of the American nation and the Colonies, are confidently anticipated: in short, wherever an English press has been set up (for it has now become universal*) a collection should be made, and contributed to by all who feel that they are indebted to the printer's art for the intellectual enjoyments of social life. The name of Franklin will ever be associated with that invaluable art, and his example serve to stimulate aspiring youth in the pursuit of its exercise. Many are they who have profited by his precepts; and his interesting Autobiography has served for a chart to the young adventurer by which to steer in the voyage of life. Let all those who have so profited—all who have attained success by following his course, look with compassion on those who have foundered or failed in the struggle with adversity. It is hoped at least that in every printing-office in the kingdom a collection will be made; and that every American residing in England will hasten to inscribe his name in so praiseworthy a record, in testimony of his approbation of the Franklin Memorial. The facilities of the post-office will enable every individual to contribute his mite, which will be thankfully received.

---

* So great has been the spread of the art of printing and the English press, that *one* manufacturer has, in the last 15 years, sent out upwards of 1500 presses to all parts of the world! If but a guinea were contributed by each of the respective parties, it would make a sum sufficient for the object proposed.

GARDENER WANTED.

WANTED a GARDENER, to manage a Small Garden. A Married Man will not be objected to.—Apply at Mr. Clarke's, Seedsman, 86, High-street, Borough.

WANTED as GARDENER and BAILIFF, a Middle-aged Man, without a Family, who perfectly understands the management of a Garden and Hothouses, and has been accustomed to overlook a Farm. None who have not unexceptionable and respectable references need apply.—Direct, with particulars, to H.V., at Messrs. Hodgson's, Booksellers, Wimpole-st.

WANTS a SITUATION as GARDENER, a Single Young Man, aged 25. He possesses a thorough knowledge of Kitchen Gardening, the Propagation and Cultivation of Plants, and Forcing in all its branches, having from early life been under the tuition of first-rate men in the above capacity. Can be satisfactorily recommended by the Lady whose service he is about leaving; also from former employers, if requisite.—Apply, by letter, to E. G., Mr. Anscombe's, Stationer, Southgate, Middlesex.

WANTS a SITUATION as GARDENER, a Married Man, 40 years of age, without family, who has had a practical knowledge of his business in all the different branches (early Forcing in particular;) he understands the management of Plantations, Meadow Land, &c. Testimonials and references of great respectability, and a good character, can be had from the family he is leaving. Distance no object. No single-handed place will be accepted.—Direct to A. B., Mr. Westland's Nursery, Dorking, Surrey.

WANTS a SITUATION as GARDENER, in or out of the House, a Single Young Man, aged 26, where one or two are kept; or would not object to a comfortable single-handed place. Reference unexceptionable.—Address C. C., Post-office, Cheam, Surrey.

WANTS a SITUATION as GARDENER.—John Halliday is about to leave his present employer, Lord Sondes, and is desirous of obtaining another situation. He has a good practical knowledge of his business in all its different branches, and can obtain most satisfactory testimonials from his present employer. Address, J. Halliday, Elmham Hall, near Dereham, Norfolk.

WANTED, a MAN AND HIS WIFE, without incumbrance, by a Single Gentleman, about Four Miles from London, where only themselves are kept. The Man as a thorough good practical Gardener, and to make himself useful about the house. The Wife as good plain Cook and general Servant. No letters can be attended to but such as contain a statement of the previous service they have been engaged in, their ages, and the wages required. — Address H. H., Tom's Coffee-House, Cornhill.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION as GARDENER, a Married Man, 32 years of age, without encumbrance, who has lived with some of the first Noblemen in England; has been very successful in forcing Pines, Grapes, Peaches, &c.; as also in the culture of Stove and Greenhouse Plants; and can be highly recommended by some of the first Horticulturists of the day, whom he has formerly lived under, and by the Gentleman he has just left, who will satisfactorily answer the fullest inquiries.—Address W. H. R., Mr. Forrest's Nursery, Kensington.

A new Edition, considerably improved and enlarged.

LOUDON'S ENCYCLOPÆDIA of GARDENING;

the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening, including all the latest Improvements, a general view of Gardening in all Countries, and a Statistical View of its present State, with Suggestions for its future progress in the British Isles, &c. With nearly 1000 Engravings on Wood, 50s. boards.

II.

A New Edition, with Supplement, of

LOUDON'S ENCYCLOPÆDIA of PLANTS;

a Description of all the Plants in Great Britain, down to 1840, with nearly 10,000 Figures, by Branston, from Drawings by J. D. C. Sowerby, F.L.S. One thick vol. 8vo, 3*l.* 13s. 6d. cloth.

*** The SUPPLEMENT, edited by J. C. Loudon, prepared by W. H. Baxter, Jun., and revised by Geo. Don, F.L.S., with upwards of 800 additional Figures, separately, price 15s.

III.

LOUDON'S ENCYCLOPÆDIA of AGRICULTURE.

Third Edition, with nearly 1300 Wood Engravings, one large vol. 8vo, price 2*l.* 10s. cloth lettered.

IV.

LOUDON'S HORTUS BRITANNICUS;

a Catalogue of all the Plants indigenous to or introduced into Britain. New Edition, with a New Supplement up to March 1839, prepared, under the direction of J. C. Loudon, by W. H. Baxter, and revised by Geo. Don, F.L.S., 8vo, price 1*l.* 11s. 6d. cloth lettered. SUPPLEMENT, separately, 8s.

London: Longman, Brown, Green, and Longmans.

TO MARKET GARDENERS.

TO be LET, a very extensive WALLED GARDEN; also an ORCHARD of choice Fruit Trees in full bearing; together with an excellent and varied assortment of Wall-Fruit Trees, trained to a wall from 10 ft. to 12 ft. high, which surrounds the whole area, comprising about four acres. The Premises are most complete, and contain extensive Conservatories, Pineries, &c., within the walls. The whole is delightfully situated, being effectually sheltered from the prevailing cold winds, and is in the highest state of cultivation.

Applications, addressed to H. T., Post-office, Llandilo, Carmarthenshire (prepaid), will be immediately attended to, and further particulars given; but no application will be noticed unless it contains one or more unexceptionable references.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief, is prepared only by Mr. White, Chemist, 24, Cornhill, London, in bottles at 2s. 6d., 4s. 6d., and 8s. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3s. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. *** Notice—The Name and Address of the Proprietors, A. Rowland and Son, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

*** Be sure to ask for "ROWLAND'S."

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

The last Exhibition will take place on Saturday, the 9th of July. Subjects for Exhibition must be at this Office on Friday, the 8th of July, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition. The Gates will be opened at One, P.M.—Tickets are issued to Fellows at this Office, price 5*s*. each; or at the Garden in the afternoon of the days of Exhibition at 10*s*. each; but none will be issued without an order from a Fellow of the Society.—21, Regent-street.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d*. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

The Gardeners' Chronicle.

SATURDAY, JULY 2, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Horticultural	8 P. M.
	Floricultural	7 P. M.
Saturday	Royal Botanic	3½ P. M.

The mode of growing Asparagus in glass bottles, so as to compel that plant to form a head, which we some time since mentioned as being practised at Nice, has, we believe, failed everywhere. We therefore presume that the exact mode of obtaining this excellent vegetable in such a form was not correctly reported to us. We find, and so do our correspondents, that when Asparagus is compelled to grow in a wine-bottle, it soon shoots up to the top of the bottle, then turns itself a little spirally, and afterwards ceases to grow altogether, becoming hard, and unfit for the table.

The causes of this are threefold: in the first place, it does not grow fast enough; secondly, the long action of light upon it causes it to harden; and thirdly, its stem is so much compressed by the narrow neck of the bottle, that this circumstance of itself prevents its free development. It seems necessary to grow it faster, in the dark, and in a bottle whose neck is wide enough to allow the stem to expand without being pressed upon. It is also probable that the sprouts of Asparagus should have their ends broken off when introduced into the bottle, so as to induce the side branches to form themselves immediately. But it is too late to attend to these things now; we can only recommend them to the attention of gardeners next spring. In the mean while, we have much pleasure in adding the following account from a correspondent, of the result of adopting the advice we ourselves have given as to the true mode of cultivating this important vegetable:

"I have," says our correspondent *J.B.K.L.*, "two beds of Asparagus about 6 years old. They were originally very badly made, not having been half filled with plants; and the naturally hungry gravelly soil having been neither removed nor replaced by better, nor enriched by good dressings of manure. No great proof this, you will say, of good gardening. I acknowledge it, but plead partly in extenuation that I was from home when they were made. As might be expected, the consequence has been that the heads have always been few in number, small in size, and inferior in quality. The land is likewise so foul and given to weeds, that unless constant diligence be exerted it is almost impossible to keep it clean; and the beds, if left only for a short time to themselves, become one mass of matwork of Knot-grass, Field-speedwell, Groundsel, and Grass. I have frequently intended to dig them up, and remake them, but something or other has always occurred to prevent me; I may, perhaps, have cherished a hope that they would mend, and have frequently sown seed in the vacant places, but the young plants have as constantly been choked up by the weeds, or pulled up with them. When early in the Spring I read in your valuable *Chronicle* the mode of cultivating Asparagus practised on the coast of Spain, I resolved, in humble imitation, to try an experiment, knowing that if I killed all the plants I should do no great harm. I therefore, long before any heads made their appearance, forked in some manure from an old Cucumber-bed, levelled the surface, and completely covered the beds with fine salt, at least a quarter-of-an-inch in thickness. As no rain fell for some time, I endeavoured to wash it in by copious waterings, and although we have had rain in addition, the salt has not long entirely disappeared; the watering and the sun together caused it to form a crust which it took some time to dissolve, and upon tasting the surface of the soil within the last five minutes, I find it very perceptibly salt. But what has been the effect?—Every weed is entirely destroyed, and the beds are as clean as a well-trodden turnpike-road. But the Asparagus! what has become of that? That has thriven, and been improved in a remarkable manner. The plants have thrown up numerous heads of surprising size and excellent quality, and I wish I had an opportunity of sending a dozen for your inspection. I am accustomed to see bundles of very fine heads from Ely and Wisbeach, which places are noted for excelling in the growth of this vegetable, but I never saw finer than mine, and all this alteration caused in a few weeks in plants before almost valueless."

Schleiden's bitter criticism of Liebig's Book has produced the following letter from Dr. Gregory, of Aberdeen. We insert it from the respect we bear for the talented writer, but we must observe that it is no answer to the arguments of Dr. Schleiden. That we agree with Dr. Gregory in his high estimate of the talents of Professor Liebig, and of the value of his work, is well known to the readers of the *Gardeners' Chronicle*, and is sufficiently proved by the notices we published of it in the beginning of last year; but it does not follow that we therefore think his views infallible, or that we approve of his attempt at riding roughshod over his contemporaries. On the contrary, we agree with Schleiden in regarding his insolent denunciation of vegetable physiologists most unbecoming, especially in a man who evidently knows as little of minute physiology as they of minute chemistry. Schleiden's caustic style may be complained of: and we must confess that we ourselves countenance it on one ground only—namely, that of its being formed upon the model of Professor Liebig's; but we must observe, that an eulogium of the talents of the one is no answer to the specific criticisms of the other.

"Having just seen in your paper the first part of a critique on 'Liebig's Agricultural Chemistry,' by Dr. Schleiden, I cannot, as a friend to truth, and an admirer of the genius of Dr. Liebig, refrain from addressing to your readers a few remarks on this review.

"I would first point out the fact, that in all cases where an individual makes a great step in advance in any science, opposition is sure to arise, and that generally in two forms. At first his facts are boldly denied, his reasonings contemned, and he is denounced as an innovator. Afterwards, when the facts can no longer be denied, he is accused of plagiarism in regard to those very facts which were formerly denied. The third stage, however, is sure to arrive when his facts and opinions, so far as they are founded on true induction, are quietly admitted.

"The work of Professor Liebig has, in most cases, passed through the two stages of opposition, and has reached that of acquiescence—the best proof of which is, that the press teems with the most unblushing piracies of his principles, in many of which his name is not even mentioned.

"As an example of the first kind of opposition, I may refer to the papers in the 'Quarterly Journal of Agriculture,' where most of Liebig's doctrines are denied, and the old view of the action of humus, attacked by Liebig, is strenuously defended. Your own paper offers an example of the second kind; for you admit fully his doctrine that the carbon of plants is derived from carbonic acid, but maintain that that doctrine was universally adopted in this country, at the very moment that the 'Quarterly Journal' maintained the opposite view. It is not my business to reconcile these conflicting statements, but I allude to them as the invariable accompaniments of every great advance in knowledge.

"Dr. Schleiden admits almost all Dr. Liebig's doctrines, but writes in a very strong manner against the author. This at first sight appears anomalous. But on examination, it is easy to trace the origin of Dr. S.'s invective. He is offended at the charge preferred against physiologists of ignorance of chemistry. Now I will not say that I approve of all the terms in which the charge was expressed; but, as a chemist, and after much reading of physiological works, I am prepared to maintain that it is substantially true. But without entering on recrimination, which is quite unsuited to a scientific discussion, I think the main question may be brought into very small compass. Will Dr. Schleiden, or any other individual, point out any previous work where the agriculturist can acquire the knowledge (admitted by himself to be valuable) which is conveyed in Liebig's work? I am not acquainted with any such work; and if here and there doctrines similar to Liebig's are to be found, their authors have never succeeded in demonstrating them, nor have they furnished an intelligible system. Nay, I maintain they could not have done so, since organic chemistry, which is essential to the investigation, was not yet developed. The time has at last come, and, as always happens, the man also.

"Dr. Schleiden makes free use of the name of Müller. Now I have the best reason to know that no man entertains a higher opinion of Liebig's work, or is more sensible of the deficiency of chemical knowledge among physiologists, than that truly eminent writer. I speak here from positive knowledge.

"In the concluding sentence of this first part of the critique, Dr. Schleiden, forgetting the calm demeanour of a man of science, makes a most unbecoming attack on Dr. Liebig, and alludes contemptuously to his laboratory, which he says Dr. Liebig has described as the only laboratory in Germany. Now, as I have on two occasions enjoyed the privilege of working for many weeks in this laboratory, and have besides a pretty extensive acquaintance among German chemists, I may safely defy Dr. Schleiden to name any laboratory where the art of research is actually taught, except the following: viz., those of Wöhler at Gottingen, Erdmann at Leipsic, Redtenbacher at Prague, and, I believe, I may add, Varrentrapp at Brunswick. The two former gentlemen I know well, and they are Liebig's most intimate friends, and among his greatest admirers. The two latter I also know; they are among the most distinguished of his pupils, and one of them has only been professor two years, and the other one year. No one admires more than I do the genius of Mitscherlich, Rose, Magnus, and the other distinguished Prussian chemists. But where are their schools? The truth is, the arrangements in Prussia, like those in England, do not admit of the formation of a school of research; and it is out of the power of these gentlemen to have more than one or two pupils, generally assistants, while the average annual number of working pupils at Giessen, owing to the liberal arrangements of the Hessian government, is fifty. I rejoice to say, that, owing to the exertions of Prof. Liebig, a great improvement in this respect may be looked for in Prussia. This subject is, I admit, irrelevant; but as Dr. Schleiden has introduced it, it is fit that the truth should be known.

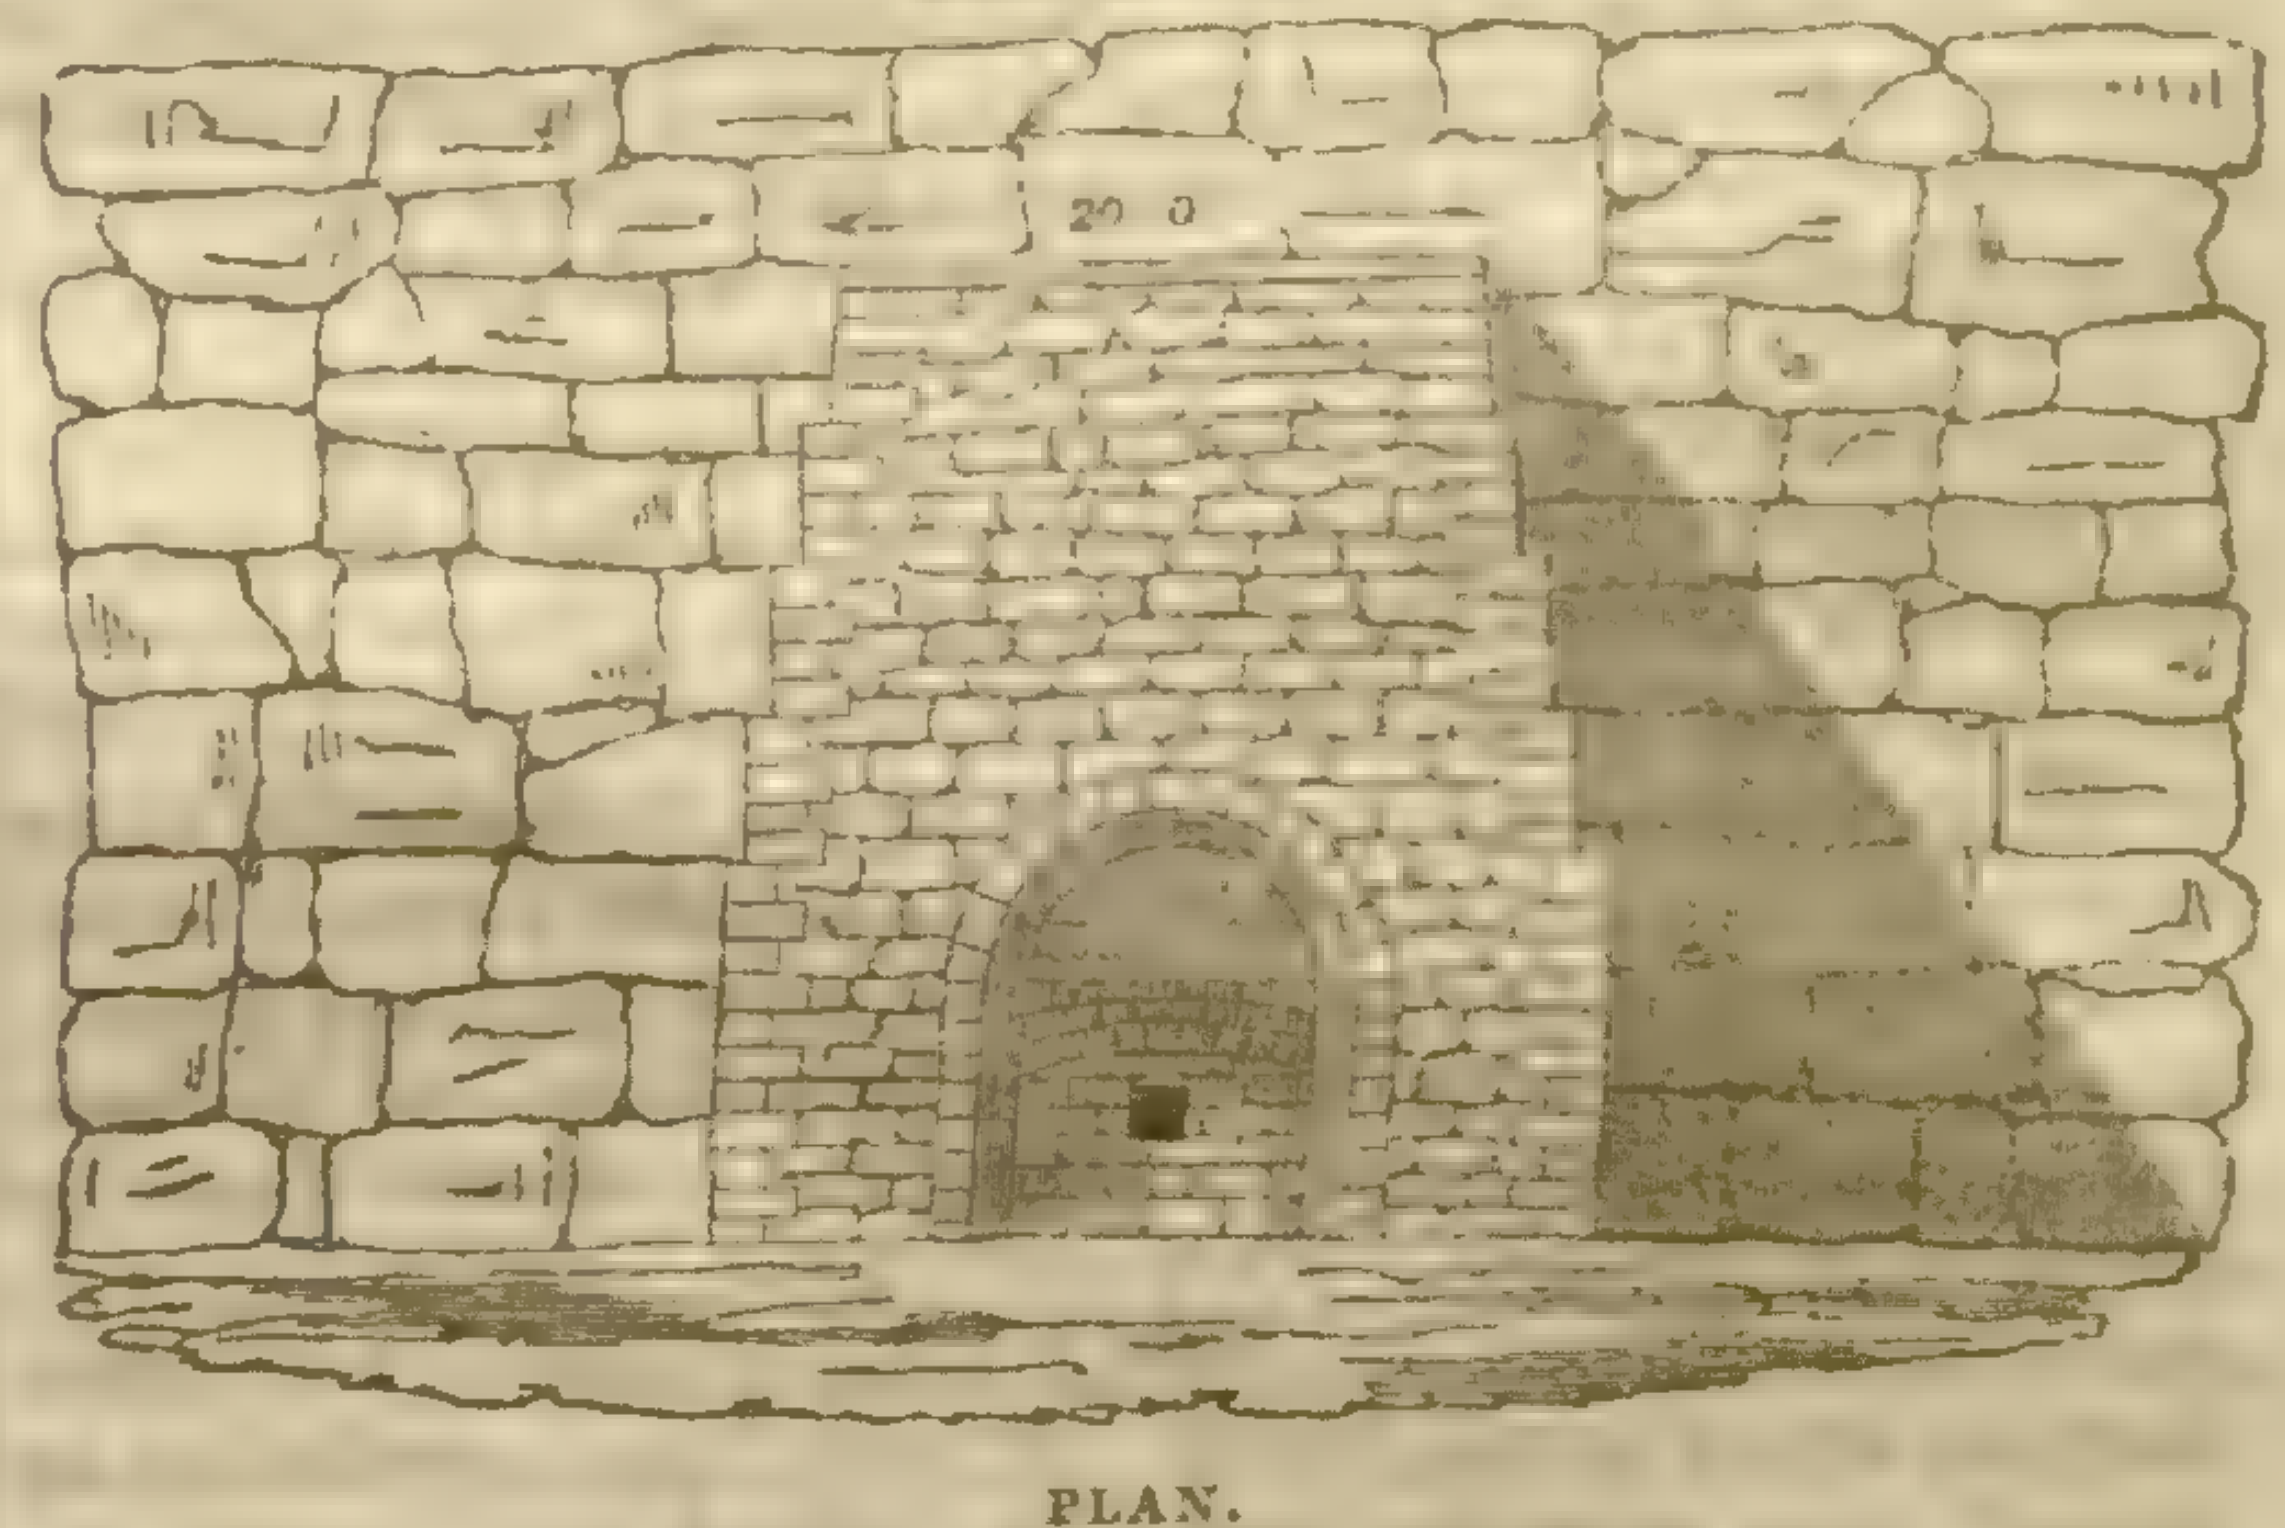
"It is not my intention at present to enter on a critique of Dr. Schleiden's review. Dr. Liebig is well able to defend himself against far more formidable attacks. Besides, I wish to see the whole review. But I feel bound to warn your readers against the spirit of this review; and I pledge myself, if necessary, to show that Dr. Schleiden has misapprehended, or misrepresented, (I do not say knowingly,) all those doctrines of Liebig which he has attacked in his first part.

"Finally, for the present, I would beg to point out, that no one chemist of eminence has stated any objection to the chemistry of Liebig's work; that many agriculturists have, to my certain knowledge, expressed their sense of its infinite value, and of its superiority to the works of vegetable physiologists; and that, although in the first attempt of this nature many imperfections must necessarily exist, yet your readers will not find in any other work even an approach to the amount of sound principle, and of important hints for practice, contained in the truly valuable work of Prof. Liebig. I differ so entirely from Dr. Schleiden in my opinion of this work, that I firmly believe, and I have good reason for doing so, that, notwithstanding the numerous piracies in a popular form, which owe all their value to the plunder of this work, its character is steadily rising, and has not nearly reached its culminating point. I willingly stake my reputation, as a chemist and as a man of science, on the opinion that Prof. Liebig's work will continue for many years to be a standard one. When I have seen the remainder of Dr. Schleiden's review, I may again address you."

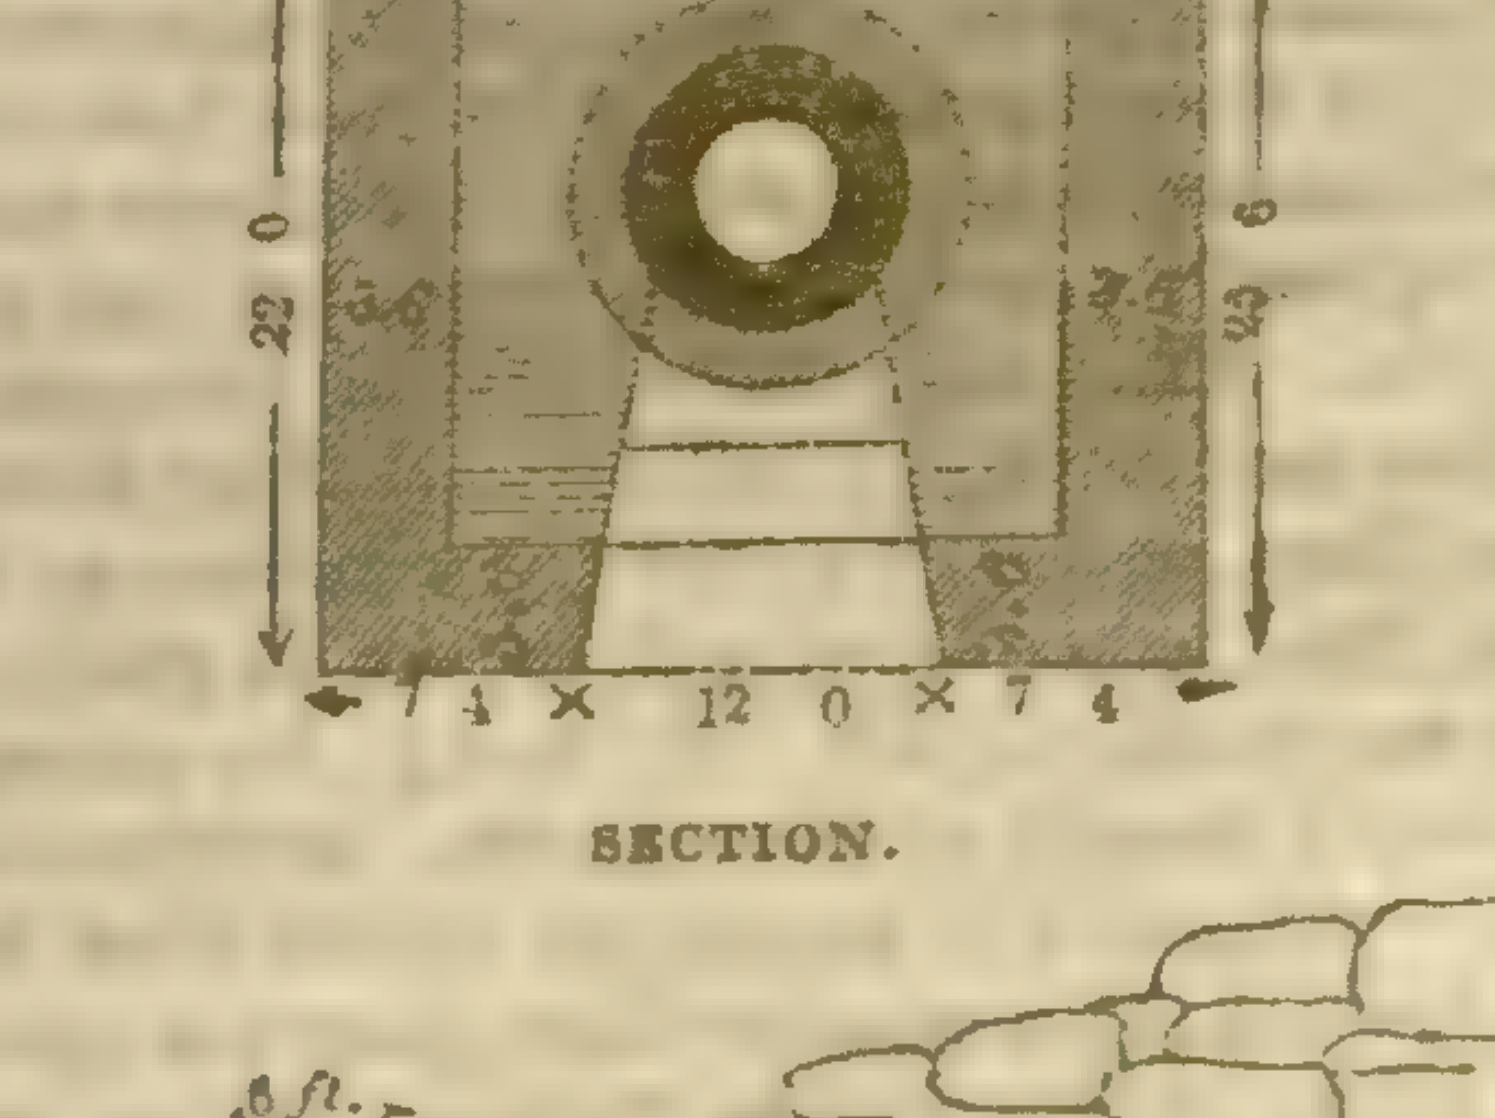
LIME-KILNS.

Herewith I send you sketches of one of the simplest, and, I believe, most efficient lime-kilns, either for agricultural or building purposes, that I have met with. They are much used in Yorkshire and Derbyshire, and are generally built by the side of the rock from which the limestone is quarried: by which arrangement the kilns are easily charged. Supposing, however, no rock or hill to be near, it will be necessary to build the back as shown in the section by the dotted lines (which will make it a rectangular building). There must be a small jib or crane fixed on the top for hoisting the limestone.

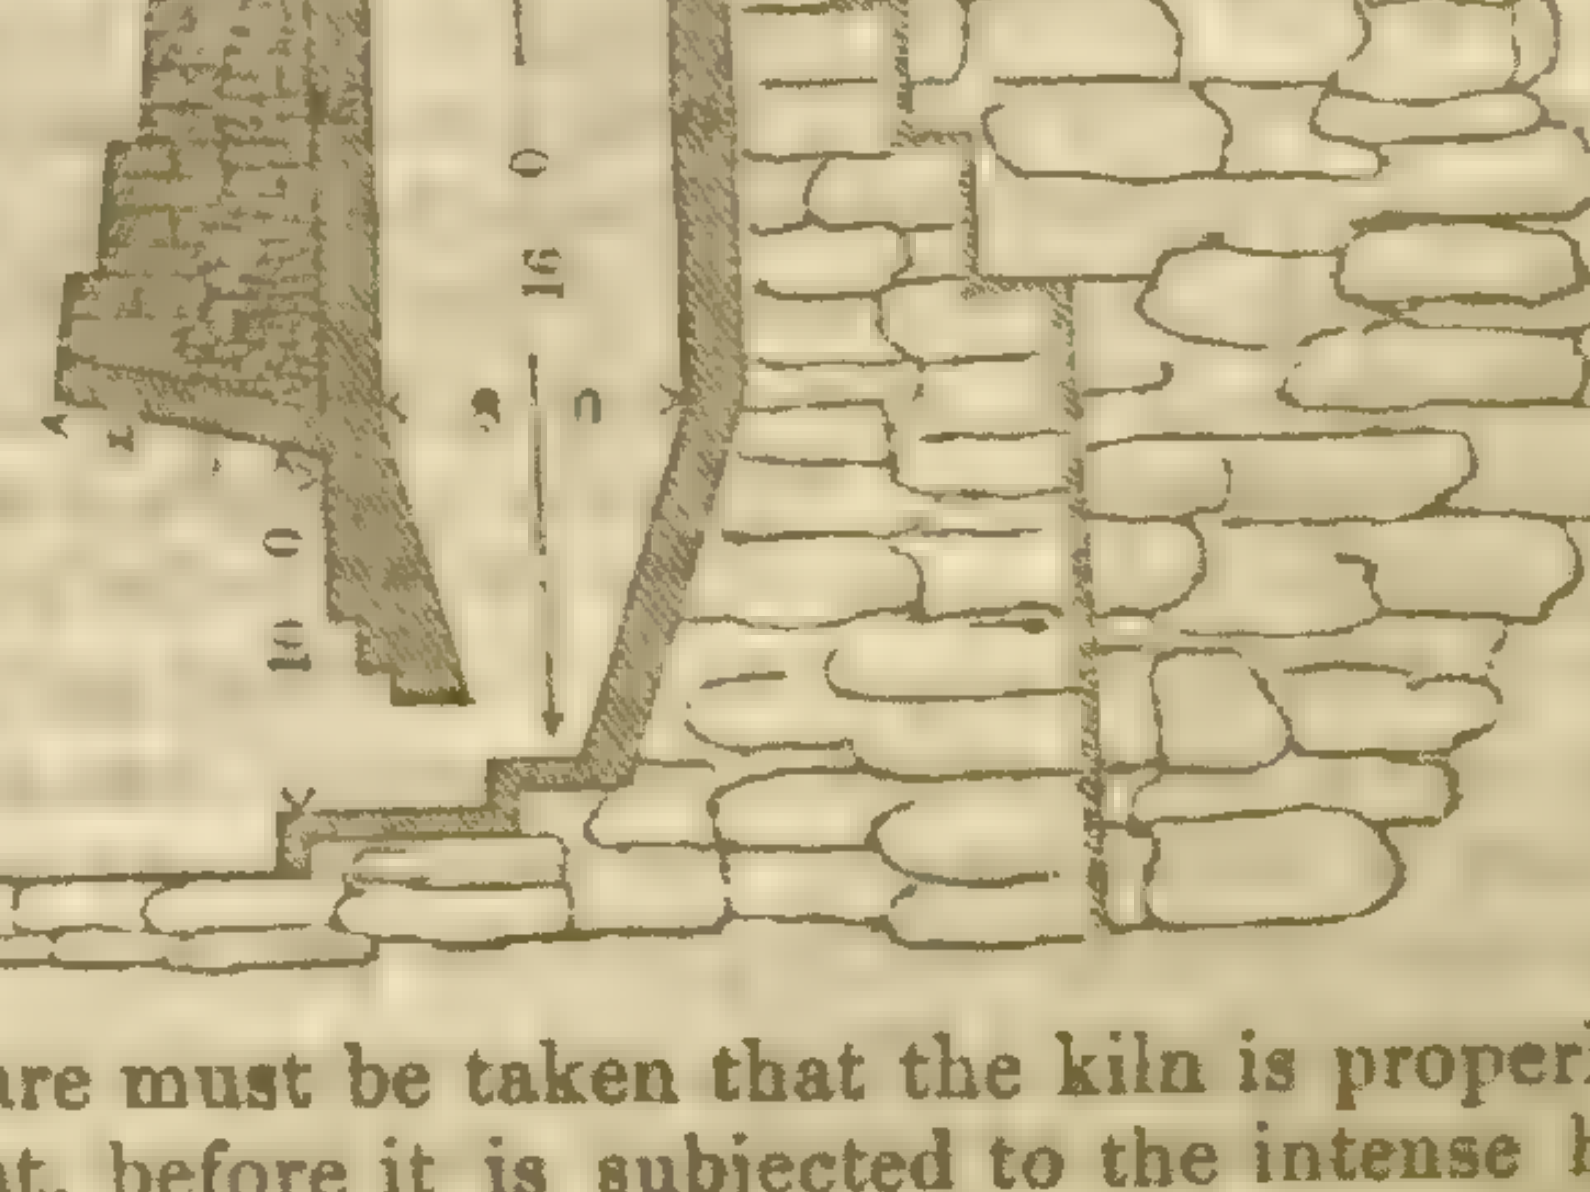
ELEVATION.



PLAN.



SECTION.



Great care must be taken that the kiln is properly dried by fire heat, before it is subjected to the intense heat required to calcine the limestone; otherwise it will be destroyed by expansion. The fuel used is small coal in alternate layers with the limestone.

I am informed the cost of a kiln of this description, with the shaft of fire bricks, the external walls of gritstone (that being the best to stand the heat), and the centre filled with rubble, will be about 35*l*. or 40*l*.—*R. S. Upton, Surveyor, Ranelagh Grove, Pimlico.*

ON THE PRESERVATION OF FUCHSIAS THROUGH THE WINTER.

It may be of some importance to inform your readers that the best and cheapest way to preserve Fuchsias through the winter months is to bury them. I buried 300 last winter in the following manner:—

At the approach of frost I shook them out of the soil, and cut all the laterals from them, as if trimming a riding cane; upon those intended to be trained to a wall, paling, or trellis, I left three, four, five, or six canes, some of them 5ft. and 6ft. long. They were then ready to be deposited in the soil until the end of April or beginning of May: I dug out a pit in the centre of my heath soil (any other tolerably dry soil or sand will do) about 3ft. deep, 3ft. wide, and 6ft. long, so as to contain all my plants, and placed them in a sloping direction in the pit, with stakes driven here and there diagonally over them, so as they might be kept hollow, and to prevent the soil from pressing too much upon their brittle stems.

In covering them I used no straw or matting, but allowed the straw to fall amongst them, and formed it into a sharp ridge on the top. When I opened them at the end of April, I was pleased to find that they were all breaking remarkably strong, and had made some very long shoots, with vigorous roots, in all directions, from bottom to top, as a pit of Willow shoots would do under similar treatment; these very soon shrunk up on exposure to light and the atmospheric air; but on being potted, and placed in a large pit, the plants were soon excited, which is the natural consequence of a transition from darkness into light. Those trimmed for a wall were planted out at once, in the beginning of May, and are now growing vigorously from the trained branches. Some of the tender kinds were more or less injured by the frosts in the beginning of May, but, generally, they are doing well, and I intend to go over them immediately, to thin the young shoots, so as to increase the vigour of those that are left.

It will be encouraging to the cottager, and those who have neither greenhouse nor any frames to place them in, to learn that those which I planted against a south-east wall, towards the end of April, are now as forward as those which I have just planted out into beds and borders from the frames and greenhouses. Those which I potted had their roots tolerably well trimmed-in, so as to enable me to put them into six and seven-inch pots for convenience, and to keep the roots as near to the side of the pots as I could; they do best in comparatively small pots, till ready to plant out into beds, when the weather becomes favourable.

I have many four and five feet long, and stripped of their young wood, to form into standards and into umbels. It is of great importance to know that such deciduous plants as Fúchsias, Bouvárdias, &c., of which a great stock is necessary to be kept through the winter, for summer embellishment, can be well preserved at little expense, without the aid of either greenhouse or frame.—*John Mearns, F.H.S., Leeds Bot. Garden.*

AMATEUR'S GARDEN.—No. XXVII.

CHRYSANTHEMUMS are now well rooted and may be shifted into pots of the next larger size. Cut or pinch off the top of each plant, and several of the buds below will be forced into growth; they must be "stopped" again by and by, and the plants will thus acquire a dwarf bushy habit, which is much prettier than when they are allowed to grow long and *straggling. Place them out of doors fully exposed to the sun, but slightly sheltered from the effects of high winds.* They will grow well in any rich free soil, such as a mixture of loam, leaf mould, and rotten dung, in equal proportions. If very large specimens are wanted, they must be frequently shifted into larger pots, and flowered in "12s" or "16s"; but it is generally more suitable for the purposes of the amateur to flower them in "32s" or "24s," as they are then better adapted to fill baskets or stands in rooms. No plants are more easily managed, providing they are liberally supplied with water; but if this is neglected, they soon lose their under leaves and become very unsightly. Manure water should also be frequently given, as this produces the most beneficial results. They should be left in the open air, until some of the earliest begin to expand their flowers in October, and then removed to the greenhouse, or other sheltered situation, when they will flower in great splendour for many weeks in winter. A vinery, for example, which is often nearly empty at this season, answers the purpose extremely well, and the possessor would thus have plenty of pretty flowers, at a season when they are generally very scarce. Many of the earlier varieties flower well out of doors, particularly if the autumn happens to be fine. When intended for this purpose, they can be planted out at once, in front of a wall or on some sheltered bed, and when the stems grow tall they can be pegged down to the ground, which they will entirely cover with their leaves; and when they come into bloom they will have a dwarf and pretty appearance. For this purpose, I would particularly recommend such sorts as Wheeler's Changeable Yellow and Early Blush, on account of their early flowering.

Any spare time which the amateur has to devote to gardening at this season of the year, cannot be more profitably spent than in visiting public gardens or nurseries. Suppose he is fond of Roses, and has a quantity of Stocks ready for budding, hundreds of the finest kinds are now in full bloom, which he can examine for himself, taking down the names of those which he most admires, and procuring buds of them as soon as they are in a fit state for budding. The same remarks apply to Verbenas and other summer flowers, as well as to the more common perennial herbaceous plants, and also to fruit trees. Lists of such things, given in the autumn or spring at the time of planting or grafting, are well enough, but the amateur is much more likely to get what will suit him if he follows the advice now given.

Ladies who are fond of window gardening, but who have not much convenience for propagating their favourite plants, cannot select a more appropriate time than the present. The plants are now in a vigorous state, and will strike from cuttings very readily. All sorts of free-growing things, such as Pinks, Pelargoniums, Roses, &c., may easily be struck, if a bed composed of loose sandy soil is made behind a wall or hedge, and covered with hoops and mats to shade them during bright sunshine.—*R. F.*

HOME CORRESPONDENCE.

Model Cottages.—In your paper for June 18th is published a design, by Mr. Loudon, for a mechanic's cottage, which I should have passed without notice if it had not been admitted into the *Gardeners' Chronicle.* You justly say—"What a change is there in cottage architecture!" I fear, however, if we were to take this model cottage as a specimen of "an economical, commodious plan, uniting comfort with little expense," the change would not be found to be for the better. In my opinion, whether in point of architectural taste, or arrangement, comfort, and construction, it is utterly unworthy of being copied. As to the arrangement, &c., we have in the first place an entrance to the living-room (*c*) fig. 2047, through the back kitchen (*b*); than which nothing can be more absurd. We have next a pantry (*d*) with a south-east aspect, a situation where no one, who knew its proper use, would place it. We have then "a light closet under the stairs," without any light, or visible means of obtaining it; for a light could not be made in the outer wall at the end, as the stairs pass there before they rise more than 2 ft. 6 in. Let me, however, be liberal enough to allow Mr. Wilson a borrowed light from the living-room. When we consider the proximity of the living-room door, living-room fireplace, stair-boxing, and door of closet under it, I think we can hardly give the author credit for many ideas of comfort. Mr. Wilson blames architects for making staircases so inconvenient, in removing an individual to his last home; but while he has so much sympathy for the dead, I wish he had some compassion for the living. Let us form an ideal section of this cottage. From the ground to the top of the chamber window-case is 17 ft. 6 in.; deduct from this 6 in. for entrance step, and 7 in. for joists, and 2 in. for floor and ceiling—we have 16 ft. 3 in. left. Now we will give Mr. Wilson every advantage, and allow 8 ft. 3 in. for the chambers, and 8 ft. for the ground floor; then we shall find that we have steps only 2 ft. 6 in. long, with no more than 8 in. tread, while the rise is exactly 8 in. But in addition to this, and independent of the fact that the situation of the stairs spoils both the living-room and chamber over, and leaves insufficient room for the passage of a good-sized coffin, they cannot be executed; for the curbed ceiling of the chambers (see the height of casings in the elevation) will come down to within 3 ft. 9 in. of the landing. I leave it to Mr. Wilson to say if it is fair to give living subjects only 3 ft. 9 in. to stand upright in, while he would allow ample room for the dead. Again, from the height of the roof I find its pitch is 45°; then, if we take the level of the chamber ceilings at the top of the dormer window-case (and it cannot be lower), we shall find that we have only 3 ft. of level ceiling and 3 ft. 9 in. of upright wall in the chambers. I therefore simply ask Mr. Wilson what sort of beds he will put up at *f* and *g*, in fig. 2050? Yet this is a model cottage. Secondly, this cottage has no architectural character in its composition, although exactly the same means arranged by a person of taste would have produced it. This is the natural result of any one attempting a subject which he does not understand. And this leads me to ask, where a mechanic, without a cow-house or pig-sty, is to collect his liquid manure from? Would it be worth his while to keep a tank (*l*), with pump, &c., for simply the dish water from his back kitchen? I think not. I object to double cottages of the same plan reversed; but, perhaps, this is more a matter of taste than of reason; yet, even suppose we admit that the families agree, and that the method is economical, still we find that both dwellings cannot be equally advantageously placed in regard to aspect; and this is the reason why the pantry (*d*) is so badly situated. All such double cottages, however, should be placed, so that the diagonal line, in the direction of North and South, should not be thus  as in the model cottage, but thus  in order that the front windows may catch the morning sun—the morning being the most delightful time to feel his rays. In conclusion, let me ask Mr. Loudon if he considered the waste of material when he recommended all roofs, of every sort of covering, to be of such a pitch, that a cross section would form an equilateral triangle—a pitch greater than was commonly used in Tudor architecture. How would he like to see his favourite Italian tiles, so highly and frequently recommended in the "Gardener's Magazine," covering the sides of a roof rising at an angle of 60 degrees? As you may not think it fair to criticise Mr. Wilson's plan so freely without offering something better, I have no objection to send you a design, if you wish it, that will, whatever its deficiencies may be, at least be free from the defects of the "model plan;" but it shall be a single cottage, for the reasons I have given in the foregoing letter.—*Scrutator.* [We shall be most happy to publish the promised improvement.—As to the plan thus criticised, we must leave Mr. Loudon to defend its merits.]

Model Cottages.—A few mechanics in our village who have little gardens, club our weekly pence to buy the *Chronicle*, and though there is sometimes a good deal that is above our comprehension, we are, on the whole, well pleased with our pennyworth. This was so long as you kept to gardening; but when you took to building cottages, which is a little in our line, we began to doubt. At last our mason pointed out that they were not your cottages, but one Mr. Loudon's, and that perhaps you would be obliged to us to tell you our minds of them. First place, it seems that one Mr. Wilson sent to Mr. Loudon a plan of a cottage, which is number 2048, and which they call a "model cottage." We don't know exactly what they mean by a *model* cottage; but we suppose it means something particularly good, better, at all events, than common chaps like us could contrive. Well, we looked at the plan, and we could not find anything very wonderful about it. It is narrower behind than before, which we don't like, because it causes expense, and makes inside corners in the walls, which corners are sometimes damp; and then the stairs begin close to the fireplace, which we don't approve. Still, it is a fairish sort of a plan. But it did not suit Mr. Loudon's *draughtsman*, I think they call him; so he sets about mending it: and a pretty concern he has made of it! He makes an ugly notch in the front room, to hold the stairs, which were much better in the back; and he contrives it so, that whoever wants to go to a bedroom, must come all through the washhouse, and nearly all through the living-room, before they can get there. Every thing and every body that has to go to or leave a bedroom, must be paraded through the whole house, in sickness and death, as well as in health, for father and mother, for boys and for girls, and for lodgers, if they have any. Then the fireplace of the best room is stuck in the corner close to the door, and close to the lump made by the stairs, so that when the tea-table is drawn comfortably to the fire, no one can go up or down stairs without disturbing the whole family; and when the good woman is sitting alone, if she takes her chair to the hearth to make the most of her bit of fire on a cold day, she is close to the draughts of the door, and too far from the window to see even her knitting. In short, you may take our words for it, there never was such a thing as this improved model cottage. Well, then they send it back to Mr. Wilson, to show how the draughtsman had mended it; and I suppose Mr. Wilson is a good sort of a person, who did not want to hurt anybody's feelings, so he adopts some of the changes, but gets rid of the worst of them by making a new entrance to the stairs from the lobby. Still he suffers his best room to be spoiled, and the family to be driven up in a corner close by the door and the stairs, and away from the light. But what provokes us most is the pretence about enlightening the ignorance of us country folks, when there are hundreds of better cottages than the best of these in every county throughout England. If these model cottages are so very good, they had better draw the plans of those we build, and show us where and why they are bad. Some day we will perhaps give you our idea of a good cottage, if you will let us. Talking the matter over to our curate, he said that we must not judge of Mr. Loudon by this; that he was a very clever man, and had done some better things than these model cottages. So, hoping that you and he will take these remarks in good part, I am, for the Club, your servant—*Stephen Stump, carpenter, Warwickshire.*—I don't think anybody could make the plan and the elevation suit with one another.—*S. S.*—[We hope our friends "Stump" and "Scrutator," since they do not like Mr. Loudon's cottage, will give us something better; for which we, and our readers, shall be much obliged to them.]

Cedar of Lebanon.—A correspondent having inquired as to the best method of rearing the Cedar of Lebanon, I am happy to contribute my assistance. There appears to be a difference in the growth of some specimens, but it is very trifling, although they are distinguished by the names "Cedrus glaucus" and "C. Lebani;" the former growing with an upright stem, from which the branches shoot horizontally; the other from various stems immediately from the ground. They may be seen (as varieties) in the grounds of Spring Grove, the seat of the late Sir Joseph Banks. The cones are precisely alike, as I have one brought from Mount Lebanon, which has been compared with those produced here. I am, however, wandering from the subject of their cultivation, which commences with seed, which ripens well in the southern parts of England, or from plants which may be met with in most nurserymen's establishments. As the plants make roots very fast, they should be shifted every year into larger pots, and when removed out of them into the ground, where they are intended to remain, they should be surrounded by shrubs for protection, but by no means to come in contact with them, as the points of the young shoots must have liberty to grow. When the plants appear well established, which will probably be in four or five years, all the shrubs around should be removed, when the more exposed to the weather they are the more vigorous they will grow. There are two here treated in this manner, which I planted in 1821, being severally eighteen and twenty-one feet high; and also one planted in 1804, forty-four feet high, and the stem eight feet in circumference at five feet from the ground; this is generally admired for its complete appearance in every respect, and is now producing cones; the lower branches extend from the trunk twenty feet in length, and are still increasing every year. *A. P., Cheam.*

Pruning Forest Trees.—Another correspondent having made his appearance in the *Chronicle* of the 18th inst., on the subject of Forest-tree pruning, I feel induced, by his remarks, to mount my Pegasus again on the same subject. Mr. Cree styles his "The concentrate system," and evidently thinks it the "true one." I feel bound to believe his statement of results, namely, 10 ft. of altitude in three years. This, in the South Highlands of Scotland, where Biggar is situated, is certainly marvellous progress; and if it could be proved that the same trees would not have made equal or greater progress if left unpruned, I should feel more disposed to believe the "concentrate system" the "true one," than I do at present. Nearly all persons who have written in commendation of Forest-tree pruning, with the ostensible view of facilitating the increase of timber, proceed upon this (to me, erroneous) principle, viz., that the activity of the root is uniform in supplying from the earth the material of increase; and that what is not expended in the production of what they consider useless or superfluous branches, must necessarily be laid upon the stem in woody fibre, or first (as Mr. Cree terms it), in "cambium, which forms the annual rings." This, too, is Mr. C.'s line of reasoning, when he says:—"It is obvious that this cambium, having less superficies to cover than when the branches are extended at large, there is a more abundant quantity for every part; and as little is required for the branches that are shortened and slender, the trunk receives the main supply." Now, from all this I beg to dissent; for, however much the leaves of a tree may be improved (or rather, increased) in size by pruning, which most of us know from every-day experience, yet Mr. Cree must admit that his "concentrate system" must greatly diminish their number, and, consequently, disturb the balance of reciprocity on which I think, according to analogy of nature, the true principle of increase depends. Mr. C. remarks also:—"He who will have branches of various lengths and sizes, without any assignable reasons, is unnaturally capricious." I beg to say, that he who will train all his trees into uniform cones, is much more so. It is true enough, "Nature in the Larch admits no such irregularity;" neither does she in the Spruce, nor the Cypress, nor the Irish Yew; but am I "unnaturally capricious," if my Oaks, Elms, and Chesnuts are not forced into the same form? I certainly think quite the reverse. I am gratified to infer, from Mr. Cree's statements, that trees rise so rapidly in the vicinity of Biggar, —a little primitive-looking town, the vicinity of which, in my younger days, gave propriety to the stanza,

In Scotland's realm, where *trees are few,*
Nor even shrubs abound;
' But where, however bleak the view,
Some better things are found, &c.

But though Biggar could not formerly boast of many trees, it may be interesting to the horticulturist to know, that it was famed for a very useful production, the memoirs of which I invite Mr. Cree to give to the Horticultural world, namely, Early Potatoes, which were highly esteemed and extensively cultivated, from Maidenkirk to John-o'-Groats, if not in other regions.—*Quercus*.——Allow me to say that very little can be learned from books or papers of any kind regarding the manner in which forest trees ought to be pruned; the directions given in your leading article of the 28th ult. may be in some cases applicable, yet in many their application differs entirely from the results there given. For instance, when two leaders of equal strength appear in an Ash or an Elm, merely taking the tip from one of them gives to the other but little advantage in overtopping its partner. It would, therefore, be better for it to be cut off nearer to the bottom; a few shoots from it would do no harm, and the main leader would then receive the whole supply of food. I by no means infer from this that a tree ought to be pruned up like a walking-stick; on the other hand, I am perfectly aware, that a certain proportion of foliage is necessary to carry on all the functions of nature. I am glad, however, to hear you advocate thick planting; some writers of the *Chronicle* have condemned it, and one has advised the planting of Gorse, Broom, or Privet, to act as a nurse to the trees, while small; but I cannot learn the reason why they do not plant something likely to prove useful; at the age of 10 years Larch Fir is often valuable, and is recommended by S. N. V. as one of the best nurses we have. I may here mention, that the remarks of S. N. V., in page 365, correspond entirely with my opinion, and much useful information is contained in that communication.—*H. M. C.* [We see no reason to alter our opinion, if the stopping is done early enough. All depends on that. When stopping has been neglected, there is nothing left but pruning, if trees *must* be meddled with.]

Summer Pruning.—The advantages derived from summer pruning are great. I would, amongst other things, advise your readers to prune Raspberries and Gooseberries, as soon as the fruit is off. Cut out all the old wood of Raspberries at once, and if not done before, as much of the new wood as may be spared. Prune Gooseberries back to a new leading shoot, and cut out clean all the new shoots which are not wanted, but shorten none of them. Everybody shortens, or cuts back in the autumn, new shoots of Peach and Nectarine trees; is this right? What would be the effect of leaving ripe wood its full length?—*S. H.* [The wood of the Peach never ripens fully in this country. It is cut back, in order to get lateral shoots.]

Rotation of Crops.—I have pursued with success for many years the following rotation in preparing ground, which has been almost exclusively devoted, during fifty years, to the growth of Strawberries:—It was usual, in renewing the beds, to mow down the plants after the fruit was gathered, and to dig up the middle of the beds for a path, retaining the runners that had struck in the old one, to bear the following season. But the ground being overrun with Couch grass, Fox-tail grass, and Bindweed, I despaired of cleaning it without destroying the beds entirely. The usual plan would have been to trench the ground; but aware that I should only increase the evil by dividing the roots of such weeds as could not be picked out, amidst an accumulation of Strawberry plants, I had them mown off close to the ground, which was afterwards trenched carefully, by breaking each spadeful, and picking out every root that could be seen. It was then planted with Celery; and every time the plants were moulded up, those roots which had escaped in the trenching were picked out. In the spring I again gave it a shallow trenching, to incorporate the dung in which the Celery grew; and I afterwards planted the ground with early spring-sown Cauliflowers, which were all cut by the middle of August. A good coat of manure was then dug in, and Strawberries were planted in patches, three or five together (according to the sorts), two feet apart in the rows, which are two and a half and four feet wide alternately. These plants bore a crop the following season, equal to what they would have done had they been planted out singly the previous spring. Whenever I make a new plantation, I usually follow the same rotation—except that I have no occasion to trench the ground. Previously to making the Celery trenches, I have only to strike a spade under the patches, and remove them with the few runners they have made attached; a little hoeing being sometimes necessary, if there are weeds on the ground. I annually dig amongst them, and, as soon as possible after the fruit is gathered, I remove from the patches all the runners they have made. It may be objected that it is more difficult to keep the fruit clean than when the plants occupy the whole row; but as I can get plenty of short grass, it is easily accomplished. I am of opinion that if the patches had double the room, I should be no loser; for, about six years ago, I removed alternate patches from two rows of Keen's Seedling—the fruit they have since borne has been very fine and not less in quantity than there would have been had I not removed any. They continue to bear well still, but I seldom allow them to stand longer than four years. Sometimes, instead of Cauliflowers after the Celery, I have a late crop of Peas, in which case I do not plant the Strawberries till the following spring; but I cannot calculate on much fruit that season.—*J. Murdoch.*

Disease in Melons.—Last season, just as my Melons were beginning to swell, small brown blotches began to appear on the upper surface of the leaves, the under part of these spots looking pale and shrivelled. These increased in size and number, until in two or three days the whole of the leaves seemed scorched, and the fruit of course destroyed. This year the same symptoms again begin to show themselves; small red spots are appearing, and the edges of some of the leaves are drying and curling up. I have occasionally watered them overhead, though sparingly, and have fumigated them thrice, but this does not seem to prevent the disease, for every hour more of the leaves seem to be attacked, and all the plants, which two or three days ago appeared in perfect health, with a fine crop of fruit, are likely to go off. What occasions this, and what ought to be done in order to prevent it?—*V. P.* [We don't know.]

Swainstone Scarlet Strawberry.—As the time is at hand when Strawberry forcers will begin to think of preparing their plants for the coming season, it may not be amiss to mention that the Swainstone Scarlet forces excellently, and moreover has the peculiar quality of continuing in a bearing state for a very lengthened period. I saw a few weeks back a splendid crop of this kind in the forcing-houses of Messrs. Endsdale, of Stansted, Essex; and Mr. Stacey, the gardener, assured me they would continue in a bearing state until November.—*W. P. Ayres.*

Nitrate of Soda for Strawberries.—While on the subject of Strawberries, it may be worth while to mention that nitrate of soda is likely to prove an excellent manure for them; and, contrary to most known cases, it may be applied over the herbage without injuring the plants. On calling upon Mr. Rivers a few days back, he pointed out a bed of rather sickly plants, half of which had been liberally dressed with nitrate, as a kill or cure remedy, and the improvement in the colour of the foliage was so decided, that a person might see to an inch where it had been applied, so that there can be no doubt of its nutritive qualities.—*W. P. Ayres.*

The Laburnum.—In No. 26, "Omikron" inquires as to the injurious effects of Laburnum seeds on animals. I beg to state, after an observation of 30 years, that in a field, with a plantation principally of Laburnums, and open to cows, horses, and sheep, no hurtful effects were produced. But the reason of that exemption appeared to be, that those animals never eat either the branches or seeds of those trees, which flowered and hung down luxuriantly, while other flowering shrubs were cropped and torn down by them. May not instinct have taught those animals to avoid the Laburnum as poisonous? I considered it so, and, after a time, planted Laburnums only where exposed to the cow, horse, &c.—*A Constant Reader.*

Chamomile.—You ask where is the evidence of the curative effects of Chamomile? (see p. 349). I can only add that I have proved it to my own satisfaction, in not a few instances, and I was led to make the experiments by having pointed out to me in the garden of Mr. Cort, of Leicester, a fine healthy plant in the borders. There were two small pots of Chamomile, one on each side and in contact; I was assured that the plant previous to this application was rapidly perishing.—*J. Murray.* [We still say, where is the *proof*? Mr. Murray, as a chemist, must be aware that such an experiment as this proves *nothing*.]

Fuchsia Bellana.—Observing that you have noticed in the *Chronicle* a Fuchsia called F. rosea-alba, I beg to say that it was raised by Mr. J. Bell, of Bracondale, near Norwich, and is a very distinct and beautiful variety.—*C. M.*

Habranthus pratensis.—You describe this as a greenhouse plant. I received it from Bridges several years ago, and planted it in the open ground, two feet in front of my greenhouse wall, where it has lived ever since, and it flowers strongly. Phycella ignea, which I received at the same time, I have lost, and should be glad to find for love or money.—*R. B.*

Bees.—A lady, who has one of Nutt's bee-boxes, is fortunate in having so splendid a stock; I have followed his system, and have not succeeded with boxes; I am, therefore, trying it with common beeskeps, and expect to meet with success. I have tried his plan of taking honey from a side box; but I prefer the following method—take the side box away in the middle of a fine day, when there are few bees in it, to an empty room, with a sash window, or one easily opened; or what is better still, one which opens outwards on hinges. Turn two chairs back to back, about nine inches apart at the top ledges; place the box carefully on the tops of the two chairs, about four feet from the window; the bees, finding they are separated from the queen, will fill themselves as full of honey as possible and take themselves off. They will fly against the window and by degrees collect together; and when they have done this, open the window and turn them out; taking care to shut it immediately, to prevent their coming in again. When more bees have left the box, and got to the window, open it again, and let them out also; and so on till the box is quite clear of them, which will be in about half an hour. Be very careful to keep the window close to prevent the bees returning; they will otherwise very soon carry away all the honey. I should recommend an empty box being put in the place of the full one. The best plan of uniting stocks, is to fumigate with fungus; take the queen away—sprinkle some honey and water over the bees, and put them under the stock you wish to strengthen. It is rather a risk to distribute them amongst different stocks, for then a little fighting will follow in all; which is better in one than half a dozen. In uniting them never put together different kind of bees, of which there are several. I have tried this; the total destruction of one is the consequence, and many of the other. I separated a double stock a few days ago, and gave each an empty hive; they are doing well.—*M. H. G.*—The lady with the bees, must, in the hottest time of a fine day, shut up the communication between the central box and the side one which she wishes to take; the front entrance in the side box should be opened, and the preventive door put on; this will cause all the bees to leave in a hurry, but they cannot return into that box. I have driven them out in 15 minutes (excepting they have had a queen there), and taken the box to a distant part of the garden, where there were only a few inoffensive drones, which were shaken out and destroyed.—*T. W. Bath.*

House Crickets.—If your correspondent *J. O.* will place a few saucers, with treacle in the bottoms of them to the thickness of about half an inch, he will soon catch every cricket about his house. It will be necessary to pick out the insects every morning, or such as afterwards get into the saucer can walk over those fast stuck in the treacle. I have caught many thousands of these insects, and cockroaches also, in this simple way, both in hot-houses and private dwelling-houses.—*Albanach.*——It is very probable that your correspondent, J. O., may find it difficult to destroy the house cricket. I was annoyed very much with them some years since, and about 11 or 12 o'clock at night I used to kill them in the kitchen by dozens; I believe, however, I should never have got rid of them entirely in this way, but fortunately an old domestic cat took it into her head to follow my example, and so effectually did she apply herself to the task, by being constantly near the kitchen fire where these animals took up their abode, that in a few months the crickets either forsook the house or were all killed by pussey, and I have heard nothing of them since.—*α. β. γ.*

Sea-Fences.—The woodcut in the leading article of the last Number correctly represents the fence to the sea at Gosford, in East Lothian, the seat of the Earl of Wemyss, and is well worthy of imitation by those who possess lands similarly situated, with a loose sandy soil. You have, however, omitted to state (what, perhaps, you may not be aware of) that the plant occupying the front ranks many yards deep, is the Sea Buckthorn (Hippophae rhamnoides), which not only protects the trees behind it, but is of great service in fixing the loose sands on the flat grounds by the sea-side, from its natural tendency to spread its roots even to high-water mark. As the plant grows wild on the coasts of Kent, Essex, Norfolk, Lincolnshire, and Yorkshire, it may be easily obtained.—*M. D. P.*

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

June 22.—His Grace the Duke of Richmond, K.G., in the chair. His Grace the Duke of Bedford, A. H. Montgomery, Esq., and O. Ricardo, Esq., were elected governors, and 73 gentlemen members. The mayor of Bristol addressed to the council an invitation to dinner at the Council-house, Bristol, on the 12th of July, which was received with thanks and accepted. Mr. Slaney read an account from Mr. Ford of Mr. Irving's new Tiles for Draining; Mr. Bullen, secretary of the Royal Agricultural Improvement Society of Ireland, transmitted a letter on the subject of Judges of Stock for the Meeting at Cork; Mr. Stott communicated the ingredients of his proposed new Saline Manure; Mr. W. Townsend, a paper on destroying the Wire-worm; Mr. Morton, a letter in reference to the Lectures at Bristol; Mr. Sholl, a paper on Hiving Bees; and Messrs. Coote, on Rye Grass. The Duke of Richmond presented a copy of the Labourers' Premium Certificate of the East Sussex Agricultural Association, framed in Oak and varnished, as presented to the meritorious candidates; Mr. Shaw, a copy of Mr. West's Remarks on the Turnip Question, and on the use of the Subsoil Plough for Turnip Culture; Mr. Revis, the first Annual Report of the Leominster Farmer's Club; and Mr. Evans, the 5th Number of the "British American Cultivator," from Canada. The Council ordered that an impression of 3.000 copies of Mr. Burke's compilation on Cottage Economy and Cookery should be reprinted for distribution among cottagers, and be supplied to members (on application) at one penny each; also a second impression of 3,000 copies of Main's Paper on Cottage Gardening, at the same price, the former copies having been nearly distributed.

MANCHESTER BOTANICAL & HORTICULTURAL SOCIETY.

The Council of this Society, in honour of the British Association for the Advancement of Science, gave an exhibition of Horticultural and Floricultural specimens, on a scale hitherto unexampled out of the boundaries of the Metropolis; and their exertions were acknowledged by the crowd of visitors to the gardens, and the spirited competition which took place among the exhibitors, who amounted to about 150 in number. The day was gloomy and threatening, foreboding heavy rain; fortune, however, favoured the company, who flocked to the gardens about 3 o'clock, when a scene of fashionable gaiety, enlivened by the music of the 1st Royals and 60th Rifles, occurred, which has rarely been witnessed in this town on any similar occasion. The arrangements were excellent, and we noticed a considerable number of distinguished savans who honoured the town by their presence at the meeting of the Association. The following is a list of the prizes, and the names of the persons to whom they were awarded: Roses: *Best Crimson or Blush Moss*, 1, J. Grimshaw, Esq.; 2, Mr. T. Barber; 3, Mr. E. Deas; 4, Mr. J. Plant, gr. to W. Bow, Esq. *White Moss*, 1, 2, Mr. J. Massey; 3, Mr. T. Marvin; 4, Mr. J. Buckley. *Single Moss*, 1, 2, 3, Mr. E. Dean; 4, E. Leeds, Esq. *Dark*, 1, Mr. S. Bromby; 2, Mr. W. Brundrett; 3, Mr. T. Marvin; 4, Mr. J. Wild. *White*, 1, Mr. S. Bromby; 2, R. Taylor, Esq.; 3, 4, Mr. T. Barber. *Red or Blush*, 1, Mr. Jute; 2, Mr. N. Cranshaw; 3, Mr. J. Faulkner; 4, Mr. T. Marvin. *Marbled or Striped*, 1, Mr. J. Fildes: 2, Mr. N. Cranshaw; 3, Mr. T. Appleby, gr. to T. Brocklehurst, Esq.; 4, Mr. T. Marvin. *Double Yellow*, 1, Mr. T. Atkinson; 2, Mr. W. Deas, gr. to P. Lucas, Esq.; 3, Mr. J. Chadwick; 4, Mr. S. Heywood. Best Collection of Roses: 1, Messrs. Goodwin; 2, ditto; 3, Mr. A. Mitchell. Pansies: 24 *varieties*, 1, Mr. W. E. Burton; 2, Mr. J. Davenport; 3, Mr. J. Ashton: 4, Mr. H. Mayor; 5, Mr. A. Mitchell, gr. to the Queen Dowager. 12 *varieties*, 1, Mr. S. Heywood; 2, Mr. J. Gaskell; 3, Mr. J. Moult; 4, Mr. R. Turner; 5, Mr. H. Openshaw. Stocks. *Scarlet*, 1, Mr. W. Deas, gr. to P. Lucas, Esq.; 2, Mr. W. Brundrett; 3, Mr. J. Massey. *Purple*, 1, Mr. W. Deas. Pæonies: 1, 3, and 4, Mr. W. Knowles; 2, Mr. Brundrett. Anemones: 1, Mr. L. Robinson; 2, Mr. T. Marvin. Pinks: *Purple-laced*, 1, Duke, and 3, Mango, Mr. J. Taylor; 2, Admiral Napier, Mr. D. O'Brien; 4, Lustre, Mr. W. Oldham; 5, Suwarrow, Mr. A. Southward; 6, Greenside, Mr. Thos. Whalley. *Red-laced*, 1 and 2, Mr. A. Southward; 3 and 4, Mr. J. Dicken; 5, Mr. J. Nicholson; 6, Mr. W. Bradshaw. *Black and White*, 1, Mr. J. Knott; 2, Mr. J. Dicken; 3, Mr. G. Holgate, gr. to James Hatton, Esq.; 4, Mr. J. Knott; 5, Mr. W. Smith; 6, Mr. J. Ashton. Best Collection of Pinks: 1, Mr. J. Dicken; 2, Mr. W. Lodge; 3, Mr. J. Knott. Ranunculuses: *Dark Self*, 1, Mr. W. Bradshaw; 2, Mr. R. Calvert; 3, Mr. W. Bradshaw; 4, Mr. S. Heywood. *Light Self*, 1, Mr. W. Bradshaw; 2, Mr. J. Osbaldeston, gr. to Mrs. Doveston; 3 and 4, Mr. W. Bradshaw. *Striped*, 1 and 4, Mr. W. Bradshaw; 2, Mr. R. Calvert, gr. to — Andrews, Esq.: 3, Mr. T. Marvin. *Yellow-edged, or Spotted*, 1, 2, 3, and 4, Mr. W. Bradshaw. *White-edged, or Spotted*, 1, 2, and 4, Mr. W. Bradshaw; 3, Mr. Thos. Marvin. *Dark Grey, or Purple-shaded*, 1, Mr. R. Calvert; 2 and 3, Mr. W. Bradshaw; 4, Mr. W. Sharp. Orchidaceæ: *Miscellaneous Collection*: 1, Mr. W. Hammond, gr. to the Rev. J. Clowes; 2, Mr. T. Appleby, gr. to J. Brocklehurst, Esq.; 3, Mr. J. Plant, gr. to W. Bow, Esq. *Single Specimens*: 1, Stanhópea oculata, Mr. W. Hammond; 2, Saccolábium guttatum, Mr. T. Appleby; 3, Stanhópea Devoniana, Mr. R. Allen, gr. to J. Knowles, jun., Esq.; 4, Gongora maculata fulva, Mr. T. Appleby; 5, Brássia sp., do.; 6, Cycnoches ventricosus, do. Stove Plants: *Miscellaneous Collection*: 1, Mr. W. Deas; 2, Mr. T. Appleby. *Single Specimens*: 1, Stephanotis floribundus, Mr. T. Appleby; 2, Ardísia colorata, Mr. J. Edwards; 3, Æschynanthus sp., Mr. J. Hulme, gr. to S. Heelis, Esq.; 4, Gloxínia rubra, Mr. J. Plant; 5, Burchéllia capensis, Mr. G. Holgate, gr. to J. Hatton, Esq.; 6, Combretum purpúreum, Mr. R. M'Vine, gr. to J. Walker, Esq. Greenhouse Plants: *Miscellaneous Collection*: 1, Mr. J. Plant; 2, Mr. W. Dees. *Single Specimens*: 1, Pimelea decussata, Mr. R. Davies, gr. to Mrs. Cropper; 2, Angophora floribunda, Mr. J. Edwards; 3, Roella ciliata, Mr. J. Plant; 4, Státice arbórea, do.; 5, Polýgala cordata, Mr. J. Rogers, gr. to A. Frerich, Esq.; 6, Alstrœmeria tricolor, Mr. R. Davies. Cacti: 1, Cactus Ackermanni major, Mr. G. Daniels, gr. to E. Chadwick, Esq.: 2, C. Jenkinsoni, Mr. R. M'Vine; 3, C. speciosíssimus, Mr. W. Deas; 4, C. Jenkinsoni, Mr. J. Edwards; 5, Mr. W. Deas. Ericas: E. Shannoniana, Mr. J. Plant; 2, E. tricolor, Mr. W. Deas; 3, E. odorata, Mr. R. Davies; 4, E. ventricosa superba, Mr. W. Deas; 5, E. viridiflora, Mr. R. Davies; 6, E. tricolor élegans, Mr. J. Plant. Pelargoniums: *Dark*: 1, Erectum, Mr. J. Plant; 2, Speculum, Mr. W. Chorlton: 3, Jewess, Mr. J. Hulme; 4, Arabella, Mr. D. Saxon; 5, Prince of Waterloo, Mr. R. Allen; 6, Flash, do. *Light*: 1, Sylph, Mr. J. Plant; 2, Alexandrina, Mr. G. Holgate; 3, Nymph, Mr. J. Plant; 4, Matilda, Mr. R. Burghall; 5, Lady Bradford, Mr. J. Hulme; 6, Foster's Eliza, do. Calceolarias: 1, Formosíssima — 2, Queen — 3, Prince Albert — 4, Constellation — 5, Adonis, Mr. J. Wood, gr. to H. Wadkin, Esq. Fuchsias: 1, Fuchsia fulgens, Mr. R. M'Vine; 2, F. corymbiflora, Mr. J. Hulme; 3, F. globosa, Mr. R. M'Vine; 4, F. Chandleri, Mr. J. Hulme; 5, F. globosa maxima, Mr. J. Wood. Ornamental Plants: 1, Mr. R. Allen, gr. to J. Knowles, jun., Esq.; 2, Mr. J. Plant; 3, do.; 4, Mr. T. Appleby; 5, do. Hardy Shrubs: 1, Menziésia polifólia alba, Mr. W. Chorlton; 2, Clématis bicolor, Mr. J. Plant; 3, ——, Mr. J. Wild; 5, Gaulthéria Shallon, Mr. J. Plant. Herbaceous Plants: 1, Campánula grandis, Mr. J. Burghill, gr. to E. Leeds, Esq.; 2, Mímulus Mackianus, Mr. R. Davis; 3, Gladíolus, var. Constantine, Mr. J. Plant; 4, Lilium longiflorum, Mr. J. Wild; 5, Mule Pink, Mr. J. Plant. Basket of Plants: 1, Mr. J. Plant; 2, Mr. R. Owen, gr. to G. R. Chappell, Esq.; 3, Mr. R. Allen; 4, Mr. J. Hulme. Basket of Flowers: 1, Mr. J. Wild; 2, Mr. J. Plant; 3, Mr. T. Barber; 4, Mr. W. Deas. Extra Prize to Mr. J. Rogers. Miscellaneous Dessert: 1, Mr. T. Appleby; 2, Mr. W. Deas; 3, Mr. G. Holgate. Pines: *Brace*, 1, F. Ramsden, Esq.; 2, Mr. T. Royle, gr. to R. E. Warburton, Esq.; 3, Mr. J. Eccles, gr. to J. Pooley, Esq.; 4, Mr. F. Macbeth, gr. to R. Mann, Esq.; 5. Mr. P. Mottershead, gr. to T. Barnes, Esq. *Single*, 1, F. Ramsden, Esq.; 2, Mr. F. Macbeth. Grapes: *Black, two bunches*, 1, Mr. J. Hall, gr. to T. Ogden, Esq.; 2, Mr. W. Deas; 3, Mr. J. Hall; 4, Mr. W. Deas; 5, Mr. J. Plant. *Coloured*, 2, Mr. P. Mottershead; 3, do.; 4, Mr. W. Deas; 5, Mr. F. Macbeth. Melons: 1, Mr. G. Holgate; 2, do. Strawberries: 1, Mr. J. Renshaw; 2, do.; 3, do. Extra Prize: Mr. Myatt, of Deptford, for his British Queen. Cherries: 2, Mr. P. Mottershead; 4, Mr. T. Royle. Gooseberries: 1, Mr. T. Marvin; 2, Mr. J. Massey; 3, Mr. G. Holgate. Currants: 1, Mr. R. Davis; 2, Mr. W. Chorlton; 3, Mr. J. Renshaw. Raspberries: 1, Mr. R. S. Yates; 2, Mr. J. Renshaw. Cucumber: 1, Mr. W. Deas; 2, Mr. R. Owen; 3, do.; 4, Mr. P. Mottershead; 5, Mr. J. Renshaw. Rhubarb: 1, Mr. J. Howard, gr. to J. Smith, Esq.; 2, do.; 3, Mr. W. Chorlton; 4, Mr. J. Renshaw. Extra Prize: Mr. J. Howard. Mushrooms: 1, Mr. R. S. Yates; 2, Mr. H. E. Barton; 3, Mr. J. Edwards. Peas: 1, Mr. J. Renshaw; 2, Mr. R. M'Vine; 3, Mr. W. Deas. Beans: 1, Mr. R. Petrie, gr. to S. Brooks, Esq.; 2, Mr. F. Macbeth; 3, Mr. T. Barber. French Beans: 1, Mr. R. Petrie; 3, Mr. W. Chorlton. Cauliflower: 1, Mr. J. Wadeson, gr. to W. Crossley, Esq.; 2, Mr. J. Renshaw; 3, Mr. R. S. Yates. Cabbage: 1 and 2, Mr. J. Renshaw; 3, Mr. F. Macbeth. Carrots: 1, Mr. F. Wadeson; 2, Mr. J. Howard; 3, Mr. R. Petrie. Turnips: 1, Mr. J. Harrop; 2, Mr. J. Howard, gr. to J. Smith, Esq.; 3, Mr. J. Wadeson. Lettuce: 1, Mr. J. Holgate; 2, Mr. T. Frith, gr. at the Deaf and Dumb Institution; 3, Mr. G. Holgate. *Collection of Miscellaneous Plants*: 1, Mr. W. Lodge; 2, Messrs. H. Bigland and Co.; 3, Mr. W. Lodge.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Be'rberis umbellata. Umbel-flowering Barberry. Berberácece. Hexandria Monogýnia. (*Hardy Shrub.*)—A specimen of this new hardy shrub has flowered in the garden of W. Wells, Esq., of Redleaf, where it has been raised from Nepal seeds. It is something like B. aristata, but has much narrower leaves, very decidedly glaucous underneath. From B. coriária it differs in the same character, and in the flowers being much smaller, and in long stalked clusters. The branches and spines are remarkably slender. The leaves are narrow, obovate, mucronate, slightly toothed, with very distant veins on a glaucous ground upon the under surface.—*Bot. Reg.*

Verónica ni'vea. Snow-white Speedwell. Scrophulariáceæ. Diándria Monogýnia. (*Greenhouse Herbaceous plant.*)—A native of the mountains of Van Diemen's Land, where it was originally found by Mr. Gunn. It appears to be half shrubby in its native country, with stems a foot and a half high, stout and stiff. The leaves are cut into many narrow segments, and the flowers are pure white. It is a pretty greenhouse plant.—*Bot. Reg.*

Becíum bícolor. Two-coloured Bécium. Labiatæ. Didynámia Gymnospérmia.—Raised from Abyssinian seeds sent to the Horticultural Society, from Paris. It is a shrub with downy stems, ovate-lanceolate, serrated, slightly petiolated leaves, and verticillasters of beautiful flowers arranged in short spikes. The calyx has a broad upper lip; the corolla is large, white, with lilac veins; and nearly an inch long. The upper lip is 3-lobed, with the middle lobe split at the point, and the points of all rolled back; the lower lip is of about the same length, oblong and concave.—*Bot. Reg.*

MISCELLANEOUS.

Liebig's Organic Chemistry, reviewed by Dr. Schleiden, (continued from p. 424).—In the chapter on Cultivation, little could be expected of interest to vegetable physiologists; and having been as badly arranged as the remainder of the work, at least half its contents consist of isolated physiological observations. First, humus is again taken up, and found to be an inexhaustible source of carbonic acid, which feeds the plants. By this process, the quantity of humus contained in the soil is, he says, subject to a continual diminution. Dr. Liebig has forgotten that, in another place, he had asserted the reverse to take place. Then comes a most surprising statement. He says (p. 109), that in a soil which communicates a yellow colour to water, no plants thrive; and that few plants flourish on barren peat-soil, or marshy meadows, whose soil has that quality. One would think that Dr. Liebig had never seen a peat-moss, or a marshy meadow, or the dense mass of vegetation which is spread over it; or that he had never heard of peat being continually reproduced by the perishing vegetation that it bears, and which quickly shoots up again; or, that on this peculiar quality of peat-moors depends the inexhaustible nature of peat-pits. The matter, however, stands thus: Farmers call that soil barren in which those plants do not thrive which they cultivate, notwithstanding that it may otherwise produce a most luxuriant vegetation. On the soils named by Dr. Liebig there do, in fact, grow as many plants as on any other soil, but of peculiar kinds. Many of them, doubtless, require a large quantity of humus, as, for instance, many kinds of Moss; while Reeds and Sedges do not seem to thrive at all, except in soil containing a large quantity of free humic acid. Dr. Liebig had already settled, as we thought, all that is requisite for the growth of plants; but (at p. 109) he suddenly produces quite a new requisite, namely, the existence of free oxygen in the soil; without, however, mentioning for what purpose it serves, and whether or in what way it is introduced into plants, and what changes it undergoes there. Further on, amidst a number of well-known observations, are more erroneous conceptions. In a preceding page of his book (p. 23), he had asserted that "no matter can be considered as nutritious, or as necessary to the growth of plants, which possesses a composition either similar to, or identical with, theirs—as in such a case the assimilation could take place without the decomposition of carbonic acid by the leaves." This is mere fiction; it has no application to parasitical plants. Of equal value is what he says, p. 115:—"Leaves serve to produce starch, woody fibre, and sugar; if we therefore bring these matters (starch, woody fibre, and sugar) into plants, by means of their roots, the vital functions of the leaves are disturbed, &c." Now woody fibre is the most insoluble vegetable matter which we know. It is incomprehensible how such a substance could be conducted by the way of the leaves to the trunk of a tree to serve there for the formation of annual rings. Starch occurs in plants only in the shape of grains, and therefore it likewise cannot be introduced into the trunk and bark by the leaves. As for sugar, it has been proved by the experiments of Saussure and Davy, that plants thrive exceedingly in dissolved gum and sugar, if the solution is not so concentrated as to render endosmose, and consequently nutrition, impracticable. But Dr. Liebig possesses great talents in the way of omitting facts which do not suit his theory; and instead of confessing that there are many things he does not know, he prefers saying that all those things which he is unable to explain, do not exist. Thus we find (p, 116) the following proposition:—"Each grain of wheat contains within itself the matter which produces its germ and root-fibres (namely, starch and gluten); and we must suppose that these two substances are found there *exactly* in the proportion necessary for the development of those organs. But the two matters are completely consumed in the formation of the first parts of the roots and leaves, and a surplus of either could in no way contribute to the formation of leaves, without a portion of the other matter exactly corresponding to it in quantity." This sounds well, and seems to be the dictum of a great genius; but, unfortunately, it is mere romance, and is contradicted by well-known facts. The proportion of gluten and starch contained in wheat varies greatly—the first between 7·0 and 35·0, and the second between 70·0 and 40·0. Can we assert that 7:70 and 35:40 form two proportions, exactly corresponding to one another? And yet the kinds of corn, thus differently constituted, are equally capable of attaining complete development.

After bringing forward a fresh supply of well-known facts, Dr. Liebig produces an idea, correct indeed, but familiar to every physiologist as soon as he begins his studies. He says (p. 120), "From this view" (the view the author had taken cannot be inferred from what precedes), "it is evident how greatly the products of a plant can vary according to the relative proportion of the nourishing matter it receives." This is just the point which renders all modern chemistry useless to vegetable physiologists; and this is the reason why physiologists cannot, like Dr. Liebig, conduct experiments on whole acres of forest or meadows, nor in ditches and ponds. They are obliged to make multitudes of exact, tedious, and laborious observations on individual plants; because their object is to learn the processes of vegetation as they actually go on in such plants,—and not to guess at the probable effects of vegetation on the natural history of the globe. I think Dr. Liebig would have been less ready to heap his invectives upon physiologists, if he had known that they have not to deal with a salt, composed, according to the constant formula $1(a+b^2)+1(c+b^3)$, but to investigate organisation, which is very changeable, and gifted with a great power of adapting itself to circumstances. For, despite of all the formulas of chemistry, there always remains an unknown x, which we for the present call vital force, notwithstanding the sentence of death pronounced upon it by Dr. Liebig. But I, this moment, perceive that I have wronged him. The great chemist, who has in his pocket all explanations ready made, who, at page 18, is quite certain that plants decompose carbonic acid, and at page 60 thinks that this is extremely improbable, feels on a sudden (p. 121) an utter consternation at discovering the miraculous effect of this vital force, which is able to produce a thing that no chemist can imitate with the most powerful galvanic pile, although it is nothing more than a simple chemical decomposition, namely, that of carbonic acid in plants, which has once more obtained his approbation. But, Sir, did you not feel, when you were writing this passage, what a silly figure you must cut in the eyes of physiologists, after having heaped upon them so many opprobrious terms? We find that 999 thousand parts of the vital functions of vegetation are inexplicable, but we perceive that the last thousandth may admit of a chemical explanation; at the same time, however, we confess, that our poor chemistry has not advanced so far as to be able to imitate even this insignificant trifle, exactly in the same manner as it occurs in the organised body. In such a case, I think the term 'vital force' would not be so very unsuitable to indicate all that is still unknown to us.

The author goes on speaking of the decomposition of carbonic acid in leaves, and says (p. 123) that it has been proved by experiments made with cut-off leaves, which of course did not receive any nitrogen together with the carbonic acid, that nitrogen is not necessarily required for the decomposition of carbonic acid. Is this the art of making experiments which is so much extolled, and can only be learnt in chemical laboratories? Does Dr. Liebig not know that every leaf itself contains a great quantity of nitrogen, and that this matter is possessed of such qualities as enable it to produce the most astonishing chemical metamorphoses and decompositions? Is it possible that he should be ignorant that every cut-off leaf, according to its nature, sooner or later, ceases to decompose carbonic acid? and what has he to answer, when I inform him that it ceases to decompose carbonic acid as soon as the nitrogen contained in it has been consumed? Such propositions as the above are not admitted into vegetable physiology. The author continues: "The carbon derived from carbonic acid assumes a state in which it is soluble, and this we call sugar, when it is sweet; gum or mucus, when tasteless; and excretions, when it is secreted by the roots, &c." Such observations as these are as worthless in chemistry as in physiology It is nonsense to call sugar a fluid form of carbon, when oxygen and hydrogen are as essential to its formation as carbon, and as it is only by the union of these three substances that sugar is produced. Nor is there more sense in what is said of excretions, among which occurs not only matter containing nitrogen, but such varied substances as oil, resin, oxalic acid, &c.

The succeeding observations, which consist of aphorisms founded on old facts, I might leave to the agriculturists, to whom they are introduced, with the same courtesy as he has observed towards the physiologists. I must, however, notice one passage, if only to prove in how hasty and superficial a way Dr. Liebig draws conclusions. According to the experiments of Saussure, plants of wheat yield before they are in blossom 0,070, whilst they are in blossom 0,054, and when the corn is ripe 0,035 of ashes. Hence the author infers that plants, from the time when they begin to blossom, return to the soil a portion of their inorganic matter; which certainly is a false conclusion. These facts only show that the relative proportion between the organic and inorganic constituents has been changed; and this may have taken place whilst the absolute quantity of inorganic constituents in each single plant has been increased tenfold, or in any other proportion. I am decidedly of opinion, that a great increase of this matter takes place, if we consider the absolute weight of plants in blossom, and when loaded with seeds. It is quite distressing to mention such things to a chemist, for he at least should know how to estimate them.

The chapter on the Rotation of Crops and Manure contains little to interest a physiologist. The author first mentions excretions by the roots, respecting which there exist no experiments of any value, except those of Macaire Prinsep. Although we poor physiologists may not have acquired the art of experimenting in chemical laboratories, yet we know, I trust, what are the requisites of a scientific experiment; and we think those of Mr. Prinsep not made with such skill as entitles them to form the foundation of a theory, as is evident from the weighty objections made to them by Meyen in his "Physiology." A theory founded on such experiments can only be a plaything. Scientific naturalists are aware that, in the complicated processes of vegetation, many things are to be considered, of which Dr. Liebig has not the most remote idea. A few propositions in this chapter, placed side by side, will show with what facility shallow people can explain things that are inscrutable to those who penetrate below the surface of the subject. "According to Macaire Prinsep, it is by their excretions that plants return to the soil such constituents as have been introduced into them during their growth. These excretions cannot be assimilated by any plants, until they again have been converted into humus. Clover secretes matter which becomes humus with great difficulty. All Clover-like plants, especially Saintfoin and Lucern, form such excretions abundantly, and continue to do it for several years in succession." From this the reader would probably infer that no plant can thrive where Clover has been grown; but Dr. Liebig does not draw such a conclusion. It is well known that many plants grow in the midst of, and almost immediately after, Clover, at least what are commonly called weeds. According to Liebig's first and second chapter, humus in no way contributes to the nutrition of plants; nevertheless he here tells us that one of the principal effects of the rotation of crops is the artificial production of humus, which is most completely obtained by the cultivation of Saintfoin and Lucern." Alas! for the poor farmer, who is to borrow the theory of his art from Dr. Liebig's book. But, to proceed: "It is evident," says Liebig, "that after from five to seven years the soil must be impregnated with excretions to such a degree, that all the roots will be surrounded by them; and as they remain for some time in a soluble condition, they are again introduced into a plant, which suffers injurious effects in consequence, because they are not capable of being assimilated." Dr. Liebig does not consider that roots extend, and that food enters them only by their extremities. This extremity, which is to receive nutrition, is annually leaving the place which, according to his theory, is poisoned with these pretended excretions, and it extends into a soil which is free from them. Sometimes these extremities advance over a considerable space in a short time. I think, therefore, that the bare places found in a field of Clover, after 5 or 7 years, are not produced by the roots refusing a soil impregnated with excretions, but that the life of such plants has arrived at its term, and that they could not continue to vegetate even in the best soil. If excretions were the cause of this change, the whole field would be depopulated at the same time; but we find that it is only single plants that die, and thus, according to the difference of their qualities, become sooner or later extinct. Thus bare places are formed on the field of Clover, but these places do not remain without vegetation until again converted into humus by the sun and atmosphere; on the contrary, even before the Clover has entirely died, they are covered with small plants, which thrive very well, although, according to Liebig, the soil has been poisoned by unassimilable excretions. It seems as if the author never saw a field, and that the bare places in it are known to him only from books on rural economy, where the term "bare places" is used to imply those spots where the cultivated plants do not grow, but not a bare soil destitute of vegetation. In his explanation of this subject, we find, p. 153, the following proposition: "Though a certain quantity of carbon in the soil be sufficient to bring many plants to complete development, it is not sufficient to provide their different organs with the greatest possible supply of nourishment." According to my weak understanding, nothing is in this passage clear, except its absurdity. No plant can attain more than its complete development, and the quantity required to produce that effect is called the maximum of nourishment, whilst a minimum implies that the nourishment is so scanty as to be hardly sufficient to maintain the life of the plant. Possibly Dr. Liebig has here confounded the plant with the field, and intended to say, that even when some plants in a field attain their complete development, there may not be sufficient nourishment for all of them, so that the field does not yield the maximum of produce. At p. 74, Dr. Liebig promises to prove that "all animal manure acts on vegetation only by forming ammonia." But at p. 154, where he treats of manure more copiously, he says, the opinion that manure acts on plants by the nitrogen it contains, and that this matter is assimilated by the plants for the formation of gluten, is quite void of foundation. For, continues he, the quantity of nitrogen contained in animal manure is so small, that it cannot be taken into account. At p. 74, he himself had produced the well-known facts, which prove the increase of gluten in Wheat, as soon as manure containing much nitrogen (*i. e.* animal excrements) is employed; and in the following pages he proves beyond all doubt, that we know no means by which the gluten of cultivated plants can be increased, except from animal excrements, and that "the powerful effect of this kind of manure can only be ascribed to the quantity of nitrogen it contains." I have no doubt that Dr. Liebig, in speaking of this matter, applies the terms "animal manure" and "animal excrements," in one place to solid matters, which contain only a small quantity of nitrogen, but are rich in salts, and in another to the fluid excrements, which contain much nitrogen and only a small quantity of salts. But if so, his meaning can only be guessed at by persons who bring to his book a knowledge of the matter as complete as his own.

But my patience begins to be exhausted, and so, I fear, does that of my reader. I shall, therefore, quit Dr. Liebig, his contradictions, his confusion, his possible explanations, and his impossible conclusions, his physiological blunders, and his chemical mistakes, with a short moral, chemical, and physiological lecture. [This is the substance of some long observations, for which we have not room.]

The ostrich, says the fable, hides its head in a bush when hunted, thinking that what it sees not, exists not. On a former occasion, Dr. Liebig unsuccessfully denied the existence of the fungi of fermentation; he now thinks to proceed with more prudence by not taking notice of them. But, sir, you are much too late. Every person, who has a good microscope, knows that they exist and are composed of cells. It would have been wiser to attack them, for your silence may induce people to think you ignorant of their existence. Two substances are required to produce fermentation in the most simple cases, namely, a solution of sugar and yeast. The product is alcohol and carbonic acid; water and a little ferment (?) remain undecomposed. A theory of fermentation is now demanded, as was formerly the case with the formation of salts; an explanation of the latter was found when the bases and acids had been decomposed into their constituents; the law of saturation could never have been discovered otherwise. Now, then, for the problem of yeast. We know tolerably well the nature of sugar and water, as far as regards their constituents; but as for yeast, do you know anything of that, Dr. Liebig? Did you ever inquire whether it is a simple body or a compound; and if the last, did you ascertain what the elements are of which it is composed, how they are combined, and how far each contributes to the production of fermentation? You have not! You must be joking. What! a great man like you, who has acquired the art of experimenting in chemical laboratories, to attempt to establish the theory of a process, one half of which is completely unknown to him? The thing is impossible! Matters containing nitrogen are among the essentials requisite for the formation of yeast. In what state are those matters when in the wort? What changes do they undergo in forming yeast? And how are we to explain the remarkable fact, that ferment which is entirely exhausted much resembles woody fibre, and is therefore destitute of nitrogen? Whence is derived this woody fibre met with thus unexpectedly? Here now we, poor, ignorant vegetable physiologists apply to chemistry for assistance. Since you cannot answer us, permit me to read you a short physiological lecture:—Cells in plants are only formed where sugar or gum occur, and a substance containing nitrogen; this nitrogen forms nuclei, and afterwards changes the sugar or gum altogether into fibrous matter (faserstoff); the cell being completed, it afterwards grows only by distention. In wort exist all the material conditions required for the formation of cells; the other conditions we are unacquainted with. When the yeast, which originates in the wort, is examined by a microscope, cells are found somewhat large and frequently connected with each other; with care, the whole process of their increase may be perceived. Such cells, at first, always consist of the nucleus containing nitrogen; besides which there frequently appear other smaller kernels in the interior of the cells, which are otherwise filled with clear, watery juice. Such cells may easily be broken by pressure; when their contents come out, a small empty bag remains. As soon as the wort no longer contains matter capable of maintaining vegetation, the formation of yeast ceases. When much alcohol has been formed, this renders vegetation impossible, and wine ceases to ferment. When beer-yeast is well washed with distilled water, and rubbed to a powder in an agate mortar, and then treated with water, alcohol, ether, &c., there remains fibrous matter (faserstoff) as a residuum, and the dissolving agents extract from the yeast a little gum, matter resembling wax or fat, and a substance containing nitrogen. My purposes are sufficiently served by this chemical analysis, which was not made for the purpose of publication; besides, I am only a poor physiologist, whose art of making laboratory experiments was learned from the deceased Stromeyer, my venerable teacher. You, I hope, will soon publish a more correct analysis of yeast, and then perhaps—but not at present—you may be able to give us a theory of fermentation which shall at least have some utility. Till that event takes place, I offer you this trifle as a proof that you may learn a good deal of physiology, and even a little chemistry, from the physiologists.—*M. J. Schleiden.*

Sale of Mr. Lambert's Herbarium.—This celebrated collection has been just disposed of by public auction. Considering that it was in bad condition—broken, soiled, and in great confusion, the sum it produced (1170*l.*) is considerable. The following are the prices which some of the best lots produced: Sieber's plants, consisting of those collected by him in Egypt and Arabia, 150 species; in Candia and Crete, 250 species; in New Holland, 400 do.; in Martinique, 150 do.; his Herbarium Palæstinensis, Flora Trinitatis, Flora Mauritiana, 150 species; and his Flora Capensis, 100 do., 15*l.* 10*s.* Mathew's Peruvian plants, collected chiefly in the Cordilleras, nearly 1,000 species, 2*l.* 5*s.*!; Bennett's plants, collected in the Sandwich Islands, most of them attached to paper of native Polynesian manufacture, and containing between 1,500 and 2,000 species, 20*l.*; Labillardiere's New Holland plants, a bad collection, 3*l.* 5*s.*; a large collection of plants, in 60 small folio bundles, supposed to be a portion of Pallas's Herbarium, and containing between 3,000 and 3,500 specimens, 12*l.* 12*s.*; a large collection of Peruvian plants, comprising a portion of the Ruiz and Pavon collection, and containing about 2,500 specimens, 71*l.*; an arranged collection (Linnean), similar to the last, in 36 large bundles, 177*l.*; Ruiz and Pavon's Herbarium, as arranged by Mr. Lambert, containing between 1,500 and 1,750 species, 270*l.* (this was bought for the British Museum); an extensive collection of South American plants, endorsed "Bolivia, Kelly, and Pentland," about 1,500 species, 13*l.*; an extensive set of plants, collected during the expedition of Capt. Beechy, from the Chinese Seas, from the Sandwich Islands, from California, Chili, and New Holland, 3*l.* 13*s.* 6*d.*; Deppe and Schiede's extensive Herbarium, chiefly Mexican plants, above 1,000 species, 21*l.*; Hartweg's Mexican plants, comprising from about 500 to 600 specimens, 10*l.*; Gillies' South American plants, chiefly from Mendoza, containing nearly 4,000 species, 52*l.*; Afzelius' Herbarium of Western Africa, chiefly from Sierra Leone, about 400 species, 6*l.* 6*s.*; a large collection of East Indian plants, principally from Bombay and Western India, 10*l.*; a small collection of North American plants, by Nuttall, Baldwin, Fraser, Boott, and others, including many species from Labrador, about 150 specimens, 5*l.* 10*s.*; Wallich's plants, about 150 species, as arranged by Mr. Lambert, 10*l.* 10*s.*; Pursh's extensive Herbarium, chiefly North American plants, between 750 and 1000 species, 25*l.* 10*s.*; Roxburgh's Herbarium, from 2,000 to 2,250 specimens from the Indian Archipelago and Continental India, 34*l.*; Professor Pallas's Herbarium, containing above 2,000 species, 49*l.*; a large collection of plants from Nepaul, by Hamilton, about 500 species, 9*l.* (this supplied the materials of Professor Don's Flora of Nepaul); Martin's Plants of Guiana and Cayenne, 15*l.*; a collection of plants made by Mr. A. Menzies, in Vancouver's voyage round the globe, 6*l.*

Agricultural and Horticultural Society, Adelaide, New South Wales.—We observe in the "Adelaide Chronicle" of Jan. 22, that a large and respectable meeting was held in that settlement, for the purpose of forming a society for the furtherance of Agriculture and Horticulture. At the conclusion of the meeting, it was agreed that a society should be established under the above appellation, and under the patronage of his Excellency, the Governor.

Signs of the Times.—Among the many indications of the prevailing fondness for flowers, is the opening a shop in Conduit-street by a Mr. Harding, who styles himself *Marchand de Bouquets.*

Meeting of the Italian Scientific Association.—It is announced that this will take place at Padua, on the 15th of September next.

Cæsia hirsuta.—We understand that Mr. Wailes, of Newcastle-on-Tyne, has been so fortunate as to flower this beautiful New Holland plant. It has fine blue flowers, transparent like Agapanthus umbellatus, and although fugitive, most lovely while they last. It was raised from seeds sent to Captain James Mangles, R.N., from the Vasse River, by Mrs. Molloy, a lady enthusiastically fond of flowers, and a most valuable correspondent of Captain Mangles.

GARDEN MEMORANDA.

Mr. T. Rivers's Nursery, Sawbridgeworth.—The late boisterous winds and driving showers have destroyed the beauty of the most forward Rose blooms; but should the weather hereafter prove favourable, the succeeding buds and later-flowering kinds promise to open well, and repay, in some measure, for the disappointment occasioned by their being thus injured in the height of their perfection. Notwithstanding the havoc made, there were still many left to admire, amongst which the Moss varieties were the most prominent; and we shall therefore commence with those of this class, which struck us as being either new or particularly good. Angelique, reddish blush, cupped, habit erect and distinct; Celina, brilliant crimson, double, but inclined to sport and lose its moss; De Metz, brilliant rose, a large and distinct flower; Grandiflora, veined rose, large, but not double; Princess Royal (raised from seed by Mr. Rivers), crimson purple, mottled with red, not quite double, but very distinct; Hortensia, bright pink, not double; Rosinella, reddish carmine, bright, and very double; Pompone feu, resembling the Luxembourg, but smaller; Lancel, deep reddish rose, compact, calyx covered with moss of a bright green; Mousseue presque partout, bright rose, a free bloomer, and of a robust habit,—the leaves of this are not quite so much curled as those of Mousseue partout; Miniature (Rivers), very small, light crimson, and semi-double, distinct; Prolific, globular, rose, of a dwarf and distinct habit, forming a compact bush—this is a good variety for forcing; Single Crimson (Rivers), bright purplish crimson, many of the flowers this year are nearly double; Louise Colet, blush, very double, the divisions of the calyx are frequently converted into leaves, which give to the flower a pretty and novel appearance. PROVENCE:—Liliacea variegata, lilac, striped with white, cupped, but rather inconstant; Rochebardon, deep rose; Sylvain, deep rose, both good cupped flowers; Spotted, carmine spotted with white; Triomphe d'Abbeville, light vivid crimson. ROSA GALLICA:—Agnodice, crimson, large, compact, and very double; Briseis, bright rose, large and perfect, a robust grower; Baron Cuvier, purple, a good cupped flower; Fleur d'Amour, shaded crimson, finely cupped; Columella, deep rose, edged with blush; Grandissima, brilliant crimson, very large and double; Cerise superbissime, brilliant scarlet, an exceedingly vivid flower; Gil Blas, bright shaded rose, cupped, of robust habit, and distinct; Kean, generally scarlet, but this season more of a crimson colour, very perfect in form, and a first-rate flower; Latour d'Auvergne, crimson, beautifully cupped, one of the best of this family; Nelly, blush, tinged with a buff or fawn colour, of erect and distinct habit; Pharericus, rosy red, large, cupped, of perfect form; Rouge éblouissante, bright velvety scarlet, cupped; Raucourt, brilliant scarlet, very vivid. HYBRID PROVENCE:—Celinette, blush, large cupped flower; Elisa Leker, rose spotted with white, quite distinct; Enchanteresse, deep rose, perfectly cupped, an old variety, but one of the finest and most perfect of Roses; Glandulosa, rose, globular, curious on account of the foliage being edged with yellow excrescences; La volupté, deep rose, well cupped, one of the best of this class; Cleopatra, blush, with deep red centre. HYBRID CHINA:—A l'Odeur de Pâte d'Amande, red, cupped, of a vivid colour and delicious scent; Cheuédole, light vivid crimson, flower larger and brighter than Brennus,—it has also bloomed with Leveson Gower, Esq., of Clapham Common, and is one of the most striking and beautiful Roses ever introduced. Decandolle, brilliant crimson and scarlet, large and distinct; Hippocrate, bright rose, one of the most perfectly cupped of this class; Henry Barbet, bright pink; La Meteore, rosy crimson, good form; Madame Pisaroni, rose colour, of vigorous habit, an excellent pillar Rose; Parigot, vivid crimson, well cupped and distinct; Sylvain, bright crimson, nicely cupped. ROSA ALBA:—Attila, rosy crimson, large and cupped; Duc de Luxembourg, flesh colour, with rose centre, a large flower; La Séduisante, brilliant rosy blush, compact and beautiful; Queen of Denmark, blush, large and compact. DAMASK:—Bachelier, rose, cupped, large and double; Bella Donna, pink, cupped, flower-stems erect, very distinct; La chérie, flesh colour, pink centre, a fine flower; Pulcherie, pure white, cupped, of a distinct and elegant habit. EVERGREEN.—Banksiæflora, white with yellow centre, a pretty little flower; Donna Maria, pure white, neatly cupped; Odorata, creamy white and very fragrant; Princesse Marie, bright pink, cupped, and a free bloomer; Jaunâtre, fawn-coloured rose, and sweet scented; Rampant, pure white, blooms freely in the autumn HYBRID PERPETUALS: Clementine Seringe, rose colour, globular, flower-stalks erect, large, and double; Comte de Paris, light crimson, tinged with lilac; Duchess of Sutherland, bright rose, mottled, large, and cupped; Coquette de Montmorency, cherry colour, distinct; Duchesse de Nemours, rose colour, blooms in large clusters; Melanie Cornu, purplish crimson, very double; Prince Albert, cupped, deep purplish red generally, but now blooming in large clusters of different shades of colour; Pauline Plantier, blush, of very erect habit. BOURBONS:—Acidalie, white, well cupped, and large; Crimson Globe, purplish crimson, of dwarf habit; Emilie Courtier, deep rose, perfectly cupped; Pierre de St. Cyr, pale blush, a fine pillar rose; Triomphe de Plantier, rosy red, of robust climbing habit; Proserpine, deep crimson purple, the finest of the family. CHINA:—Archduke Charles, rose changing to crimson, cupped; Clara Sylvain, pure white, globular, and distinct; Mrs. Bousanquet, pale flesh colour, cupped, and resembling wax; Virginie, rose and crimson, shaded, very erect and distinct; Rubens, rose changing to deep crimson; Napoleon, blush, very large, and finely cupped. TEA-SCENTED:—Comte de Paris, pale rose, large, and cupped; Duchesse de Cazes, creamy flesh colour, very delicate and beautiful; Elisa Sauvage, pale yellow, with orange centre; Charles Reybaud, rose colour, very large; Safrano, bright fawn colour, this is beautiful when in bud; Reine de Bassora, rose, with buff centre. NOISETTE:—Angelina, deep purplish crimson, the darkest of this class; Duc de Nemours, lilac, well cupped; Elizabeth, nearly white, very double; Julienne le Sourd, bright pink, dwarf and pretty; Miss Glegg, pale flesh, nearly white, when half open the blooms are of a bright rose; Victorieuse, pale blush, large, and showy. Mr. Rivers also pointed out some Strawberries upon which a kill-or-cure experiment was tried with nitrate of soda, about a month since; in a few days after the application some of the young and tender leaves appeared quite dead; but the plants have gradually recovered since that time, and are now looking remarkably healthy, and of a most lively green; so much so that the limits of the application are distinctly visible. The proportion used was about 3 oz. to the square yard. It was also tried upon Roses, but infallibly occasioned their death, thus proving that, in the vegetable, as well as in the animal kingdom, that which is the food of one plant is the poison of another. Guano was also tried upon another patch of Strawberries, but its effects were far from being so apparent as those of the nitrate of soda.—*R. A., June 27.*

Mr. Denyer's Nursery, Loughborough-road, Brixton.—The Roses here are looking well, which, considering their proximity to the smoky atmosphere of London, is rather surprising. Amongst the most showy we noticed the following:—ROSA GALLICA.—Cecile Bereau or Bizarre Marbré, mottled crimson, a large and compact flower; Boula de Nanteuil, bright crimson, well cupped; Charles Augusta, pale crimson, imbricated, and very double; General Donnemont, dark purplish lake, margined with a lighter colour; Madame Dubarry, crimson, compact, and remarkably good. ROSA ALBA:—Blanchfleur, white with blush centre; Queen of Denmark, blush with rosy centre, well cupped. HYBRID PROVENCE:—Duchesse d'Angoulême, rosy blush, a good double flower; La ville de Londres, bright pink, large; Reine des Belges, pure white, nicely cupped, and a free bloomer. HYBRID CHINA:—Brennus, reddish carmine, a large well-formed flower; Belle Marie, rose coloured, well cupped; Coupe d'Amour, pink, a pretty free-blooming variety; Duke of Devonshire, pale rose, sometimes striped; Fulgens, bright crimson, a beautiful colour, but thin of petals; Fimbriata, bright red, with fringed petals; Hortensia, flesh-coloured, a large flower; Morning Star, bright red; Petit Pierre, shaded dove colour, flowering in large trusses; Triomphe de Guerin, delicate pink, a good globular flower. DAMASK:—Helvetius, rosy lilac, bright, but not well filled up in the centre; La ville de Bruxelles, pink, large, and cupped; Madame Hardy, pure white, an excellent bloomer. SEMPERVIRENS:—Félicité perpétuelle, creamy white, a remarkably free bloomer. PERPETUAL:—Bernard, salmon and rose, rather small, but nicely cupped; Josephine Antoinette, rose, well cupped. NOISETTE:—Aimée Vibert, pure white, a neat little cupped flower, and a very free bloomer; La Biche, pale rose and white, somewhat larger than the former, and also a prolific bloomer.—*R. A., June 23.*

Reviews.

My Bee Book. By W. C. Cotton, M.A. 8vo. Rivington.

THIS book deserves the attentive perusal of all who keep bees, for it abounds with plain practical information, and contains some curious matter reprinted from old bee-writers. It is, moreover, a very handsome volume, beautifully printed, and illustrated with excellent woodcuts.

To bee or not to bee might have been taken as a motto for the work—for it is an able advocate of the system of "driving" bees instead of killing them. The inhumanity of the latter practice is continually pointed out, and what is more likely to produce an effect upon bee-keepers, the disadvantage of it is clearly shown.

Never kill a Bee is Mr. Cotton's maxim. It has been well said that man, who ought to be their friend, is often their worst enemy. Bees have no defence against the brimstone match, though they can conquer all their other foes if man will help them. Be kind to them and they will repay you amply. Take no heed of those who tell you that in two or three years bees will do no more good—that they get old and lazy, and that, therefore, they had better be destroyed. Bees do not live more than a year; their place as they die is taken by others newly hatched; and all the bees burnt in September are of the same year's brood, and ready to begin work the next year. Mr. Cotton's system is to smoke bees out of their hives by a fungus, which stupifies them for twenty or thirty minutes and does them no more harm. During this their trance, he takes away queens with impunity, cuts out honeycomb, joins weak stocks to strong ones, and, in short, acts as he pleases with whole regiments of these little flying lancers. For the way in which all this and much more is to be done, we must refer to the book itself. The only extract we can find room for is the following, from the "Note Book," which shows the amusing manner in which our author treats his subject, and at the same time conveys some useful information:—

"I have always loved Bees; one of my earliest recollections consists in the vision of a swarm being brought home for me in the tax-cart belonging to one Mr. Noble, a carpenter. They stayed with us only one year, for, in the autumn, they were "murdered for their pains." Soon after I tried the storifying system, for at least four years. Some beautiful boxes of honey were obtained from the stocks, but the many disadvantages of the system soon forced themselves even on my notice, inexperienced as I was, and straw hives, with glasses on the top, were gradually substituted for my boxes. But as I was ignorant of ventilation, the proper method of feeding, and the advantage of good winter quarters, what could be expected but failure? My stock once reached the number of six hives. But on my return from Eton in Easter (I think, 1829-30), I found all but one dead. The winter, as far as I recollect, had been very warm, and if the preceding year was a bad one for bees, the result is easily accounted for. I remember my grief at taking up the hives one after another, and seeing the bees all dead between the combs, which were quite empty. Had these been fed, as were my bees in 1836, I doubt not but all would have been saved. The stock which was left, swarmed in the following summer. The swarm was put into the storifying boxes, and placed away from the parent stock, in a situation nearer the forest. The news of the "three glorious days" had just been received in England, when a remarkable instance of the rapid diffusion of the revolutionary mania, and its eager reception by all classes, fell under my observation. I was sitting quietly in my room, about four o'clock in the even of a fine August day, when my sister came puffing into the room, and exclaiming, 'Oh! Willy, make haste, and come into the garden; the bees are swarming!' 'Nonsense,' I said, 'they cannot be swarming: it is August, and four o'clock in the even.' Nevertheless, I was bound, as a loving brother, to see what grounds my wise sister had for her assertion. I got up, went to the window, and although I was at least four hundred yards from my bees, the air seemed full of them. I rushed out to the garden; the first sight of my hive made me think my sister was right. On looking more narrowly I perceived that the bees were hurrying in, instead of swarming out; and on peeping about, I saw, lying on the ground, the—

"'Defuncta corpora vitâ
"Magnanimum heroum.'

Each old veteran, where he fought, there he fell. They all had died fighting, as the play-book says, '*pro hares et foxes.*' The stock, though heavy, was not strong in bees. My plan was soon laid. I determined to pay off these most unruly plebeians, who had dared to fall upon my poor bees with such murderous effect. I soon fetched some sulphur squibs, which the gardener used for taking wasps' nests. These I lit, put in at the mouth of the hive, and stopped it up. When the squib burned out, I turned the hive up, and the number of bees which I had slaughtered was quite extraordinary. The attack on my hive was evidently not the unpremeditated work of a single stock, but of a joint league. (What a glorious opportunity this would have been for capturing the robbers, and adding them to my own stocks, had I then been acquainted with the narcotic and fumigating apparatus!!*) I carried the hive away to the house as fast as I could, to save the honey, surrounded by bees, who were so intent on plunder, that they did not attempt to sting me, and dashed into the burning squib which I waved round my head.

"My thoughts then turned to my other stock, which was about a quarter of a mile off. I ran to it as fast as I could; hardly had I arrived there, when an advanced body of the robber regiment followed me; they soon thickened. I tried every means I could think of to disperse them, but in vain. I threw dust into the air, among the thickest; and read them the passage in Virgil, which makes the throwing of dust in the air equivalent to the Bees' Riot Act:—

"'Hi motus animorum, atque hæc certamina tanta
"Pulveris exigui jactu compressa quiescent.'
VIRGIL. *Georg.* iv.

I should have lost this hive also had not a sudden thought struck me, which I adopted. It being so late in the even, I concluded that most of my bees had come home. I therefore shut up the entrance, and let the robbers knock until they were tired! I made a gimlet-hole in the top, to give them air, and next morning, when I let them out, all was quiet."

CALENDAR OF OPERATIONS *for the ensuing week.*

BESIDES the regular routine of mowing and sweeping, hoeing and raking, there are many little operations connected with cleaning, which, although trifling in themselves, are yet essential to high keeping. Fading Roses, for instance, if left to wither upon the trees, detract very much from the pleasing effect of those that are in beauty; it would be advisable, therefore, to have those trees which are placed in conspicuous parts of the ground looked over every morning, and all the blossoms that are past their best, together with the attached seed-vessels, cut off and carried away. The petals might be preserved for drying or distilling, and thus made to pay for the labour of collecting. Take care that the tender leading shoots of young ornamental trees, as the Pine tribe, are properly secured to stakes; the loss of a leader would be absolute ruin to many species.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Many fruit will now probably be ripening; to heighten their flavour, whenever a change of colour is perceptible, remove the plants out of the close and humid atmosphere in which they have hitherto grown, into some more airy place, where they may be fully exposed to light. Take off the suckers, if fit, shorten the leaves of the plant, and give it no more water (unless there are suckers left upon it) till the fruit is cut. Pine-apples may be kept a fortnight or longer in perfection, if, before they are quite ripe, the plants are removed to a cool and airy room. It is sometimes necessary to take suckers off plants before the fruit is ripe, in which case great caution must be used not to injure the stem. Use a long-handled, sharp-pointed knife to detach them from the plant; twisting the suckers off generally injures either them or the plant.

VINERY.—On hot days a little air ought invariably to be given betimes in the morning, before the sun has power to raise the temperature many degrees, that the moisture which has been condensed upon the leaves and fruit during the night may be gradually dried. As soon as the colouring process commences, cut off all laterals except the uppermost, but take care to retain all the principal leaves uninjured; air must likewise be more liberally given, and syringing discontinued.

PEACH-HOUSE.—Do not neglect giving air soon in the morning to the late house, while the fruit is stoning. When that process is completed, the trees should be regularly dressed, loose shoots neatly tied in, and all that are not wanted cut close off, except those which have fruit at their base, when a spur with a few leaves upon it should be retained.

FIG-HOUSE.—If this house has been very gently forced, and the fruit is not yet ripe, cautious management must be exercised while it is taking its final swell. Give a great deal of air, and be moderate in watering over the top.

CUCUMBERS AND MELONS.—When Melons are full swelled, give the plants one good watering, and then cease till after the first ripe fruit is cut; when, if necessary, a further supply can be given. Sprinkle growing plants daily in hot weather, and shut them up warm; humidity is the best preventive of red spider, but this practice must not be carried too far to induce canker. Plants upon which the fruit is setting ought not to be sprinkled, as impregnation cannot take place unless the pollen is dry.

MUSHROOM-HOUSE.—As a supply from the fields cannot always be depended upon, a bed for bearing in autumn might now be made up.

Out-door Department.

Should continued dry weather again set in, the watering of all vegetables that were transplanted during the late rains must be regularly attended to. Bear in mind that one thorough watering, with a little soil afterwards drawn over the moistened part, will be more efficient than half-a-dozen dribblings. Continue to cut and dry herbs of all sorts, as they become fit.

BEANS.—The drought having caused the succession crops to blossom earlier than their proper season, it may be advisable to cut down a row or two close to the ground; the stalks will shoot again and produce some late Beans, if the season is genial. Sow in a dry and sheltered place for the latest crop.

BEET, SCORZONERA, and SALSIFY, should be finally thinned, if not done.

CAULIFLOWERS.—These, in all their stages, must be well supplied with water, or they will form small and premature heads.

CELERY.—Let this be liberally watered. The Celery fly (see Vol. I., p. 660) is busily at work now; the plants should therefore be examined frequently, and all the discoloured blotches on the leaves either pulled off or squeezed sufficiently hard to kill the larvæ that are embedded within them.

ENDIVE.—Sow again; the plants from this sowing will be likely to stand the winter better than the earlier ones.

LETTUCE.—Sow a successional crop.

MUSTARD AND CRESS, RADISHES, &c.—Keep up a succession.

PARSLEY.—Cut off the flower-stalks of all that is not wanted for seed.

PEAS.—Put in the last crop of some early sort, selecting a dry and warm situation where they will be sheltered from early autumn frosts. These (and all other seeds when the ground is dry) should be well watered before covering them.

Orchard. The nailing of wall-trees and destruction of insects are the chief matters now requiring attention in this department. In nailing Fig-trees too many shoots ought not to be laid in, and all that are retained should have the terminal bud nipped off. Do not permit laterals to grow on wall Vines, to the detriment of the young fruit; but the trees must not be so closely dressed as to expose the bunches to the direct rays of the sun. Prune and tie Espalier fruit-trees. See that grafted trees are properly secured against violent winds. Water late Strawberries.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Give manure-water to such plants as Hibiscus Rosa sinensis, Musas, and Passion Flowers. Many of the young things intended for specimens will require to be repotted. Top the young shoots of Euphorbia jacquiniflora frequently, to render it bushy; this treatment should also be applied to other things of like habits. Continue to propagate and to pot-off cuttings and seedlings. Keep the bed and passages very moist during this warm weather.

GREENHOUSE AND CONSERVATORY.—Pelargoniums from which it is intended to save seed should be gone over daily, and the seeds secured as they ripen. Head down those plants that bloomed early, and set them out of doors in a shady place till the buds break. The cuttings might be planted in a bed of light soil in the open ground, or in an old frame, where they will soon make good plants, if attended to in shading and watering. Calceolarias whose bloom is past should be set in a shady place, and sparingly watered; those intended to produce seed should be kept under glass, and it would be advisable to reduce the number of their flower-stalks, when there will be a greater probability of obtaining good seed. The Conservatory borders should be copiously watered, and the plants sprinkled overhead occasionally. See that the plants out of doors are properly secured from being injured by violent winds.

PITS AND FRAMES.—Persevere in propagating everything that is needful. Hybrid Fuchsias for flowering in autumn must not be allowed to blossom now. Campanula pyramidalis, Salvias, Leonotis, Chrysanthemums, and all the late-blooming plants, should be repotted as often as is necessary to maintain them in a vigorous state of growth, upon which their flowering well essentially depends. The shoots of Chrysanthemums that have been planted out for repoting in autumn, should be stopped in time, to induce a bushy growth. Inarch the more tender varieties of Chinese Azalea upon stocks of some hardy kind, such as the common white; all work of this kind ought to be done soon, that a perfect union may take place before winter.

Out-door Department.

ON light soils, which the late showers have insufficiently moistened, watering on an extended scale will now be imperative, if it be desired to keep the flower-garden gay with blossom. As a set-off in some degree against the dearth of flowers, more attention than usual should be paid to general cleanliness. Some of the autumn-sown annuals have probably ripened their seed, which should therefore be gathered and the plants removed to make room for others. Take up bulbs as the leaves and stems decay. All desirable herbaceous plants should now be propagated by cuttings, either under hand glasses, or in a spare division of the pits.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—The budding of all ornamental trees that are usually propagated by that means, should now be attended to. Train some of your seedling Rododendrons with single stems to standard height, to be afterwards budded with new and fine varieties; these make singularly fine objects on a lawn. Keep seedling plants free from weeds, and water all that require it.

FOREST AND COPPICE WOODS.—Drain, trench, and otherwise prepare ground for planting Posts and rails, palings, and other dead fences, should be repaired or renewed. This is also a good time for the painting of rough wood-work, which now contains little or no moisture.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending June 30, 1842, as observed at the Horticultural Garden, Chiswick.

June		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max	Min.	Mean.		
Friday	24	29.679	29.420	72	54	63.0	S.W.	
Saturday	25	29.806	29.685	66	54	60.0	W.	.09
Sunday	26	29.915	29.674	70	49	59.5	S.W.

Wednesday	29	30.078	29.989	82	52	67.0	W.	
Thursday	30	29.933	29.791	71	50	60.5	N.E.	.80
Average		29.985	29.818	73.4	50.6	62.0		.89

June 24. Overcast; cloudy and fine; overcast at night.
25. Overcast; cloudy with brisk wind; boisterous with rain at night.

"* *Query:*—Should I have been justified in so doing, or could the Queens of the invading stocks have taken out a writ of *Habeas Corpus* against me? A knotty question this for the lawyers, to whom I leave it."

26. Fine: windy; clear and dry.
27. Clear and fine: very dry; light clouds; clear and fine.
28. Clear; hot and dry; sultry; dark thunder clouds; clear at night.
29. Fine; hot and dry; clear and fine.
30. Slight rain; densely overcast; very heavy rain at night.

Mean temperature of the week 0·3 deg. above the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending July 9, 1842.

July.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat.	9	73.7	51.0	62.3	2	0.57	1	1	—	—	2	3	6	3

The highest temperature during the above period occurred on the 5th, in 1836—thermometer 94°; and the lowest on the 9th, in 1839—thermometer 40°.

REPORT ON COVENT GARDEN MARKET,

For the week ending July 1, 1842.

THE supplies of Fruit and Vegetables have, in most instances, been very good during the past week, and trade has been tolerably brisk. *Fruit.*—Pines have not varied much since our last report. Grapes have differed somewhat in price; the Muscats fetching from 5*s* to 10*s* per lb.; the Black Hamburgh, Frontignans, &c., from 2*s*. to 7*s*. per lb.; among them we observed a remarkably fine bunch of the West's St. Peters. Melons of various sorts are plentiful, from 2*s*. to 8*s*. each. Peaches and Nectarines are remarkably good, from 12*s*. to 30*s*. per doz. Cherries are unusually abundant; the wall-fruit, which is excellent, is selling from 1*s*. to 3*s*. per lb.; the standard fruit from 1*s* 6*d* to 12*s* per doz. lbs. Strawberries continue to be plentifully supplied, from 6*d*. to 1*s*. 6*d*. per pottle. Raspberries, which are small, are selling from 4*d*. to 1*s*. per gallon. Ripe Gooseberries are abundant; the dessert fruit fetching from 2*s*. 6*d*. to 6*s*. per half-sieve; the kitchen fruit from 2*s*. to 3*s*. per hf.-sieve. Currants may likewise be obtained at the same prices. Cucumbers are good, from 1*s*. 6*d* to 6*s*. per doz. *Vegetables.*—A small quantity of Asparagus is still to be procured, the best of which is fetching from 4*s*. to 5*s*. per bunch, while the smaller shoots are selling for 1*s*. 6*d* and 2*s*. per bunch. Cauliflowers have altered little since our last report; but Cabbages have risen in price, being from 1*s*. to 2*s*. per dozen. Peas are of good quality and are selling from 2*s*. 6*d*. to 5*s* per bushel sieve. Windsor Beans are somewhat cheaper, being from 2*s*. to 3*s*. per bushel French Beans are likewise considerably reduced in price, and are obtainable at 5*s*. and 6*s*. per half-sieve. New Potatoes are well supplied, from 2*s*. to 4*s*. per half sieve. Vegetable Marrows are somewhat cheaper than quoted in our last, from 1*s*. to 2*s*. per dozen. Onions are tolerably good; those for kitchen use are selling from 2*s*. to 6*s*. per dozen bunches; the small green ones from 1*s*. 6*d*. to 5*s*. 6*d*. per dozen bunches. Leeks likewise are good, at 4*d* per bunch. Mushrooms are rather cheaper than they were last week, being from 1*s*. to 1*s*. 9*d*. per pottle. Radishes and all kinds of salading are plentiful, at the prices previously quoted. *Flowers.*—Amongst these we observed several handsome cut specimens of Orchidaceous plants and Hibiscus Rosa sinensis; as well as Picotees, Pinks, Alstrœmerias, Ericas, Fuchsias, Lilies, and Pelargoniums.

PRICES SATURDAY, JULY 2, 1842.—FRUITS:—

Pine Apple, per lb. 5*s* to 10*s*
Grapes, per pound, 2*s* to 7*s*
— Muscats, per pound, 5*s* to 10*s*
Melons, each, 2*s* to 7*s*
Peaches, per doz. 12*s* to 30*s*
Nectarines, per doz., 12*s* to 30*s*
Cherries, wall, per lb 1*s* to 3*s*
— standard, per doz. lbs., 1*s* 6*d* to 12*s*
Gooseberries, per hf. sve., 2*s* to 5*s*
— dessert, per punnet, 1*s* 6*d*
Currants, White, per hf. sv. 2*s* 6*d* to 3*s* 6*d*
— Black, per hf sieve, 3*s* to 4*s*
— Red, for wine, 2*s* 6*d* to 4*s*
— for dessert, per punn. 1*s* 6*d*

Cucumbers, per doz., 1*s* 6*d* to 6*s*
Strawberries, per pottle, 6*d* to 1*s* 6*d*
Raspberries, per gall. 4*d* to 1*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s* to 3*s* 6*d*
Walnuts, per bushel, 16*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 1*s* to 2*s*
Cauliflowers, per doz., 1*s* to 4*s*
Peas, per sieve, 3*s* to 5*s*
— per half sieve, 1*s* 6*d* to 2*s* 6*d*
— per sack, 6*s* to 12*s*
Beans, Kidney, per hf. sieve, 5*s* to 6*s*
Windsor, per bush., 2*s* to 3*s*
Potatoes, Old, per ton, 70*s* to 120*s*
— per cwt 4*s* 6*d* to 6*s*
— per bushel, 2*s* 6*d* to 3*s*
— Kidney, per bushel, 3*s*
— New, per cwt., 5*s* to 7*s*
Artichokes, per doz. 2*s* 6*d* to 4*s*
Turnips, per doz bun., 2*s* to 5*s*
Carrots, per doz. bunch, 2*s* to 6*s*
Red Beet, per dozen, 1*s* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* 6*d* to 7*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 2*s*
Chives, per pot, 3*d*
Leeks, young, per doz. bun., 4*s*
Garlic, per bunch, 4*d* to 6*d*

Onions, Old, per half sieve, 4*s* to 5*s*
— Cooking, per doz. bch., 2*s* to 6*s*
— Green, Ciboules, per doz. bun. 1*s* 6*d* to 5*s* 6*d*
Shallots, per bch., 3*d* to 4*d*
Asparagus, per 100, large, 4*s* to 5*s*
— Second or Mid., 1*s* 6*d* to 2*s* 6*d*
Lettuce, Cabbage, p. score, 1*s* to 1*s* 6*d*
— Cos, 9*d* to 1*s* 6*d*
Celery, young, per bundle, 1*s* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 4*d* to 6*d*
Parsley, per half sieve, 1*s* 6*d*
Tarragon, dried, per doz. bun., 2*s* to 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz bunches, 2*s*
Sage, per dozen bunches, 2*s*
Mint, per doz bunches, 2*s* to 3*s*
Marjoram, per doz. bunches, 2*s*
Savory, per doz. bunch., 2*s*
Basil, per doz. bunches, 2*s*
Vegetable Marrow, per doz., 1*s* to 2*s*
Mushrooms, per pottle, 1*s* to 1*s* 6*d*

Notices to Correspondents.

W. F. D.—No. 36 would be most acceptable; we have copies of No. 1.

A. P. V.—If your Cucumbers are grown out of doors upon a ridge, they will require to be looked over and watered regularly, thinning out all the superfluous vines, and stopping the remaining shoots occasionally to throw them into fruit. If the plants are in a frame, and have been in bearing for a length of time, either take them up and replace them with younger plants, or cut out all the useless vines, and peg down some of the best shoots at the joints, afterwards covering them with soil and watering them gently; these will soon strike root, and replenish the frame. A paper upon the early treatment of Cucumbers will be found at p. 253 of this year's *Chronicle*.

J. and J. Gaitskell.—We cannot praise your ROSE. It is too irregular in form; its colour is not bright enough; in fact it looks like a bad "Tuscany."

A Young Cottage Gardener before he puts impertinence on paper should, at least, know what he is talking about. He evidently does not know what BLACK HELLEBORE is when he says it is found in every marsh. It does not happen to grow wild in this country at all.

Vigneron's plants are,—1, Gardénia radicans; 2, Chirónia frutescens; 3, Escallónia rubra; 4, Mesembryanthemum aureum; 5, a Galium. The "THEORY OF HORTICULTURE" is an application of science to general Gardening.—We do not know the work of Professor Daniell's which you speak of.

A Constant Reader.—The leaves of your PINES appear to have been affected by the rays of the sun having struck powerfully upon them, when the plants have not had an ample supply of water at the roots to furnish the leaves with the fluids necessary to enable them to fulfil their functions at so high a temperature.

D. X. F. will find the Index of last year's *Chronicle* in No. 1 of this year. We continue to state from time to time what we can learn respecting GUANO, and until further experiments have been made with it, it will be impossible to say whether it may be used with safety upon all greenhouse-plants. NITRATE OF SODA, if applied in small quantities, and only upon the *roots* of plants, has been found of great benefit, and might probably be of service to Orange-trees.

Œdipus.—Both your plants are Ismene Amancaes.

J. S.—Your marine plant is a species of Gelidium, and probably from the Chinese Seas.

H. W. H. will find "Johnson's Elements of Agricultural Chemistry" most suited to his purpose.

If *A Lover of Justice* was acquainted with all the facts connected with the meetings of Horticultural Societies near London, he would have saved himself the trouble of writing his letter. Upon referring to the observations we have made upon this subject he will see that we have sufficiently distinguished low gardeners from the respectable men. As, however, he does not seem to understand us, we will beg to ask him whether he thinks it decent for gardeners to sit smoking and drinking in public-houses till they are half-drunk; and then, with red faces, loud voices, and the odour of gin and tobacco, to thrust themselves among gentlewomen, collecting in groups, obstructing the passages, hedging-in the tables, and rendering it impossible for those for whom the flowers are exhibited to see them. We repeat that such men are nuisances. Respectable gardeners do none of these things. The low ignorant men we speak of do them all. "A Lover of Justice" seems to think that all this is justified by the possession of a certain amount of skill in raising flowers, or is excusable because of the zeal and ardour of the men complained of. We can inform him that the great and skilful gardeners who produce the beautiful objects that load the exhibition tables of the Horticultural Society are not those who are thus offensive; the good sense which gives them the *skill* to be good gardeners, also teaches them how to *conduct* themselves. The nuisances we speak of form a particular class, of which we may some day give a full and particular account, and with which we suspect our "Lover of Justice" would not be ambitious of being associated. If, however, he is desirous of joining them we shall have no objection to include him, for we suspect we know him, although it *is* a long way from London to Edinburgh.

Guillaume's plants are,—1, Anagallis arvensis; 2, Euphórbia helioscópia; 3, Capsella bursapastoris; 4, Medicago intertexta.

A Journeyman Gardener may procure the "Theory of Horticulture" of any respectable bookseller.

A Journeyman.—We cannot give any opinion on points of LAW.

Juvenis.—Repot your AZA'LEAS which have done flowering into pots one size larger than those they are now in, using roughish peat and a small quantiy of silver-sand. Water them well after potting, and place them out of doors in a sheltered and rather shady situation, where they may remain until the middle of September. Syringe them occasionally, and take care that they are not injured by the wind. For further information we must refer you to p. 284 of this year's *Chronicle*. The Climbers best adapted for training upon a wire trellis in pots are Tropœ'olum tricolor, T. pentaphyllum, T. brachyceras, Zíchya pannosa, Z trícolor, Hardenbérgia racemosa, Philibértia grandiflora, Gompholóbium polymorphum, Thunbérgia alata, T. alata alba, and T. aurantíaca.

A Welsh Subscriber's Grasses are,—1, Agrostis alba; 3, Poa ánnua; 4, Poa nemoralis; 5, Arrenatherum avenáceum; 6, 8, Poa trivialis; 7, Aira flexuosa; 9, Holcus lanatus; 10, Catabrosa aquática: 11, Festuca bromoides: 12, Bromus squarrosus.

Vindogladiensis—Your plant is Digitalis lútea

G. J. F.—For a GREENHOUSE 12ft. by 10ft., and a propagating-pit 4ft. square adjoining, we would recommend you to use 3in. pipes, and one of the smallest of Rogers's boilers.

L. and M.—The PELARGÓNIUM is a showy and free-trussing variety, but is deficient in form, the upper petals being too high, and the lower ones long and narrow. The FU'CHSIA is small and pretty, but it does not appear to differ sufficiently from some we have seen. Of the MIMULI, No. 2 is a beautiful variety; the bright vermilion rose-colour of the corolla, with the deep velvety colour of the throat, gives it a rich appearance; the other Seedlings are good, as forming a contrast to the attractive colour of No. 2.

An Old Subscriber, Cork.—We recommend you to add the following PELARGÓNIUMS to those you already possess.—Garth's Witch, Leila, Matilda, Cyrus, Annette, Amethyst, Eveline, Mabel, Gem of the West, Hebe, Paragon, Symmetry, Lyne's Duke of Cornwall, Garth's Queen of the Fairies, Gaines's Rising Sun, Lumsden's Madeleine, Hodges' Emperor, Vulcan, Grand Monarch, Unit, Lord Mayor, Lady Mayoress, Augusta, Mr. Garth.

A Subscriber's insect which is very troublesome amongst his stove plants is a THRIPS, figured and described in the *Gardeners' Chronicle*, at p. 228, where he will obtain the information required.—*R.*

Nemo's plant is Umbilicus pendulinus.

An Inquirer.—The Orchidaceous plant is Neóttia Nidus avis; the other is Thalictrum alpinum.

R. E.—Your plants are,—1, Ptelea trifoliata; 2, a species of Billótia; 3, Leptospermum juniperinum; 4, a Westríngia. The best book for acquiring a preliminary knowledge of Botany is "LINDLEY'S ELEMENTS OF BOTANY."

B. A.—The going off of MIGNONETTE in patches is probably owing to the soil being no longer able to provide it with the food it wants. Land tires of Mignonette as well as of Clover.

R. B.—We should think an advertisement would produce the old Calceolaria arachnoidea and the single Dahlia coccinea.

H. R. You are mistaken in supposing that the stamens of AGRIMONIA are hypogynous. If you tear off the calyx, they will come away with it; a sufficient proof of their adhering to it, or being perigynous.

A Subscriber.—The CLIMBING plants you mention will all succeed in a wood, if planted in open spaces where their roots are not interfered with; except Passion-flowers and Bignónia radicans. Good PEAT soil may be used as soon as it is cut; peat contains iron in variable proportions—sometimes much, sometimes little.

T. T. will be fully answered next week.

Mr. Cornish will be answered next week; the necessity of some woodcuts delays Mr. Paxton's reply.

W. F. G. F.—The Cyrtopodium is new to us; if it is not a variety of C. Andersonii, it must be an undescribed species.

C. D—The PLANTS are rightly named, and Nos. 1 and 2 are very pretty; the Horticultural Society would be greatly obliged by cuttings or seeds of them. The Sphenógyne is, perhaps, crithmifolia. This has been the very best possible season for MELONS, if gardeners have known how to manage them. You are obviously right in considering it necessary to give them unusual quantities of water, to supply the excessive evaporation by the leaves. It is probable that the dry weather has forced the Raspberry into fruit a season earlier than usual.

An Original Subscriber.—CINDER-ASHES are, *per se*, a useful manure for heavy land, and a good application to any land if added to the manure-heap, and incorporated with the other ingredients.

Cadwallader.—Black oxide of Manganese is a most durable material for black PAINT, and cheap. Gypsum may be had in Liverpool, and, we presume, at a cost not exceeding 2*l*. per ton. Lime would be a good dressing for your land; if it is light, 30 bushels an acre will be sufficient; if heavy, use three times as much. We have no experience in weighing-machines. It will not be difficult to remove Roses at Michaelmas, but you had better, when you do so, deprive them of *all* their leaves and replant them as soon as you can.

G. B.—It is impossible to distinguish your Vine by a leaf.

R. B.—Your Pentstemon is P. Cobæa.

Botanist's plants are,—1, Cýtisus sessilifólius; 2, Coronilla E'merus; 3, Myosotis palustris; 4, Melissa grandiflora; 5, Thalictrum flavum; 6, Thalictrum alpinum; 7, Thalictrum minus; 8, Aspérula taúrica; 9, Gálium boreale; 10, Vícia cracca. The Moss is Sphagnum acutifólium. Silver-sand is best adapted for striking cuttings of CAMELLIAS in; but the surest methods of propagating them are by grafting, layering, and inarching.

W. D. F.—Your plants are Polemónium cœruleum and Buphthalmum grandiflorum.

J. K.—Your plant is not a Metrosideros, but a Callistemon. We never heard of any difficulty in flowering either this or Fúchsia corymbiflora, unless grown in a very dark place; or probably the soil in which they are growing may be so rich as to induce such a state of luxuriance, that they will not flower unless some check is given them. You might try the effect of slight root-pruning.

W. H.—No. 1 is Carex paniculata; 2, is Carex remota.

α. β. γ.—As your FIG tree drops its fruit prematurely, not only in a dry season, but in a wet one, the cause must not be assigned to drought. Badly matured wood often produces an effect similar to that of which you complain, on other kinds of fruit less precarious than the Fig. The latter is, moreover, liable to be affected by cold in winter and spring; especially when, as has probably been the case with yours, the young fruit has been too far advanced in the preceding autumn. If you now pinch the terminal buds, so as to arrest their progress, it will occasion some of the buds below to break; and you will have fruit on the firmer wood of the early part of the season, instead of an abortive production, which otherwise naturally forms on the portion of wood grown after Midsummer. Your PEAR tree, in common with many others, has received a treatment like that of Osier plants: shoots are encouraged in summer, and cut to the lowest buds in winter; and thus successive crops of shoots are annually produced. It would have been proper to have commenced stopping a portion of the shoots of your Pear tree a month ago; but, as the case now stands, you should lose no time in shortening, by a few inches, every shoot, except when you wish to extend the main branches; and, having done so, observe whether there is still a crowding which obstructs the light from the foliage at the base of the shoots; and, if this is the case, shorten some of the shoots to within three inches of their base, and a number may be cut clean out. By this mode of proceeding your Passe Colmar will soon begin to bear; it is then apt to overbear itself, and will require *all* the sap which its roots can supply.

H. T.— you will refer to pp. 83, 100, and 181, of last year's *Chronicle*, you will find instructions respecting the treatment of PELARGÓNIUMS from some of the most successful cultivators.

As usual, many letters have arrived too late for answers this week.

ERRATA.—In No 25, page 409, col. *a*, line from the top 95, *for* (Abax) Trogla *read* (ABAX) STRIOLA; and line 137, *for* Anisopia *read* ANISOPLIA.

NEWS OF THE WEEK.

A TELEGRAPHIC despatch from Marseilles reached town yesterday, announcing the arrival of the India mail. The main facts are in every respect favourable: Gen. Pollock has arrived at Jellalabad, and Akhbar Khan has begun to treat for the ransom of the prisoners. Gen. England has been able to extricate himself from his dangerous position, and has reached Candahar. The news from China comes down to the 19th April. The Chinese, on the 10th March, attempted to take Ningpo with a force of 10,000 men, while another body attacked Chinghae, but they were repulsed in both instances with great loss.—The threatened ordonnance of the French Government relative to the import duties on foreign linens and threads appeared on Monday. The duties on threads are raised to 20 or 30 per cent., and the increase on woven goods is even higher. These duties, which are avowedly directed against England, amount to a prohibition of the coarser kinds of manufacture, and will, no doubt, embarrass to a great extent the commercial intercourse of the two countries. At the first announcement of the ordonnance, the French funds declined, from an apprehension that the measure might lead to immediate reprisals; and a fall has also taken place in our own securities from the same cause. The ordonnance, however, has been hailed with warm expressions of satisfaction by the Paris press, and it is expected to have considerable influence on the pending elections, which continue to excite undisguised avowals of hostility to England. The result of the elections is likely to give a large majority to Ministers; and the address of Gen. Jacqueminot, one of the most eminent of the Conservative party, is considered to indicate that Count Molé will succeed M. Guizot in the Foreign Department.—In Spain the new Ministers have presented to the Cortes a programme of their intended policy. The chief features of this document are their intention to support the present system, to put down the factions in Catalonia by force, and to resist the suggestion of a national bankruptcy. No division has yet taken place in the Chambers; but the Opposition have unanimously resolved to oppose the Ministry to the utmost of their power; and it is not expected that the Cabinet, as at present constituted, can long hold its ground. Apprehensions are entertained of another outbreak at Barcelona; and some agitation of a revolutionary character has prevailed at Pampeluna; but the precautionary measures taken by the authorities have hitherto succeeded in preserving order.—In Portugal, the Commercial and Slave-Trade Treaties are still impeded by vexatious difficulties; and the elections are proceeding favourably for Ministers, who are likely to have a large majority on the entire elections.—In Turkey, the recent conference between the Ottoman Ministers and the Ambassadors of the Great Powers, on the affairs of Syria, has led to no result, and little hope is entertained that any satisfactory arrangement will be conceded by the present Ministers. The Greek question also remains unsettled, and the mission of M. Mavrocordato has entirely failed in effecting an arrangement of the points at issue.—By recent arrivals from the United States, we learn that the negotiations of Lord Ashburton at Washington, on the Boundary question, are proceeding favourably, and it continues to be the general impression that they will be satisfactorily concluded. The terms of compromise are still unknown, but it is supposed in New York that the question will be settled by the division or commutation of territory, either in money or land: the free navigation of the Mississippi by English ships, and of the St. Lawrence and St. John's by those of the United States, is also mentioned as one of the points of discussion and arrangement.

At home, several Bills have been advanced in the House of Lords, among which are three connected with the suppression of the Slave Trade. In the Commons, the adjourned debate on the Poor-law Amendment Bill was resumed on Monday, when a motion by Mr. Duncombe for throwing out the Bill, another by Mr. Wakley for the postponement of the first clause extending the commission to five years, and one by Mr. B. Wood for the discontinuance of the present assistant commissioners, were negatived by large majorities. On the third reading of the Tariff Bill, Mr. Jervis moved the allowance of a drawback of the duty on exported coal, when re-shipped by British steamers for their own consumption; Mr. T. Duncombe moved an amendment of the duty on onion-seed, and a reduction of the duty on cork; but each motion was negatived, and the Bill passed, amidst great cheering from both sides of the House.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Buckingham Palace. The Queen, accompanied by Prince Albert, and the King and Queen of the Belgians, honoured the German Opera with her presence on Monday, and the Italian Opera on Tuesday evening. On Tuesday her Majesty honoured the Duke and Duchess of Buccleuch with her presence at a *fête*, given by their graces to her Majesty, at Montagu House, Whitehall. On Wednesday, the Queen held a Court at Buckingham Palace for the reception of addresses on the throne. On Thursday her Majesty honoured the Duchess of Gloucester with her presence at an entertainment given by her Royal Highness at Gloucester House. The King and Queen of the Belgians received the foreign diplomatic corps on Saturday at Buckingham Palace. On Sunday, the King left town for Claremont, and returned to Buckingham Palace on Monday, where their Majesties still continue, but it is now expected that they will take their departure about the middle of next week.

Gazette Announcements.—The Queen has appointed H. C. Cotton, Esq., to be Deputy Surveyor-General in the island of Van Diemen's Land. G. Aubert, Esq., has been appointed to be her Majesty's Attorney-General in the island of St. Lucia. Her Majesty has appointed Lieut. Col. S. Dickson to the office of Civil Commissioner and Resident Magistrate of the District of Swellendam, in the colony of the Cape of Good Hope. Henry Rivers, Esq., has been appointed to the office of Treasurer in the colony of the Cape of Good Hope. The Queen has approved of Col. Wright as Consul-General in London for the Republic of the Equator.

Parliamentary Movements.—A vacancy has occurred in the representation of the county of Bucks, by the death of Sir W. L. Young, Bart., which took place on Monday last.

Foreign.

France.—*Ordonnance on the Linen Duties.*—The most important feature in our intelligence from Paris this week is the announcement of the long-expected ordonnance, augmenting the duties on foreign linen thread, which appeared in the "Moniteur" of Monday. The report on the subject presented by Ministers to the King explains the grounds on which Government considers such a measure necessary. It states that "the law of the 6th May, 1841, had already endeavoured to circumscribe within certain limits the competition of foreign linen yarns in the French market. Desirous of proceeding with reserve and moderation in matters of so complicated a nature, we then hoped that a protection of 10 or 11 per cent. would afford a sufficient security to our spinners. An extraordinary decrease of price, resulting from the steam-power applied to spinning by our neighbours, from a glut of production, and from the lower cost of the raw material in other countries, disappointed the calculations and provisions of the legislature. To check this evil now, an important augmentation of the present duties, an augmentation which, on some classes of linen goods, will more than double them, is indispensable." It then proceeds to state, that "the augmentation of the tariff of threads must be attended, as a necessary consequence, with an analogous modification in that of the cloths and woven goods of the same kind, otherwise the balance between the two branches of industry would be broken, and the weavers would suffer by the measure intended to preserve our spinning factories." The report concludes with the following words: "We think that the productions of a contiguous country, in which the conditions of the manufacturer are more akin to our own, may be excepted from the measures just explained: but as the negotiations which have been opened with Belgium, in order to secure to us concessions on our wines, our salt, and our silks, are not yet completed, we have thought that this exemption ought to be adjourned until the probable conclusion of these arrangements." The tariff of the new duties corresponds with this report. The duties are raised in all instances from 10 or 11 to 20 or 30 per cent., whether on raw threads, bleached, or dyed; and this increase amounts to prohibition of the coarser classes of these goods. The proportion of increase in the duties on woven goods is even a little higher than that on linen yarns. These duties are only to be levied on the land frontier from Armentières to Malmaison, near Longwy, until the 20th July next, unless a subsequent ordinance be made to the contrary. A trifling decline took place in the funds on Monday, occasioned by apprehensions that this measure on the part of Government might lead to a misunderstanding with Great Britain. A fall of $\frac{3}{8}$ per cent. also took place in the British funds on the first receipt of the intelligence. The announcement of the ordonnance has, however, been received with expressions of satisfaction by the press of Paris, though the "Courrier Français" begins to express fears that it may seriously affect the interests of the wine-growing districts of the south of France.

The Elections.—With the exception of the ordonnance relating to the linen duties, the only other subject that occupies the attention of the public and the journals is the approaching elections. The papers continue to publish a variety of electoral addresses from the different parties, which require no particular notice. The object of all the candidates, in their endeavours to conciliate the favour of the electors, seems to be directed to the assurance of anti-English prepossessions; to declare that they were opposed to the ratification of the treaty recognising the right of search, and that they would never vote in favour of any commercial concessions to England. The journals said to be under the influence of M. Thiers are particularly violent in their allusions to this country. The most important incident, however, that has occurred connected with this subject has been a declaration of Gen. Jacqueminot to the electors of the first arrondissement of Paris, in which he defends this country from the imputations cast on it in reference to the Right of Search Treaty. Gen. Jacqueminot is one of the most eminent of the Conservatives; and his speech, which is temperate, is understood to represent the views of the Ministerial members of that party, and is thought by some to indicate that Count Molé will replace M. Guizot in the department for Foreign Affairs. The general opinion continues to be that the result of the elections will be a majority in favour of Government, whose popularity appears to have been considerably increased by the appearance of the ordonnance on linen duties, which, it is said, was in a great measure determined on by Ministers with the view of conciliating public opinion.

Right of Search.—The excitement which a short time since prevailed among the public generally, and particularly the Paris press, on the subject of the right of search, and which had, in a great measure, subsided, has been revived by a report made by Captain Seignac, master of a French ship called the Two Sisters, lately arrived at Bordeaux. The captain states that, while on the coast of Africa, having sailed from Sierra Leone, he was boarded on the 21st Jan. by the first-lieutenant of the British frigate Madagascar; but seeing the British officer without uniform and without papers, he refused to show him his papers. This irritated the officer, who giving the command of the vessel to another officer, returned to his ship for his papers. On his return, Captain Seignac showed his ship's papers, which the lieutenant thought necessary to send to his commodore; after which they were returned, and the Two Sisters released. Capt. Seignac, however, complains that the British sailors robbed his ship of a great number of articles; and adds that, when he made a complaint of it, a midshipman of the Madagascar observed that their best sailors were the greatest thieves. The subject has given rise to much angry comment in the journals; but there appears to be reason for believing that the captain's statement is exaggerated, no confirmation of his account having been received.

Algeria.—Despatches have been received from Algiers to the 20th ult. They are very voluminous, and contain reports of various encounters with the Arabs, all of which, with only one exception, have proved favourable to the French arms. The exception alluded to is an affair between the natives and the garrison at Milianah; and though not so disastrous as it was at first reported, proves to be serious. It was attended with the loss of two captains, three lieutenants, four sub-lieutenants, four corporals, and thirty rank and file, with two officers and several non-commissioned officers and privates wounded. It appears, from the report of the Commandant of Milianah, that on the night of the 6th ult. he left that town with a force of rather more than five hundred men, for the purpose of a razzia on the tribe of Beni Menasser, and ravaged their territory, capturing 6,000 oxen, from 10,000 to 12,000 sheep, a great number of mules laden with valuable effects, and making more than one hundred prisoners. Whilst returning with this booty, his force was attacked in a ravine by more than two thousand Kabyles. The combat lasted for nearly half an hour, and the Arabs fought with great desperation, but at length gave way, for a short time, leaving 200 dead on the ground. The French took advantage of this respite to effect their retreat, during which they were followed by the Kabyles, and much harassed. The Commandant received a pistol ball in his breast, but concealed his wound from his troops, and continued to command them. The loss of the Kabyles from the fire and bayonet charges of the French troops, during the retreat of the latter, is stated to have been very great; and the French were able to retain possession of the prisoners they had made, and the mules laden with booty which they had captured.

Spain.—Our intelligence from Madrid is to the 22nd ult. The President of the Council presented to the Cortes, on the 20th ult., his Ministerial plan, by which it appears that the Cabinet will maintain the *pronunciamiento* of Dec. The Ministry had given orders that the factious in Catalonia should be put down; and they protest against the idea of a national bankruptcy. No resolution had been moved, nor had any division taken place, in the Cortes. A private meeting of the members of opposition took place on the 19th ult., when, after a long discussion, they resolved unanimously to oppose the new Ministry to the utmost of their power, in consequence of none of its members having been selected from their ranks. It was generally rumoured in Madrid that Señor Ferrer would take the Presidency of the Council, but that Gen. Rodil would retain the War department. The fifth anniversary of the Constitution passed off tranquilly, notwithstanding reports had been generally circulated that a *pronunciamiento* would take place in favour of the Constitution of 1812. The Queen, accompanied by her sister and the Regent, reviewed the troops in the Prado, and the day concluded with a general illumination. The British embassy was illuminated, but no such demonstration was exhibited at the hotel of the French legation. The Princess's Regiment of Hussars, which generally performed duty at the residence of the Regent, at the Palace of Buena Vista, had been ordered to Alcala de Hernares, and was to be replaced by the Regiment of Lusitania. Serious apprehensions appear to be entertained that Barcelona will again be the scene of disorder; but, according to our latest advices, nothing had occurred to disturb the tranquillity of that city. Accounts from the frontiers state that some agitation had prevailed at Pampeluna, in consequence of a report that the Constitution of 1812 was about to be proclaimed in that city. The authorities had adopted measures for the preservation of order, and the troops had been consigned during two days to their quarters. On the 17th ult., all was quiet in that city and in the northern provinces.

Portugal.—We have news from Lisbon to the 20th ult. The commercial and slave-trade treaties remained still unsigned, the delay being attributed to some misunderstanding as to the force of certain words and phrases in translating the English draught sent from Downing-street into Portuguese. The election of deputies by the parochial delegates commenced on the 19th ult.; the delegates from each province meet in the chief town, and elect the number of deputies allotted to the province, which is according to the population. The province of Douro returned twenty-nine deputies, and a telegraphic despatch had been received from Oporto, announcing that Government had carried them all. From Villa Real, the capital of Tras-os-Montes, which returns eleven deputies, a telegraphic despatch had also been received, stating that the deputies elected were all Chartists. At Lisbon the electors for the province of Estremadura, which returns 24 deputies, had met on the 19th ult., when, owing to a division among the Chartists, the combined opposition was able to elect the board, which superintends the returns, out of their own partisans, by a small majority—74 against 72. The scrutiny commenced the next day, and was still proceeding when the packet left. It was expected that the result would be that the leading men, both on the Government and opposition side, would be returned for Estremadura, but no Miguelites; and the same result was expected from the province of Alemtejo, which sends 10 deputies, and where also the opposition had carried the electoral board. It was thought that on the entire elections, Government will certainly have a majority of 3 to 1. The guards had been doubled at Lisbon with cavalry patrols in the streets, but the election was going on quietly, and there appeared no symptoms of disturbance. The Court has been staying at Cintra, where Lord and Lady Howard and family were also residing. The Queen was about to proceed to Alhandra, to stay at the Duke of Terceira's during the bull-fights there. An order had been issued by the Minister of Marine, directing all the commanders of the Portuguese cruisers on the African seas, or at Cape Verde, Prince's Island, and St. Thomas's, to take on themselves the responsibility of adopting such measures as they consider best calculated to repress the slave-trade, communicating with the different governors whenever practicable.

Germany.—The news contained in the journals is unusually limited. It is stated that the Austrian Government, which six months since was about to accede to the German Customs' Union, has indefinitely postponed that intention.—Private letters from Berlin inform us that a M. Schmidt, burgomaster of Bremen, has been in that city for some time, for the purpose of negotiating a commercial treaty in the names of the cities of Hamburgh, Lubeck, and Bremen. It is added that in case this accession should take place, the German princes belonging to the Customs' Union would guarantee to the city of Hamburgh a loan of 30 or 40 millions of marks banco, which it intends to contract, for rebuilding the portion of the city destroyed by fire. Information was received on the 23d at Coblentz, by telegraph, that the King of Prussia had set out for St. Petersburg, and the Queen for Dresden.—The journals state that a short time since the Academy received a letter from M. Eichhorn, the Minister of the Interior, relative to their late election of the learned Jew, Dr. Peter Reiss, to one of the professors' chairs, inquiring if "the Academy was aware that Dr. Reiss was of the Jewish persuasion?" This demand occasioned a rather animated discussion, at the close of which the following reply was voted almost unanimously: "The Academy is perfectly well aware of what it does, and again prays most earnestly that the confirmation of Dr. Reiss's nomination may not be any longer delayed." As the King has since expressed himself in favour of the appointment, it is expected that the public reception will not be long delayed.—The serious accident which lately occurred, as noticed in a former Number, at Schleiz, where the roof of a riding school, used as a temporary theatre, fell in, has proved more serious than was at first anticipated; the total number of deaths, including those who afterwards died of their wounds, is now twenty-six. Amongst the bruised were a prince and princess of the reigning family of Reuss.

Belgium.—The journals inform us that the King and Queen are expected at Ostend, on their return from

London, about the 14th or 15th inst. Baron Deffauder, minister plenipotentiary of France at Frankfort, arrived at Brussels from Paris on the 27th ult., supposed to be the bearer of important despatches addressed to the King by the King of the French. M. Deffauder went to Ostend, but was too late; and their Majesties having already left, the despatches were sent to London. Baron Deffauder waited at Brussels for the answer, and having received it, set out for Paris on Saturday night. The punishment of Messrs. Vandersmeere and Vandersmessen has been commuted, by a decree of the 19th ult., to 20 years' confinement, and that of Messrs. Verpraet and Van Lathem to 10 years, in the fortress of Bouillon.—The British Queen, steamer, arrived at Antwerp on the 24th ult., having performed the voyage from America in less than 17 days.

Holland.—Private letters received from the frontiers of Luxembourg announce that a new commercial treaty between France and Holland is now negotiating.

Italy.—Private letters from Rome give an account of a féte given on the 4th ult. by the Duke de Torlonia, at his villa, on the occasion of inaugurating the obelisk brought there, at great expense, from the Simplon. Upwards of 18,000 invitations were sent out, and the King of Bavaria, the College of Cardinals, all the foreign ministers resident at Rome, the prelacy and nobility, and the most distinguished citizens, both natives and foreigners, were mingled together in the walks, alleys, and lawns of the beautiful grounds of the Duke's residence. To add to the general satisfaction, the Pope honoured the scene with his presence, and remained for two hours, conversing benevolently with all who were near him.—A rumour was current among the fashionable circles of London during the early part of the week, announcing the death of the Earl of Lichfield, which was said to have taken place lately at Naples, where his Lordship has been residing. The rumour, however, appears to be incorrect, as Lord Coke, eldest son of the Earl of Leicester, who arrived from Naples last week, by way of Gibraltar, states that at the time of his departure, his noble relative, though occasionally suffering from gout, was not worse than when he quitted England; and at the date of the last letters received by the Hon. Col. Anson, a few days since, his Lordship's indisposition was not adverted to.

Turkey.—By the arrival of the Levant mail, we have received advices from Constantinople to the 7th ult. The conference between the Ottoman ministers and the plenipotentiaries of the Great Powers upon the affairs of Syria, noticed in our last Number, appears to have led to no result; and it is said that the Plenipotentiaries, finding they could make no impression upon the Porte, have determined to adjourn the question until the return of Selim Bey, although there appears to be little reason even then for anticipating any satisfactory change. A council of ministers was held on the 2d ult., at the Teherazan Palace, when the whole of the documents relative to Syria were laid before the Sultan. Upon this occasion his Imperial Majesty is said to have expressed his deep regret that circumstances should have arisen to cause the slightest misunderstanding between the Porte and its allies, and strongly urged the policy of propitiating foreign powers by every possible concession compatible with the honour and interests of the empire. The Vizier and ministers replied that they were ready to obey the Sultan's commands, and desirous to preserve the most cordial understanding with foreign courts; but they were not prepared to sacrifice their duties to the Sultan, or to the empire, by granting concessions which they considered detrimental to the dignity and subsequent welfare of both; and that if the Porte admitted the doctrine of foreign interference in its internal administration, it must abandon its independence, and establish precedents the danger of which was too palpable to require observation. Nothing, therefore, appears to have been gained by this council, which broke up without coming to any decision. According to the latest advices, the Lebanon was tranquil; but it is said that foreign agents were busy with their intrigues, which served to augment the dissatisfaction of the people, and caused an increase of watchfulness and severity on the part of the Turkish authorities. We noticed in a previous Number that the Porte, adhering strictly to the treaty of July 13, which closes the Dardanelles to all but light vessels of war employed for the service of foreign legations, had refused a firman for the passage of a heavy Danish frigate having on board a young Prince of Hesse Cassel, proceeding as a visitor to the Bosphorus. It now, however, appears that the refusal was accompanied by an offer to place the Sultan's private steamer at the Prince's disposal, and to receive him with every mark of honour due to his rank. This offer has been declined, and the affair referred to Sir S. Canning. The Grecian question appears to be stationary; the Porte having definitively declared that it will not commence negotiations until it receives full satisfaction for the outrages committed upon its subjects at Chalcis. The intervention of Sir S. Canning, and the mission of M. Mavrocordato, have alike failed to produce any effect.—The Hon. W. Maule has met with a severe accident by the fall of his horse; but the physicians have announced that his injuries are not likely to prove fatal, as was at first feared, and no bones have been broken. The British Ambassador has taken a house at Buyukderé for five months, for which 300*l.* is to be paid. A new palace is to be built forthwith, which when finished will cost 40,000*l.* Private letters state that the house of Messrs. Nyvin, Black, and Co., of Constantinople, has declared its inability to meet its engagements. A report has been current that a misunderstanding had arisen between M. de Bourqueney, the French Ambassador at Constantinople, and Sir S. Canning; but it appears to be without foundation. The mail supposed to be from India, as reported by the French telegraph received from Marseilles, and given in our last, proves to have been the despatch forwarded to Government by Sir S. Canning, respecting the contents of which nothing has yet transpired.

Egypt.—Our intelligence from Alexandria, which extends to the 6th inst., is not of great importance. Gen. Brooks, on his return from India to Europe, had arrived at Alexandria, and had been well received by the Pacha. The plague continued to be felt at Alexandria, Damietta, and Aftè. A circular had been issued by the British Consul to the merchants of Alexandria, stating that the Pacha has acceded to his, the Consul's proposal, that the import and export duties be for the future levied upon valuation of merchandise, and in Egyptian currency, without reference to the tariff of 1839. The circular adds, that the Pacha having declared the trade in cotton free, the 5 per cent. duty upon imports would become payable from the 26th June, but that three per cent. duty would be paid for goods passed during the interval between the 23d Nov. of last year, and the 26th day of June in the present year. This appears to be regarded as a satisfactory arrangement for the mercantile interests in Alexandria.

India and China.—The Great Liverpool arrived at Marseilles on Wednesday, with the overland mail. The following is the telegraphic despatch received by the French Government:—"Marseilles, June 29. The Great Liverpool reached this morning. On the 16th of April General Pollock made his junction with the garrison of Jellalabad, re-establishing during his march the authority of Thorabaz Khan at Salpoora. He is to march on Cabul when Colonel Boulton joins him. Captain M'Kenzie reached Jellalabad with proposals from Akhbar Khan for ransoming prisoners. Nothing known of answer. Elphinstone died on the 23d. General England had joined his forces to Nott's at Kandahar.—China news is of the 19th of April. 10,000 Chinese attacked Ningpo on the 10th of March, and others attacked Chinghæ; but both were repulsed with great loss."

United States.—By the arrival at Liverpool on Tuesday of the Royal mail steamer Columbia, and the Great Western at Bristol on Wednesday, we have intelligence from New York to the 16th inst. The Great Western performed the voyage from New York in 12½ days, and the Columbia from Halifax in nine days and 12 hours. The principal event noticed in the papers is the suspension of specie payments by the banks of New Orleans, the accounts received by former advices, which led to the expectation that the resumption would have been permanent, proving incorrect. It seems that a run commenced upon the banks on the 30th May, which lasted for several days, the result of which was that all the banks except the Union had been obliged to suspend cash payments until the day for resumption fixed by law, the 5th Dec. next. The accounts from Washington are favourable, and it continues to be the general impression that the negotiations between Lord Ashburton and the United States' government will have a peaceable and honourable termination. The different commissioners and agents of the several states interested had arrived at Washington, and were consulting the government during the progress of the negotiation. These commissioners, as stated in our last advices, have full powers to agree to a new treaty on honourable principles. In addition to these there are also at Washington the land agents of Maine and New Brunswick; and every effort will be made to bring the Boundary question to a close. It does not appear to be known exactly what are the terms of compromise; but it is generally supposed that it will be settled on some principle of equity—dividing or commuting the territory, either in money or land. It is thought that the free navigation of the Mississippi on the part of England, and of the St. Lawrence and the St. John's on the part of the United States, will be one of the points of discussion and arrangement. The Caroline and Creole affairs are not expected to involve any difficulty; and it is said that the right of search, as developed in the quadruple treaty to suppress the African slave-trade, though not likely to be assented to by the United States government, will not present any obstacle to the conclusion of the present negotiations, as any arrangement on the subject of slavery will form the basis of a separate treaty between Great Britain and the United States.—Another arrival has since taken place, the packet ship George Washington, which arrived at Liverpool on Wednesday, bringing passengers Mr. Charles Dickens and his wife. The George Washington left New York on the 8th ult., and consequently brings no news which is not anticipated by the intelligence received by the Columbia and Great Western.

West Indies.—The letters and papers brought by the Medway last week, and which were delivered too late to be noticed in our last, bring intelligence which is on the whole of a satisfactory nature. The crops generally promised to be abundant, although to a certain extent injured in some islands by drought, and in others by excessive rain; still, however, the prospect is described as far more cheering than in 1841. Trade remained greatly depressed, but from all appearances was expected to revive shortly. Lord Elgin, the new Governor, had been sworn in, and his arrival appears to have given general satisfaction. The condition of Demerara is stated to be even worse than it was reported by our last advices. The planters were unable, either by persuasion or reward, to induce the labourers to work: and consequently the quantity of produce was expected to be less than it had been last year. The condition of the public treasury, and the inability of the colonists to support the imposition of any increase of taxation, forbade the hope of obtaining immigrants with the assistance of the Executive. The House of Assembly had been called together for the purpose of voting the ordinary supplies for the year, and had reported that a deficiency of 298,000 dollars existed upon the expenses of former years, and recommended, as the only means left to meet it, a considerable reduction on all branches of the expenditure.—Further accounts have been received by the Columbia relative to the late earthquake in the island of St. Domingo. A private letter from Cape Haytien, dated the 14th May, is interesting from being written from the spot where the calamity occurred. It states, that on the 7th May, about half-past five, P. M., the city was laid in ruins, and it is supposed that half the inhabitants were at once destroyed. Shock after shock had followed up to the date of the letter, and at the very moment while it was writing, one of the severest had been felt, which lasted nearly a minute, being accompanied by a loud subterraneous noise, generally the forerunner of a shock. Fort Dauphin had experienced the same fate as Cape Haytien, with the additional calamity of the powder magazine having blown up. Gonaives had been destroyed, but only one life lost; and Port de Paix, according to a report at the Cape, was annihilated. The writer of the letter describes himself as having been in the upper part of his house at the time the calamity occurred, and as having been dug from the ruins comparatively unhurt, half an hour afterwards. The fallen walls had completely blocked up every street in the city, and it was difficult to pass along the ruins. Every house had fallen; and during the first days of the calamity the misery of the inhabitants had been greatly increased by the people from the plains rushing among the ruins for the purposes of plunder, and even murder. At the date of the letter the marauders were quarrelling and murdering one another, and the arrival of several companies of the National Guard had put a stop to these disorders. The occurrence of famine and pestilence appears to be regarded with great apprehension, particularly the latter, which, it was feared, might be occasioned by the number of unburied bodies. A singular fact is recorded in this letter, that only one foreigner lost his life—a Frenchman, from Cuba, who had sought a refuge in Cape Haytien from his creditors.

Australia.—We have this week received Adelaide papers to the 4th Dec. The accounts they contain speak favourably of the progress of the colony. A long statement is given of a public dinner, given on St. Andrew's Day by the Scottish portion of the community, in celebration of the day. The meeting was numerously attended, and among other toasts, one, proposing "The agricultural and pastoral interests of South Australia," gave rise to some interesting remarks on the natural capabilities of the colony. Mr. Murray proposed it, and entered at great length into a review of the past and present prospects of the colonists. Those who had been there some time, he said, could not but remember the very desponding feelings which were generally entertained among the settlers two or three years ago, as to the productive capabilities of the plains of Adelaide; but they had now sufficient proof that those plains were capable of producing the finest wheat man could wish for. Those plains extended from Mount Terrible to the Sources of the Light, a tract of land of about 100 miles in length by 20 in average breadth, every acre of which was susceptible of cultivation; and it was scarcely possible to calculate what amount of population they were capable of supporting. Mr. A. M'Laine, in replying to it, said the time had been when such a toast would have been a doubtful proposition; but that day had now passed away. He had himself followed both agriculture and grazing to a small extent, so that he could form an opinion for himself from his own experience; and he was happy to say, so far as that went, he had no doubt whatever as to the capabilities, both grazing and agricultural, of their adopted country. Mr. Duncan M'Farlane proposed "The Horticultural interests of the colony." He said he gave the toast with great pleasure, for he was sure no better indication could be obtained of the capabilities of the colony than the productions of their gardens. He had been over a considerable part of New South Wales, but he had not seen, in any part of that colony, any gardens more luxuriant than those around Adelaide and Mount Barker. The bananas and other tropical fruits growing in the gardens of his friend Mr. Stevenson were worth the while of any colonist going to inspect, and he hoped to see Mr. Stevenson's example much more generally followed than it had been. The whole country within many miles of Adelaide was remarkably suited for the growth of the vine; and he hoped to see soon a large portion of it covered with that plant. In the cultivation of the grape, and the growing of wheat, the colonists need fear no competition; and the sooner they extended their operations in these branches of colonial wealth, the better. Mr. Stevenson, in his reply, said that he could now say, from his own personal knowledge and experience, that this colony was capable of producing to perfection all the fine fruits of Syria, Persia, and other parts of Asia. It had been said that the colony could not produce potatoes; but he might leave the chairman to decide whether he had ever seen finer than those produced last year in Mount Barker. In other countries the vine took five years to come to perfection, but here it produced freely in the second, and abundance of fine fruit in the third year. The same might be said of several other kinds of horticultural produce, their progress towards maturity being much more rapid than in other countries. The fig, the banana, the pomegranate, the olive, and others, would be in abundance; and no country, he was persuaded, would ever surpass South Australia in the richness and variety of its horticultural produce. Mr. Sutherland, in proposing "The Commercial and Shipping Interests of the Colony," remarked that these, though of great importance, must be based on the agricultural and pastoral. Hitherto they had been on rather an unsound basis. It had been all importation; but now they had commenced exportation pretty largely, and importation was becoming more in proportion to their exports. They had now shown the neighbouring colonies that they could send them butter, cheese, and even fat cattle—all of which had been exported within the last two months; and he thought, in another year, if not in this, they would be able also to send them wheat. He said he had travelled through England, Scotland, and Ireland, and he had seen as fine wheat growing on the plains of Adelaide as he had ever seen in any of the finest districts of those countries. A number of other speeches were made; all the speakers representing the condition and prospects of the colony in a very favourable point of view.—The other news contained in these papers are chiefly of a local nature.—We have also received papers and letters from Western Australia to the 22nd Dec. They are chiefly occupied with reports of a statement from Capt. Stokes of H. M. S. Beagle, addressed to the Hon. J. S. Roe, giving an account of a journey undertaken by the Beagle, for the purpose of ascertaining beyond a doubt the existence of Port Grey, as described in the accounts published of it and the neighbourhood by Capt. Grey. These accounts, giving a very favourable description of the place and neighbourhood, had been for some time before the public, had been generally credited, and Mr. Arrowsmith's map, drawn up from them, had been filed among the records in the Survey Office. Capt. Stokes, in a despatch dated "Gage's Roads, Dec. 19, 1841," states that after the most diligent search, he has been unable to discover such a place as Port Grey, within a degree of the lat. marked down for it on the map. He further adds, that the whole neighbouring country, instead of presenting the fertile and attractive appearance represented by Capt. Grey, is quite barren, and affords little or no wood, and no water, but what is either salt or very brackish. The following is an extract from Capt. Stokes's report: "If such a harbour as Port Grey existed in 29 deg., as according to Arrowsmith's chart, we must have seen it; moreover, I feel assured, excepting the bight fronted with rocks, situated 5 miles south and by east of Point Moore, and the secure summer anchorage bearing the name of Champion Bay, there are no bays or bights offering an indifferent anchorage for ships or vessels on this portion of the western coast of Australia, between the lat. of 28 deg. 20 min. and 29 deg. 20 min." Capt. Stokes is of opinion that Capt. Grey has mistaken the locality of Champion Bay for the place set down in the map as Port Grey. The report proceeds to state: "We left Champion Bay on the morning of the 16th instant. After stretching out to the N.W., we met a favourable westerly wind, which, by afternoon, carried us past the bight south of Point Moore, and sufficiently near to see that its shores were fronted with many sunken rocks. This leads to the conclusion that Champion Bay is the port Captain Grey speaks of in his journal, placed in Arrowsmith's chart 12 miles south of its true situation. Our position during the early part of the 17th afforded means of laying down some islands, reefs, and a portion of the coast passed by Capt. King in the night; and on the afternoon of the 18th we reached Gage's Roads, after fully and satisfactorily accomplishing the object in view with most fortunate despatch. The tracks of the Beagle to and from Champion Bay, in addition to her former ones, must tend to satisfy the public that no dangers exist outside of 9 miles from the coast between Swan River and the Abrolhos."

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of petitions, Lord Denman moved the second reading of his bill for admitting in judicial proceedings as equivalent to an oath, the affirmations of Baptists and several other sects of Dissenters who entertain conscientious objections to incurring that sacred obligation.—The Earl of Wicklow opposed the measure on the ground that the cases of hardship under the present system were few, and mostly imaginary. The Bishop of London said that he could hardly make up his mind on one side or the other as it regarded the religious scruples of a most respectable religious body. He did not think that these objections to taking oaths were valid, but as they were conscientious he thought they were bound to respect them. He was willing to relieve persons who conscientiously objected to take an oath, but he, at the same time, did not like to support this measure, as he saw that it would lead to the abrogation of all oaths.

Lord Abinger, in refusing his concurrence to the measure, said that in the course of the debate the case of the Quakers had been referred to, as one in which Parliament had consented to remove the necessity of taking an oath. He did not think this measure had been attended with very fortunate results. The Quakers themselves, when called as witnesses in courts of justice, were most difficult to fence with; and he had often, in cases where they had been examined before him, been compelled to make an apology for them to the jury; albeit, in fact, it was a part of their religion never to give a direct answer on any occasion; and this was so much a matter of certainty, that whenever a gentleman proposed to examine a Quaker, he never expected to get a direct answer. He begged it, however, to be understood that he was not speaking in disparagement of Quakers, far from it. He had never meant to say that an evasion to tell the truth was a part of the religion of a Quaker; but what he had said was that a direct answer to a question could seldom be obtained from a member of that sect; and he had said that he had occasionally made an apology for them, for their not giving direct answers, because their religious feelings were of too rigid a nature to allow them to do so. He concluded by saying that he should be reluctant to sanction any measure which should have the effect of abolishing oaths.

Lord Brougham, in defending the Quakers, said he had known them in public and in private during a long and uninterrupted intercourse with many of them, and he would venture to say that there existed in no part of the community a more constant, solemn, and serious regard for the truth—for the obligation of what they called an affirmation, and what others called an oath, and to violate which they professed as great an abhorrence as we professed for the violation of an oath. He believed that the noble and learned lord had fallen into this mistake, that he had confounded their great scrupulousness in affirming that which was matter of fact, with an attempt to evade questions which were put to them. They felt the force of the obligation of the affirmation administered to them; and it was because they did so—because they felt how solemn the occasion was on which they were called upon to speak, that they were most scrupulous in selecting the language which they employed, and that they were fearful of giving a colour to a statement of facts, to which, according to their recollection, it was not entitled.—Lord Denman also defended the Quakers from the imputations of Lord Abinger, and, on a suggestion from the Bishop of London, which was supported by the Lord Chancellor, the bill was withdrawn; on the understanding that the entire subject be referred to a select committee, with a view to some future legislative proceedings.

The Slave Trade Suppression (Hayti) Bill, the Slave Trade Abolition (Argentine Confederation) Bill, and the Slave Trade Treaties Bill, respectively passed through committee, and the reports were ordered to be received on Tuesday.—The Drainage (Ireland) Bill, and the Railways and Conveyance of Troops Bill, were brought up from the Commons, and read a first time.

Tuesday.—After the presentation of petitions, the Municipal Corporations Act (Ireland) Amendment Bill was brought up from the Commons, and read a first time.

The Duke of Richmond moved, on the suggestion of the Bishop of London, the appointment of a select committee to inquire into the effect of the administration of oaths in judicial proceedings.

The Earl of Mountcashel directed the attention of the House to the report on the medical charities of Ireland, which he censured as not being trustworthy. He complained of the suppression of letters by the Irish Poor-law Commissioners, and moved for their production. Lord Wharncliffe replied that the Commissioners had intimated that these letters were confidential documents, which they were ready to produce should their Lordships require them. He hoped, however, that no such order would be given.—A debate ensued, in which several noble Lords joined, and the Duke of Wellington said he thought there could be no doubt that the motion ought not to be agreed to by the House.—The Earl of Mountcashel wished to withdraw his motion, but the Duke of Richmond insisted on its formal rejection, which was done without a division.

Several bills were then forwarded in their respective stages.

The Lord Chancellor laid on the table a Bill to prevent inconvenience to counties from the Quarter Sessions Bill coming into operation in the middle of a session. The bill was read a first time; and the Lord Chancellor gave notice that on Wednesday he would move the suspension of the standing order to expedite its progress.

Wednesday.—The House sat only a short time. The Jurisdiction of Justices Bill was read a second time, and the standing orders having been suspended, the bill went through the Committee, was reported without amendment, read a third time, and passed. On the motion of the Earl of Shaftesbury, the report of Sir J. Walsham on the state of the Burnley Poor-law Union, and the correspondence on the subject with the Poor-law Commissioners, were laid upon the table.

Thursday.—The Royal Assent was given by commission to the Assessed Taxes Composition Bill, the Slave Trade (Argentine) Compensation Bill, the Slave Trade (Hayti) Suppression Bill, the Slave Trade Treaties Bill, the Jurisdiction of Justices Bill, the Agents and Factors Bill, and several private bills.—The Customs' Duties Bill was brought up from the House of Commons, and read a first time, and ordered to be read a second time on Tuesday next.

In reply to a question from the Earl of Mountcashel, the Duke of Wellington stated that the present Government intended to act up to the spirit of the undertaking of the late Administration in respect to advances of money for carrying on public works in Canada. Ministers were now in communication with the Governor-General of Canada, for the purpose of determining the amount that would be required, and how it might be most advantageously applied.—On the motion of the Duke of Wellington, the standing orders were suspended, and the Irish Corporation Bill went through its several stages and passed.—Lord Brougham presented a petition from a deputation of individuals connected with the manufacturing districts of the north of England, calling attention to the distress of the labouring population, and gave notice that he should bring the subject fully before the House on Monday the 11th inst.—In reply to some remarks from Lord Kinnaird, the Duke of Wellington said that the money which had been collected in virtue of the Queen's letter had been placed in the hands of the manufacturers' relief committee, an establishment which had existed in London some years; and he had full confidence that they would distribute it in a perfectly satisfactory manner.—The regulation of the Municipal Corporations (Ireland) Bill, and the new Tariff Bill, were brought up from the Commons and read a first time.

Friday.—The Royal assent was given, by commission, to the Jurisdiction of Justices Act Amendment Bill, the Copyright Bill, the Public-houses Regulation Bill, the Municipal Corporations (Ireland) Bill, and the North American Colonial Association Bill.—Some petitions were presented, and their Lordships adjourned.

HOUSE OF COMMONS.

Monday.—Mr. Roebuck, as chairman of the Election Proceedings Committee, appeared at the bar, and stated that Mr. Walter, who had been summoned, refused to attend and give evidence. The main ground on which Mr. Walter refused was expressed in a letter he had written to the committee, in which he stated that however disposed to yield obedience to the legal orders issued by the House, through one of its committees, he objected to appear and put himself in the power of a court the presiding member of which had manifested undisguised personal hostility to himself. The ground for making this statement was an expression used by Mr. Roebuck during the last session of Parliament, when, in reference to some comments on his conduct in "the Times" newspaper, he said that, "if any hon. members were attacked by 'the Times,' and did not wish for a repetition of the attack, he would suggest to them at once to horsewhip the proprietor, Mr. Walter, and they might depend upon it the attack would not be repeated."—The House ordered the attendance of Mr. Walter on Tuesday; and some conversation ensued on the subject of the inquiry before the Election Compromises Committee being conducted with closed doors.—Mr. Roebuck stated that the committee had come to a unanimous resolution that the inquiry would be best conducted in that manner, though they did not dispute the right of any member of the House being present. The proceedings were ordered to be printed, with the votes, for the use of members only.

The adjourned debate on the Poor Law Amendment Bill was then resumed by Mr. Fielden, who strenuously opposed the measure.—Mr. Lawson said that Mr. Roebuck had decried as vulgar the opinions of those who disapprove the Poor Laws: whilst the opinions of the vulgar were those of the very classes of the people whom Mr. Roebuck professed to represent.—The House then divided:—Against Mr. Duncombe's motion for throwing out the Bill, 156; for it, 37: majority against it, 119.

The House having resolved itself into committee, Mr. Wakley moved the postponement of the first clause, which enacts that the period of duration of the Poor Law Commission shall be for five years. He said that his object in proposing the postponement was to get the provisions of the bill settled, and the powers of the Commissioners defined, before the period of duration of the Commission was decided on. He supported his motion by a long speech against the New Poor Law, warning the House against the serious consequences which he considered would result from the passing of the Bill.—Sir J. Graham protested against the language used by the opponents of the Bill, and the harsh accusations which they indiscriminately brought against its supporters, who were of all parties, Tory, Whig, and Radical. He assured Mr. Wakley that there was no intention of passing a part of the bill and abandoning the rest. He hoped to pass all the clauses, and in the order in which they stood. Feeling deeply and sincerely for the present distress, he was the more anxious, on that very account, to carry this bill, and to carry it in the order of its clauses.—Mr. E. Buller endeavoured to show that the primitive Poor-law Acts of Elizabeth were far from deserving the credit for humane consideration for the poor which was usually ascribed to them.—After some observations from Mr. Benett in opposition to the bill, and from Mr. Rice in support of it, Mr. S. Wortley thought it reasonable to postpone the clause, and to consider, when the rest of the act should be complete, what length of time should be allowed to the commission.—Capt. Pechell supported the motion for postponement.—Mr. Cardwell also pleaded for the postponement of the clause, on the ground that it was unfair to ask them to come to a decision on the continuance of the commission, until they saw what would be the character of the bill.—After a few observations from Mr. Darby, Mr. T. Duncombe said, the House had a right to know what were to be the duties, before they settled the duration of the authority for discharging them. He quoted a speech of Sir E. Knatchbull, who last year, on the bill of the late Ministry, had moved the postponement of the corresponding clause.—Sir E. Knatchbull said, he had certainly made such a motion, and, finding the general sense of the House against him, had withdrawn it. He had made that motion with respect to a bill which he did not approve; but he was not, therefore, to concur in a similar motion with respect to this bill, which he did approve. He admitted that he had seen cause to be dissatisfied with the commissioners in some particulars.—Mr. P. Howard supported the New Poor-law. He thought that part of its unpopularity arose from the use of terms by the commissioners which had the appearance of harshness.—Mr. Wakley replied, and the committee divided, negativing the motion of postponement by a majority of 206 to 74.—A motion was then made by Mr. B. Wood, having for its object the discontinuance of the present assistant-commissioners.—Sir J. Graham maintained that the assistants were the hands and eyes of the central commission; and that if the former should cease, the latter would be entirely useless. Col. Sibthorp had no objection to the present proposal because it would knock up the whole system. He could not brook an institution under which the gentlemen of each district were to be controlled by paid Commissioners, however respectable.—Mr. Ferrand animadverted in strong terms upon a report made by one of the Assistant Commissioners, in which he, Mr. Ferrand, and his brother magistrates were censured.—Sir J. Graham gave some explanations on the subject, and repeated his offer, made on a previous evening, of a committee of inquiry.—Mr. B. Wood replied; and the committee dividing defeated his proposal by a majority of 228 to 45.—Capt. Pechell then moved to adjourn the Committee. Some explanations took place between Mr. Ferrand and Sir J. Graham; and the committee adjourned.

The report of the Customs Bill was brought up and read; and the bill, with the insertion of an amendment by Mr. Gladstone, the object of which was to reduce the duties on nutmegs, &c., from one shilling to threepence, was ordered to be engrossed.—The report of the British Possessions Abroad Bill was brought up and read. The New South Wales Bill passed through committee. The Stock in Trade and the District Courts Bills were read a second time. The Municipal Corporations Bill went through committee.

Tuesday.—After the presentation of petitions, Lord Eliot, in reply to a question from Mr. D. Browne, stated that the Irish Executive were taking measures to mitigate the distress in the west of Ireland, though it was not at present expedient to describe particularly the nature of those measures.—Mr. Hume asked if the announced issue of half-farthing coins was a hoax.—Mr. Gladstone said it was no hoax. The coin was in constant demand in some of the colonies, to which they would be shipped if they were found to be useless in this country.

Mr. Walter was then called to the bar, and repeated the statement which he had made in his letter sent to the committee, that his refusal to attend arose from no disrespect to the House, or reluctance to give evidence, but from a feeling that every subject of the realm ought to be arraigned and tried before an impartial tribunal. The chairman of the committee, Mr. Roebuck, had used terms respecting him within the House which indicated strong personal hostility. He, however, submitted himself to the House, claiming its protection.—Mr. Roebuck moved that Mr. Walter be ordered to attend the committee, and give evidence.—Sir R. H. Inglis strongly deprecated the course pursued in the case of Mr. Walter, by which he was deprived of the advantages of an impartial tribunal. At the same time he admitted that he had not acted judiciously, first, in writing his letter to the committee, and then in abandoning his high ground in appearing at the bar, and offering to submit.—Col. Sibthorp said he had seen with great pleasure the respectful yet firm demeanour of the hon. gentleman who had just left the bar. He should have been proud himself to be placed in the same position; and would be among the first, if Mr. Walter should be committed, in paying his respects to him.—Sir G. Grey suggested that Mr. Walter should be admonished. Sir R. Peel thought that the authority of the House would be upheld by an intimation from the Speaker to Mr. Walter that it was his duty to attend.—A division took place on the motion that Mr. Walter be ordered to attend, which was carried by 223 to 77.

Sir G. Grey then moved that Mr. Walter be called to the bar, and receive from the Speaker a communication of the determination of the House.—Another debate arose, in which the question of the propriety of these election inquiries, Mr. Wakley, amongst others, strongly condemning the appointment of Mr. Roebuck's committee as a tyrannical exercise of power to inquire into what were private transactions.—Lord Stanley argued that Mr. Walter had been summoned, not as a defendant, but as a witness, and had therefore no right to object against any member of the committee.—Sir R. Inglis endeavoured to show that, in substance, Mr. Walter was a party accused; a new crime, that of compromise, being charged against him.—Mr. Walter was recalled, and the Speaker acquainted him with the resolution.—A report was then presented by Mr. Roebuck from the same committee, informing the House that another gentleman, Mr. A. B. Cochrane, had likewise refused to attend, which report was ordered to be taken into consideration on Wednesday.

On the third reading of the new Tariff Bill, Mr. Jervis moved a proviso, providing for a drawback of the duty paid on exported coal, when re-shipped in foreign ports on board British steamers, for their own consumption. He pleaded for this concession, from regard to our steam navy, and the interests concerned, which were at present struggling with difficulties and scarcely realised any profits.—After a few remarks from Mr. Wallace, who seconded the motion, the Chancellor of the Exchequer said that Government had been anxious to concede this point, but experienced officers of the Customs had satisfied them of the impracticability of the idea. A drawback to be allowed, not in our own dominions, but in foreign ports, would lead to frauds of the most extensive nature.—Mr. Hume, Sir C. Napier, and Mr. M. Attwood severally supported the motion, arguing that every encouragement should be given to our commercial steam marine.—Mr. Gladstone and Sir Robt. Peel opposed the resolution, and again went over the grounds urged on the former debate on the same subject, on which Government refused to concede the privilege.—After some discussion, the motion was rejected by 80 to 42.

Mr. T. Duncombe proposed an amendment on the duty on onion-seed. He said the present duty is eight guineas the cwt.; in the first edition of the Tariff it was reduced to 5*s*., but on the repeated solicitations of interested parties, Government raised it to 10*s*., and then 20*s*.; and not content with this, they yielded still farther, and consented to postpone this 20*s*. duty till 1843. The interested parties were so elated by their success, that they sat down somewhere about Mark-lane, and drank champagne, toasting the amiable weaknesses of the Board of Trade. He thought the great similarity between onion and leek-seed would lead to great fraud; and the reduced duty on leek-seed was to come into immediate operation. He moved that the words be struck out, postponing the operation of the duty.—Mr. Gladstone said that Mr. T. Duncombe had drawn largely on his imagination in his description of the interviews of parties with the Board of Trade. In reducing the enormously high duty on onion-seed, and postponing the operation of the reduced duty, Government were actuated by a consideration for the home-growers, who were exposed to a more sweeping change than any other class affected by the Tariff, and to whom time was of great importance. Care would be taken at the Custom-house to prevent onion-seed from being introduced as leek-seed.—Mr. Alderman Humphery produced several samples of leek and onion seeds, and contended that they were so much alike, that the Custom-house officers would never know the difference, and thus the opportunity for fraud was given by the Government proposal to reduce the duty on leek-seed immediately, while they postponed their onion duty till next year. Leek-seed would be introduced and sold for onion.—Mr. Hume thought that Mr. T. Duncombe had completely made out his case for the immediate reduction of the duty. It was plain that Government had been cajoled.—Mr. Baring entertained no doubt that the difference of duty between leek-seed and onion-seed would be a fruitful source of fraud.—Mr. T. Duncombe replied, and the amendment was rejected by 93 to 63.

Another amendment, proposed by Mr. T Duncombe, that the amount of duty to be levied on cork squared for rounding be reduced from 16s. to 4s. per cwt., was rejected by 110 to 74. On the question that the bill now do pass, Lord J. Russell said he would take this last opportunity of speaking upon the general principles of the tariff. Congratulating the country on the liberal declarations of Government, he yet lamented that they had not been practically applied to sugar, corn, coffee, and other important articles of food and consumption. He regretted that Government had not used its great power to give the country a consistent tariff, dealing with all the great articles of consumption on similar principles.

Sir R. Peel said he should be sorry at this final close of the tariff to introduce anything that should savour of party asperity, especially as he must acknowledge the support he had received from opponents as well as from friends. He had himself contended, so long since as 1825, for the principles which he had now applied. It was said he had not carried them far enough. Now on coffee he had given a greater relief than even the late Government had proposed. On butter and cheese a duty, for revenue, had indeed been retained; but the late Government itself had proposed no alteration there. On meat he had made a large remission. Sugar, for specific reasons, appeared to be an exception from the general principle. The corn question had been dealt with separately; and he believed that the conclusion which the Legislature had adopted on that head was the correct one. But the tariff must be taken as a whole; and in this view, he believed that the reflecting part of the community would deem the influence of the Government to have been exercised wisely. and the changes of duty to have been made as extensively as the state of the country will allow. He trusted the result would benefit the country, by reviving her resources and her trade; and if so, there was no labour which had been, or could be, undergone by Ministers which they would not regard as amply repaid.

Mr. C. Berkeley asked whether the accounts published respecting the French and Prussian imposts on English goods were true.

Sir R. Peel deeply regretted to say, not merely on account of commercial considerations, that the accounts which had been published respecting the French ordonnance were true. The accounts which Ministers had received were brief; but they contained the same information as that which, he believed, had appeared in the public newspapers. With regard to the German League, there had been no opportunity of raising the duty upon mixed cotton wool, and he trusted that it would not be raised. After some farther conversation on the extent and character of the changes in the tariff, the question was put that the bill do pass, which was carried amid loud cheering from all parts of the House.

On the motion for the third reading of the British Possessions Abroad Bill, Mr. Labouchere brought up the clause, of which he had given notice, to allow the free importation of flour from the United States to Canada.—Mr. Gladstone opposed the clause, which was negatived on a division, the numbers being; for the clause, 83; against it, 160; majority against the clause. 77.

Mr. M. Gibson moved that the clause which subjected sugar refined in this country in bond and exported to the colonies to an *ad valorem* duty of 10 per cent. be struck out.—Mr. Gladstone opposed the motion, and the House divided; for the clause, 105; against it, 36; majority, 69.—The bill then passed.

The Stock in Trade Bill and the District Courts and Prisons Bill passed through committee. A select committee to inquire into the allegations as to the management of the poor in the Keightley Union contained in the report of Sir J. Walsham and Mr. Mott, was agreed to on the motion of Sir C. Napier.

Wednesday.—After the presentation of petitions, Sir R. Peel, in answer to Dr. Bowring, said that the five powers were unanimous in opinion as to the policy to be pursued by the Turkish Government in Syria, and were labouring concurrently to induce the Porte to carry out their views.

Mr. T. Duncombe, alluding to the inconvenience occasioned in the country by the proclamation relative to the gold coinage, exhibited a copy of a handbill, circulated by the guardians of the poor, in the city of Norwich, announcing that, in consequence of the scarcity of silver, they were issuing tickets of the nominal value of 1*s*., which they received back again, in amounts of not less than 10*s*., which he said he supposed they did that they might be enabled to pay away their light half-sovereigns.—The Chancellor of the Exchequer said he had not heard of this matter before. The Mint was coining silver, and every exertion was making to remedy the inconvenience felt by the public.

Mr. Roebuck brought up a report from his Committee, praying the sanction of the House for the exclusion of Members as well as strangers during the examination of witnesses. This prayer he supported, on the ground that it was the way to get at the truth in the most complete manner, with the least pain to individuals.—Major Beresford objected to this secret mode of inquiry, which was, he said, analogous to the unconstitutional procedure of the Star Chamber, and by a curious coincidence, the committee assembled in that very apartment where the Star Chamber had held its sittings. For himself, publicly accused as he had been, he asked for a public investigation.—Col. Sibthorp expressed his strong disapprobation of the committee, its constitution, and its objects, and his resolution to persevere in his announced motion for its dissolution. He desired to move as an amendment, that the order appointing the committee should be discharged.—Lord J. Russell was satisfied that the committee had every disposition to do justice, and expressed a hope that Members would abstain from claiming their privilege of being present during their proceedings.—Sir R. Peel must oppose Col. Sibthorp's amendment. He did not regret having voted for the committee, and doubted whether a refusal of inquiry would not have been very injurious to the character of the House. He was glad to see that the committee were pursuing their investigations with a view to public advantage, and not for individual punishment. He was, however, opposed to giving the committee any additional powers, and hoped they would not ask for what would constitute them specially a secret committee.—Sir R. H. Inglis claimed for all parties implicated in these inquiries the right of being present, irrespective of the right of every Member of the House to be present at all committees, except secret ones. After some further discussion, in which several Members joined, Mr. Roebuck said that the committee would act on the suggestion thrown out by Lord J. Russell, and recommended by Sir R. Peel, of leaving it to the good sense and taste of Members to abstain from being present. A division then took place, when Col. Sibthorp's amendment was rejected by 177 to 55.

Mr. Roebuck then moved that Mr A. B. Cochrane, one of the members for Bridport, be ordered to attend the committee on Monday next. Mr. Cochrane repeated, that every part of the statement he had formerly made in the House was true. His reason for declining to answer was, that indictments were pending against him, upon which his testimony before the Committee might be given in evidence. The committee intended to examine him before they examined Mr Warburton, thus leaving him no opportunity of replying to Mr. Warburton's statements. He objected also to the secret procedure of the committee, but if the House willed that he should attend it, he would bow to its decision, but he would produce no documents and answer no questions which would in the remotest degree implicate any one of his constituents. Mr. Roebuck interposed, stating that if Mr Cochrane pleased, the committee would examine Mr. Warburton not only before him, but in his presence.—Mr. Mitchell intimated that he also would attend the committee, but would give no information tending to criminate.—Sir R. Peel reminded the House that Mr. Cochrane had expressed great anxiety for an investigation, and he did not, therefore, understand his present objection to the committee of inquiry. He referred to the Speaker for an opinion as to any precedent for an order of the House, requiring a member to attend a committee.—The Speaker cited several cases in which the House had directed that members should be examined before committees if they so thought fit; but said he had sought in vain for precedents of a peremptory order to a member to submit to be so examined.—Sir R. Peel suggested the appointment of a committee to search for precedents.—Lord J. Russell proposed the adjournment of the debate, with the view of getting out of the difficulty, by giving time for consideration, or of allowing the members concerned voluntarily to attend the committee. This motion was ultimately agreed to, and a committee to search into precedents was appointed, on the motion of Sir R. Peel.

On the motion of Mr. Mackinnon, the order of the day for the motion to issue a new writ for Southampton was postponed for a fortnight. The discussion on the second reading of the Sudbury Disfranchisement Bill just commenced, when the House was counted out.

Thursday.—The Lords' Amendments to the North American Colonisation Association of Ireland Bill were agreed to, and the Bill passed The London Bridge Approaches Bill, the Toxteth Park Paving and Sewerage Bill, and the Leeds Burial Grounds Bill, were read a third time and passed.

Sir R. Peel presented copies of the ratified treaties between this country and Texas; at the same time observing, that these treaties were suggested and concluded with the republic of Texas by the late Government, and acting upon the general principle that is always followed on occasions of this nature, the present Government, seeing that the agents engaged in the negotiations of these treaties had in no degree exceeded their powers or instructions, have felt it to be their duty to recommend their ratification.

Sir R Peel, in reply to Mr. O'Connell, said that the latest accounts he had received from Mexico stated the blockade not to be an effectual or *bonâ fide* blockade, and he entertained some hope, although he could not say he had any specific grounds for doing so, that the Government of Texas would not persist in carrying on the blockade.

Lord Eliot, in answer to Col. Verner, stated that Government do not intend this year to increase the grant to Maynooth.—Sir R. Peel said he would take that opportunity of warning hon. Members to receive with distrust those accounts of the Irish Government which are published in the Irish papers. He had seen accounts of dissensions and other matters, which but for those papers, he should never have known. He would therefore warn hon. Members not to draw conclusions from such assertions however positive.—Sir R. Peel, in reply to a question from Mr. Wallace, stated that it was not the intention of Government to alter the standard of value in this country, or to propose the adoption of a silver standard.

Lord Mahon called the attention of the House to a petition from Mr. S. Knowles, Mr. D. Jerrold, and others, complaining of the present state of the law with respect to the drama. He pointed out the evils arising out of the present state of things, not only to dramatic authors, but to the public generally. With reference to the monopoly possessed by the two great theatres, Drury-lane and Covent-garden, he contended that it was not profitable to those who possessed it, and he would rather vest the appointment of the licenser in the Government than in the Lord Chamberlain. He concluded by moving for copies of any communications addressed upon the subject of the drama to the Secretary of State for the Home Department in the course of the present year.—Mr. G. Knight seconded the motion.—Sir J. Graham confessed that he had not turned his attention to the subject, and was not prepared to bring in any measure on it; but he would give his best consideration to any measure which might be brought forward next session by the noble Lord or any other Member. The motion was then agreed to.

Sir R. Peel, in reply to Mr. M. Milnes, said that he had not received any intimation of an intention on the part of Prussia to propose to the Zoll-verein an increase of duty on the import in Germany of British productions.

Mr. G. Knight moved for copies of certain ukases issued by the Russian Government in 1841, relating to the administration o Poland. He reviewed the conduct of Russia towards Poland, regretting the loss of its nationality, and expressed his conviction that it was not for the interest of Russia itself, so to act towards that conquered nation.—Sir F. Burdett seconded the motion; and after a short discussion, in which Messrs. Hume, M Milnes, P. M. Stewart, and Sir R. Inglis joined, Sir R. Peel said that an exactly analogous motion was made in 1832, which was unanimously agreed to, and he could not think of taking an opposite course now. He was glad that no harsh or offensive expressions had been introduced into the debate, for the Russian Government had given unequivocal proofs of its friendly feeling towards this country. Still, speaking as a public man, he could not say that the policy of Russia towards Poland had been wise; for harsh and unjust treatment of a gallant people was neither safe nor wise. But it would also be delusive towards the Poles, to hold out any expectation that we could interfere in their behalf; though he did hope that the Emperor of Russia would ameliorate the condition of that people, by adopting a policy which would redound to his own honour.—After a few remarks from some other Members, the motion was agreed to.

Mr. Cowper called the attention of the House to the state of the Greenwich Hospital schools, which he said were deficiently supplied both in religious and civil instruction; and moved a resolution that it is expedient that these schools should be open at all times to the visits of inspectors appointed by the committee of Privy Council on Education, and that reports of such inspection should be annually laid upon the table of the House.—Mr. S. Herbert, Secretary to the Admiralty, admitted the correctness of Mr. Cowper's description of what is called the lower school, the condition of which, he said, was disgraceful. The upper school, however, was in a better condition, and had sent out boys who were a credit to the service. The Admiralty were directing their attention to the subject, and arrangements were making to render the system of education as efficient as possible.—Some conversation followed, after which the motion was withdrawn.—Lord Clements moved for a select committee to inquire into the administration of the grand jury laws in the county of Donegal. He entered on a variety of details with a view to show that gross fraud and other irregularities prevailed in Donegal.—Col. Conolly said that Lord Clements was ignorant of all he denounced. He gave an explanation of the circumstances which had been called in question: and, after some discussion, the motion was negatived without a division.

Friday.—On the motion of Lord Stanley, the New South Wales and Van Diemen's Land Bill was read a third time and passed. Lord J. Russell's Bribery at Elections Bill was referred to a select committee.—Mr. Wallack moved a series of resolutions affirming the existence of severe distress, and moving an address to her Majesty that Parliament be not prorogued until an effective remedy be provided for the relief of the country.—Mr. Attwood supported the motion.—A long discussion ensued, in which Lord J. Russell, as well as Sir J. Graham and Sir R. Peel, opposed the resolutions. The debate was at length adjourned to Monday.—The Mines and Collieries Bill was read a third time, after several unsuccessful divisions in order to obtain an adjournment of the question.—Mr. Gladstone brought in a Bill regulating linen manufactures in Ireland; which was read a first and second time, and passed through committee.

CITY.

Money Market, Friday.—Consols for the account advanced to 91¼ to ⅜; 3-per Cents. Reduced, 91½ to ⅝; Exchequer-bills, 2d. issue, 41s. to 43s. premium; ditto, 2¼d. issue, 45s. to 47s. prem.; and Bank Stock, 166½ to 167½.

Metropolis and its Vicinity.

Fêtes to Her Majesty.—On Tuesday, the Duke and Duchess of Buccleuch gave another brilliant *fête* at their mansion, Whitehall, to the Queen and Prince Albert. The King and Queen of the Belgians, the Duchesses of Kent and Gloucester, Duke and Duchess of Cambridge, Prince George and Princesses Augusta and Mary of Cambridge, and Prince Edward of Saxe Weimar, together with a select circle, composed of the foreign ministers and the leading nobility in town, were also invited to the entertainment. Her Majesty arrived shortly before 5 o'clock, and was loudly cheered by a crowd of persons who had assembled in the neighbourhood. The Queen, who was followed by the other royal guests and a numerous suite, was met at the foot of the grand staircase by the Duke and Duchess of Buccleuch, and her Majesty having accepted the arm of the noble host, proceeded through the hall to the state apartments, and thence to a pavilion erected on the terrace next the Thames, where the remainder of the company were already assembled. The whole party then took their seats, and witnessed the boat-race, by selected watermen, to whom the Duke of Buccleuch had offered a prize of 60 sovereigns for the encouragement of the watermen of the river The river facing the Duke's mansion, was crowded by wherries, yachts, and craft of every description, and Westminster-bridge, and every part of the opposite shore which could command a view of the house and gardens, were thronged by persons of all classes anxious to obtain a sight of the proceedings. During the whole time the band of the Coldstream Guards played selections from some favourite operas. The entertainment that followed was of a costly and superior description. The Royal table was laid in the principal saloon, whilst other apartments were appropriated for the general company. The party began to break up about seven, when the Queen and Prince Albert took their departure, and were again loudly cheered by the people assembled in Whitehall.—On Thursday, the Duchess of Gloucester gave an entertainment to her Majesty at her residence, Gloucester House. The King and Queen of the Belgians, several members of the Royal family, and a select circle of distinguished visitors, were invited to meet her Majesty. The Queen, accompanied by Prince Albert, arrived at Gloucester House about ten o'clock, where her Majesty was received by the Duchess and conducted to the state-rooms, where a succession of tableaux was represented by a party of the nobility and gentry, in an adjoining room, in the following order:—Tableau 1. Lalla Rookh. 2. Marino Faliero before the Council of Ten. 3. Group from Pinelli. 4. Bride of Lammermoor. 5. Scene from Sir Charles Grandison. 6. Vice. 7. Novice. Finale, "God save the Queen." The whole entertainment was of a brilliant description, and the Queen, who did not leave until a late hour, was loudly cheered both on her arrival and departure.

Death of the Earl of Leicester.—This venerable nobleman died at his seat, Longford Hall, Derbyshire, on Thursday last, the 30th ult. For nearly 70 years he was before the public, not only as a politician, but as the first commoner in England, and the first of English agriculturists As Mr. Coke of Norfolk, he is said to have been the first English gentleman of large estate and fortune who devoted his entire attention to the improvement of agriculture, and thereby induced others of rank and influence to adopt it as their pursuit. Lord Leicester's experiments with live stock are too well known to require observation: from their successful results Norfolk has become the centre of attraction for drovers from all parts of the kingdom. His Lordship was born May 4, 1752, and was consequently in his 91st year.

East India House.—A special court of the proprietors of the East India Company, adjourned from last week, was held on Monday, to take into further consideration the motion of Mr. D. Salomons, relative to the war in Affghanistan. Sir J. L. Lushington took the chair. Mr. Lewis resumed the debate, and in a speech of considerable length maintained that the expenses of the war, which he said was European in its origin, should be met by the British Government and not be thrown upon the East India Company or the people of India. He concluded by saying that he trusted success would attend the British forces in Affghanistan, but let mercy and not revenge prevail. We should recollect that we had no right to wage war in Affghanistan; that we entered that country without any just cause, and that it did not become us to have recourse to a revengeful and cruel spirit. He trusted we should quit that country if successful, and leave the people as God had made them—the best, safest, and the strongest barrier that could be raised against Russian influence. Messrs. Fielder and Thompson followed on the same side, and maintained that the Indian Government ought not to be called on to contribute anything to the expenses of the war. The chairman said it afforded him great satisfaction that the present question had been brought before the Court of Proprietors, as it would assist the Directors in getting the just claims due to India performed by the British Parliament. The question under discussion was, he would admit, one of an European character: but it was not altogether so, but was mixed up with an Indian character. He would ask the mover of the resolution under discussion, to allow a slight alteration to be made in it, to the effect that a portion, but not the whole of the expense of the war, ought to be defrayed by the British Government; and if such an alteration were made, he thought there would be a much better chance of their gaining their object. He was most anxious that the court should come to an unanimous vote on the present occasion. After a few observations from Mr. Weeding, Mr. D. Salomons consented to the alteration in his resolution suggested by the chairman, which, after a long discussion and a division, was carried, the numbers being, for the chairman's alteration 23, against it 20, majority 3.

Entertainment to Sir R. Peel.—On Wednesday, the Goldsmiths' Company gave an entertainment in honour of Sir R. Peel, as first Minister of the Crown. Several Cabinet Ministers and a select circle of distinguished individuals were invited to meet the Right Hon. Baronet, who was loudly cheered on his arrival by a number of persons assembled in the neighbouring streets as well as the company in the hall. After dinner, the usual loyal toasts were given, when the Prime Warden proposed the health of Sir R. Peel, and expressed a hope that he might long continue to direct the affairs of the country. Sir R. Peel returned thanks and said, he felt that he was under a deep obligation to that company for the great and uniform kindness which he had met with at their hands. He knew of no institution which was more entitled to their respect, admiration, and support. He said he was sure he need not tell them that Ministers were attempting to perform the duties which they owe to the Crown and to the country to the best of their abilities, and that to them the highest reward would be an assurance of approbation and support from such a society as that which he now had the honour of addressing; and if they entertained a hope that they should be enabled to relieve the country from all her distresses—and of this they did entertain a confident hope—it was founded upon the belief that they should be supported and upheld by the esteem, the approbation, and the sympathy of the classes of which that society was composed. A number of other toasts were given, among which were the Church, acknowledged by the Bishop of Llandaff; the Army and Navy, respectively acknowledged by Sir H. Hardinge and the Earl of Haddington, first Lord of the Admiralty, and the House of Commons by Sir J. Graham. Sir R. Peel left at an early hour, and the company soon after broke up. The Rt. Hon. Baronet was again loudly cheered on his departure by a large concourse of persons, who crowded the approaches to the Hall.

Public Meetings.—On Wednesday, a public meeting of planters, merchants, and others interested in the colony of Jamaica, was held, Lord St. Vincent in the chair, for the purpose of offering to Sir C. Metcalf their assurance of their participation in the sentiments of gratitude and admiration expressed by the colonists for the manner in which he has governed Jamaica, and also of their regret at his resignation. The meeting was numerously attended. Mr. Burge addressed the assembly at some length, and eulogised the policy pursued by Sir C. Metcalf in his administration of the Island of Jamaica, which he said had united that colony in the strongest bonds of amity with the mother country. He then spoke in praise of Lord J. Russell and the late Government for the uniform support which they gave Sir C. Metcalf in the discharge of his duties, which he said he had undertaken at the instance of the Marquis of Normanby. In conclusion, he moved a resolution, pledging the meeting to present to Sir Charles, upon his arrival in this country, an address expressive of their admiration of the manner in which he administered the government of Jamaica. Sir A. Grant seconded the resolution, which was adopted unanimously. A deputation, consisting of the principal gentlemen in the room, was then appointed to present the address to Sir C. Metcalf upon his arrival.—On Thursday the sixth annual meeting of the South Australian Company was held. Mr. M'Laren, the manager of the company, read the report, from which it appeared that the division of the company into two establishments had taken place in July 1841 (banking and trading), which had caused a reduction of the dividend from six to four per cent. for the next year. From an inventory taken abroad, it was found that the company's property in South Australia amounted to 333,680*l.*, and that the surplus of assets beyond liabilities was reckoned at 57,000*l.* The total revenue for the year ending 1841 was 17,289*l.* 10*s.* 3*d.*, and the balance of the profit and loss account was 9,121*l.* 15*s.* 4*d.* After some conversation, the report was adopted. Mr. Davenport observed, that the present Governor of the colony, though he declared he would not draw bills on England, but get a loan in the colony on his arrival, found he was obliged to do the same as was done by the former Governor, namely, draw on the mother country. Several papers were read by the chairman, which showed the colony to be in an improving state, and the crops very abundant.—On Thursday a public meeting of authors and publishers was held, for the purpose of adopting measures to prevent the great and increasing evil of foreign piracy of British literary works, Mr. Thos. N. Longman in the chair. The meeting was numerously attended, and amongst the gentlemen present were Lord W. Lennox, Sir Chas. Morgan, Mr. James, Mr. T. Hood, Mr. Horace Smith, Mr. Buckingham, Mr. Spottiswoode, Mr. Bentley, Mr. Duncan, Mr. Colburn, &c. The chairman opened the business by simply stating the object of the meeting. Mr. James, in a speech of some length, explained the great injustice which literary piracy by foreigners inflicted upon British authors and publishers. He instanced cases wherein works which cost here 1*l.* 11*s.* 6*d.* were sold in America for 1*s.* 2*d.*; and wherein several thousand copies were published abroad, while only one thousand were put in circulation here. He concluded by moving a resolution, asserting that a right of property in literary productions ought to be recognised by all civilised nations. Lord W. Lennox and several other gentlemen moved resolutions condemnatory of foreign literary piracy, as detrimental to authors, publishers, and readers; and it was ultimately resolved that the resolutions adopted should be forwarded to the proper departments of Government, in order to induce Ministers to give the subject their immediate attention, and to adopt means for bringing about such treaties with foreign powers as would enforce a mutual recognition of literary property. A committee was appointed to carry out these resolutions.

Metropolitan Improvements.—It is now decided that several of the narrow and densely-populated streets of the district of Whitechapel are to come down, and a new street is to be immediately constructed. The line is to run from the London Docks through Whitechapel to Spitalfields Church. This new street is expected to prove a great convenience to the merchants and traders of the neighbourhood.

The Shrievalty.—A common hall has been held for the purpose of electing the sheriffs for the ensuing year. The Common Sergeant first read the names of the several gentlemen who were eligible to serve the office of sheriff, and a show of hands being taken, the Sheriffs declared them to be in favour of Mr. Alderman Hooper and Jeremiah Pilcher, Esq., citizen and haberdasher, who were consequently declared elected to serve the office of Sheriffs for the ensuing year.

The Nelson Monument.—On Saturday, the block of Granton stone, presented by the Duke of Buccleuch for the statue of Lord Nelson, which is intended to stand on the summit of the column now erecting in Trafalgar-square, was landed from the river at Westminster, in the presence of a large number of spectators, and conveyed by twenty-two horses through Parliament-street and Whitehall to Trafalgar-square. Its elevation, however, to the top of the column still remains to be effected. It is stated to weigh thirty tons, and has been reduced from a block weighing forty-five tons; it is of the description known as "Craigleith," of the liver rock, and in point of durability equal to granite. The entire height of the column will, it is said, be about that of the spire of St. Martin's church.

King's College.—On Thursday the distribution of the prizes among the successful competitors in the various classes at King's College took place in the theatre of that establishment. The Archbishop of Canterbury presided and delivered the prizes. There were also present the Bishops of London, Winchester, and Llandaff; Lords Bexley, Monteagle, Radstock, Sir R. H. Inglis, together with a considerable number of the metropolitan clergy, and many friends of the institution. After an address from the Rev. J. Lonsdale, the Principal of the College, the Archbishop distributed the prizes, after which the various Professors of the College handed to his Grace the list of those pupils who had obtained the prizes in each of the other classes, and gave a satisfactory account of the industry and good conduct, not only of the prizemen themselves, but of all the students under their instruction. The prizes consisted of valuable books.

Newgate.—At a recent Court of Aldermen, held for the dispatch of public business, the subject of the admission of the public into the Chapel in Newgate during service on the "condemned sermon" day, a practice which our readers will remember has lately been animadverted on in both Houses of Parliament, was brought before the meeting. After some discussion, a resolution was passed that the public should in future be excluded from the Chapel on all occasions; and a resolution was also adopted referring to the gaol committee to consider whether any and what alterations, if any, ought to be made in the regulations for the admission of strangers on days of the execution of criminals.

Fires.—On Thursday a serious fire occurred in Bermondsey, attended with great destruction of property. The fire broke out in the eastern extremity of that district, which is very crowded and densely populated; the northern side consisting almost entirely of large warehouses and corn granaries adjoining the river; and the southern being chiefly occupied by shops. The fire commenced on the premises of Mr. Ramsey, painter and glazier, 13, Bermondsey Wall, about three in the morning, and was discovered by a policeman passing by. Numerous engines were soon on the spot, and every exertion made to subdue the flames, but without any success for many hours. There appears to have been at first a deficiency in the supply of water; and a strong wind blowing at the time, caused the flames to spread with great rapidity. The fire, however, was effectually got under about one o'clock; by which time 25 houses had been burnt down, and property to the amount of 15,000*l.* destroyed.

Mortality in the Metropolis.—The following are the number of deaths that have occurred in the Metropolis from all causes, registered in the week ending Saturday, the 18th ult.:—Males, 380; females, 372; total, 752. Weekly average in 1838-9-40-1, males, 467; females, 445; total, 912.

Chatham.—On Saturday, a naval operation of an unusual character was carried into effect in this dockyard, which excited considerable interest among a great number of spectators. The Penelope frigate, 46, had been cut in half for the purpose of converting her into a steam-ship, and the process of separating the two portions was now performed. Two large booths were erected on each side of the frigate, and were filled by naval and military officers, and upwards of 1000 persons altogether witnessed the operation. Three ropes were fastened to the gunwale of the ship from three capstans, which were fixed in the ground facing the dock, and which were worked up by windlasses by nearly 200 convicts. On the arrival of the Rt. Hon. T. Cory, one of the Lords of the Admiralty, together with Sir W. Symonds, the surveyor, and Capt. R. Brandreth, architect of the navy, and other officers, the master builder, Mr. Fincham, gave direction for all hands to work. The fore part of the vessel was then gently moved up the dock, until having been brought up to the mark allotted, a space of 62 feet was left between the two parts of the ship, which will admit of her being lengthened to about 190 feet. She is to have in her two engines of 650 horse power, and to have engine room for 600 tons of fuel; complete stowage under hatches for 1000 troops, with four months' stores and provisions, exclusive of a crew of about 450 men, and is to be armed with 20 guns of the heaviest calibre, besides carronades. She is expected, when complete, to be the finest war-steamer in the service.

Provincial News.

The accounts received from different parts of the country represent the condition of the labouring classes generally, but more particularly in the manufacturing districts and towns in the north of England, as seriously distressed. A deputation from the country, at present holding its meetings in London, for the purpose of receiving accounts of the distress prevailing among the working classes from all the different towns and districts throughout the empire, have published some startling statements on this subject, from which the following details are selected:—It is stated that in Leeds nearly 20,000, or one fourth of the population, are subsisting on the poor-rates. In Newcastle-upon-Tyne the labouring part of the population is also represented as suffering greatly from want of employment; in consequence of which a meeting has lately been convened there, at which it was officially stated that 11,000 of the population were receiving parish relief. In Wolverhampton the number of persons out of employment is also represented as very great. It is said that in Accrington, Lancashire, out of a population of 9,000 persons, not more than 100 are fully employed. In Marsden, near Burnley, out of 5,000 persons, 2,000 have become paupers, and most of the remaining 3,000 are said to be nearly reduced to the same state. The poor's-rate is 1s. in the pound per month. The poor's-rate in the township of Great Bolton in 1836-37 was 3,951*l.*; 1839-40, 8,950*l.*; 1840-41, 12,750*l.*; 1841-42, 16,740*l.*; and for the next six months not less than 10,000*l.*, it is stated, will be wanted. To prove the depreciation in the value of the property of Bolton, it is mentioned that out of the rated rental of 86,000*l.* a year, only 36,000*l.* is paying to the poor-rates, the remainder being either empty property, or the occupiers unable to pay the rates. In Stockport many thousands are represented as being entirely without the means of living, except from charity. Last year the poor's-rate was 6*s.* in the pound, and this year it is said that 10*s.* will be required. The guardians are 5,000*l.* in debt; and, as a proof of the amount of unoccupied property, and the depreciation in the value of that which is occupied, it is stated that a rate of 2*s.* in the pound now does not yield more than a rate of 4*d.* produced four years since. From Prescott and Saddleworth the accounts are equally distressing. The poor's-rate in the township of Sheffield, in an average quarter of 1836 amounted to 162*l.*; the quarter ending June, 1839, to 541*l.*; in 1841, to 1,836*l.*; and in 1842, to 4,253*l.* In Nottingham, the poor's-rate for the year ending March, 1841, was 4,963*l.* 16*s.* 7*d.*; in March, 1842, it was 7,277*l.* 14*s.* 6*d.*; being an increase in one year of 2,313*l.* 17*s.* 11*d.* The number of persons receiving parish relief in 1841, was 4,453; in 1842, it was 7,938; shewing an increase in one year of 3,488. In the midland counties, where the hosiery trade is carried on, more than one third of the population are described as unemployed. The accounts from Leicester state that one house in the glove trade in that city paid 500*l.* weekly two months ago, whereas they now pay only 200*l.*, thus employing about 600 persons fewer than before; and other houses are said to have diminished the number of their workmen in about the same proportion. The deputation conclude their statement by saying, that details of a similar nature might be given of the distress prevailing in a great many other towns and districts in Scotland as well as England, and that they are in possession of facts of an equally painful character from almost every part of the country.

Arundel.—We understand that it is in contemplation to carry into effect a variety of improvements at the Castle gardens, and that the Duke of Norfolk has determined on making a new garden, of a superior description. The time for carrying the proposed plan into effect does not seem to have been yet decided on by his Grace; but it is thought that it will not be later than next spring.

Berwick.—The local papers inform us that the commissioners in the bankruptcy of the Tweed Banking Company, noticed by us in former numbers, are making arrangements for the payment of a first dividend to the creditors—namely, a dividend of 5*s.* in the pound to the creditors of the joint estate of Messrs. Batson, Wilson, and Langhorn (the partners in the late firm); a dividend of 3*s.* in the pound to the separate creditors of Mr. Batson; and a dividend of 5*s.* in the pound to the separate creditors of Mr. Wilson. No dividend has yet been declared upon the separate estate of Mr. Langhorn, in consequence, it is said, of the Saving's Bank of this town urging a preferable claim, amounting to the full value of the assets.

Bradford.—Considerable alarm has been created throughout the whole West Riding, by an announcement that it is the intention of Prussia to impose heavy duties on all worsted and woollen goods imported into the states included in the Prussian League. This determination on the part of Prussia, occurring just at the time when France and the United States have also signified their intention to increase the customs' duties on all manufactured goods imported into those countries, will, it is feared, occasion very serious injury to English manufactures generally, but particularly to the worsted stuff trade. It appears that as soon as the intention of Prussia to propose an enhancement of the duties was known, a circular was issued by a house largely engaged in the German trade stating the fact, and requesting the principal manufacturers and merchants in the worsted stuff trade in the West riding, to meet at Bradford, in order to consider what steps ought to be taken. A meeting has accordingly been held in this town, when a committee was formed to arrange evidence and facts to be laid before Ministers; and a deputation is to be appointed to wait upon the Premier. The declared value of woollen and worsted exports to Germany, exclusive of yarns, was 564,740*l.* in 1821, 424,992*l.* in 1831, and 883,878*l.* in 1841. It will be seen, under our Parliamentary intelligence, that Sir R. Peel stated on Tuesday night that, with regard to the German League, there had been no opportunity of raising the duty upon mixed cotton wool, and he trusted that it would not be raised.

Bristol.—The adjourned inquest on the policeman killed in this city, as stated in our last, by a party of Irishmen, has, after a lengthened investigation, terminated by the jury returning a verdict of "Wilful murder" against Charles Dwyer, and against two others as accessories. The remaining prisoners have been acquitted; but they are summoned to appear before the magistrates to answer a charge of assaulting the police in execution of their duty.

Cambridge.—The festival in honour of the installation of the Duke of Northumberland as Chancellor of this University, which will commence this day, has attracted a large number of distinguished persons, so that the town is said to be more crowded than has ever been known. The preparations made for the reception of visitors have been on an extensive scale, and the coming week is expected to be one of great gaiety.

Carlisle.—A local paper informs us that on Tuesday, the 22d ult., the shock of an earthquake was distinctly felt at Cartmel. A considerable change had taken place in the atmosphere, the temperature having suddenly fallen 15 degrees; the air was filled with clouds of a dark red, and it was supposed that there was about to be a fall of rain. Between ten and eleven at night a strange rumbling noise was heard under ground, which made several houses shake, after which the noise died away, and was not repeated. A Westmoreland paper contains a similar statement of a shock felt in that neighbourhood.

Chelmsford.—Since the recent proclamation relative to the gold coin, public attention has chiefly been drawn to the inconvenience occasioned by it in London; but the consequences resulting from it to the provincial towns seem to have been still more serious. Accounts from this town state that the banks are crowded with applicants for a change of gold, who find a difficulty in getting anything but paper money, or other sovereigns, which in some instances, it is said, have also proved to be light. It is added, that the manufacturers, agriculturists, and relieving officers of the poor have been compelled to offer a premium for such quantities of silver as they require, this being compensated for by a deduction from the wages of the labourer. Even for a sovereign of full value it is difficult to get change in silver. Altogether, it is stated, the present excitement in this town has been equal to that during the panic in 1826.

Hastings.—The Belvidere Temple on Harting Hill Up Park, near this town, the seat of Sir Harry Featherstone, was destroyed by fire on Monday night. This building, which from its commanding situation served both as a sea and land mark, was discovered to be in flames at midnight; and although immediate assistance was procured, it was too late to save the temple, which was burnt to the ground. It appears that Sir Harry Featherstone has for some years opened his park and grounds at this season of the year to the neighbourhood for promenade and gipsy parties; and it was at first supposed that one of these parties had omitted to put out the fire used by them in the temple, and that some sparks had communicated with the woodwork. An investigation, however, is now going on to ascertain the real cause of the fire, and it is said there are grounds for supposing that its origin was not accidental.

Liverpool.—The usual yearly comparative statement of the rates and duties received in this port in the years ending 24th June, 1841 and 1842, has been published, from which it appears that the total income of the trust was, in 1842, 198,782*l.*; in 1841, 195,251*l.*; increase in 1842, 3,520*l.* The duties on tonnage were, in 1842, 93,291*l.*; in 1841, 91,755*l.*; increase in 1842, 1,536*l.* The duties on goods were, in 1842, 83,871*l.*; in 1841, 83,750*l*; increase in 1842, 120*l.* The number of vessels which entered the docks in 1842, was 16,458; in 1841, 16,108; increase 350. The tonnage amounted in 1842 to 2,425,319; in 1841, 2,425,461; decrease, 142.

Lymington.—It is announced that the long-established mail between this town and Southampton will be taken off the road on the 10th inst., and that the country post-bags will after that period be conveyed with the London mail-bags. This will give the inhabitants of this town the advantage of two hours longer to answer their western correspondence; and the cross post letters will also reach this town two hours earlier in the morning than they do at present.

Manchester.—On Saturday the British Association for the Advancement of Science resumed its sittings, the first of which was noticed in our last; and the seven sections of science met at the usual hour, and were attended numerously. The Marquis of Northampton, Lord F. Egerton, Professor Bessel, and a number of other distinguished individuals attended; but the section broke up at an early hour, and nothing of importance occurred. The American Minister, Mr, Everett, had an address presented to him on Monday, said to be from the merchants, manufacturers, and traders of Lancashire, expressing their wish for the establishment of perfectly free relations with the United States. A dinner was given in the evening to the members of the Association, Lord F. Egerton in the chair. After dinner a number of toasts were proposed; none of which, however, require particular notice, with the exception of the health of the American Minister, Mr. Everett. The chairman, in proposing it, among other complimentary expressions, said he was sure that England would consider she could not have had a higher compliment paid to her by the United States than in sending Mr. Everett as her representative. Mr. Everett, in returning thanks, said he should be more or less than man if he did not feel considerable embarrassment at the manner in which the toast had been received. He was, however, relieved by the conviction that it was meant to reach far beyond himself —across the Atlantic—and that it was meant for the people whom he had the honour to represent. Republicans as they were, there was a much greater affinity between America and Great Britain, politically speaking, than between any of the European monarchies, or any two nations on the face of the earth. With the Americans, as with the British, liberty was enshrined in the constitution. His Excellency concluded by expressing the happiness that he should feel in being instrumental in cementing the best understanding between England and the United States. At the meeting on Monday, the city of Cork was, after a long and animated discussion, determined on as the place of meeting for the Association next year. On the subsequent days of the week, the various sections were well attended, and numerous communications, which our space does not allow us to notice, were read.

Preston.—The local papers inform us that during the past week the colliers in the employ of the Earl of Balcarras have received notice that the working of females in the colliery will be discontinued, as soon as the necessary arrangements can be made for that purpose.

Winchester.—It is stated that the authorities contemplate raising a new regiment, to be designated the 100th Foot, and that this city has been named as the place where it is to be organised. The arrangements for this addition to her Majesty's land forces are expected to be completed by the end of next month.

Railways.—The following are the receipts of the principal Railways during the last week:—Blackwall, 4,061*l.*; Greenwich, 752*l.*; Brighton, 4,061*l.*; Eastern Counties, 1,012*l.*; South Western, 7,237*l.*; Great Western, 14,534*l*; London and Birmingham, 17,713*l.*; Birmingham and Derby, 1,279*l.*; Birmingham and Gloucester, 1,947*l.*; Manchester and Birmingham, 490*l.*; Manchester and Leeds, 4,505*l.*; Hull and Selby, 931*l.*; North Midland, 4,362*l.*; Grand Junction, 9,188*l.*; Midland Counties, 2,870*l.*; Great North of England, 1,239*l.*; York and North Midland, 1,662*l.*; Edinburgh and Glasgow, 2,122*l.*—On Tuesday a special general meeting of the shareholders of the London and Blackwall Railway was held for the purpose of getting their sanction for raising 66,000*l.* more capital. The chairman stated that the present capital was 800,000*l.* by shares, and 200,000*l.* on debentures, in addition to which they now required 66,000*l.*, about 20,000*l.* of which would be required for the purposes of the railway, and the remainder to settle liabilities. Against this sum was about 70,000*l.* worth of property unsold. He was still of opinion that the total cost of the concern would not exceed 1,025,000*l.* With regard to the rumours current about steam-boats, he stated that not a single farthing of their cost had been taken from the funds, though the directors of the company had aided a speculation which they thought to the interests of the proprietors. Mr. Serg. Gazelee asked a number of questions, and concluded by moving that the question be adjourned till the next meeting in Aug. The chairman replied that the reason why the arches did not realise 8,000*l.* a year was because they had not been constructed for houses, as originally intended; that the steam-boat wharfage was in one week 150*l.*; and that, up to March, 1841, there was no boat running between Blackwall and Gravesend: but in the April following 10,000 passengers landed at Brunswick-wharf, in May 26,000, and in June 40,000; whilst in March, 1842, the number was 29,000, in May 57,000, and for this month it was reckoned at 70,000. The adoption of the motion for raising the sum required was then moved, and carried unanimously.

IRELAND.

Dublin.—It is stated that the Lord Lieutenant has deferred his departure from this country for Baden till the 16th inst., and that Mr. Magenis, the private secretary, will accompany his Excellency. It is added, that the Countess De Grey will remain at the Viceregal Lodge until the return of his Excellency, and that one of her ladyship's daughters, Lady Mary Vyner, is expected to arrive shortly at the Park, accompanied by her family, on a short visit.—A Privy Council has been held at the Castle, the Lord Lieutenant presiding; at which it was ordered that a circular be issued to the magistrates of Ulster, stating that it is not the Lord Lieutenant's intention to issue a proclamation against the breach of the statute for suppressing illegal processions, which it appears has usually been done by former Governments about this time, in reference to the anniversary of the Battle of the Boyne, his Excellency being desirous to make it known that his abstaining from so doing arises from a confident hope and expectation that a spirit of obedience to the laws may lead to a discontinuance of processions of every kind, which can only tend to excite party and religious animosity, and which have been so repeatedly attended with consequences of a disastrous character.—The papers publish a statement of the effective force of police employed in Ireland on the 1st Jan. 1842, from which it appears that they amounted to 8,931 officers and men, with 287 horses. This includes the inspector general, deputy inspector-general, provincial inspectors, and all other officers. The total expense caused by this force for the year ending the 31st Dec. 1841, amounts to 433,661*l.* 1*s.* 10¼*d.* This includes the stipendiary magistrates. The proportion of this sum, borne on the consolidated fund, was 260,623*l.*; and the proportions borne by the cities and counties, cities and towns, 173,037*l.* 10*s.* 6¼*d.*

Ennis.—The two magistrates and the police-officers who had been on duty on the night of the recent riots in this town, have been suspended by Government, pending the trials connected with the subject, which are about to take place at the assizes at Clare. The local papers state that since the late disturbances, and the committal of the police, the authorities appear to be paralysed, and that there seems to be a complete neglect of local duties by the police force, the consequence of which has been a renewal of the riots, though on a small scale. A few nights since a mob of the lower classes boarded a vessel containing flour, lying adjacent to the quay at the village of Clare. They succeeded in taking away about a dozen bags, when, the tide having receded, they were unable to get through the mud between the quay and the vessel, and consequently all further plunder was abandoned. No steps appear to have been taken by the authorities to prevent or repress these disorders.

Waterford.—This town and neighbourhood was on Sunday thrown into a state of painful excitement, by the report that a serious accident had happened to the Marquis and Marchioness of Waterford. The accounts, which were at first exaggerated, stated that although the Marquis had escaped unhurt, the Marchioness was so seriously injured as to leave little hopes of her recovery. The following, however, are the correct particulars of the unfortunate occurrence:—The Marquis and Marchioness were driving in their phaeton, unattended, with a pair of horses, which his Lordship had purchased only a few days previously for 150 guineas. One of the horses got restive, and becoming unmanageable, in one of his plunges fell and upset the carriage, when the Marquis and Marchioness were thrown out. Her Ladyship's head came in contact with a tree, and it is feared she has received a slight fracture—she has also received some severe contusions on different parts of the body, and a slight wound across the chest. The Marquis fortunately escaped unhurt. Medical attendance was immediately procured, and after having been bled, her Ladyship, according to the latest advices, remained composed, and without fever, though still weak and languid. The escape of Lord Waterford is considered extraordinary, as he fell between the horses while they were most violent. One of the horses has died from the injuries it received, and the other is not expected to survive. Subsequent accounts state that on Tuesday the Marchioness was improving, although still in a condition which creates some uneasiness. The local papers state that the Marquis of Waterford has intimated to his agent, his intention of relinquishing to the whole of his agricultural tenantry one entire year's rent, and that this munificent act was determined on by him immediately after his recent nuptials.

SCOTLAND.

Edinburgh.—At a recent Court of Session held in this city, a process of reduction having been raised by the minority of the presbytery of Strathbogie, for the purpose of setting aside the first decree of suspension and interdict, obtained by the majority of the same presbytery, annulling the sentence of suspension pronounced by the commission of the General Assembly in Dec. 1839, a preliminary defence was put in, to the effect that, before the pursuers of the reduction could be heard in that cause, they were bound in law to pay all the expenses incurred by the other party in obtaining the said decree of suspension and interdict. Lord Cockburn, as ordinary, overruled this objection; and the majority of the presbytery having reclaimed to the second division, a debate took place some time ago. The case came on to be finally advised a few days since, when the court altered the Lord Ordinary's interlocutor, and found the majority of the presbytery entitled to the expenses demanded, and the additional expense occasioned by the discussion in the outer and inner houses. Lord Medwyn held that the majority were entitled to their expenses. Lord Moncreiff was of opinion that it was in the discretion of the court to give such part as they thought fit, on considering the circumstances. Lord Meadowbank concurred with Lord Medwyn, and hence his lordship's opinion became the judgment of the court. The Lord Justice Clerk retired before the opinions were given.

Glasgow.—A case which created some interest came lately before the Commissioners for Assessed Taxes in this city, being an appeal by a gentleman against a charge for armorial bearings. On being examined, the appellant disclaimed the use of any armorial bearings whatever; he said he had no armorial bearings on his carriage, none on his plate, and, in short, did not wear them in any way whatever. He was asked if he had no signet, ring, or stamp, on which armorial bearings were engraved? and replied that, at a former period, he had used something of the kind, but that latterly he had thrown it aside into a box, and did not now make any use of it whatever. The appellant was here shown a letter, written by himself, complaining of the charge against which he had now appealed, and the authenticity of which he admitted. The wax with which this letter was sealed, bearing the impress of armorial bearings, was then shown to the commissioners; and this fact terminated the case by the court giving sentence against the appellant.—The circus of Mr. Cooke, the well-known equestrian, situated on the Green in this city, was entirely destroyed by fire on Monday. The fire was first discovered by a policeman engaged to watch the building, but the flames having already communicated with the hayloft, soon gained such an ascendancy, that it was found impossible to get them under, until the circus was entirely destroyed. All the horses, however, were saved. Not more than a quarter of an hour elapsed from the first discovery of the fire till the building was burnt down. The audience had begun to assemble for the evening's performances when it broke out, nearly 300 being in the gallery at the time, and a few in the pit and boxes, but they all got out without accident. The circus was opened on Saturday for the first time since its re-erection. It appears that Mr. Cooke's circus has several times before been destroyed by fire; once in America, when his whole stud, as well as other property, was consumed.

Paisley.—The distress among the operatives in this town, to which we have referred in former Numbers, continues to increase, and is said to be at present very serious. It appears that the number of unemployed, with their dependents, as taken upon a new inspection, amounts to 8,050, who for some weeks past have been supported with funds intrusted to their charge by commissioners from London. It is however stated that Mr. Twistleton, one of the commissioners, has intimated that his connexion with the Paisley relief committee has now ceased, and that he has been appointed by the relief committee in London to organize a new committee to take charge of the employment. In consequence of this change a committee of 14 gentlemen has been appointed.

THEATRICALS.

ITALIAN OPERA.—A scene of great tumult took place at this theatre on Saturday, in consequence of the displeasure of the audience at an unexpected change in the performances. The opera announced for that evening was the "Puritani," in which Madame Persiani and M. Ronconi had before appeared with great success. Just before the opening of the doors, however, the public were informed by placards that, owing to Madame Persiani's illness, the opera was necessarily postponed, and "Beatrice di Tenda" substituted in its room; this announcement being accompanied by a regular medical certificate. On the opening of the doors, the theatre was soon filled in every part. The performance did not commence precisely at the time usual on Saturday evenings, which gave occasion to some marks of disapprobation; and at the rising of the curtain, the performers were hissed from the stage, amid great uproar, and calls for the manager. After a short interval, the stage manager made his appearance, and first attempted to address the audience in French; but not being listened to, he made some endeavours to express himself in English, but could not obtain a hearing, the cry being for the manager, Mr. Lumley. Sig. Rubini then came forward, and was received with general cheering; but, when he attempted to address the audience, he also was hissed, and twice compelled to withdraw. The confusion continued till past nine o'clock, when Mr. Lumley presented himself, and endeavoured to pacify the audience by assuring them that Madame Persiani was really so ill that it was impossible for her to appear; and that, not being himself aware of the fact till the middle of the day, he had no alternative but to change the opera, or close the house. This explanation, however, failed to satisfy the audience, and Mr. Lumley was obliged to retire. The noise continued, and attempts were made in vain to begin the music of the opera. Mr. Lumley then came forward a second time, and said that, as a part of the audience seemed determined not to listen to the opera, he had given orders to proceed with the ballet; and that those who desired to have admission another evening should receive tickets for that purpose. This appeared to satisfy the audience, and the ballet of "Alma" was then performed without further disturbance. It is stated that the Queen had intended to be present at the performance, but the account of the tumult within the house, which had been transmitted to the Palace, deterred her Majesty from coming. The King and Queen of the Belgians, the Duchess of Kent, the Duke and Duchess of Cambridge, Princess Augusta, Prince George of Cambridge, were present, with a great number of the nobility and fashionable world. On Tuesday Madame Persiani was so far recovered from her indisposition as to make her appearance as *Elvira*, in the "Puritani." She was well received, and her performances, as well as those of Sig. Rubini, Lablache, and Ronconi, were loudly applauded by a crowded audience. Her Majesty and Prince Albert, with the King and Queen of the Belgians, and several other members of the Royal Family, were present.

Miscellaneous.

Niger Expedition.—On Monday Capt. Walters, of the ship William Canynges, arrived at Bristol from Cape Coast Castle, which he left on the 22d March, bringing some interesting information respecting the Niger expedition. The following is an extract from Capt. Walters' report:—"The William Canynges sailed from the Cape Coast Castle on the 22d March. At Cape Coast Castle were her Majesty's ship Madagascar and the steam-packet Wilberforce attached to the Niger expedition. This vessel (Wilberforce) arrived on the 20th March from the island of Ascension, on her way to Fernando Po, whence she was to proceed, in company with the Soudan steamer, on a second attempt to ascend the Niger. With the exception of one case of dysentery, all on board the Wilberforce were in tolerable health. The Wilberforce brought accounts from the island of Ascension as late as March 10. At that time the island was healthy, and most of the invalids from the Niger expedition had sufficiently recovered from fever to allow of their being invalided to return to England. One death had occurred among them while in hospital at Ascension. The Albert remained at Ascension, undergoing a refit. The Gold Coast had been visited lately by a swarm of locusts, which had done much damage among the corn, &c. The Ashantee mission had been established under favourable circumstances, and the two princes, Quantamissah and Ausah, were residing with the Rev. Mr. Brooking, at Coomassie. Capt. Stanley, late 2nd West India regiment, and Lieut. Fairholme, invalided from the Soudan, passengers (per William Canynges) from Cape Coast."

French Statistics.—From a recent statistical account of the industry and commerce of France, it appears that there are 84,954 looms in the country, producing annually a quantity of silk equal in value to 250 millions of francs. These looms employ 170,000 workmen, and work up 140 millions of francs' worth of silk. The hand labour amounts to 70,923,965f., or about 411f. each workman. The manufactories at Lyons alone, in ordinary times, employ 40 to 50,000 looms, 90,000 workmen, and nearly 100 millions of silk. The home consumption of French silk amounts to 75 millions, and the exports, on an average, to about 140 millions.—From another statistical account recently published, it appears that the agriculturists of France possess the following number of animals:—

Oxen and cows .	6,681,000	estimated at 877,343,000f.
Merino sheep .	766,310	306,524,000
Common sheep .	30,845,852	616,917,040
Horses and mules	1,656,000	66,105,500
Pigs	3,900,000	3,000,000
	43,849,162	1,869,790,340f.

From the same calculation it appears that the annual produce of the French soil amounts in value to 6,000,000,000f

Freaks of Nature.—A lady residing in Garstang, who is a fancier of birds, possesses a Canary, which has for some time been sitting upon one egg; on Monday last it laid another egg, and on the Saturday following both the eggs brought forth young ones, which, as well as the old bird, are doing well, and are visited by all the bird-fanciers in the neighbourhood.—*Facile.*

Law.

COURT OF EXCHEQUER.—*Arden* v. *Pullen.*—This was a rule for a new trial involving an important question as regards landlords and tenants. It was an action by the landlord to recover 15*l.* for a half-year's rent of a house at Hoxton-terrace, which was let upon lease to the defendant upon a covenant, amongst others, to keep the house in as good repair as it was when he took possession. It appeared that very soon after the defendant entered into the occupation, it was found that the drainage and sewers were in so defective a state, that the house could not be inhabited with a due regard to the health of the inhabitants, and that the commissioners of sewers for the district, for some reasons, had refused to take the sewers connected with these premises under their superintendence. It was also admitted, that, to perfect the drainage and make new sewers, would involve an expense equivalent to that of rebuilding the defendant's house. The purchase of the plaintiff's interest in the premises was recent, and it was not suggested that there was any concealment or misrepresentation on the part of the plaintiff. Under those circumstances the question was, whether the defendant was bound to continue the rent, although he derived no benefit from the premises. The jury found for the defendant, upon which a rule was obtained to set aside the verdict, and enter a verdict for the plaintiff, if under the circumstances the Court considered the defendant bound by his lease. The Court was of opinion that as the defendant had bound himself by the lease to pay the rent, and there was no fraud or misrepresentation on the part of the plaintiff, the contract was not voided, and the defendant continued liable. The circumstance that the defendant, to render the house habitable, must rebuild it altogether, however hard it might be, was no reason for saying he should not perform his contract. The verdict was ordered to be set aside, and a verdict entered for the plaintiff, damages 15*l.*

Clayton v. *Nugent.*—This was an issue directed by the Court of Chancery, arising upon the facts connected with a document propounded as the will of the late Sir Gilbert East, Bart. It appeared that Sir G. East, who was residing up to the time of his death on his estate in Wiltshire, died on the 11th Dec. 1828, leaving personal property to the amount of 90,000*l.*, and real estates to about the same value. Amongst other peculiarities, Sir Gilbert had an unconquerable aversion to the employment of lawyers in the management of his affairs, and determined to make a will without legal assistance, which should pass all his real and personal property after his decease. The instrument by which the testator sought to give effect to his testamentary intentions was altogether in his own handwriting, extremely elaborate, and singular in many respects. It resembled an ordinary banker's pass book of unusual thickness. The pages were regularly numbered, and, in describing the objects of his bounty, they were referred to, in most instances, not by their names, but by alphabetical letters, an index to which was to be found contained on a card, which was referred to as annexed to the will. In many cases blanks were left for the names, or the letters which were to be substituted for names, and these letters were afterwards inserted by the testator in pencil. Pages and portions of pages were also left in blank. By the Statute of Frauds, a will to convey real property must be witnessed by three persons; and the testator appeared to have perfectly comprehended this provision, as he had the will attested on three different occasions by three of his servants. The first attestation was in 1820, the second in 1825, and the last in June, 1827. These renewed attestations became necessary, in order to enable the testator to dispose of newly-acquired property, which he had purchased in the interval since the former attestation. The plaintiff, who is the second son of Sir William Clayton, appeared to be the principal object of the testator's bounty, as he left him the bulk of his real estates; but he also provided for many other persons by legacies, and made a most comfortable provision for his dogs, and for a favourite parrot. It was admitted on all hands that the will was an operative instrument so far as regarded the disposition of the personal property, but its validity was impugned by the heir-at-law, as regarded the real estates, on the ground that the card, which was meant to be an index to the will, and without which the alphabetical references in the will would be wholly unintelligible, was not made at the same time as the will, and had no existence when the will was executed. The card, which was drawn up by the testator in the form of an index, referring to the names represented by certain letters in his will, purported to have been signed by him on the 30th July, 1828, which was seven months after the last attestation of the will. One of the testator's servants deposed that he had seen such a card with the will two years before the death of the testator, but he could not swear that it was the card now produced, and found after the testator's death, and it was obvious that if it had been the same card, it must have been altered, to adapt it to the arrangements made by the testator when he had the will attested on the last occasion. The conjecture which was put forward on the part of the defendants, who were the representatives of a trust created by the heir-at-law, was, that the testator left blanks in his will, which he afterwards filled up in pencil, and rubbed out, substituting others, as caprice dictated, and that the card containing the index had no existence until the day it bore date, when a previously existing card was probably destroyed. That the testator had tampered with his will after it was attested, was evidenced by the fact, that he left 60*l.* per annum, and the care of a parrot, in the will, purporting to be executed in 1820, to a person designated by a letter, which, on looking to the index, represented a married woman named Martha Hanks, who was, in 1820, a spinster, and her name was Martha Bradley. From this instance the jury were called upon to infer that the testator had, in other instances, altered his will after attestation, in which case the Statute of Frauds was not complied with, and the real estates would pass to the heir at-law. Lord Abinger said the question for the jury was, whether the card now produced was referred to in the will, so as to make it part of the will? That again depended on the question whether the card produced existed as an index to the will of 1825, or in 1827, when the will was attested. If the jury thought the card existed in 1825, or in 1827, they should find for the plaintiff. If they believed it did not exist as an index to the will until the day it was purported to be signed by the testator, namely, the 30th Jan., 1828, they ought to find for the defendant. The jury, after a short deliberation, returned a verdict for the defendant, thus deciding against the validity of the will, as regarded the real estates.

TATTERSALL'S, THURSDAY.—*Goodwood Stakes.*—Una, Arnagill, and Tupsley were backed freely, each with a decisive effect on the prices; we give the last that were laid, but 10 to 1 against Arnagill, and 12 to 1 against Tupsley, had been previously taken several times. The Knight of the Whistle was backed at 8 and 9 to 1, and closed at offers of the lower odds, with a very slight call of Una.

Goodwood Cup.—The only changes of any consequence were the retreat of Beeswing to double the odds laid a fortnight back, and the *debut* of Marshal Soult, who opened at 18 and 20 to 1, and was run up in a short time to 12 to 1; 11 to 2 was taken to 50*l.* about The Squire, and an offer made to back Middleham at 10 to 1. Nothing worth speaking of was done on the St. Leger or Derby. Offers of 3 to 1 on the field for the July Stakes, but no bet laid; a very "dark race," and not likely to be speculated upon with any spirit. Last prices:—

GOODWOOD STAKES.

8 to 1 agst	Knight of the Whistle	17 to 1 agst	Vakeel
9 to 1	Una	17 to 1	The Corsair
10 to 1	Welfare (taken)	8 to 1	Vakeel and The Corsair (taken and afterwards offered)
11 to 1	Arnagill (taken)		
13 to 1	Tupsley (taken),		

GOODWOOD CUP.

11 to 2	The Squire (taken)	12 to 1	Marshal Soult
10 to 1	Beeswing	7 to 1	Beeswing & Marius (t.)

ST. LEGER.

550 to 25 agst Artful Dodger (taken)

DERBY, 1843.

1750 to 50 agst	Progress colt	1750 to 50 agst Napier, laid in one bet
1750 to 50	Cotherstone, and	

MARK LANE, FRIDAY, JULY 1.—There was but little English Wheat offered on sale this morning, and prices were the same as on Monday. The market for Foreign was very flat, and the business transacted was to a limited extent, but there was no difference in value; bonded is much neglected for want of speculative demand.—Barley comes sparingly to market, and commands the same prices.—Peas and Beans are unaltered in value.—The Oat trade is nominally the same as on Monday.

Crickets, to destroy . . . 437 *c*
Crops, rotation of . . . 437 *a*
Cucumbers, treatment of . . 441 *a*
Danyer, Mr., his Nursery noticed . . . . . . 440 *a*
Fig-tree, cause of fruit dropping 441 *c*
Forest-Trees, to prune . . 436 *c*
Fuchsia Bellana . . . . 437 *b*
Fuchsias, to preserve in winter 435 *c*
Gypsum, where obtained . 441 *b*
Habranthus pratensis . . 437 *b*
Hippophae rhamnoides, its use in fixing loose soils . . 437 *c*
Laburnum, not eaten by animals . . . . . 437 *b*
Lambert's Herbarium, sale of . 439 *b*
Liebig's Organic Chemistry, rev. by Dr. Schleiden . . 433 *b*
Lime-kilns, formation of . . 435 *c*
Melons, disease of . . . 437 *b*
Pear-tree, its treatment in summer . . . . . 441 *c*
Pelargoniums, good sorts . . 441 *b*
Pines, cause of their leaves spotting . . . . 441 *a*
Pruning, advantage of summer 437 *a*
Rivers, Mr., his Nursery noticed 439 *c*
Schleiden, Dr., criticised by Dr. Gregory . . . . 435 *b*
Strawberries, improved by nitrate of soda . . . 437 *b*
Strawberry, Swainstone Scarlet 437 *b*
Veronica nivea . . . . 438 *b*

FLORICULTURAL SOCIETY OF LONDON.—THE CARNATION AND PICOTEE SHOW is fixed for TUESDAY the 19th inst., when 12 Prizes for Collections will be awarded to Amateurs and Professional Florists, viz.:—6 for Carnations, and 6 for Picotees; the stands of Carnations and Picotees to consist of 6 Flakes and 6 Bizarres. In Class showing, 9 Prizes will be awarded for the best of each Class of Flake and Bizarre in Carnations, and for the best light and heavy red and purple-edged Picotee; in addition to which an Extra Prize of One Guinea each will be presented by Mr. Headly, of Stapleford, for the best Carnation and Picotee of any Colour.

To SEEDLINGS, as many 1st and 2d Class Prizes will be given by the Society as the Judges may consider proper—one bloom of Seedlings of the present year being required, and three of those raised previously; together with a SILVER CUP, of the value of FIVE GUINEAS, presented by Dr. LINDLEY, F.H.S., &c. &c., for the best seedling PICOTEE, provided the flower be of the 1st Class; but should it be decided to be only second-rate, the prize will be reduced to half the amount. Seedlings may be entered for this prize separately; but any flower to which a first-class Prize shall have been awarded by the Society must be subsequently entered for the Cup.

The competition in the Amateurs' class is confined to Members, but in all other Classes it is open; and country growers who wish to compete for the Seedling or other Prizes may forward their Flowers to the Secretary at the Crown and Anchor Tavern, on the morning of Show, carriage paid, with the entrance, and accompanied by the name intended to be given to the flower, as well as that of the raiser and the year when raised.

Entrance for Collection: Members, 2*s.* 6*d.*; Non-members, 7*s.* For Single Blooms and Seedlings: Members, 1*s.*; Non-members, 3*s.* For Dr. Lindley's Prize, 5*s.* Exhibitors to provide their own stands; and notices (except for Seedlings) to be forwarded to the Secretary on or before Monday the 18th inst., addressed, "Grove-place, Southampton-street, Camberwell."

T. C. WILDMAN, Hon. Sec.

KINGSTON.

THE ROYAL HORTICULTURAL SOCIETY has fixed their ANNUAL EXHIBITION for THURSDAY, SEPT. 15th, 1842.—For particulars apply to

JAMES JACKSON, Hon. Sec.,
Thames-st., Kingston, Surrey.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

NEW AND SPLENDID FUCHSIAS.

MESSRS. YOUELL have much pleasure in referring the admirers of the above beautiful Tribe to their List as advertised in the *Gardeners' Chronicle* of the 18th of June, which they continue sending out per post, free, upon the terms there named.—Great Yarmouth Nursery, June 23, 1842.

"MANETTIA BICOLOR."

MESSRS. VEITCH and SON have now ready for delivery Plants of this beautiful New Greenhouse Climber, at 42*s.* each.

N.B.—A Medal was awarded to this Plant at the Horticultural Society's Meeting in Regent-street, in April last.

Exeter, July 6, 1842.

CARNATIONS AND PICOTEES.

J. T. WILLMER and SON, King's-road, Chelsea, by appointment Florists to Her Majesty, beg to announce that their Splendid Collection of the above Flowers are now in Bloom, and will continue so for the next Three Weeks. Admittance gratis (Sundays excepted).

TO HEARTSEASE GROWERS.

J. PEARSON'S SPLENDID PANSY, the "BLACK PRINCE," is ready for delivery at 15*s.* each; on receipt of a Post-office order, it will be sent by post, prepaid. It is much larger and better shaped than "Black Diamond," brighter black, and fine golden eye. The usual allowance to the Trade if two or more are taken.—Chilwell Nurseries, near Nottingham.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. J. C. and S. STEVENS will Sell by Auction, at their Great Room, 38, King-street, Covent Garden, on Wednesday, 20th July, at 12 for 1 o'clock precisely, a large and valuable Consignment of ORCHIDACEÆ, just arrived in most beautiful condition, and collected from a range of country comprising upwards of 300 Miles, in the neighbourhood of Guatemala, in Central America, and consists principally of the hardy cold-climated Plants adapted for the Greenhouse.—May be viewed the day previous and Morning of Sale, and Catalogues had of Messrs. J. C. and S. STEVENS, 38, King-street, Covent-garden.

TWENTY-THREE VASES and PEDESTALS to be Sold very cheap. They were made by Messrs. AUSTIN and SEELEY, for a deceased Gentleman, and are composed of the best artificial Stone, each of the Vases being 3ft. high, and the Pedestals 4ft. 4in. high. They are of a most elegant form, and well worthy the attention of any person wishing to possess such ornaments.—Apply to Messrs. AUSTIN and SEELEY, New-road, near the Regent's Park, where the Vases and Pedestals can be seen.

SPLENDID SALE of the WOODHALL COLLECTION OF EXOTICS.

There will be Sold by Auction, within the Gardens of Woodhall, in the parish of Bothwell, and County of Lanark, lying 10 Miles east of Glasgow, between Airdrie and Holytown, on THURSDAY, the 28th day of JULY next, and following day, commencing at 11 o'clock each day, the whole of that extensive and celebrated COLLECTION of HOTHOUSE and GREENHOUSE PLANTS, consisting of numerous rare and valuable species, among which are many magnificent specimens of Camellias, Heaths, Epiphyllums, Citrons, Oranges, Shaddocks, Zamias and other Palms; with a very extensive and superior variety of Pelargoniums (Geranium), Indian Azaleas, and other miscellaneous Greenhouse and Stove Plants; of which Catalogues may be had by applying to Mr. Murray, of the Botanic Gardens, Glasgow; Messrs. Austin and M'Aslan, Nursery and Seedsmen, Trongate, Glasgow; Woodhall Office, 33, Buchanan-street, Glasgow; or to the Gardener by Holytown.

The collection of Camellias is well known as not surpassed by any in the Empire, the specimens being of the very finest growth, many of them from 15 to 20 feet in height. The Heaths also afford numerous specimens of the finest sort, which for size and furnishing, it is believed, far surpass any collection ever shown.

The whole of the Plants are in the very best state of health; and as the operations of the mineral workings on the estate have already encroached upon the garden, they must be sold off, as it is, in consequence of the said operations, to be entirely broken up; therefore, great bargains may be expected. The Plants will be set up in Lots to suit purchasers, beginning with the Camellias, Heaths, Epiphyllums, &c.

The collection may be viewed any day prior to the Sale, by applying at Woodhall Garden. Further information learned, and particulars given, on applying to the Factor, Woodhall-house, Holytown.

BARCLAY and SKIRVING,
Woodhall-house, May 1842. Auctioneers.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l.* for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.
20	£1 1 4	£1 5 10	£1 10 11	£1 16 9	£2 3 8
30	1 6 4	1 12 2	1 19 1	2 7 4	2 17 6
40	1 16 1	2 4 4	2 14 6	3 7 3	4 3 4
50	2 16 7	3 9 4	4 5 5	5 6 3	6 13 7

PETER MORRISON, Resident Director.
A liberal commission allowed to Solicitors and Agents.

WESTERN LIFE-ASSURANCE SOCIETY.—OFFICE—49, PARLIAMENT STREET, WESTMINSTER.
Capital 500,000*l.*—10,000 Shares, 50*l.* each.
Deposit 5*l.* each Share.

This Society is established for the Assurance of Lives, upon principles combining economy with perfect security.

Directors.

Henry Edgeworth Bicknell, Esq.
William Cabell, Esq.
Thomas S. Cocks, jun., Esq.
George Henry Drew, Esq.
William Evans, Esq.
William Freeman, Esq.
Francis Fuller, Esq.
James Hunt, Esq.
John Arscott Lethbridge, Esq.
Edmund Lucas, Esq.
George Kennet Pollock, Esq.
James Lys Seager, Esq.
John Bazley White, Esq.
Joseph Carter Wood, Esq.
Henry Wrench, Esq.

Trustees.—William Whateley, Esq.; L. C. Humfrey, Esq.; George Drew, Esq.
Auditors.—Ormus Biddulph, Esq.; John Freeman, Esq.; John Bazley White, jun., Esq.
Consulting Counsel.—William Page Wood, Esq.
Conveyancing Counsel.—Samuel Jay, Esq.
Physician.—William Richard Basham, Esq., M.D., 17, Chester-street, Grosvenor-place.
Surgeons.—Alfred Leggatt, Esq.; George David Pollock, Esq.
Bankers.—Messrs. Cocks, Biddulph, and Co., Charing Cross.
Solicitors.—Messrs. J. L. Bicknell and J. C. Lethbridge, 25, Abingdon-street, Westminster.

TABLE OF PREMIUMS to assure £100 for the whole term of Life.

Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.
20	1 14 2	35	2 11 0	50	4 3 3
25	1 18 11	40	2 19 6	55	5 5 4
30	2 4 8	45	3 9 1	60	6 15 3

The object of this Society is to afford to the Assured all the benefits of Life-Assurance, at a great reduction in the rates of Premium.—FOR EXAMPLE—A person aged 30, may with this Society assure his life for 500*l.* by the annual payment of 11*l.* 3*s.* 4*d.*, which in a Society where the bonus is held out as a main inducement, would cost him 13*l.* 7*s.* 4*d.*, or, in other words, for the same annual premium he could at this Office assure very nearly 600*l.*, whereby he derives AN IMMEDIATE AND CERTAIN BONUS OF 100*l.*

All particulars as to Shares, Loans, Assurances, &c., may be obtained on application to the Secretary; and, if required, forwarded to the country.

Parties in the country eligible for undertaking Agencies are requested to apply.

A very liberal Commission allowed to Solicitors and Agents.

EDW. T. RICHARDSON,
Actuary and Secretary.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, moveable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering-pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY.

The Number for July, 1842, contains highly-finished drawings of *Habránthus Praténsis, Borònia Anemonæfòlia, Cinerària Webberiana, Tropæ'olum Edùle*; likewise Papers on Gardening as a science; on Suspending Plants in Greenhouses and Stoves. Reviews—Sir Uvedale Price on the Picturesque; Loudon's Encyclopædia of Trees and Shrubs. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for June, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

MEXICAN BOTANY.
This day is published, part Second, price 1s.,

PLANTAS HARTWEGIANAS IMPRIMIS MEXICANAS, adjectis nonnullis Grahamianis, enumerat novasque describit GEORGIUS BENTHAM.

Part the First may still be had, price 2s. 6d., or the two Parts in one, complete, price 3s. 6d.

William Pamplin, London.

ILLUSTRATIONS OF INDIAN BOTANY—JUST IMPORTED FROM MADRAS.

WIGHT'S ILLUSTRATIONS OF INDIAN BOTANY. Volume 2d, Part 1st, price 25s.
Any of the previous Parts may still be had, price 7s. 6d. each Part.

WIGHT's ICONES PLANTARUM INDIÆ ORIENTALIS. Volume 2d, Part 3d, price 30s.

Any of the previous Parts of this Work also may still be had, price 5s. each Part.

WIGHT's PRODROMUS FLORÆ INDIÆ ORIENTALIS PENINSULÆ, &c. New, in cloth, Vol. 1, price 16s.

WIGHT's CONTRIBUTIONS to the BOTANY of INDIA. New, in cloth, price 7s. 6d.

William Pamplin, 55, Frith-street, and 9, Queen-street, Soho-square, London.

IMPORTANT TO AGRICULTURISTS, &c. &c.
Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1s.,

A WORD OR TWO ON GUANO, and a NEW MANURE ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15s. per cwt. cash.—Chemical Works, Upper Fore-street, London.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2s. cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2s.

THE HAND-BOOK OF AGRICULTURE;
Chiefly for the use of those interested in the Allotment System. Price 1s. 3d.

THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2s. cloth.

THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Person. Price 2s. cloth.

THE HAND-BOOK OF THE LAUNDRY;
Expressly intended for those who "wash at home." Price 1s. 9d.

THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1s. 9d.

London: W. S. Orr and Co.; and W. and R. Chambers, Edinburgh.

IMPORTANT AGRICULTURAL WORKS,
Published by Ridgway, Piccadilly, and to be had, by order, of every Country Bookseller.

A POPULAR TREATISE on AGRICULTURAL CHEMISTRY, intended for the use of the practical Farmer. By CHARLES SQUAREY, Chemist. Price 5s. bound in cloth.

"The writer of this work has succeeded with great skill and ability in simplifying a subject generally considered too abstruse for a large portion of the agricultural body."—*Farmers' Journal.*

2. THE NATURE AND PROPERTY OF SOILS. By JOHN MORTON. Third edition, enlarged. Price 7s.

3. ON FERTILISERS; being a complete Guide to every kind of Manure—to what Lands each is adapted, and the best means of application. By CUTHBERT W. JOHNSON, Esq. Price 12s.

4. THE COTTAGE FARMER'S ASSISTANT. By CUTHBERT W. JOHNSON, Esq. Price 1s., or for distribution 9s. per dozen.

5. SINCLAIR ON GRASSES. A new edition, with coloured plates. Price 30s.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID, With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenæum.*

"Cannot be easily surpassed."—*Dublin University Magazine.*

COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES of EUCLID, with Enunciations. Price 1s. 6d.

London: Whittaker and Co.; sold by all Booksellers.

This Day, Post octavo, 5s.,

PRACTICAL CHEMISTRY for FARMERS and LANDOWNERS.
By JOSHUA TRIMMER, F.G.S.

By the same Author, octavo, with 200 Illustrations, 12s.,
PRACTICAL GEOLOGY and MINERALOGY, and the CHEMISTRY of METALS, with an Introductory Discourse on the Nature, Tendency, and Advantages of Geological Pursuits.

London: John W. Parker, West Strand.

Just published, Post 8vo, handsomely bound in cloth, gilt, price 7s. 6d., THE

BOTANICAL LOOKER-OUT among the WILD FLOWERS of the FIELDS, WOODS, and MOUNTAINS, of ENGLAND and WALES; forming a familiar Monthly Guide for the Collecting Botanist. By EDWIN LEES, F.L.S.

London: Tilt and Bogue, Fleet-st.; and H. Davies, Cheltenham

A HISTORY OF BRITISH FERNS. By EDWARD NEWMAN, F.L.S., B.S., &c. In one volume, 8vo., with Eighty-seven Illustrations, price 10s. cloth.

OPINIONS OF THE PRESS.—To every lover of British Botany we cordially recommend Mr. Newman's volume.—*Magazine of Natural History.* This is a very elegant and pleasing work.—*Spectator.* The clear account of species and the popular suggestions for their culture, contained in this volume, justify our cordial recommendation of its pages.—*Atlas.* The embellishments of this pretty volume are executed with equal good taste and skill.—*Gentleman's Magazine.* A valuable present to the lady botanist.—*Loudon's Gardener's Magazine.* No lady in the country ought to be without it.—*Gardeners' Gazette.* It is just such books as this which render Natural History so attractive to everybody who finds other pleasures in a country life besides hunting, coursing, fishing, and shooting.—*Gardeners' Chronicle.* Those who are desirous of acquiring an intimate acquaintance with our native species of this beautiful and interesting order of plants, cannot do better than consult Mr. Newman's "History of British Ferns."—*Mr. Ward, on the Growth of Plants in closely-glazed Cases.* If there be a little damp nook or dell with rock-work and water at command, let it by all means be made a fernery, for which Mr. Newman's book will supply plenty of materials. —*Quarterly Review.*

John Van Voorst, Paternoster-row.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra." —*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

A new Edition, considerably improved and enlarged.

LOUDON'S ENCYCLOPÆDIA of GARDENING; the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening, including all the latest Improvements, a general view of Gardening in all Countries, and a Statistical View of its present State, with Suggestions for its future progress in the British Isles, &c. With nearly 1000 Engravings on Wood, 50s. boards.

II.

A New Edition, with SUPPLEMENT, of

LOUDON'S ENCYCLOPÆDIA of PLANTS; a Description of all the Plants in Great Britain, down to 1840, with nearly 10,000 Figures, by Branston, from Drawings by J. D. C. Sowerby, F.L.S. One thick vol. 8vo. 3*l.* 13s. 6d. cloth.

⁂ The SUPPLEMENT, edited by J. C. Loudon, prepared by W. H. Baxter, Jun., and revised by Geo. Don, F.L.S., with upwards of 800 additional Figures, separately, price 15s.

III.

LOUDON'S ENCYCLOPÆDIA of AGRICULTURE. Third Edition, with nearly 1300 Wood Engravings, one large vol. 8vo, price 2*l.* 10s. cloth lettered.

IV.

LOUDON'S HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to or introduced into Britain. New Edition, with a NEW SUPPLEMENT up to March 1839, prepared, under the direction of J. C. Loudon, by W. H. Baxter, and revised by Geo. Don, F.L.S., 8vo, price 1*l.* 11s. 6d. cloth lettered. SUPPLEMENT, separately, 8s.

London: Longman, Brown, Green, and Longmans.

Just published, in 2 vols. 8vo. cloth, price 24s.

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas." —*Atlas.* Edward Moxon, Dover-street.

Just published, price 20s., dedicated, by permission, to His Grace the Duke of Portland,

A TREATISE on the ACACIA TREE (Robinia pseudo Acacia.) By W. WITHERS, of Holt, Norfolk, author of a Memoir, addressed to the Society of Arts, on Planting and Rearing Forest Trees, &c. &c.

The Work contains a complete detail of the History, Character, Growth, Qualities, and Uses of the Tree, with the most approved Methods of Cultivating it; and an Inquiry into the strength and durability of its truly-valuable Wood, when applied to the purposes of Machinery, Ship-building, Farming Implements, &c.

To which is added a Treatise on Planting, Manuring, and Pruning; comprehending all the particulars required by the Planter in the early and later growth of Forest and Ornamental Trees, choice of Varieties, nature of Soils, and the Diseases and Laws to which Trees are subject.

Longman and Co., Paternoster-row.

WANTS a SITUATION as GARDENER.—John Halliday is about to leave his present employer, Lord Sondes, and is desirous of obtaining another situation. He has a good practical knowledge of his business in all its different branches, and can obtain most satisfactory testimonials from his present employer. Address, J. Halliday, Elmham Hall, near Dereham, Norfolk.

WANTS a SITUATION as UNDER-GARDENER, a steady industrious Man, aged 23, who has been accustomed to the business, and has had the charge of a Garden; he would not object to a Horse or Cow, or to make himself useful. Can be well recommended by the Gentleman he is about to leave. Wages no object.—Address R. U., 3, Salvadore-place, Lower Tooting.

WANTS a SITUATION as GARDENER, a steady, active, Married Man, without encumbrance, who perfectly understands his business, and can have five years' good character from the place he has just left.—Direct to L. H., Mr. Denyer's Nursery, Brixton Causeway.

WANTS a SITUATION as GARDENER, a respectable, steady, sober, industrious Married Man, without encumbrance, who understands Forcing Grapes, Melons, and Cucumbers; Kitchen-garden; Pruning and Training Wall-trees, and the treatment of Meadow Land. No objection to the care of a Cow or two. Can have a good character from his last place.—Direct to J. W., 1, Denmark-road, Camberwell.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

TO MARKET GARDENERS.

TO BE DISPOSED OF, in consequence of the death of the Proprietor, the Unexpired Lease, for Seven Years, of 16 Acres of productive Garden Ground, well stocked and crossed; together with good Dwelling-house, and all necessary Outbuildings for carrying on the business. Situate within Five Miles of Hyde Park-Corner.—For further particulars apply to Mr. JAMES ELLIOTT, Appraiser, Putney, Surrey.

WATERING STREETS.

DEAN'S PATENT WATER-CARTS, for Watering Streets of any Breadth, by passing *once* along them, are superior to any Machine hitherto invented for

IRRIGATING LAND WITH LIQUID MANURE;

For carrying-off Water after Floods; Draining Fens or Marshy Land; and may be so constructed as to be instantly converted into FIRE ENGINES

Of immense capability; thus combining, in a single useful Agricultural Machine, the most economical means of preserving Roads, and the best protection against Fire.

PATENT GARDEN ENGINES,

Dispensing with the tiresome action of the Hand Pump, and serving as Fire Engines of great power, and capable of being worked by any number of persons.

PATENT MILL MANUFACTORY.

SHERLOCK-STREET, (SMITHFIELD,) BIRMINGHAM.

N.B.—Especial attention is directed to DEAN'S PATENT PORTABLE STEAM MILL, consisting of a very superior STEAM ENGINE, attached to a Patent FLOUR and MEAL MILL and DRESSING MACHINE, with a MALT and CORN CRUSHER; all of which are upon one Iron Frame, occupying very little room, easily wheeled about, may be worked in any convenient place, require no fixing or *skill* in working; and the cost of the *whole, with Boiler complete*, warranted to grind and dress Six Bags of Wheat per day, to split Twenty Bags of Beans per day, or to crush Oats, Malt, or other grain, at the same time, is only 70*l.* The Engine, when detached from the Mill, for the greater convenience of moving about, is exceedingly simple and compact; and if applied to a Thrashing Machine will perform more work than three or four Horses. Food for Cattle may be steeped, *Grain kiln-dried*, and Baking Ovens heated, by the surplus steam, without additional fuel.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief, is prepared only by MR. WHITE, Chemist, 24, Cornhill, London, in bottles at 2s. 6d., 4s. 6d., and 8s. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3s. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

SUN-BURNS, FRECKLES, TAN, and other Disfigurements of the Skin, prevalent at this peculiar season, are pleasingly eradicated by that unique preparation, ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Ask for "ROWLAND'S KALYDOR," and see that these words are on the envelope, with their signature and address in red: "A. ROWLAND & SON, 20, HATTON GARDEN, LONDON;" the same are engraven on the Government Stamp affixed over the cork.

Sold by the Proprietors, and by respectable Chemists & Perfumers.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d*. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

The Gardeners' Chronicle.

SATURDAY, JULY 9, 1842.

MEETINGS IN THE ENSUING WEEK.

COUNTRY SHOWS.—July 11, Felton Florists'. 15, Roxburghshire Horticultural.

THE operation of budding, which at this season is about to be practised everywhere, deserves some notice from us. We shall not, however, pay our readers so bad a compliment as to suppose them unacquainted with the art of *doing* it; our remarks will be confined to the principles which appear to determine its *success*.

Budding is a kind of transplanting, and the causes of success or failure are not very different. In transplanting, a tree is dug out of the ground in one place, and is removed to another. In budding, a piece is cut out of the stem of one tree, and is removed to another. The earth is the source of food to the former; elements already extracted from the earth are the nutriment of the latter. If from any cause a transplanted tree loses its fluid contents faster than it can get more from the earth, it dies; if a bud loses its fluid contents faster than it can get more from the living tissue to which it has been transferred, it also perishes. The transplanted tree must form new mouths at the ends of its roots, wherewith to feed; the transplanted bud must form new mouths over its whole under-surface, for the same end. Let us, however, be more precise.

The leaf-bud of a tree consists of a central vital portion, called the growing point, over which a skin of bark is drawn. If the growing point is destroyed, the bud perishes. It forms what is named the eye of the bud, and being brittle and tender, easily snaps off when the wood of the bud is jerked out; if, however, it is pulled out in that part of the operation, the bud is useless, and will remain "blind." This accident usually occurs when the bud is not completely formed. Buds should therefore be selected quite perfect, which is known by their prominence and plumpness.

Before the operation can be performed, it is necessary that the bark of the stock should run "freely," so that the wood may completely separate; and as this takes place most readily in half-ripe, young wood, the latter is to be preferred to wood of a previous year. When first inserted, the bud is mainly nourished by matter sent down from the leaves of the stock; it should, therefore, be introduced near the lower end of a shoot, and not near the point. The number of buds to be put intó the same branch is no farther material than that many incisions in the same branch will have the effect of impairing its general health.

As the young bud is to be nourished at first by the leaves above it on the stock, the best place to insert it is close beneath some leaf in full activity; it is not, therefore, the most open and smooth part of the stock which is to be selected, when a choice can be made. For the same reason, it might appear injudicious to shorten the branch into which a bud is inserted; but if the shoot is not stopped, the rising sap will be attracted into the youngest leaves, and expended in their increase, while on the other hand, if the shoot is stopped, the sap will be forced laterally into the buds already forming on its sides, and the new bud will participate in this advantage. It is therefore, upon the whole, advantageous to cut off a part of each shoot into which a bud is introduced; the removal of a quarter of it is enough to answer the intended purpose.

As it is important in every way that the vigour of the budded branch should be preserved for the buds which it is forming, all flowers or fruit should be cut off it, and from the twigs in its vicinity, otherwise those parts will consume the organisable matter which should be applied to the service of the new buds. Prickles, however, do no harm, and may possibly be useful, although we do not know what their use is; we therefore presume they had better be preserved.

It is of little consequence what material is employed in tying the bud down. Bast is as good as anything. The great point is to apply the ligature firmly, without cutting the bark, and to relax and re-tie it when, after some time, the bark shall be found swelling a little over it. It is not desirable to remove the ligature finally until, from the greenness and plumpness of the bud, and the slight swelling which takes place in it, evidence is had that the operation has succeeded.

What happens when the bud is skilfully inserted is this: the surface of the inner bark of the bud is applied firmly to the young moist wood of the stock; in this way the cellular systems of the two are brought into contact, and, under favourable circumstances, will adhere in a few days. In the mean while woody matter descends from the leaves above the bud, and interlaces itself with the new cellular matter forming between the bud and wood, and ties them together; as soon as the growing point of the bud begins to quicken, it too sends down fine streams of woody matter, and increases that entanglement which, in the end, renders the bud and the stock inseparable. If a quantity of wood is left on the inner face of the bud, this union is more difficult; and therefore the complete removal of the wood of the bud is desirable, provided, as we have already said, the growing point is not jerked out. If the latter event takes place, the bark and wood may adhere, and the bud may remain green, but it will not sprout.

The only other point to be considered is the propriety of leaving a leaf upon the bud to be inserted. This question is one which practice can answer better than theory. Theory says the leaf will *injure* the bud by carrying off its fluid particles, and *assist* it by the secretions it will send down to it, and to the nascent tissue forming beneath it. Now, since the abstraction of fluid is rapid and dangerous, while nutrition is slow and of the less moment, because the leaves proper to the branch will themselves furnish food, it seems most advantageous to cut off the leaf, or at least the principal part of it. After a time, nature settles the question for us by throwing off the leaf, which is a good sign; for it indicates a rapid augmentation of the bud itself, to which the leaf cannot respond.

No one who has been watching the progress of Agriculture for the last few years can for a moment dispute the importance of the foreign substances which, like nitrate of soda and guano, have been introduced into husbandry. But, admitting to the fullest extent the value of these materials; admitting, too, the utility of some of the artificial manures compounded for sale; we must observe that it is most absurd for the farmer to put himself to the expense of purchasing them until he has utterly exhausted all the means which his farm affords him for nothing, of increasing the fertility of his land. Such substances should be employed *in aid* of ordinary manure, not *instead* of it. The art of farming and market-gardening consists, or should consist, in obtaining the greatest possible amount of food at the smallest possible expense.

Now it must be obvious that those manuring substances which are necessarily produced upon a farm are the least expensive of all things; to the careful collection and preparation of them should the good husbandman turn his attention in the first instance; and when all the resources of skill are exhausted upon that preparation, it is time to look abroad for assistance. Farm-yard manure is, therefore, the first object of improvement; and it is tó this great end that our remarks upon manures have of late been principally directed. The man who wastes his farm-yard manure, and buys other things, can only be compared to him who should leave his wheat upon the ground, and buy rice or maize to make good his prodigality. We assert, without fear of contradiction, that the farmer does, in the great majority of cases, commit a folly equivalent to this; not, indeed, intentionally, but from not knowing better.

It is not, however, merely because of its cheapness that farm-yard manure is the best of all substances for enriching land, but because it contains such a great variety of substances, among which each crop finds that which it most requires, and in the fittest state for becoming its food. "Fortunately," says Dr. Daubeny, in one of his excellent agricultural discourses, "we are provided, in the dung of animals, with a species of manure of which the land can never be said to tire, for this simple reason, that it contains within itself not *one* alone, but *all* the ingredients which plants require for their nutrition, and what is, perhaps, of equal importance, existing too in that precise condition in which they are most readily taken in and assimilated." No wonder, then, that the Royal Agricultural Society of England should have made the management of farm-yard manure the subject of one of their prizes, and that we should in the mean while be turning our feeble efforts in the same direction.

It must be evident to those who have read our previous articles on this subject, that the great points to attend to are—1stly, to reduce the animal and vegetable matter of manure to a decayed state; and 2dly, to keep everything that results from this decay, whether fluid, or solid, or invisible, after it has been obtained. It is of no use to catch the hare, if you do not hold her. The farmer lets his stock trample straw and manure together in the yard, and by degrees it becomes partially rotten; it is then thrown in heaps, and allowed to ferment; and then it is used. The market-gardener carts the long stable litter from London, throws it in a heap, lets it ferment, and then applies it to his land. In both these cases, rain and other fluids wash away one part, which runs to waste; the fermentation drives off another, which disappears in the air; and what is left is at the most about half as good as it should be. This cannot be the way to manage manure.

What *should* be done is something like this:—Every husbandman should have a place on purpose for preparing manure. It should be a trench or ditch, large in proportion to the quantity of manure to be prepared. The bottom and sides should be made hard with clay or any other material that will prevent a waste of the water used in preparing the manure. This trench should fall towards one end; and at that end a hole (*A*) should be made, well puddled, so as to hold water, into which all the liquid matter that runs from the manure should drain. By the side of the trench should be a pump and well, which might be so contrived as to throw water in a stream all over the manure, when necessary. All things being ready, a quantity of raw manure, consisting, as usual, of straw and all sorts of impurities, should be placed in a layer on the bottom of the trench, well watered, and trampled down; by this means it will be enabled to decay faster than if it was dry, for the mass will begin to heat: what water the straw cannot suck up will run into the hole *A*, out of which it should be afterwards drawn, and poured again over the heap. At the same time that the layer of raw manure is placed upon the floor of the trench, there should be scattered among it a quantity of gypsum, if that earth can be had cheap, or else some powdered green vitriol; then the fluid which drains away will consist of those ingredients or their elements, water, &c. The object of adding such substances is to prevent the loss of ammonia, an invaluable substance, which flies away from manure, if you let it alone, but which either the gypsum or the green vitriol holds fast, and keeps with themselves in the manure. Gypsum is, in many places, the cheapest material; but the wholesale price of green vitriol is not more than 5*s*. per cwt. in the London market; and probably the material called salt cake, and now worth about 3*s*. 6*d*. per cwt., would answer the same purpose.

When there is a fresh supply of raw manure ready, it should be placed in a layer over the first, mixed with gypsum or green vitriol, or some other "fixer," and well trampled down; then let it be thoroughly watered with the fluid in the hole *A*, if there is enough there; or with water from the pump, if what has drained into *A* is not sufficient. Water, or drainings, should be constantly added to these heaps, for it is of the first importance that the manure should be kept continually moist, in order to hasten its decay.

In this manner the manure heap may be increased from time to time, as raw manure accumulates, until it is too high to be conveniently raised further, or to allow of water or drainings being easily poured over it. By degrees the whole mass will become a soft pasty substance; and when in that condition, will be fit to put upon the land, or to lie by till wanted. In the latter case, however, care must be taken not to allow any of its "goodness" to be washed out of it again; and reservoirs should be formed at the edge of it to receive what does run from it, which should be poured over it again, or carried elsewhere.

If this plan were merely speculative, we should have nevertheless thought it worth proposing; but it is, in fact, the result of experience. It is essentially the same as that practised by Mr. Schattenmann, as mentioned by us on a former occasion, and seems to us the best method of managing the dunghill that has yet been proposed. It has the great merit of saving everything, of wasting nothing, and of causing no other additional expense than that of the purchase of gypsum, which would probably be bought without being thus applied, or of a boy occasionally to attend to the watering the dunghills. Although we entertain no sort of doubt of the extreme importance of attending to these suggestions, and of the ample return they would make for any expense connected with them, we shall be quite satisfied if any of our readers will try them first in a small way, and then ascertain the relative effect per load of common farm manure, and manure prepared in this more careful manner. We are inclined to prefer it to liquid manuring, which is contrary to the habits of our cultivators, and is attended by inconveniences that are better avoided.

IN the *Chronicle* of June 4 (p. 363), are some observations on the principles of pruning, and the effect of stopping young plants in good time. Our worthy correspondent, Mr. Billington, has written us a long letter on the subject, in which he complains, that, although these views are the same as his own, as published by him in 1825, yet no allusion has been made to that circumstance. We are glad to be reminded that so good a forester entertains the same opinion as we do; but we can assure him, that neither he nor ourselves have the smallest claim to credit for originality in this matter. The truth is, that what we have recommended is a mere application to practice of the simplest principles of vegetable physiology, and has been well known at least since the days of *Miller* and Duhamel. It is true that foolish plans have in many cases driven such sound practice out of sight; but we will undertake to say, that no *forester* who understood the principles of his business was ever unacquainted with its value. We ourselves have seen it in Norfolk when a boy, and we never heard of its being a novelty.

We mention this matter, partly for the sake of putting Mr. Billington right, and partly for the sake of stating, once for all, that we lay no claim to originality in the views which are from time to time introduced into our columns. Multitudes of facts are familiar to men of science, of which the mass of the world is ignorant; whenever such facts have a practical application, it is desirable that they should be promulgated in a popular form, and it was precisely for this purpose that our *Chronicle* was established. We have neither leisure nor inclination to rummage the history of discovery; and if any one fancies he has a right to the views we publish, he is perfectly welcome to them, for we lay no claim to their ownership.

We take the present opportunity of correcting a typographical error in the article now alluded to. "Plant thickly" was misprinted for "Plant thinly;" as must have been evident to those who remember the arguments used some months ago (Feb. 26), to prove the disadvantage of thick planting.

FAMILIAR BOTANY.—No. VII.

The Common Laurel.—It is the practice of the common people to confound things of the most different kind, because of some vague and unimportant general likeness that they find among them. They consider rock-crystal and diamonds to be a sort of glass, because they have no colour and are transparent; but, on the other hand, they distinguish things that are much alike, because of some trifling but striking differences scarcely connected with their real nature: and thus they cannot perceive the amethyst to be a sort of flint. It is just the same among plants: Cherries, the Bay-tree, and the Daphne, are all looked upon as Laurels, although they are plants having little or no relation to one another; but people fail to discover the resemblance of the Nettle and the Fig, although these plants are really near relations. We must never, then, form an opinion of the real nature of things upon vulgar names; and this is one reason why the names of science, although hard to remember, are so much to be preferred.

The Common Laurel is, in truth, a kind of Cherry, and some persons call it the Cherry-laurel; but that name is but little used. It is named in Latin Cérasus Lauro-cérasus, and belongs to the same group of plants as the Almond, Plum, Apricot, and Peach, which are themselves a branch from the great Rosaceous order. Collectively, all such plants are said to form the Amygdaleous subdivision, because Amygdalus is Latin for an Almond. Of the common characters which bind them together, the chief is their bearing stone-fruit; another is that they have 20 stamens, or thereabouts, placed in a ring at the edge of a waxy cup (the calyx), which also bears five petals.

It is not a little singular that these plants, which are so useful to us on account of their fruit, an important article of our diet, and which, moreover, pour forth a clear insipid gum, like *gum-arabic*, when they are wounded, should nevertheless be poisonous. Yet such is the case. If we chew their leaves, or their bark, or even their kernel, we immediately perceive that peculiar taste, called the flavour of bitter almonds. This is owing to the presence in them of the most subtle of all poisons, prussic acid; and accordingly the distilled water of our Common Laurel has been used for the purposes of assassination; and its bruised leaves have been recommended for the more harmless object of destroying insects that infest plants in greenhouses and gardeners' frames. How it is that the same plant should thus be able to form such different substances as gum, and astringent matter like tan, and the sweet subacid pulp, and this prussic acid, by means of the same organs, is one of those problems which neither the chemist nor the physiologist can pretend to solve, but which must be referred to those constitutional peculiarities stamped by the Almighty, at the creation, on all living things, each after its kind.

There is one curious circumstance connected with the Common Laurel which is little known, but which we must by no means pass by. The leaves of plants are usually regarded as the organs by means of which a plant is able to breathe and to digest its food, and to perspire; and here in general its attributes are said to stop. But when we look at the natural emission of honey by some, of drops of water by others—of wax by the Cabbage—of poison by the Nettle, and of lime by the Saxifrages—we must add to their duties that of throwing off excreted matter. In most cases, as far as has been observed, this discharge takes place by the whole surface, and probably through those microscopical holes, called stomates, of which millions are bored through the skin of many leaves. In the Common Laurel, however, there is a particular apparatus specially destined for this purpose. If you look beneath its leaf, you will find near its base, and close to the midrib, about four roundish or oval spots, which are very like tiny plates sunk in the substance of the leaf; they are green when young, and reddish when advanced in life. In a morning they are often covered with a globule of some transparent, apparently sugary fluid, which dries up as the day advances, and which while it lasts is the favourite food of bees; this is the excretion of the Common Laurel. The spots are harder than the substance which surrounds them, and stand in the centre of a number of veins directed towards them, probably for the purpose of pouring into them the fluid they excrete; and

> Thus, through a thousand tubes the wave distils,
> And thirsty glands discharge the exuberant rills.

R. E.

HORTICULTURE OF GUIPUSCOA.

(*Continued from p.* 284.)

The Capsicum; Pimiento (Spanish) is not cultivated with success on the light soil covering the sandstone, but in the neighbourhood of Tolosa, Aspeitea, and other places where limestone abounds, it comes to great perfection. The cultivators consider a strong soil, with heat and moisture, requisite to its success. These are to be found near Tolosa, where, at the base of limestone hills varying from 400 to 600 feet in elevation, an accumulation of red loam (deriving its colour from an oxide of iron, with which the district abounds), is met with of great depth. The summer heat is increased in the hollows and ravines at the base of these hills by radiation from the naked rock, and water is abundant. Under these combinations the produce is abundant. The plants are reared under walls having a south aspect; and when about six inches in height, are planted out, which generally happens early in June; the ground is previously well dug, but not manured, and the young plants set out in rows five ft. asunder, and about three ft. apart in the rows. Great care is observed in transplanting them; and if the weather prove hot and dry, a bright moonlight night is chosen. Should there be no moon, the evening is necessarily taken. Holes are made about six inches deep, at the distance already mentioned, which are half filled with moss, fresh cut grass, or weeds, and well watered. Upon this the young plants are set, and covered in with earth, but not watered. This method succeeds so well, that I have rarely seen plants flag, even in the hottest days, that succeeded the operation. Afterwards they grow rapidly, and always produce fruit in plenty from August to October. During the heats of summer the plants are watered plentifully; the time chosen is between three and five in the afternoon; the mode of doing this is common over all the south of Europe, but perhaps not generally known in England. Long narrow dams, the walls of which are constructed of manure, are filled with water, which is then carefully conducted round each plant in succession; the water for the purpose is most frequently collected from a stream or rill into deep ponds, which are made to overflow for watering the plants by a simple contrivance: one, two, or more half barrels are placed in a pond, and loaded with stones; thus causing a supply at discretion for keeping the dams or reservoirs at the proper height. Care is taken to stir the earth gently to prevent it becoming encrusted after these waterings; but the ground is never moved deep, as the cultivators consider any check to be prejudicial to the shape of the fruit. Those that are intended for winter use are suffered to ripen on plants set apart for the purpose; the others are gathered when about six inches in length. The large variety named by the Spaniards pimentones, and by the English abroad the Bell capsicum, attains an immense size under the above treatment, and is an excellent ingredient in cookery.

Celery; Apis (Spanish.)—Is grown in abundance, but only used for culinary purposes. No skill is exhibited in its culture, as far as regards blanching or endeavouring to produce it of a large size.

Cucumbers; Pepinos (Spanish).—Like the preceding, they are not an object of horticultural emulation. They are generally sown in the neglected parts of gardens, where, of course, but small and ill-shaped fruit is produced.

Endive; Chicoria, achicoria, escarola (Spanish.)—No plant in a Spanish garden occupies more of the gardener's time. The seed is sown in June for the first crop, and in August for a crop to stand the winter. The seed is scattered very thinly in drills 18 inches apart on the ground left vacant by the previous year's Lettuce, and which, as will be hereafter shown, has been well manured. As soon as the plants appear, they are thinned to three inches apart, but not transplanted; when they become crowded, they are again thinned to six inches, and finally to about 18 inches apart. The blanching is generally performed by pressing the heart of the plant gently down, on which a fragment of tile is laid; over this a light covering of earth is sifted. The fringed edges of the exterior leaves are carefully freed from earth, and exposed to light; having small bits of tile laid over that portion of the soil from whence they protrude, to render the blanching perfect, and produce what the gardeners particularly pride themselves on, viz.—a plant of Endive white all over excepting the edges of the outer leaves, which should show about two inches of green. The plants thus cultivated are slightly bitter, crisp, and juicy; no liquid manure is used, water is given freely whenever needed.

Lettuces; Lechuga (Spanish); are grown in large quantities. A piece of ground well open to the sun is selected, that for at least three or four years has not borne a similar crop. The beds are of any length, and about five feet in width. In the autumn a trench is opened lengthwise two feet wide and a foot deep, which is filled with the freshest night soil that can be procured by the growers in the neighbourhood of St. Sebastian. Those remote from that city must of necessity procure the manure at other places. The exact limits of the manured space are then marked by four stakes, and the earth dug out in the process of trenching replaced as a central ridge, on the sheltered side of which in the month of November, the plants sown early in October are pricked out to stand the winter. Early in the March following, if the weather prove favourable, the seed is sown thinly in shallow drills, drawn parallel to the sides of the trench, at about eight inches distance; so that if the trench be 20 feet long, 2 feet wide, and the drills 8 inches from the sides of the trench, it follows that the plants when they come up will be 3 feet 4 inches apart in the rows. When they have attained the proper size for transplanting, they are thinned to 10 inches apart, and the remainder are removed to a bed similarly prepared, the same precautions being used in the transplanting as described for Capsicums. Water is liberally supplied; and when the root fibres have penetrated to the manured trench, which is readily known by their luxuriant growth, they are tied up for blanching. The lettuces thus grown are remarkably large, tender, and juicy. After the summer crop is all drawn, the bed is thrown up into one long ridge, leaving the central trench undisturbed. This ridge is the spring following occupied by some light crop, when it is levelled, and in July or August Endive is sown within the limits of the trench, in drills 18 inches apart. The Endive, after having been treated as mentioned in the notice of that article, is succeeded by Onions.

Onions; Cebollas (Spanish).—The beds, as before stated, which had been previously cropped with Lettuce and Endive, are in the early spring of the fourth year prepared for this vegetable by deep digging, and by well incorporating the manure of the central trench with the earth, to which, if necessary, sand is added. The seed is sown broadcast, and the after treatment is similar to our own, except frequent waterings with liquid manure. The inference I venture to draw from this mode of culture, which is eminently successful, both as to the size and flavour of the vegetables, is, that slightly decomposed night soil promotes the growth of Lettuces in an extraordinary degree; still more decomposed, it is equally favourable to the Endive; and in the last stage of decomposition, to Onions.

Parsnep; Chirivia (Spanish).—Rarely grown in gardens, and the produce very inferior.

Peas; Arvesas (Spanish).—Rarely grown in gardens. Some cultivators, however, devote a little time to their sticking and hoeing, and occasionally bring them into the market early in June.

Pumpkin; Calabaza (Spanish).—Grown in abundance, generally between the rows of Indian Corn, or in any other place where heat and shade may be found. The Spaniards prefer the Indian Corn grounds, as they are of opinion that the large leaves of the plant prevent the too rapid evaporation of moisture. The seed is sown in May, at the same time as the Maize, and frequently produces fruit 1½ foot or more in diameter. The young plants are, however, destroyed in great numbers by the mole cricket, a most active enemy.

(To be continued.)

THE ROSE GARDEN.—No. I.

THIS has been, on the whole, an unfavourable season for Roses; the early flowers were scorched by the excessive heat, and the late tempestuous winds have irreparably damaged the buds of all the summer kinds, so that we must look to the autumnal Roses for fine flowers, which calm weather and soft dewy nights will alone bring to perfection.

Among those universal favourites, the Moss-Roses, very few new varieties have bloomed satisfactorily. Tempting descriptions from the French growers induced Rose-amateurs to form high anticipations of the following, which this season at least have not been realised:—Moss Hortensia, Sanguinea, Pompone feu, d'Orleans, à Feuilles pourpres, Mauget and Helena Mauget, seem seedlings from the Luxembourg Moss: all pretty, with bright red and pink-cupped flowers, but too much alike, and all lacking that desirable quality possessed by the common Moss-rose, viz., large and globular form and complete plenitude of flower. Celina, one of the best of the new Moss-roses, is deficient in this desirable quality. It is decidedly an improvement on its parent, the Luxembourg Moss, in colour and size of flower; but it has not that desirable globular form, neither is it double enough to constitute a first-rate variety. This deficiency in shape is the result of crossing with the Rosa Gallica, to procure depth of colour, by which much of the fragrance and form of the genuine Moss-rose is lost.

Among the new Moss-roses, however, one has been introduced peculiarly distinct and beautiful, namely, the Moss Unique, or Mousseue Unique de Provence, exactly like our favourite Unique Rose, in its robust habit and tendency to bloom in large clusters: its flowers are pure white, and abundantly mossy.

A Moss Rose, raised by Mr. Rivers from the Spotted Moss, crossed with the old dark Tuscany Rose, is at present the darkest Moss Rose known; its flowers are of deep crimson purple, mottled with red, but it is not at all double enough for a first-rate variety, having but five or six rows of petals. Its shoots and leaves in spring are of the deepest red, so that before it bloomed, it was anticipated that the great desideratum—a black Moss Rose—was at last obtained. It seems exceedingly difficult to procure a genuine Moss Rose from seed with any depth of colour; seedlings from flowers that have been crossed with dark varieties of Rose Gallica are inclined to lose their moss, as are in fact some of the established varieties. The Luxembourg moss, on its own roots, has this season, in two or three places in rich soils, lost every particle of moss, and cannot be distinguished from a variety of Rosa Gallica.

Moss Roses, particularly the White, Lancel, de Metz, &c. &c., when budded on the Dog-Rose, are in many soils short-lived, or have but a languid existence after the first year or two. The best stock for them is the old hybrid Bourbon Rose, Celine, which has large semidouble flowers, and blooms in immense clusters. This is a most vigorous grower, and strikes readily from cuttings, if planted in the open border in October. For the White Moss, in particular, this will be a most eligible stock—making this shy and delicate Rose grow freely and bloom abundantly.—*A. Z.*

AMATEUR'S GARDEN.—No. XXVIII.

As the season for budding has now arrived, a few observations upon that subject may not be uninteresting to those for whom these papers are more particularly written. A great deal of the pleasure which is felt in performing and succeeding with an operation of this kind, must necessarily depend upon understanding its principles. If these are not understood, the operator, it is true, may succeed, but he knows not the reason why he does so; and if he fails, he cannot tell the cause, nor guard against such a failure for the future.

The novice in gardening is generally astonished when he is told, for the first time, that a bud or shoot taken from one tree may be made to grow upon another; and yet, if he considers the subject a little, he will soon see that the principles which regulate that operation are essentially the same as those which regulate the striking of a plant from a cutting. Suppose, merely for the sake of illustration, that the Rose-tree, instead of being considered as a single individual, be looked upon as a colony, each bud possessing within itself the means of independent existence, providing it is placed in favourable circumstances; then the question naturally is, what are those circumstances? The moisture in the soil and air, with a certain degree of heat, enables the buds of a cutting to send down roots, and to form fresh leaves, and so in time to become a perfect plant. But if only one bud was taken from a tree, and planted in the soil, in many instances the experiment would fail, because the circumstances would not be favourable to its growth, although in many more it would succeed, as in the case of Vines and other things which could be mentioned, that are propagated in this way. Instead, therefore, of placing the bud in the soil, it is put between the bark and wood of a tree of the same family, and is, in fact, as nearly as possible in the same circumstances in which it was before it was removed by the knife of the gardener. Its food is ready prepared, and it commences immediately to unite and send down woody matter to the stem; which is, of course, analogous to the roots which a cutting sends down into the soil.

After this explanation, the amateur will see at once, that the main thing to be done in budding, is simply to adapt the bud and the stock for each other: in short, to place the bud as nearly as possible in the same circumstances in which it was before, and then tie the wound up with matting, to prevent the air from drying up the moisture. Those who are not acquainted with the operation should see it once done by a good gardener before they begin.

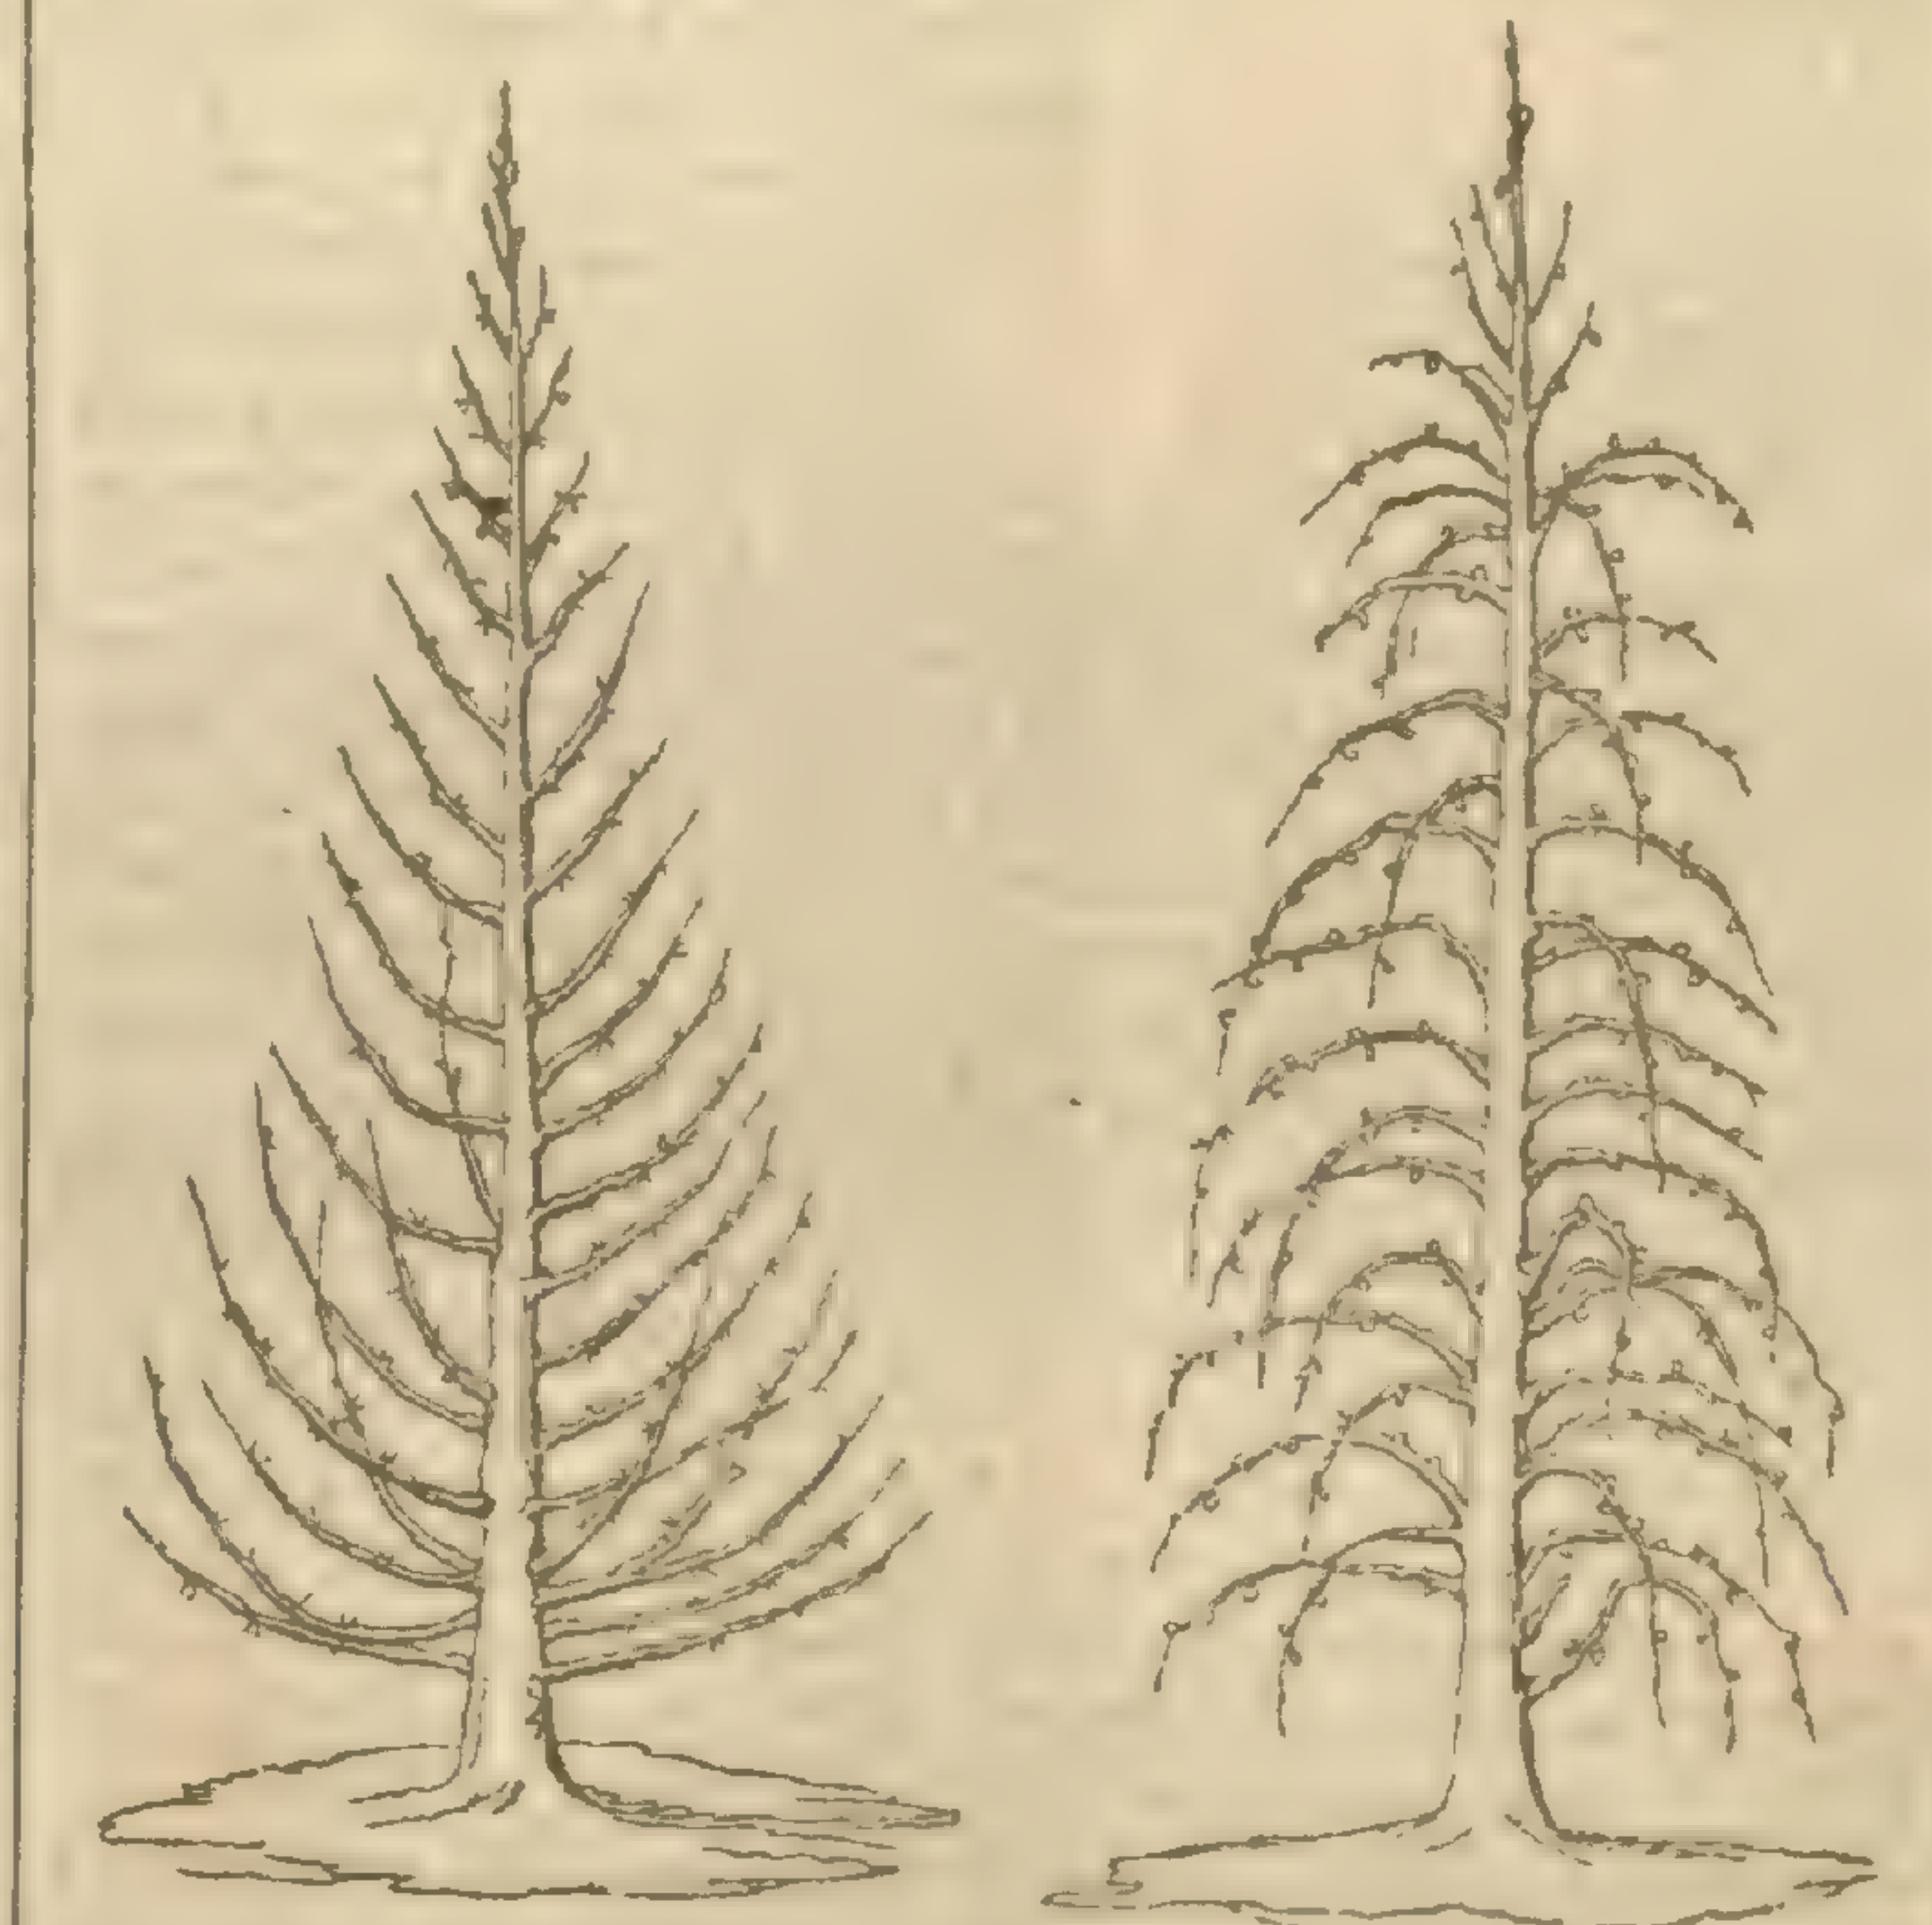
The budding of Roses may commence immediately, or as soon as the bark rises freely from the wood. This showery weather is of great service in keeping the buds moist. If the advice given last week has been attended to, the amateur will now have fixed on the more beautiful kinds, and of course will endeavour to procure buds of these for his garden. If he has not stocks to bud upon, it may be worth his while to go to a nursery and fix upon the plants he intends to purchase in the autumn.

Peaches, Plums, and Cherries may be budded shortly; but as some parts of the country are more early than others, the same test must be used as for Roses, namely, when the bark separates freely from the wood. In the earlier part of the season I gave the names of the better sorts of Plums and Cherries, to which the Amateur is now referred. The following are the best Peaches and Nectarines for a succession on the open wall:—*Peaches*—Early Anne, Acton Scot, Grosse Mignonne, Royal George, Noblesse, Barrington, Bellegarde, Late Admirable. *Nectarines*—Elruge and Violette Hâtive.—*R. F.*

HOME CORRESPONDENCE.

Cottagers' Prizes.—I am a young man, unmarried, and living with my father, assisting him in the labours of a small farm; and I have devoted about half a rood of one corner of a field to the cultivation of flowers and vegetables; and I have this year sold a few shillings' worth of my produce, chiefly Celery plants and a few Cucumbers; which having come to the knowledge of the committee of the Dewsbury Floral and Horticultural Society, of which I am a member, I have received intimation that I am no more eligible to compete in the Cottagers' class. I, therefore, enclose you a copy of the rules of the above society; and hope that you will favour me with your opinion, whether such proceeding is in accordance with reason?—*Industry.* [If you have already been recognised as a "Cottager," your selling the produce of your garden cannot disqualify you, either according to the rules of the Dewsbury Society, or the suggestions of common sense. But we should not think you, living with your father, who is a farmer, to be such a person as is usually considered a cottager. By that term ought to be understood exclusively day-labourers, living in their own cottages, or their children.]

Cottager's Calendar.—In consequence of inquiries addressed to Mr. Paxton, upon some points in his valuable "Cottager's Calendar," he has sent us the following series of memoranda:—*Keen's Seedling Strawberries* for cottagers may be planted in 4-feet beds, 9 inches apart, planting them at right angles and allowing the outside rows to be six inches from the edges of the bed; this will give five rows, but they must be kept free from runners. Old Pine may be planted in the same manner, allowing them one foot apart or four rows in the bed.—The *White* or *Brown Spanish Onions* are usually sown broadcast, to stand the winter; and they may be allowed to remain as they come up, without thinning, until spring. About half an ounce of seed will be sufficient for a moderate bed. Some persons do allow their onions to remain in the seed-bed without transplanting, and by picking off the flower-stem as soon as it appears, sometimes obtain very good Onions; but I very much prefer transplanting them, by doing which, on well-prepared ground, better Onions are obtained, many of them not running to seed at all, as they almost invariably do when allowed to remain in the seed-bed.—In *Training Pyramid Pears*, with pendulous branches, the first tier may be about 18 inches from the ground, and it is not strictly necessary that they should afterwards be in tiers, but four or five side branches may be left each season, or more, according to the strength of the tree; the diameter of the tree at the base should depend upon its height; but if this is six or seven feet, then from four to five feet is a proper width: but this is a matter of taste. The annexed woodcuts will give a better idea of their training than any description.



The branches should not be tied in a pendulous position for a year or two at first; unless the tree is growing very vigorously; and the neatest way to secure them is to drive down five or six stakes at equal distances round the stem, and form a hoop by connecting them with cord or walching; to this the lower shoots may be tied with bast, which will last a season.—Dwarf Apples are usually *grafted* on Paradise, and Pears on Quince stocks; but, whether on dwarf or free stocks, they may be kept within the required bounds by root-pruning; the kind of soil has more to do with the choice of stocks than the mode of training to be adopted; for moist land, dwarf stocks are preferable; for very dry situations, the free stock.—*Joseph Paxton.*

Model Cottages.—In your last Number I perceive an article (p. 436), in which the writer animadverts with severity on a design for a mechanic's cottage in Mr. Loudon's Cottage Architecture, as if Mr. Loudon had overlooked or authorised the defects which he points out. Now it is but fair to say, that Mr. Loudon himself had noticed, under the head of "Remarks," the very same things which have called forth the lecture in your paper, even to the approving a single cottage rather than a double one. Your correspondent's paper, therefore, I conceive, ought not to have been sent to you for admission, for two reasons: the first, that its remarks had been anticipated; the second, that the author of them should not have attacked Mr. Loudon with weapons which he had borrowed from Mr. Loudon, and then turned against him.—*Amicus Loudoni.*

Training Forest Trees to Supersede the Necessity of Lopping, Mutilating, or Pruning.—After what I have before stated on this subject, I am astonished that "Quercus" should still persist in condemning my system, having, as he acknowledges, never seen it practised nor described; and further, he hopes "I will now give in," as he perceives that "my opinions begin to waver." Mine, however, are not merely opinions, but natural truths derived from experience. He says the principle he set out with, was the "reciprocity between the root and head;" the roots we cannot see, but I believe the roots are increased in proportion to and from the branches; with this I perfectly agree. Further, he says, in page 380, that your leader has completely superseded the necessity of his reply to my observations, they are so convincing that "I must now give in." Had "Quercus" perused my publication, which he ought to have done before he cast so many doubts upon it, he would have seen the principles and proofs from actual experiments, which he says are so convincing, when coming from another pen in the leader alluded to, and almost in the same words, with diagrams or woodcuts nearly similar. As an act of justice to me, I would, therefore, beg "Quercus" to procure my publication, and look into Chapters 3, 6, 7, 8, and 10: he will there find, fully described, the use of the branches and leaves, as the cause of the increase of the girth, and, by proper regulation, the height of the tree, even to the stopping of the young shoots with the finger and thumb. Were this begun and followed up from the infancy of the plants, as I have so frequently recommended, there would be no necessity for lopping and mutilating, nor would much pruning be required. There is no wavering on my part, for what has been advanced as the true principle of pruning in the article alluded to, and which is to make me "give in," is exactly my system brought forward in a fresh form. The altering my term from "pruning forest trees," to the "training or preventive system," has been the means, I verily believe, of bringing out this "no-pruning system." I have been long convinced, as I have before remarked, that I had used a wrong term, from the evil effects of Pontey's system, which, I am sorry to observe, is still extensively practised. If "Quercus" should feel a desire to see my publication, I could inform him where he may procure one, as it is nearly out of print. I should be glad of a private communication if agreeable.—*W. Billington.*

The Laburnum.—In answer to your correspondent "Omikron," I beg to state that I have some hundreds of Laburnums in plantations, to which cattle have had access for many years, and I have never known or heard of any evil happening to them in consequence; though I have, for other reasons, excluded cattle from most plantations, yet I have some in which they have free access to the Laburnum trees, one or two of which are within reach of sheep. That the seeds are poisonous to man I have learned from experience, having once made myself very ill when a boy by eating some; the effects were those of narcotic poison.—*P. C.*

The Portugal Laurel.—This tree has exhibited, in many instances, a remarkable feature in its physiology, in the bending down of its branches to the earth, and their rooting in the manner of the Pandanus candelabrum and others. There is a good example of this phenomenon at Sudbury Hall, but the most remarkable fact of the kind I ever witnessed was at Penjerrack, near Falmouth, in Cornwall. This tree covered an immense space, and the rooting branches formed an impenetrable thicket.—*J. Murray.*

The Banksian Rose.—May I add, in confirmation of Mr. Frost's statement, as to the best season for pruning the Banksian Rose, that I have a white one which covers a great space of trellis-work in the greenhouse, and which has every spring, for the last five years, been covered with bloom? I have pruned every season either the last week in June or the first week in July; this year it has been the admiration of all who have seen it.—*D. Burton, Ditton Park.*

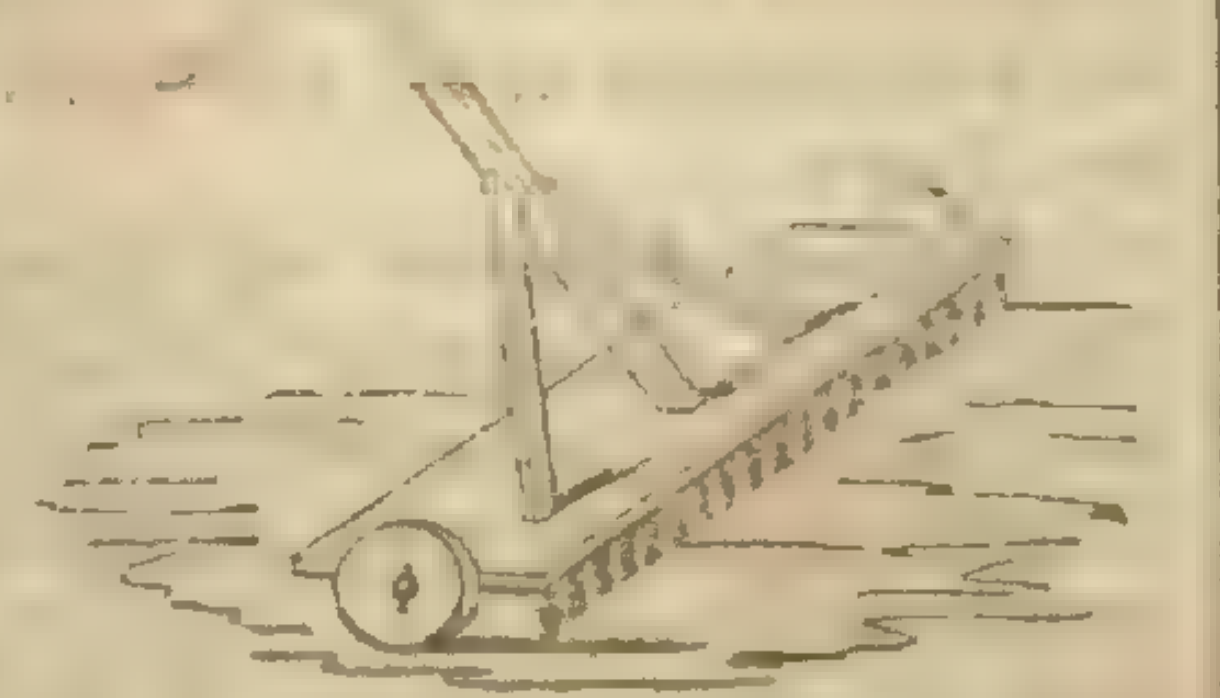
Curious Instance of Vitality in a Noisette Rose.—During the summer of 1841, I observed a Noisette Rose-tree, which is naturally a free-growing variety, to become stunted, having only produced two shoots of a yellow tinge, about eighteen inches long, from the extremity of each of which a bunch of flowers, of a pale and sickly colour, depended. For some time I was unable to account for its unhealthy state, and attributed it to the soil being unsuitable for it. As I was determined to ascertain the cause of the disease, I examined the stem closely; and to my astonishment, I perceived that for about twelve inches above the soil it was quite dead, being hard and brown throughout, without even a particle of the bark showing signs of vegetation; but where the branches forked, two white excrescences, about the size of a marble, had been formed; these were ready to throw out shoots, and were evidently trying to make an impression upon the mortar of the wall. I applied fine earth to the roots, and in about three weeks obtained two healthy young plants, which are now flourishing in my garden. This curious effort of nature may be common, but I have never before observed it. Is not the above fact a proof of how large a portion of nourishment plants and trees take up by their leaves? The Rose-tree in question must have been existing many days without deriving any sustenance from the roots. The circumstance I have related is much in favour of a plan, which I, as an amateur, have always adopted, though in opposition to the opinion of practical gardeners, namely, that of watering my flowers in the evening during hot and droughty weather; although I felt convinced that the roots could derive but little benefit from the operation, the small quantity of moisture not penetrating half an inch into the ground.—*W. W.* [This is analogous to what happens in such Apples as the Bur-knot, in the Vine in a damp hothouse, and to the Common Laurel in dark, damp situations. The stem of the Rose was, no doubt, alive in the centre long after it appeared dead on the outside, and even then it probably conveyed *some* fluid upwards from the soil, which the excrescences, by virtue of their root quality, were able to take up.]

Moss Roses.—I have been quite at a loss to account for Moss Roses, when highly cultivated, losing their moss; this I find often the case. I at one time thought that the moss was the result of high culture. Can you oblige your readers with a few words on the subject?—*Rosa.*—[Nothing is known to physiologists upon this subject. The mossiness is supposed to be a diseased structure; but whether induced by low diet, or high feeding, or neither, is unknown.]

Stratiotes aloides.—The multiplication of this singular aquatic is truly wonderful. One or two plants being brought from a considerable distance (Ormskirk, if I remember right), were incidentally thrown into a pool near Preston, in Lancashire, several years ago; I may safely say that these have now become thousands. They appeared to me almost entirely to monopolise two ponds, to the exclusion nearly of all other aquatics. A plant of the Water Aloe cost, if I mistake not, the late Lord Vernon half a guinea, and it has already cost the present Lord more than a hundred pounds to get rid of its progeny.—*J. Murray.*

Mills' Improved Pits.—I beg leave to contribute my testimony to the superiority of the above pits over every other which I have seen constructed for the growth of Cucumbers and Melons. My employer last autumn erected two pits according to Mills' improved system, one of which was 42 feet long, in four divisions, of three lights each; the other was 26 feet in length. They both answer admirably, and it is surprising how quickly the Cucumber plants grow in them. I have not the least difficulty in obtaining a good crop of Melons, as upon an average ten or a dozen fruit set upon each plant. I doubt not but it is adapted for the growth of Pines as well as for Cucumbers and Melons.—*E. Jones, Bentham Hill, Tunbridge.*

Turnip Fly.—Mr. Read's observations upon the Mite which infests the Brassica tribe are very just; and I have observed them in great quantities on the seed, and particularly upon that which has been kept in paper. It is a good plan to preserve the seed in drawers in a dry room, and to sift it frequently. It often happens when the seed is sown, that the fly destroys the plants as soon as they make their appearance; and I know a farmer in the north of England, who sowed a field of 60 acres with Turnips, which came up very well. In the course of the following week he perceived that the seed-leaves were becoming spotted, and by the next morning he found that half his crop was gone; and after another day and night the whole of his Turnips were destroyed. I therefore send you a receipt which may perhaps be useful to your readers:—Procure a deal plank, one inch and a half in thickness, six feet long, and one foot broad, with the under side planed smooth; a little wheel should be affixed to each end, about the size of those on garden chairs; and it should have a handle to draw it by, similar to that of a truck. Beneath the back part of the board some holes should be pierced, to admit some feathers from a fowl's wing. The under side of the board should then be painted pretty thick with white paint; and by drawing the board as level as possible over the Turnips, the brushing of the feathers behind throws up the fly, which sticks firmly to the paint. One of this size will be large enough for a garden; but for a field, the board should be larger, and drawn by a horse, and will require to be painted every time of crossing the field. This operation should be performed when the sun is shining powerfully; and the board should be cleaned after being used. The accompanying diagram will give some idea of the machine. The ground should be rolled previously to the seed coming up.—*Wm Bromby.* [This correspondent confounds the Mite with the common Turnip-fly (flea).]



Insects injurious to Ash-Trees.—A correspondent in the *Chronicle* (p. 269) has made some inquiries respecting the insects which are injurious to the Ash-tree; and my recent journey into Cheshire has given me an opportunity of gratifying his curiosity. There is scarcely a tree of this description in the vicinity of Northwich which is not showing symptoms of decay in consequence of the depredations of an insect of the Coleopterous order, nearly allied to the Scolytus Destructor, which a few years since proved so injurious to the Elms in the neighbourhood of London. Like it, this little beetle pierces the bark, in the inner part of which it forms a horizontal passage; and at right angles to this passage, on both sides of the same, the larvæ form other minute cavities, nearly parallel to each other. The name of this insect is Hylesinus Fraxini; its colour varies from slate to chesnut; the head is depressed, the antennæ clavate, and the elytra striated and dotted. The larvæ are small fleshy grubs, with white bodies and chesnut heads. Its nature and habits are so similar to those of the Scolytus, that the same means would probably be equally effectual in destroying both. It has been recommended in the case of the latter to cover the tree with a mixture of tar and train-oil in March, to a certain height from the ground; corrosive sublimate and turpentine have also been mentioned as a probable prevention of the mischief; but as I have not had an opportunity of proving their good effects in the present instance, I can by no means speak with certainty as to the eligibility of such applications. Another insect that has of late years done much damage to Ash-trees in Staffordshire, is the larvæ of the Cossus ligniperda, or Goat-moth, which bores passages in the alburnum, of the size and appearance of auger-holes, from which they have here received the name of "auger-worms." I am not acquainted with any other insects besides the above which are peculiarly detrimental to Ash-trees.—*O. Mosley, Rolleston Hall.*

FOREIGN CORRESPONDENCE.

Launceston, Van Diemen's Land, 30th Nov., 1841.—Subjoined are remarks upon the state of the weather for a number of years in one of the central districts of this colony. The observations were made by a person upon the accuracy of whose statements perfect reliance may be placed. The table is condensed from a somewhat diffuse manuscript; and it will be seen that the range of the thermometer has been taken for the concluding three years only; it may, however, furnish data sufficiently accurate to determine the nature of the climate, and may possibly guide your deductions in reference to the habitat of plants of which you may possess specimens from the locality referred to, or be indirectly useful in drawing a comparison between the climate of this and a corresponding region in your northern hemisphere. The average monthly temperature will show that the climate is well suited to the cultivation of any plants which will thrive in the gardens of Britain; whilst the recurrence of frosts at the elevation of Jericho will demonstrate that neither care nor skill can guard against occasional and serious injury to horticultural produce; so hazardous indeed have the contingencies been found, that some occupiers have abandoned the cultivation of most of the fruits, except, perhaps, the Gooseberry, Currant, and a few varieties of Apple, and of the more tender sorts of vegetables. On this, and on the southern side of the island, the temperature is by some degrees higher, and summer frost almost unknown: consequently our gardeners have every inducement to exertion; the formation of two Horticultural Societies has given rise to a spirit of emulation, from which much may be expected, although it appears to operate more upon the amateurs than the professional class.

Remarks on the Weather at Jericho, Van Diemen's Land, Lat. 42° 25′ South, Long. 147° 20′ East; elevation 1,260 feet, according to Wollaston's boiling point of water Apparatus, and a mountain Barometer used by Count Streleski.

	Months.	Monthly average of days on which it Rained.	Monthly average Days' Snow.	Monthly average Nights' Frost.
Years 1826 to 1840.	January	5		2 in 3 years
	February	5		1 in 14
	March	7	1 in 14 years	1
	April	5	1 in 7 years	2
	May	6½	1 altern. yrs.	4
	June	6½	2	6
	July	7	2	7
	August	6	2½	4
	September	7	1	3
	October	8½	3 in 4 years	3 in 4 years
	November	8	1 in 2 years	4 in 5 years
	December	5¾		1 in 2 years

REMARKS.—During this period of 14 years the greatest number of days on which it rained—90 in 1832; least do., 59 in 1833; greatest do. snowed, 15 in 1837; least do., 3 in 1826. On the 3d January, 1832, the severest frost remembered destroyed all the crops in the district; on the 10th, the same month and year, the thermometer stood at 122° in the sun, and on the 19th at 118°! In June same year 5 nights' frost, and in July 6 nights' frost *. On 6th and 8th Nov., 1833, thermometer 110° in the sun; 1st and 4th same month low lands flooded; on 16th deep snow.

Range of thermometer for three successive years; observation taken at 8 o'clock, p.m.; the glass under cover, but exposed to influence of air:—

Months.	1837.			1838.			1839.		
	Max.	Min.	Mean.	Max.	Min.	Mean.	Max.	Min.	Mean.
January	72	50	61	74	54	64	66	50	58

October	55	44	49.5	60	46	53	64	44	54
November	68	46	57	62	46	54	62	48	55
December	83	54	68.5	78	50	64	65	50	57.5

REMARKS.—On 12th Nov., 1837, a frost occurred similar to that of 1832. On 5th Nov., 1838, very severe frost, cut off all the fruit, and injured Turnip crop. On 5th Nov., 1839, frost similar in severity to that of previous year. On 24th of same month, highest flood remembered for many years.

PROCEEDINGS OF SOCIETIES.

MEETING
OF THE BRITISH ASSOCIATION AT MANCHESTER.

[BOTANICAL SECTION.]

As might have been anticipated from the early period at which the Association met this year, very few botanists were present. The following is a list of the officers and committee of this section:—

President.—The Hon. and Very Rev. Wm. Herbert, LL.D., F.L.S., Dean of Manchester.

Vice-Presidents.—John Richardson, M.D., F.R.S.; John Moore, F.L.S.; Sir Wm. Jardine, Bart., F.R.S.E.; the Bishop of Norwich, P.L.S.

Secretaries.—Edwin Lankester, M.D., F.L.S.; Robert Patterson, J. A. Turner.

Committee.—Professor Royle, G. T. Fox, F.L.S., H. E. Strickland, Professor Owen, John Blackwall, F.L.S., Capt. Brown, Professor Daubeny, John E. Gray, F.R.S., Richard Taylor, Sec. L.S., C. C. Babington, F.L.S., Rev. W. Scoresby, F.R.S., Count Von Keyserling, Dr. Roget, Sec. R.S., Arthur Strickland, Rev. J. B. Reade, F.R.S., B. Maund, F.L.S., E. Charlesworth, F.G.S., J. Alder, G. Webb Hall, H. Denny, Dr. Fleming.

We shall select from the proceedings that which we think may be interesting to the readers of the *Gardeners' Chronicle*.

Thursday.—Mr. BABINGTON read a report from a committee appointed to ascertain the best substances for preserving animal and vegetable matters as preparations for museums, &c. The result of the experiments hitherto performed by the committee had been to prove that none of the solutions of simple salts of potassa, soda, &c., were good preservers of either animal or vegetable substances. The best preservatives were found to be arseniate of potassa and bichloride of mercury. Naphtha, also, and naphtha and water, in the proportion of one part of the former to seven of the latter, had also preserved specimens well. The greater number of experiments had been made on animal matters; but those substances which preserved animal matters best, also preserved vegetable matters best.—Dr. RICHARDSON stated that he had used Goadley's solution, but he had not found it answer so well as spirits of wine; and he thought nothing had as yet been proposed that was a good substitute for this agent in the preservation of animal and vegetable matters.—Dr. LANKESTER said that the best mode he had seen employed of preserving animals for dissection for a length of time, was injecting their arteries and veins with a solution of arseniate of potass and bichloride of mercury, and placing the whole in a strong solution of common salt. He pointed out the fact that substances, both animal and vegetable, when kept a long time in solutions of salts, often had crystals of the salts deposited in their tissues, which might mislead the microscopical inquirer, if he were not aware of the fact.

Mr. MOORE, of Manchester, exhibited some specimens of parasites on fishes; which was followed by a discussion on the causes of parasitic beings, on both plants and animals.—Dr. LANKESTER believed that, where parasites appeared in large numbers, the animal or plant on which they appeared would be found to have been previously in a state of disease. In cases where crops had been attacked with plant-lice, or blight, he had observed previously a sickly state of the plants. This might in general be traced to meteorological changes.—Mr. WEBB HALL stated that it was very well known that previously to the attacks of blight, &c., a sickly state of the plants was first observed; and he believed this depended on the state of the atmosphere.—Mr. E. SOLEY, jun., thought that atmospheric changes might produce a state of disease in plants; but he was anxious to know if the inorganic manures that had been lately used, as nitrate of soda, gave any tendency to mildew, &c., in the plants. He was lately struck with the fact that solutions of sulphate of copper favoured the development of fungi.—Mr. BABINGTON, of Cambridge, had lately seen two parcels of corn, one of which was manured with nitrate of soda, the other without anything; and that which had the nitrate of soda was entirely destroyed by mildew, whilst the other was in a comparatively healthy state.

Friday.—A paper from Mr. COUCH was read to the section, containing the times of the flowering of plants, the arrival of birds, &c., in certain districts of Cornwall. This paper was drawn up in compliance with a request made by Mons. Quetelet, of Brussels, at the last meeting of the British Association, in order to enable Mons. Des Longchamps to ascertain whether any and what relations existed between the phenomena of the organic world and the physical changes that are going on in the atmosphere, and on the surface of the earth.

Mr. H. E. STRICKLAND read the report of the committee appointed to investigate the growth and vitality of seeds. The operations of the committee had been of two kinds: first, procuring seeds of great age, and planting them; and secondly, preserving seeds, in order to be planted at a future time. Under the first head, it was reported that none of the seeds obtained from old herbaria, and various other sources, had grown when planted. Some of the seeds preserved had been planted, and amongst these it was found that of seeds gathered in 1835-36-37, the greater proportion had failed to grow when planted in 1841. The mode followed in preserving the seeds had been to enclose them in brown paper, and place them in jars, opened at one end, surrounded by sand. The committee requested the contribution of ripened seeds, with the date of their being gathered, as also specimens of soil, &c., in which old seeds were supposed to be contained. A long discussion ensued on the reading of this report, and many instances related of the great length of time that seeds retained their vitality. Mr. C. C. BABINGTON doubted altogether the fact of seeds from Egyptian tombs having vegetated. The Arabs were in the habit of selling these seeds to Europeans, and previously deposited them there. He had investigated several of these statements, and found reason to doub them. The PRESIDENT and Mr. A. STRICKLAND related instances in which, after the cutting of a canal, the banks were covered with the common rape, which had not grown there before. Mr. H. STRICKLAND said, that frequently in new cuttings, &c., a soil was thrown up which suited a plant, and seeds already there, or carried there by the wind, &c., would immediately commence growing. In these cases it was necessary to examine the soil, to ascertain, if possible, the presence of the seed. If this was not done, all these facts must be set aside, as tending to prove the great vitality of seeds. Dr. LANKESTER thought the negative indications given by the seeds from herbaria as of no value, as seeds obtained from this source would be, in almost every case, exposed to circumstances unfavourable to the retaining their vitality. The inquiries of the committee would be interesting in connexion with the character of the seed, as related to the embryo and albumen. It would be undoubtedly found that the quantity and quality of the albumen would influence, to a great extent, the powers of vitality of the embryo, which it in many instances enclosed.

Saturday.—Professor ROYLE read a paper on the cultivation of the various species of the Cotton-plant in India. After enumerating the authors that had described the species of Gossypium, he stated his belief that they might all be reduced to four, viz., two indigenous to the East Indies, *G. arboreum* and *G. herbaceum*, and the two cultivated and indigenous in America, *G. peruvianum* or *acuminatum*, and *G. barbadense*. He pointed out the varieties of these species, and the changes which they underwent by being grown in different soils. He then went into an examination of the causes of the inferiority of the Indian Cotton to that brought from America, and traced it to the much greater care and labour bestowed on the cultivation of the Cotton in America than in India. The author pointed out the difference of the soils in which the Indian and American species grew; and stated that although the American species would not grow where the Indian did, yet there were plenty of soils in India on which the American species would grow. Experiments were now being made in several parts of India, under the superintendence of American Cotton-growers, to grow Cotton there for the British market. The last accounts from these experimental farms were of the most satisfactory nature; and Dr. Wight, in a letter written as late as last March, to Dr. Royle, stated his belief that next year India would send to Britain 1000 bales of Cotton fit for the Manchester market. Dr. Royle concluded his paper by exhibiting specimens of the Cotton of the American species grown on the farms of India.—Several Manchester manufacturers were present, and pronounced that one of the specimens on the table, grown at Cawnpoor, was equal to any of the American-grown Cotton brought to their market.—Gen. BRIGGS expressed his great satisfaction at the result of the experiments in growing Cotton in India; and pointed out the superiority of the north-western districts of India, for the growth of American Cotton, over those of the south; and hoped that no want of success in the latter would induce the present experimenters to abandon the former. He went into some calculations to prove at how great advantage to this country Cotton might be cultivated in India.—Mr. BAZLEY said that such Cotton as he had seen this morning, at a low price, would be the means of setting again at work the looms of the Manchester Cotton-spinners,

Monday.—Mr. WEBB HALL read a paper on the means of promoting the growth of plants. In this paper the author detailed the general principles on which the application of manures should depend. He pointed out the necessity of carbonic acid to the growth and development of plants, and stated that the greatest desideratum in manuring plants was some substance that, by a slow combustion (*eremecausis*) should afford this gas in the greatest abundance to plants. This he thought had been secured by Mr. Daniell's new manure, which principally consisted of lignine combined with bituminous matters and ammonia.—Dr. DAUBENY stated that, as the agriculturists had in a manner undertaken to supply the country with food, it was their duty to seek to supply it in the largest possible quantity. In the early periods of man's settling on a soil, he found the earth stored with sufficient manure. In the course of time he had to supply it from without with animal manure; and when cities began to rise, it was necessary, in order to produce enough food for their inhabitants, to supply the earth with artificial manures. There was no antecedent improbability with regard to the success of artificial manures like Mr. Daniell's, and it was from such sources that great improvements must be looked for.—Dr. PLAYFAIR observed that he thought Daniell's manure would be better without the bituminous matter, as it was known to be injurious to plants. The carbonic acid would be formed in just as large quantities and just as well without it.—Dr. LANKESTER thought that this manure might fail on many soils. It evidently did not contain all the ingredients necessary for the nourishment of Wheat; these ingredients were probably present in the soil on which the experiments were made, and would not be in another soil: and the manure would thus become a failure. It was stated at one time that sulphur was an ingredient in this manure. He thought this an important agent in organic processes: it was almost constantly present in small quantities in organic bodies. It was probably introduced into plants in the state of sulphuretted hydrogen. The decomposition of the sulphates in contact with vegetable matter would supply this gas in almost every soil.—Mr. EDWARD SOLLY, junior, would not reject the bituminous matters from this manure. They might act mechanically, which was of great importance in the soil. Liebig had stated sulphuretted hydrogen to be injurious to vegetation in any quantity; he believed a small quantity might be necessary. Beans and Peas which he had watered with water impregnated with sulphuretted hydrogen grew well. Cruciferous plants flourished uncommonly well on dunghills that gave out sulphuretted hydrogen.—Professor JOHNSTON, of Durham, thought that Daniell's manure might be a failure on many soils. It did not contain all the ingredients necessary for nourishing Wheat. Sprengel had pointed out the value of the sulphurets as manures, which acted beneficially most probably by giving off sulphuretted hydrogen. There were very few soils in which sulphuretted hydrogen was not present, and it probably arose from the cause referred to by Dr. Lankester.

The Rev. J. B. READ wished to call the attention of the section to the use of the microscope in detecting salts, both in rain-water and in plants. He had succeeded thus in detecting ammonia in rain-water. He also thus found that the interior of the cells of cellular tissue were lined with a coating of various kinds of salts.

Dr. PLAYFAIR read the report of Professor Liebig on the Application of Chemistry to Animal Physiology.—Mr. WEBB HALL proposed a vote of thanks to Professor Liebig for his report.—Dr.

---

* Our readers will remember that June and July are the winter of Van Diemen's Land.

Daubeny seconded this motion, and in doing so referred at some length to a review of Professor Liebig's last report to the Association, which had been written by Dr. Schleiden, and had appeared last week in the *Gardeners' Chronicle*. He did not agree with that review, and thought its tone too severe and reprehensible. Professor Liebig had perhaps fallen into some errors; but every one must allow that to him organic chemistry was more indebted than to any man alive.—Dr. Playfair returned thanks in a speech highly laudatory of his friend and tutor Dr. Justus Liebig.

The Rev. J. B. Read read a paper on the fallacies of Liebig's theory of fallows. Liebig had stated that the advantage of a fallow was, that it allowed a certain quantity of alkali to be disintegrated in the soil, that was necessary for corn crops. If, however, the Leguminosæ were planted as fallow crops, they would do no harm, "as they are remarkable on account of the small quantity of alkalies or salts in general which they contain." The author did not dispute the correctness of the theory of fallows, but of the practice with regard to it. He had found that Leguminosæ contained a large quantity of alkaline matters, especially potassa, which Liebig had denied they contained. He then detailed the experiments by which he had concluded that Clover, Beans, Peas, &c., contained potassa, and recommended that they should not be planted as fallow crops.—Dr. Playfair doubted the correctness of Mr. Read's experiments.—Professor Johnston believed Mr. Read was correct. He had no doubt that the Leguminosæ contained potassa, and that Liebig's theory was wrong. Sprengel's analyses proved that green crops contained both potassa and soda.

Tuesday.—Dr. Daubeny related the following occurrence:—An Aloe began to throw up its flower-stem in May 1841. The first blossoms opened about the end of July, and it went on flowering till October. Several suckers were removed from the plant, after the blossom was over, and one which grew on a kind of underground stem, perhaps two feet and a half long, which had apparently been lengthened in seeking for a convenient place to reach the light, had three buds at the end of it. This was planted, and in May 1842 one of the buds opened in the form of an imperfect flower, having some green leaves, with spines on the edge, as in ordinary leaves, and others approaching to the form and colour of true petals, and two perfect stamens, with anthers and farina, and others distorted.—Dr. Lankester observed that this was an interesting specimen of regular morphosis, especially as it had occurred in the Aloe. This development of the flower had arisen from the want of that supply of nutriment which the sucker had received when on the parent plant.

Mr. H. G. Strickland exhibited specimens of a Medick of very rapid and large growth, which he had obtained from the Ionian Islands. He thought it would answer for cultivation as a green crop.—Mr. Babington pronounced the plant to be the Medicago maculata. It was not uncommon on the sandy sea coasts of Great Britain.

Mr. Edward Solly, junior, called the attention of the section to specimens of diseased bark from Ash-trees. He stated this disease was producing the greatest ravages amongst the Ash-trees of Cheshire. The disease seemed to invite the attacks of an insect which was everywhere found in the diseased parts. He also exhibited the larvæ of the Cossus ligniperda, which attacks the Oak-trees. Mr. Babington stated that the insects of the Ash-tree were the Anobium striatum and the Hylecætus fraxini. These insects were not at all the cause of the disease in the trees, but preferred living in diseased trees.

HORTICULTURAL SOCIETY.

July 5.—Sir C. Lemon, Bt., M.P., in the chair. M. Bell, J. Giles, T. Pakenham, and J. E. Winterbottom, Esqrs., were elected Fellows. On account of the near approach of the Garden Exhibition, the subjects shown were necessarily few. Mr. Mills sent a brace of handsome Cucumbers, cut from plants raised from cuttings, to show that such will succeed as well during winter as other plants raised from seed. The fruit exhibited were produced from cuttings struck in Oct. 1841, the fruit of which were shown at Ipswich on the 8th of Feb. last, and also on the 25th of May, being pronounced by the Judges the best Black Spine Cucumbers exhibited. They were grown by Mr. Mills in one of his improved pits, and clearly evince that plants raised from cuttings are equally productive with those raised from seeds. From Mr. Green, gr. to Sir E. Antrobus, were Scyphanthus élegans, a climbing plant, with bright yellow flowers, formerly called Loasa volúbilis: a Calceolária raised from imported seed, said to be sweet-scented, but its perfume (if it has any) is scarcely perceptible; it bears considerable resemblance to a badly-grown specimen of Calceolária arachnoidea; and two seedling Cacti, one with small, the other with large flowers, having much the appearance of C. Ackermanni. From Mr. Brown, of Hampstead, five seedling Fuchsias: one, named Prince Albert, seems to be a prolific bloomer; but they were all too much like other known varieties to prove very attractive. Mr. J. D. Parks likewise sent two seedling Fuchsias, which possessed the same fault as the preceding; and a seedling Pelargonium, of a lilac colour and a large size, but deficient in those properties which constitute a good flower. From the Garden were a collection of Orchidaceous and other plants, amongst which Miltónia spectábilis stood conspicuous: the flowers are large and produced singly; the perianth is white and the centre of the labellum dark purple, which becomes gradually lighter towards the margin; this species is well worthy of a place in every selection of Orchidaceous plants, on account of the beauty of the flowers, and the length of time which they will continue in perfection, sometimes, in a warm and moist atmosphere, remaining unimpaired for six or eight weeks; there were also two pans of Brachycome iberidifólia, with violet-coloured aster-like flowers, one of the best annuals of recent introduction; Rondelétia speciosa, a handsome stove plant, producing dense clusters of bright and orange blossoms, and Statice mucronata, of a pale lilac colour, which deserves to be more generally cultivated. Besides these, there were cut flowers of Triptilion spinosum, a half-hardy biennial, introduced some years since from the mountains of Chili; since which time it has been lost to the country and again restored; the blossoms are of a rich deep blue, and the leaves are of a prickly nature; the plant not only requires protection during winter, but appears to suffer from the heat of summer, and it should, therefore, be kept cool and moist during the latter season. Pentstemon gentianoides coccinea, with flowers of deep crimson; Potentilla insignis, of a bright yellow; a collection of Verbenas, amongst which were some excellent varieties of V. teucrioides, and a collection of Roses, were likewise from the garden of the society.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

June 29.—H. Handley, Esq., President, in the chair. The Earl of Powis was elected a governor, and 80 gentlemen members.—The council decided on the prize sheet for next year at the Derby meeting, and resolved that all certificates and entries should be delivered by the 1st of June; the president called attention to the appointment of judges for the show at Bristol, when all present who intended to be competitors on that occasion having left the board-room, the remaining members proceeded to nominate the judges for the particular departments of the exhibition. Professor Royle presented some seed of the Khelat Lucerne; W. Vaughan, Esq., transmitted a packet of Wheat from the Sandwich Islands, the produce of seed left there by Vancouver; G. Pryme, Esq., M.P., sent half a bushel of a new kind of Cole or Rape seed; and the proprietors of "Bell's Weekly Messenger" presented the scarce numbers of that journal to complete the society's copy; for which the council voted thanks. The report of the Bristol committee, and a communication from Professor Sewell in reference to a lecture at the Bristol meeting, were read.

BOTANICAL SOCIETY OF LONDON.

July 1.—J. E. Gray, Esq., President, in the chair. The following donations were announced:—Specimens of Lastræa cristata (Presl), collected at Holt, in Norfolk, presented by the Botanical Society of Holt. Specimens of Gelidium rostratum (Harvey), collected at Aberdeen by Mr. G. Dickie, and presented by him. British Plants had been received from Lady S. Windham and Mr. F. Robins. Seeds from the Cape of Good Hope, from Mr. R. Phillips. British Mosses from Mr. J. F. Hellings. Various Specimens of Plants and Specimens of Woods, purchased at the sale of the Botanical Museum of the late A. B. Lambert, Esq., and presented by some of the Members. Donations to the Library were announced from the Imperial Academy of Sciences, the American Philosophical Society, and the Academy of Sciences, Philadelphia. Mr. T. Twining, Jun., exhibited a collection of cultivated specimens from Twickenham. Mr. T. Sansom communicated a paper, being "Notes on an excursion taken by some of the Members of the Society into Kent, in June last, and containing a list of the plants observed."

FLORICULTURAL SOCIETY.

July 5.—Mr. Wildman in the chair. Mr. Day, of Oxford, sent three seedling Fuchsias, named rósea élegans, rubra, and Vivid, for the opinion of the society, which was as follows:—"That the blooms were large, but coarse, and possessed that sameness of colour which pervades most of the varieties lately raised."

LAUNCESTON (VAN DIEMEN'S LAND) HORTICULTURAL SOCIETY.

March 9.—This meeting was held at the society's rooms, and was numerously attended. The display of fruit was particularly good; the principal prizes being given for Hothouse Grapes; Early Newington Peaches; Nectarines; Coe's Golden Drop; Magnum Bonum and Green Gage Plums; Jargonelle, Gansell's Bergamot, Crassane, Brown Beurrée, and Swan's Egg Pears; Ribston Pippin, Court of Wick, Alexander, Nonpareil, Nonsuch, Golden Harvey, and various other Apples; Black Rock, Cantaloupe, and Water Melons; White and Red Currants, and Barberries. The flowers consisted chiefly of Balsams, Dahlias, Roses, Cratæguses, and Cape Bulbs. Among the Vegetables were the Italian and common Vegetable Marrow; White Spanish and Madeira Onions; Savoy and Red Cabbages; White Beet; Red and Black Potatoes; Carrots, Capsicums, Tamatoes, Pumpkins, and Cucumbers. The prizes were chiefly won by the Rev. R. Davies, and Messrs. J. Bonney, J. Cox, S. Smillie, T. Bartley, J. Reid, S. Henty, J. C. Underwood, and J. Gleadow.—*Launceston Examiner*.

COUNTRY SHOWS.

Tamworth Royal Horticultural Society, June 26.—The second meeting of the Society was held at the Town Hall, and a finer display of Pinks and Roses has seldom been witnessed, upwards of 300 being staged for exhibition; but we still have to lament the want of support from gentlemen who have stoves and greenhouses. The Society are under great obligations to R. Green, Esq., who kindly contributed to decorate their table. The prizes were awarded as follows:—The Adelaide Prize: *Cornucopia*. R. Greene, Esq. Heaths, Mr. Holmes. Fuchsias: Mr. J. Bramall. Pelargoniums: *Collection*, R. Greene, Esq. *Nosegay*: 1, Mr. R. C. Browne; 2, Mr. Garry. Roses (*Dark*): 1, Prince Charles, Mr. Holmes; 2, George the Fourth, R. Greene, Esq. *Light Red*: 1, Princess Royal, Mr. Holmes; 2, Brennus, R. Cook. *Lettuce*: J. Kitchen. *Shallots*: do. *Garlic*: J. Evorall. W. Bird's Prizes: *For best Collection*: 1, T. Cook; 2, T. Johnson.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Barke'ria specta'bilis. Showy Barkéria. Orchidáceæ. Gynándria Monándria. (*Stove Epiphyte.*)—Under the name of Flor de Isabal, this beautiful plant forms one of the votive offerings of the Guatemalese. Mr. Skinner long since sent living plants to England, and more recently Mr. Hartweg, one of whose specimens has just flowered in the garden of the Horticultural Society. It forms a tuft of cylindrical stems about four or five inches high, each of which bears two fleshy lanceolate acute leaves, separated from each other by intervals of about an inch. The raceme rises out of some brown dry sheaths, and in the plants that have flowered bears about six most lovely nodding blossoms: but according to Mr. Skinner's account it varies in length from there inches to a foot. The expanded flowers are nearly three inches and a half wide, their colour is a bright lilac; the sepals are linear-lanceolate, the petals ovate-lanceolate in form and unspotted: but the labellum is white at the base and in the middle, lilac at the edge and point, and richly marked with small blood-red spots. Along its middle, below the column, are five purple lines, which pass into three elevated colourless ridges, beyond the place where the anther touches the lip. It is with Cattleyas, and such beautiful plants, that this charming species is worthy to be arranged.—*Bot. Reg.*

Achimenes pedunculata. Long-stalked Achimenes. (*Stove Herbaceous Plant.*) Gesneráceæ. Didynámia Angiospérmia.—The shady woods of Santa Maria, in Guatemala, produced this fine species for Mr. Hartweg, who forwarded it to the Horticultural Society. It blossomed for the first time in September 1841. The flowers of this species are numerous, large, and of a peculiarly deep scarlet, richly marked with rows of crimson spots. It is a good addition to collections. It was introduced at the same time as A. longiflora and A. rósea, and requires much the same treatment as those species. The stems die off after it has done flowering in the autumn, and then the pot in which the bulbs are, ought to be kept perfectly dry until spring, when they should be re-potted in fresh soil, and kept moist. They will soon grow vigorously, and will then require a liberal supply of water. Any light rich soil will suit them, and they may be grown in a house a little warmer than a common greenhouse, but not so hot as a stove. Like the other species it may be multiplied abundantly, either by parting the scaly bulbs in spring, or from cuttings of the young shoots. The period of flowering is during the summer and autumn.—*Bot. Reg.*

MISCELLANEOUS.

Manure for Potatoes.—We find the following important statements in the last number of the "Quarterly Journal of Agriculture," concerning experiments on Potatoes, carried on by Mr. Fleming of Barochan. "All were dunged in the usual manner with farm-yard manure, at the rate of about 30 cubic yards per acre. The Potatoes were all planted on the 25th of March, on the same heavy black soil. The several dressings were applied on the 20th of May, and the Potatoes were all lifted on the 28th September.

No.	Description of top-dressing.	Rate per imperial acre.	Produce per imperial acre.	Weight of produce of 18 yards' drill.	Increase in bolls.
1.	Nothing,		66 bolls	77 lb.	
2.	Nitrate of Soda,	160 lb.	80 ,,	93 ,,	24
3.	Sulphate of Soda,	200 ,,	73 ,,	86 ,,	7
4.	Do. & Nitrate of Soda,	200 ,,	107 ,,	124 ,,	41

Note—The peck is 35 lb. weight, and 16 make a boll or 5 cwt.

"This break of ground consists of a piece of poor clay, mixed with moss, about 9 inches deep; subsoil a very stiff blue till. The dung was old from the farm yard, about the ordinary quantity (30 cubic yards per acre), spread upon the land, and dug in. The Potatoes were drilled in with the hoe; as the ground was wet the plants came up but weak. The nitrate of soda was sown before the other top-dressings, and had remarkably quick effect, as it showed the third night after being sown. The sulphate of soda does not occasion the dark green colour which is seen upon the Potato after the dressing of the nitrate; but there is not the smallest doubt of its beneficial effects, although not in so great a degree as the nitrate. The mixture, which is composed of two-thirds of sulphate of soda, and one-third of nitrate, has a wonderful effect in strengthening the growth (which it keeps longer than with nitrate alone), and the mixture has the same effect in producing the dark green colour as the nitrate alone." Professor Johnston, in remarking on this and similar experiments furnished by Mr. Fleming's gardener, observes: "Those who are the most sceptical in regard to the benefits to be derived from agricultural experiments, when well conducted, will scarcely question the importance of this result—the most backward in making experiments will be anxious to repeat this upon his own Potatoes. The cost of the mixture to be applied, in the quantity used by Mr. Fleming, is as follows:—

Sulphate of soda, 75 lb. dry, at 10*s.* per cwt., or 150 lb. in crystals, at 5*s.*, . .	£0	6	9
Nitrate of soda, 75 lb., at 22*s.*, .	0	14	9
	£1	1	6

The return for this 21*s.* 6*d.*, was in each of the above cases upwards of 8 tons of Potatoes."

Tea of Thibet.—This is of great importance in the trade of Ladakh, and the consumption of it in the country is very considerable, but it is also exported in large quantities to Kashmir and the Punjab. According to information obtained from two intelligent natives of Bisahar, the Tea of that province is of two kinds, green and black. The green Tea is the produce of a shrub which is an evergreen, seldom exceeding 4½ feet in height. It grows both in Bisahar and Kulu on a dry soil, especially near the banks; and in greatest abundance about Jhagul, between Rampur and Sarai. New leaves appear about the end of April or beginning of May, and are gathered from July to November; the peasants cut the smaller branches into pieces and mix them with the leaves, selling the whole to traders. The latter infuse this Tea in hot water for some time, until it has imparted much of a reddish colour to the water, and then throwing away the infusion, squeeze and rub the leaves between their hands and dry them in the sun. They say that if the first infusion were used, it would heat the body and occasion pains in the limbs; but I drank some tea prepared from the leaves which had not undergone this process, and experienced no ill effects. It is not much in request. The black Tea of Bisahar is produced by a deciduous shrub, found near the villages of Asrang and Lipi, about seven days' journey from Rampur and eight from Piti, in a situation more elevated than Jhagul. The leaves are put forth in April, and fall about October or November; they are plucked in July and August, and are sold to traders, being prepared in the same manner as the green; but a colouring extract is in the first instance mixed with them, of which, after the first infusion, enough remains to tinge the water in which the Tea is boiled. The leaves are rolled and dried in imitation of the China Teas. It is not much used by those who can afford to buy the Tea of China, but is very often mixed with the latter by the poorer people. I have drunk of it freely unmixed, and found no inconvenience from its use. The infusion of the green Tea is of a yellowish green colour, with less aromatic flavour than that of China. The black yields an infusion of a dark red colour, but of little flavour. It was the opinion of Mohsin Ali, a wholesale dealer in Tea to a large extent, that the Teas of Bisahar differed from the coarser Teas of China only in the mode of preparing them for market.—*Moorcroft's Travels*, vol. i., p. 350.

Cauliflower Fritters.—Prepare the Cauliflowers and boil them; when done enough drain them, put them in an earthen pan with a dash of vinegar, some salt, and whole pepper. Let them remain for half-an-hour, drain them, dip them in a light batter, fry, and when of a good colour serve up.——*Another way.*—Boil and drain as before; then cut into pieces, an inch and a half long, fry in batter, and serve with grated Parmesan cheese powdered over them.

GARDEN MEMORANDA.

A. Rowland, Esq.'s, Rosenthal, Lewisham.—This agreeable residence well merits the appellation of Rosenthal, or the "Villa of Roses," being decorated on every side with a profusion of that beautiful flower. The principal entrance to the garden is from the drawing-room, adjoining which is a small aviary, which communicates with a greenhouse, chiefly filled with Orange-trees and Balsams. Upon entering the garden the eye is struck with the view of a small temple, to the left of the main walk, supported by light pillars of woodwork, to which, and over whose roof, Roses of different shades of colour are carefully trained. In the centre of this temple, tastefully decorated with shells, is a fountain, which, when set into action, imparts a lively appearance to the scene. Many of the Roses are of the first order, and being sheltered from the winds by the surrounding shrubs, are still blooming profusely. The choice varieties are protected from the sun and rain by a canopy about 4ft. in diameter, composed of canvas, spread over a circular frame of wirework, from the circumference of which extend across at right angles two other wires, bowed upwards, and forming a convex roof, which effectually excludes the wet, and preserves the colours of the flowers unimpaired for a considerable length of time. The whole is supported by an iron stake, firmly fixed in the ground. The principal walk leads from the house beneath several arches, hung with festoons of Roses, to a small piece of water, in which a fountain is continually playing. On the right of this miniature lake a grotto, composed of immense masses of Derbyshire marl, is erected, from which the view of the house and grounds is peculiarly pleasing. From this grotto is a walk, shaded by an avenue of trees, which terminates in a Rose-garden, the extent of which is about two acres; this is planted chiefly with the crimson Perpetual and common Provence kinds, which at this time presented one mass of bloom. Mr. Rowland informed us that he had applied to a portion of them (previously well manured) nitrate of soda, in *small* quantities, and that their growth afterwards was remarkably strong, but this might probably be owing to the manure. The nitrate, however, produced one good effect, which cannot fail to recommend it: the place, which had up to that period been infested with slugs, was, after the first shower of rain, completely cleared of these pests, nor has one been seen since near the spot where the soda was applied. A path through another smaller Rose-garden leads us to two small Vineries; the roofs of both houses being covered by a single Black Hamburgh Vine, which is loaded with an abundant crop in different stages of maturity.—*R. A., July* 4.

Reviews.

Journal of the Royal Agricultural Society of England. Vol. III. Part I. 8vo, Murray.

The first article in the present volume is a sketch, by Earl Spencer, of the improvements at Holkham, of which the following was the earliest cause:—"It happened that the lease of a large part of the land which now forms Holkham Park was within two years of its expiration. In the lease previous to the one then current this land had been let at 1*s.* 6*d.* per acre; on the then current lease it had been raised to 3*s.* Lord Leicester offered to the tenant to renew it at 5*s.*; but Mr. Brett, the tenant, who deserves to have his name recorded for the great good he unintentionally did to the country, refused to give so much for the land; upon which Lord Leicester determined to take it into his own hands." This land, for which Mr. Brett refused to give 5*s.* per acre, now, under an improved system of management, produces nearly 4 qrs. of Wheat per acre. "The lease having expired in 1778, Lord Leicester commenced farming." It may be inferred that for several years he did not meet with much encouragement from success, since "Wheat was first sown on the farm in 1787. At that time the agriculture of the kingdom was recovering from a state of great depression, and consumption was on the increase in consequence of the stimulus given to the trades and manufactures by Mr. Pitt's treaty of commerce. Similar causes were producing similar effects in France. About a year afterwards, Arthur Young noted that the price of the 4 lb. loaf of wheaten bread was 10*d.* in Picardy. The discontent occasioned by this rise of prices led to the annihilation of French commerce and manufactures. Fortunately this danger was warded off from our own, and during a quarter of a century the two countries exhibited a perfect contrast. The expense of making the barren wastes of Norfolk, Lincolnshire, and other counties capable of producing 4 qrs. of Wheat per acre was fully remunerated by high prices; whether without them the same improvements would have taken place generally, is doubtful. The example of the Earl of Leicester might have been as ineffectual as had been that of Duhamel in France, where Arthur Young found his drills and other implements stored away as curiosities. Lord Leicester was fortunate in possessing upon his estates a most "effective source of fertility, which, under his management, was adopted to a much greater extent than it hitherto had been. The surface soil of the whole district is a very light sand, but nearly throughout it there is a stratum of rich marl at various depths underneath. Pits were opened, and the marl dug out and laid upon the surface. This not only increased its fertility, but gave to the soil the solidity which is essential to the growth of Wheat. By these means Clover and other artificial Grasses were raised, and the power of keeping more live stock was attained."

This success induced another great Norfolk landowner, Mr. Angerstein, to recommend the same method to his tenants on land in Lincolnshire; on land similarly situated, one of them, who had been on the brink of ruin, brought his affairs into a highly prosperous state by marling. Its effects were such, upon another of his farms, that the tenant having, in the last year of his occupation, sown wheat upon two-thirds of it, Mr. Dawson, the largest and most successful farmer in the county, declared in evidence upon a trial for damages, that the land was not exhausted by this over-cropping; he mentioned that the effect of marl was more powerful and permanent than that of bone manure, which has been so wonderfully useful, that it is proposed to manufacture it according to a communication made by the secretary at a late general meeting of the society.

Lord Spencer's paper is followed by an account of the relative draught of Ploughs—a short but very important communication, showing the unsuspected drain on farmers' resources, which extensively exists in consequence of the use of implements of unnecessary draught. Other articles are from Sir Robert Peel, on Drainage; Sir H. De la Beche, on Geology; Col. Le Couteur, on the Jersey Plough; Mr. Curtis, on the Insects affecting the Turnip Crop; the Rev. Mr. Rham, on the comparative value of the different kinds of Fodder; Mr. French Burke, on Cottage Economy and Cookery; Mr. Morton, on Agricultural Mechanics; Mr. Murchison, on the Black Earth of Russia; and Dr. Daubeny, on the application of Science to Agriculture. These communications are all valuable, but will hardly bear abstracting within the space we can at present allot to them. Perhaps we may notice some of them separately hereafter.

The Magazine of Domestic Economy. 8vo.: Orr and Co.

Vol. 7 having lately appeared, we take the opportunity of recommending this book to public favour. It is a useful miscellany—carefully conducted, and embracing an infinite variety of domestic subjects, as will be evident from the volume before us, which contains articles on Electricity and Dress-making, Quack Medicines and Cookery, Manures and Monetary Matters, Wet-nurses and Hydropathy, Camellias and Fish-ponds, Scented Snuff and Fomentations; to say nothing of Puddings, Butter, Jellies, Dyeing, Servants, Laces, Bathing, Brewing, and we cannot tell what besides. For the amusement of our readers, we pick out the following extract from an article *On Making the Skeletons of Leaves.*—"Choose the leaves of trees or plants which are somewhat substantial and tough, and have woody fibres, such as the leaves of Orange, Laurel, Apricot, Apple, Oak, &c.; but avoid such leaves as have none of the woody fibres which are to be separated and preserved by this method; such are the leaves of the Vine, Lime-tree, and some others. These are to be put into an earthen or glass vessel, and a large quantity of rain-water to be poured over them; after this they are to be left to the open air and to the heat of the sun, without covering the vessel. When the water evaporates so as to leave the leaves dry, more must be added in its place: the leaves will by this means putrify, but they require a different time for this; some will be finished in a month, others will require two months or longer, according to the toughness of their parenchyma. When they have been in a state of putrefaction for some time, the two membranes will begin to separate, and the green part of the leaves to become fluid; then the operation of clearing is to be performed. The leaf is to be put upon a flat white earthen plate, and covered with clear water; and being gently squeezed with the finger, the membranes will begin to open, and the green substance will come out at the edges; the membranes must be carefully taken off with the finger, and great caution must be used in separating them near the middle rib. When once there is an opening towards this separation, the whole membrane always follows easily; when both membranes are taken off, the skeleton is finished; and it is to be washed clean with water, and then dried between the leaves of a book."

Stephens's Book of the Farm closes the first volume with the 7th Number, which has just appeared. It is announced that the commencement of the second volume will be delayed two months, in order to give time for the embodyment of new materials. We can only add to what we have already stated on former occasions, that this work maintains its character as it proceeds, and that we know of no book in which so much useful information on general as well as special farming is to be found. The present Number is chiefly occupied with draining and ploughing. Let us hope that when completed there will be a full general *Index* of the manifold contents of the two volumes.

Lees's Botanical Looker-out (8vo. Tilt and Bogue) contains the author's observations upon wild flowers and other natural objects, arranged beneath each month of the year, and interspersed with poetry selected, for the most part, from favourite authors. It is a pity that so much zeal and knowledge of natural history should be grafted on a vicious, affected style, which would ruin the most beautiful descriptions; and the pity is the more because, notwithstanding, the book has much that is agreeable and instructive.

CALENDAR OF OPERATIONS *for the ensuing week.*

The early forcing-houses being now out of use, a convenient opportunity is afforded for putting them into perfect repair. With this object, therefore, the fire-holes, flues, or other heating apparatus, ought to be examined and made efficient; and then the sashes, rafters, and other woodwork, should be cleaned and painted. This last operation is often put off from year to year, till exposure destroys the texture of the surface of the wood, and then paint has much less power as a preservative. A light coat of paint annually would be more conducive to neatness of appearance, and little less economical in the end, than the too general method of giving two or three coats every four or six years. Plant-houses, too, being now partly empty, ought to be thoroughly repaired. Colour is, of course, a mere matter of taste, yet we venture to recommend a subdued stone colour in preference to an unnatural green, or a glaring white, for the exterior of hothouses.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Examine the bark-beds frequently, to ascertain whether their temperature is confined within proper limits, for an injury now to the roots of growing plants would be likely to mar all the previous care bestowed on them, by causing them to start into fruit. Beds which have recently had an addition of fresh bark will probably be too warm, when the bark must immediately be drawn away from the pots to let the heat escape. On the other hand, if the bed has not been renovated since the May shifting, its surface may have become too dry to uphold the necessary fermentation, in which case watering, and afterwards stirring the bark with a prong, might have the desired effect. This should be done without disturbing more of the plants than is absolutely necessary. Bear in mind that plants which have filled their pots with roots will require water oftener than those which have been lately potted.

Vinery.—Where Vines root inside the house, the borders must be well supplied with water. A layer of good manure, hid by a slight covering of mould, will be of great service on the border, as the water in passing through it will carry its nutritive particles down to the roots; it will likewise prevent the borders from drying so rapidly. The outside borders must also be watered in dry weather, if they are not mulched. Look over Grapes that are swelling off, and take out a few of the inner berries where they are too close together. Give all the air you can in fine weather to fruit that is colouring, and keep the house drier than before.

Peach-house.—The Royal George Peach, which is one of the most common in forcing-houses, is peculiarly subject to mildew. The best remedy is sulphur, which should be applied immediately upon the appearance of the disease. If not yet done, the sashes should be taken off the early-house.

Fig-house.—The directions given in the preceding Calendars must be applied according to circumstances. If the first crop is gathered, use the syringe freely, and also water liberally at the roots; but if the fruit is nearly mature, too much moisture will be prejudicial; and ripe Figs must never be wetted, or their flavour will be much deteriorated.

Cucumbers and Melons.—Maintain a gentle heat by linings to the pits and frames, which will be of great benefit to the plants in cold and dull weather, and no way injurious in warm days, provided plenty of air is given. When the night temperature is low, which has often happened of late, it will be well to cover up the Melon-frames, observing always to uncover early in the morning. Fumigate upon the first appearance of aphides or thrips, for if these pests are once permitted to breed, they cannot be eradicated without much trouble.

Out-door Department.

Cardoons.—Thin the young plants, leaving only one in a place.

Carrots.—If such things are required, sow a small breadth of the Horn for drawing young in autumn.

Celery.—The first crop will now require earthing, which must not be done when the plants are wet. Take away the small leaves, and also the side-shoots that sometimes spring from the neck of the plants.

Chervil.—This, with Lamb's Lettuce, and all annual herbs that are used in salads, should be sown to supply the demand in autumn.

Endive.—Plant from the early sowings, but not largely.

Garlic and Shallots.—Take these up if the foliage begins to wither, or if the maggot has attacked the roots, and lay them in the sun to dry.

Kidney-Beans.—If the autumn be dry and warm, the dwarfs sown a month ago will probably not continue so late in bearing as might be desired; therefore, by way of a reserve crop, a few more may be put in, at the foot of a south wall, if such a situation is available. For this purpose choose a sort which comes quickly into bearing, such as the Negro or the Dun-coloured.

Leeks.—Plant out the principal winter stock, in very rich soil, if large stalks are required. Those left in the seed-bed should stand thickly, small Leeks being sometimes wanted.

Orchard.—Preparations should now be made for procuring an ample stock of Strawberry-plants for forcing next spring. To obtain strong plants, we can, from experience, recommend the layering system, as here described: Fill the required number of pots (32's is a convenient size) with rich soil, and after distributing them among some established plants, lay one of the young plants, which are now forming upon the runners, on the soil in the pot, and keep it in a proper position by placing a stone upon the runner, cutting off that portion of the latter which extends beyond the plant; with a little attention in watering these will soon strike root and grow vigorously, when they might be detached from the parent runners, and removed to any convenient situation. When the pots are filled with roots the plants must be shifted into others a size larger, and afterwards the usual routine of watering and weeding is all that is necessary till they are removed to winter-quarters.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Move the plants frequently which are placed on the bed, to keep the roots from taking permanent hold of the ground below. Reset them from time to time, giving the best plants the most favourable situations. If the weather should happen to be cold and dull for a few days, heat the flues or pipes of the Orchidaceous house during the day, allowing the fire to go out in the afternoon. This is necessary to preserve the young shoots from damping. Do not light fires at night, for it is unnatural to have the temperature at night higher than during the day.

Greenhouse and Conservatory.—In fine weather too much air cannot be given; but during very rough winds, which have often occurred of late, the sashes should be only partially opened. Plants that have been tenderly reared, such as Gloxinias, Achimenes, Balsams, &c., must necessarily suffer from injudicious exposure to wind or cold. After the leaves and stems of Tropæolums are withered, take the tubers out of the pots, and lay them in dry sand, to remain till they again vegetate. Camellias that have not been repotted should have occasional supplies of liquid manure. Orange-trees, especially those in fruit, should also have manure-water once in ten days or a fortnight.

Pits and Frames.—Propagate by offsets another set of Cinerarias, to bloom after those taken off in June, which will now probably require re-potting. Seeds of Primula sinensis sown as soon as ripe will produce plants to bloom next spring. Sow seeds of Tropæolum tricolor; if the hard outer shell is taken off, the seeds will soon germinate; but if that covering is not removed they will lie dormant till it decays naturally, probably till next spring. Bud seedling Orange-trees with the cultivated varieties; cuttings of the young wood may now also be put in.

Out-door Department.

Remove biennials and annuals from the mixed borders as they lose their beauty, and replace them with others from the reserve beds, or from pots. Failing beds of short-lived annuals, as Nemophila insignis and Gilia tricolor, should be replanted with Verbenas, Heliotropes, Petunias, or any species which flower a long time successively. Layer Carnations and Picotees, and put in pipings of Pinks. Likewise put in cuttings of the finest Snapdragons, many of which are exceedingly handsome, but cannot be depended upon from seed. Save seed of coloured Cowslips and Primroses; also of Hepaticas, which would probably give some new varieties.

NURSERY AND FOREST DEPARTMENT.

Nursery.—See that the shoots from last year's buds, and from the present season's grafts, are effectually secured against high winds. Worked fruit-trees, which were headed down in spring, should also be looked to, and their young shoots properly trained to stakes. Grafts that were late in pushing will now require untying. Weed, thin, and water young seedlings of all kinds, according as they require these operations.

Forest and Coppice Woods.—This is the proper season for the summer pruning of young timber trees, and we advise all who wish for straight and clean boles, to adopt that system. Common sense tells us that it is better to "train up a tree in the way it should go," than to suffer it to grow according to the bent of its inclination for a number of years, and then suddenly to mutilate it into a prescribed form.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending July 7, 1842, as observed at the Horticultural Garden, Chiswick.

July		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	1	29.849	29.747	70	50	60.0	W.	.05
Saturday	2	29.848	29.830	69	46	57.5	W.	.05

The highest temperature during the above period occurred on the 11th, in 1836—thermometer 88°; and the lowest on the 13th, in 1840—thermometer 41°.

REPORT ON COVENT GARDEN MARKET,

For the week ending July 8, 1842.

The Market has been well supplied during the past week with fruit of every description, and vegetables, except in a few cases, have been plentiful; trade also has been very brisk. *Fruit.*—The best Pines are somewhat cheaper than in our last account, being from 6*s*. to 8*s*. per lb. Grapes have varied but little; Muscats are selling from 5*s*. to 7*s*. per lb., and Black Hamburghs, &c. from 2*s*. to 5*s*. per lb. English Melons are from 3*s*. to 5*s*. each; and the Dutch, of which there are a large quantity, are from 1*s*. to 4*s*. each. Peaches and Nectarines are considerably cheaper, the highest price being 18*s*. per doz. The quantity of Cherries offered is very great; the wall fruit fetches from 1*s*. 6*d*. to 2*s*. 6*d*. per lb., the standard fruit from 1*s*. 6*d*. to 4*s*. per doz. lbs. The supply of Strawberries is good, the best consisting chiefly of Myatt's British Queen and the Elton Pine; the average price is 2*s*. per gallon. Gooseberries are very plentiful, and the best fruit is selling from 2*s*. to 4*s*. per half-sieve. Currants are quite ripe; the dessert fruit is fetching from 3*s*. to 5*s*. per sieve. Cucumbers are good, and rather dearer than in our last account, being from 3*s*. to 9*s*. per dozen. *Vegetables.*—Asparagus is no longer to be obtained. Cauliflowers are plentiful and good, from 1*s*. 6*d*. to 4*s*. per doz. Cabbages have altered little in price since our last report. Peas are abundant, and are selling from 3*s*. to 4*s*. per bushel. Windsor Beans are considerably cheaper, having fallen to 1*s*. 6*d*. and 2*s*. per bushel. French Beans are more plentiful, and fetch from 3*s*. to 5*s*. per half-sieve. There is little alteration in the prices of Turnips and Carrots, which the late rains have materially improved. New Potatoes are offered in large quantities; the Kidney kinds are selling from 4*s*. to 5*s*. per half-sieve; and the round ones from 3*s*. to 4*s*. per half-sieve. Vegetable Marrows are becoming more abundant, but their price is not altered. Lettuces are good, from 1*s*. to 1*s*. 6*d*. per score. We observed a small quantity of excellent Endive from France, which was selling from 1*s*. 6*d*. to 2*s*. per doz. Young Celery has been rather scarce, and has consequently risen in price. Spinach has been well supplied, and fetches from 2*s*. 6*d*. to 5*s*. per junk. Artichokes are tolerably numerous, from 1*s*. 6*d*. to 2*s*. per doz. The small quantity of Mushrooms to be obtained are offered at 2*s*. 6*d*. and 3*s*. per pottle.

PRICES, Saturday, July 9, 1842.—FRUITS:—

Pine Apple, per lb. 6*s* to 8*s*
Grapes, per pound, 2*s* to 5*s*
— Muscats, per pound, 5*s* to 7*s*
Melons, English, each, 3*s* to 5*s*
— Dutch, 1*s* to 3*s*.
Peaches, per doz. 12*s* to 18*s*
Nectarines, per doz., 12*s* to 18*s*
Cherries, wall, per lb. 1*s* 6*d* to 2*s* 6*d*
— standard, per doz. lbs., 1*s* 6*d* to 4*s*
Currants, White, per hf. sv. 3*s* to 3*s* 6*d*
— Black, per hf. sv., 2*s* 6*d* to 3*s* 6*d*
— Red, for wine, 2*s* 6*d* to 4*s*
— for dessert, 3*s* 6*d* to 6*s*

Gooseberries, per hf. sve., 2*s* 6*d* to 6*s*
Cucumbers, per doz., 3*s* to 9*s*
Strawberries, per gall., 2*s*
Raspberries, per gall. 1*s* 3*d*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 6*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 7*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s* to 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 1*s* to 1*s* 6*d*
Cauliflowers, per doz., 1*s* 6*d* to 4*s*
Peas, per sieve, 2*s* 6*d* to 5*s*
— per half sieve, 1*s* 6*d* to 2*s* 6*d*
— per sack, 6*s* to 10*s*
Beans, Kidney, per hf. sieve, 3*s* to 5*s*
— Broad, per bush., 1*s* 6*d* to 2*s*
Potatoes, New, per ton, 100*s* to 200*s*
— per cwt. 5*s* to 10*s*
— per bushel, 2*s* 6*d* to 5*s*
— Kidney, per bushel, 3*s* to 10*s*
Artichokes, per doz., 2*s* 6*d* to 4*s*
Turnips, per doz bun., 3*s* to 4*s*
Carrots, per doz. bunch, 4*s* to 6*s*
Red Beet, per dozen, 1*s* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* 6*d* to 7*s*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Spinach, per sieve, 2*s* 6*d* to 3*s*
Onions, Green, per doz. bun. 2*s* to 4*s*
— Cooking, per doz. bch., 2*s* to 4*s* 6*d*

Chives, per bun., 3*d*
Leeks, young, per doz. bun., 4*s*
Garlic, per bunch, 4*d* to 6*d*
Shallots, per bch., 3*d* to 4*d*
Lettuce, Cabbage, p. score, 1*s* to 1*s* 6*d*
— Cos, 9*d* to 1*s* 6*d*
Endive, per doz. 1*s* 6*d* to 2*s*
Celery, per bundle, (12 to 15), 2*s* to 3*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, p. dz. small bunch. 4*d* to 6*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Fennel, per dozen bunches, 2*s*
Thyme, per doz. bunches, 2*s*
Sage, per dozen bunches, 2*s*
Mint, per doz. bunches, 3*s*
Marjoram, per doz. bunches, 2*s*
Savory, per doz. bunch., 2*s*
Basil, per doz. bunches, 2*s* to 3*s*
Vegetable Marrow, per doz., 1*s* 6*d* to 2*s*
Mushrooms, per pottle, 2*s* 6*d* to 3*s* 6*d*

Notices to Correspondents.

Country Shows.—As it is our intention next week to publish a Double Number, we shall be obliged to any of our Correspondents, who have not sent in an account of their exhibitions, if they will forward them to our Office before Wednesday next.

P. R. W.—Of your plants No. 1 is Triticum repens; 2, Aira flexuosa; 3 and 5, Agrostis vulgaris; 4, Lólium perenne; 6, Festuca pratensis; 7, A'llium vineale; 8, Polýgonum aviculare.

J. Murdock's Pear-tree leaves are blistered by the larvæ of Tinea (Argyromiges) Clerckella, *Linn.*, figured and described in vol. 1, p. 261, of the *Gardeners' Chronicle*, where means are suggested for freeing the trees from this little pest.—*R.*

A Northern Reader's insect is the Woodlouse: we beg to refer him to p. 425 of this Journal, where he will find a method for destroying them, and probably boiling water poured along the base of the frames, both inside and out, might thin their numbers. We have only to add that if the frames be old and decayed, every chink should be filled with putty, and all the crevices in the brickwork well stopped with mortar or Roman cement, as the Woodlice delight in such places, and are generated there.—*R.*

Simple.—Your plants are,—1, Clianthus carneus; 2, Ageratum album; 3, Acacia pulchella.

Clericus.—It is the practice when Pelargoniums have done blooming, to remove them from the greenhouse to a situation where they are exposed to the influence of the sun and air, that the young wood may become hardened. This will be effected in about ten days or a fortnight, when it will be proper to cut them down. You will find the following varieties an agreeable addition to your collection:—Coronation, Orange Boven, Matilda, Madeleine, Leila, Arabella, Bridesmaid, Grand Duke, Amethyst, Hodges' Emperor, Cyrus, Erectum.

E. T. O.—Araucária braziliensis will not stand the winter in this climate; Cunninghámia lanceolata probably may. The soil should be turfy loam, and a rather exposed situation, with a perfect drainage, will suit the latter.

J. C. L.—Your Gongora is G. atropurpúrea.

A Limerick Subscriber.—We should imagine that strong liquid manure applied to Fuchsia fulgens would cause it to drop its blooms; if, as you say, the plant has plenty of pot-room, and is plunged in the flower-border, we can account for it in no other way. Fuchsia Atkinsónia is one of the oldest varieties, and is now almost forgotten; there are many better to be obtained.

R. X.—Your plant is Thymus serpyllum.

X.—Your seedling Fuchsia is a pretty pink variety, but it is impossible to form any opinion of its merits by the mere sight of a flower.

Cadwallader.—Your Pea is Lathyrus grandiflorus, which never produces seed, and is propagated by division of the roots. All the old shoots of Raspberries, as soon as they have done bearing, should be removed.

A. Y.—The colour of your Pelargonium is pretty, and the substance of the flower good; the form is, however, destroyed by the narrow under petals. There are so many superior varieties in the same class that a flower to merit notice must possess a superior form, with some distinctive quality, to render it worthy attention.

A Constant Reader.—There is no downright necessity for transplanting autumn-sown Onions to make them form bulbs the following spring; but where this is done, the bulbs are materially increased in size, and are less liable to throw up flower-stems. We would advise you to sow a small bed broadcast this autumn, and transplant them early in the spring upon rich soil which has been previously thrown up in ridges during the winter.

Delphinium.—The seedling Fuchsia is small, and too much like other varieties cultivated. The Delphínium also bears too much resemblance to D. mesoleucum.

Win.—Your Bignónia radicans growing against a south wall, which was planted seven years ago, and has progressively increased till now, being above 12ft. high, and very healthy, but which has never flowered, requires some check to throw it into bloom; since its over-luxuriance appears to be the principal cause of its not flowering. If the roots could be raised nearer the surface of the border, so as to be brought more under the influence of the sun's rays, there is no doubt but it would bloom freely.

W. H. Mx.—Your seedling Pinks are of a peculiar class. They are remarkably small; the lacing, however, is perfect, and the pods are well formed. No. 2 is decidedly the best, from the near approach of the petals to the smooth rose-leaf edge, and from the crown of the flower being better filled with petals. The remainder partake too much of the serrated edge; they are too small to be of any value, as show flowers, in this part of the kingdom. Of the Pelargo'niums, the bottom petals of No. 1 are too narrow. 2 is an attractive flower; the colour is rich, and the spot, though small, clearly defined; it is a decided improvement upon a variety named Splendidum, which it somewhat resembles, but is superior to it in the form of the flower and the richness of its colour.

T. H. Hastings.—Your varieties of Mimulus cardinalis are pretty, but they appear to want brilliancy. This arises from the flowers requiring some distinctive marking—as a yellow throat, or a dark spot surrounding it. We have lately seen seedlings thus marked, in comparison with which your specimens want decision and brightness. The flowers sent for our inspection, which have invariably arrived in good condition, have had their stalks enveloped in wet moss, and tied up securely with bast; they should then be placed in a pan of water till they are packed up, that the moss may imbibe all the moisture possible. The flowers should be covered with tissue paper, and surrounded with cotton wool, and the whole lightly packed up in damp moss. It is important, in order that the flowers should be as fresh as possible, that they should be gathered soon after they have expanded, and before the bees have had access to them. A waterproof wrapper is not necessary, but it would doubtless assist in preserving their freshness. Ivy or Laurel leaves would be of little use if the flowers had to travel a considerable distance.

V. P.—It is probable that the under surface of the leaves of your Melons are infested with the aphides, which, exhausting the sap from them, cause the leaves, when exposed to the sun, to assume the scorched appearance you complain of. If you grow them in proper soil, you may keep back the insects by fumigating them once or twice a week; the best way to do which is to place a live coal in a flower-pot, and, after shaking a little tobacco over it, to shut it up in the frame, and having thrown some wet mats over the latter, to let the pot remain in till morning. The heat of the beds should never be allowed to decline, and they should be slightly shaded during the heat of the day.—*J. W.*—I beg to ask "V. P." whether the woodwork of the lights under which he grows his Melons has been Kyanised?—as I have witnessed the same result in a house of Vines, caused by the above.—*J. H.*

P. A. K.—It is impossible to recognise Verbenas which have been packed up in a letter for twenty-four hours; in fact, we cannot devote time to the naming such plants.

A. A.—We recommend the following Autumnal-flowering Roses:—Aubernon, Fulgorie, Madame Laffay, Prudence Ræser, Crimson Perpetual, Striped do., Bernard, Queen Victoria, La Mienne, Josephine Antoinette, Antinous, and Perpetual Rivers. They will, no doubt, grow well in peat; but they would flower stronger if some good turfy loam were mixed with it previously to their being planted.

J. D.—Your plants are, 1, Lílium Martagon, the pale variety; 2, Mimosa marginata; 3, Lavándula pinnata; 4, Medicago arbórea? 5, Plumbago capensis; 6, Hypéricum baleáricum; 7, a species of Gledítschia.

A Subscriber.—No. We would recommend the second volume of Hooker's British Flora, as a guide to the Cryptogamic plants of Britain.

A. H.—Your plant is Genista tinctoria. We fear your only hope of extirpating it is in the constant use of the plough. When wire-worms attack farms they can only be destroyed by burning, or by the natural enemies which God has provided for them. Salt will do them no harm, and in *large quantity* will ruin your land. If your land is heavy, burning it will improve the soil and annihilate your enemy.

J. B. H.—We see no difficulty in picking off the young fruit of the Asparagus by hand; a child can do it. When in flower, the stems, drawn smartly through the closed palm, would have been to a great extent cleared of the flowers. On no account cut the stems down; that would ruin everything.

S. S. J.—The best paper for an herbarium of wild plants is stout foolscap: they should be neatly fixed down on half-sheets, with weak carpenter's glue; and only one species should be put on each half-sheet. We know nothing of short-hand: to gardeners it is useless, and of very little use to anybody else except reporters.

Lomax.—Your seeds are all of well-known stove plants; they must be raised on a hotbed, and when raised are of no interest in this country except in Botanic Gardens.

Bacchus.—Climbers and trailers come equally within the meaning of the expression "climbing plants." But Mirbélias and Platylóbiums are neither the one nor the other.

A Little Gardener.—Hoare's Treatise upon the Vine is an excellent work upon the treatment of out-door Vines, but is not applicable to those cultivated in Vineries or other houses. We know of no recent method for the cure of the Canker in Fruit-trees; the best plan is, with a sharp knife, to cut out the diseased part in old trees, and to protect the wound from wet with clay or some other material, until the bark has closed over it; if it appears on young trees, cut off the infected branches immediately, to prevent, if possible, its further progress.

An Inquirer.—The letter-press at p. 436 is perfectly correct: *straw*, and not *earth*, is to be allowed to fall amongst the branches of the Fúchsias. Cle'matis fla'mmula and others of the genus may be readily increased by cuttings and seeds. Cuttings of the young wood, taken off now and planted in light sandy soil, with a slight bottom heat, will soon take root. Jasmines, Honeysuckles, and Erythrina Crista-galli, may be increased in the same way. Short cuttings are far preferable to long ones.

H. C.—The Fig is indigenous where a mild temperature prevails even in winter, and where its vegetation is not so much arrested as to prevent a sufficient supply of sap from being forwarded for the maintenance of the autumn-formed fruit. In proportion to the advanced state of the young fruit, so is its dependence on the flow of sap increased; and if your fruit have been so far advanced as to require a more active circulation than that almost torpid condition which the rigour of our winters induces, nothing can prevent your Figs from dropping. If, however, they have as yet a fresh, not a yellow appearance, they may attain maturity, by your affording a sufficient supply of moisture to the roots, and pinching off the extremities of the shoots; you may also cautiously ring some of the strongest branches.

A. C.—Mr. Knight's Physiological and Horticultural Papers may be obtained through the order of a bookseller.

Query.—Your plant is Callichroa platyglossa, and is an annual.

Sempervirens.—Another week.

Muff.—See Familiar Botany, No. VII.

T. T.—See leader of this day.

Discipulus.—The upper part of the half-ripened wood of Roses, and in fact of most hard-wooded plants, is found to be most suitable for propagation by cuttings, although many persons prefer to have a small portion of the old wood adhering to the base of the cuttings. All kinds of Roses may be propagated in this manner, if the cuttings are properly treated. The Prince Albert Strawberry is a most abundant bearer, but of very indifferent flavour. Your Strawberries are, 1, Keen's Seedling; 2, Dwarf white Carolina; 4, 6, 7, Surinam; 5, Wilmot's Superb; and are all inferior sorts, with the exception of Keen's Seedling.

A. X.—The best course for you to take with the contents of your Cesspool, is in both instances to mix it with earth and gypsum. What you have been burying is most valuable manure, and it is extravagance to waste it. Suppose you placed a layer of gypsum 3 inches thick all over the soil and then "turned it in" among the substances buried beneath it. The common operation of bastard trenching would probably mix the materials sufficiently.

T. W.—The numbers to your Pansies having been displaced, we cannot refer to any excepting 25. This is of little consequence, as they are all similar in character; being large, flat, finely formed flowers, with the eye bold, and well defined in each. No. 25, and one entirely white, are the best. The yellow one is very inferior to the white varieties, the lower petals being small and deficient in form, and it is, moreover, disfigured by a deep notch in the lip.

A Gentleman's Gardener.—Your Vine, from the appearance of the leaf sent, appears to have been scorched by the rays of the morning sun having struck full upon it, before air has been admitted to the house. We have seen similar instances, in which, of two Black Hamburghs, in the same house, one has been affected like the specimen sent, and the other has not been the least injured; probably owing to the roots of the latter being in a more healthy condition.

A New Subscriber.—We would recommend you to cut up your Strawberries which have been planted 4 years; taking care of the best runners for future plantings. Trench up your ground well, giving it a good dressing of manure and lime rubbish, and replant it with Keen's Seedling, Elton Pine, and American Scarlet. We do not wonder at your want of success with Myatt's Pine, since few persons can grow it satisfactorily. The should-be-white Fuchsia may be struck from cuttings as readily as any other variety. Passiflora fragrans is a Greenhouse climber.

P. W. C.—From the appearance of the specimen sent, we should judge your plant to be Cynoglossum canescens.

Lombardy's plants are, 1, Brachypódium sylvaticum; 2 and 6, Chenopódium cymígerum; 3, Sagina procumbens; 4, Circæa lutetiana; 5, Sedum dasyphyllum.

H. H.—Your plants are Poa trivialis, Festuca duriúscula, and Carex panícea.

W. H. is right. The Carex is C. divulsa.

O. A.—Your plant appears to be a species of Ceropégia.

N. V.—The seedling Antirrhinum is a very good one, but there are plenty closely resembling it. It will not come true from seed.

Tamworth.—Your description agrees pretty well with the Beechwood Melon; yet, if you have found it only pretty good, it must be wrong; this variety is excellent.

R. J. S.—We are not acquainted with any book which gives the names of English trees exclusively. They will be found in Lindley's Synopsis of the British Flora.

Ignoramus.—We do not know the cause of your Mignonette dying off; it is impossible to tell without seeing the ground. Perhaps the wireworm has attacked it.

W. U.—The question for the judges to determine is not what *your* opinion of your plants may be, but what theirs is. They do not seem to have agreed with you. We are not judges.

F. G. C., having several acres of young Larch, observes this summer that in almost every tree *one* branch has withered, and fearing that the disease may increase, he would be glad to know what is the cause of it, and, if possible, a cure. Can any one say?

A Botanical Inquirer's plants are, 1, Myriophyllum verticillatum; 2, Rhinanthus Crista-galli.

Z. shall be answered next week.

Industry.—Grapes will not ripen well on the open wall so far north as the West Riding of Yorkshire; we would therefore advise you to plant Peaches or Plums, instead of Vines. Budding should be performed upon this year's wood, whenever practicable, within a few inches of the base of the shoot. The dimensions of a Dahlia stand for 12 blooms should be 22 inches long by 16½ wide, 4 in depth, and 5¾ from tube to tube. 16½ by 11¼ will be the proportion for a stand of 6. The surface of stands is generally painted a light green, a colour which shows the flowers off to the greatest advantage.

W. R. F.—The plant is Vallota purpúrea.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

Our home news contains an account of another attempt upon her Majesty, as incomprehensible in its character as the one which so recently occurred. It took place on Sunday, the day on which the inhabitants of the Metropolis were made acquainted with the reprieve of Francis. The event caused the greatest excitement in London during the afternoon of that day. The Privy Council was immediately assembled, and sufficient evidence has been adduced to lead to the committal of the prisoner for the misdemeanour, the capital charge having been abandoned. The culprit, in this instance, is a mere lad, apparently without accomplices of any kind; and the act seems to have been entirely unconnected with any political motives.—Parliament continues to be actively engaged in the discussion of various important measures. In the Lords, the amendments on the Tariff Bill, proposed during its passage through committee, have been negatived by large majorities; and the Bill was read a third time last night. In the Commons, on the motion of Lord Stanley, several resolutions respecting the financial arrangements of South Australia have been agreed to, by which its general government will be placed in the hands of the Crown, on a footing similar to that of our other colonies. Lord Ashley's Bill on the Mines and Collieries has been read a third time and passed, after several unsuccessful attempts to retard its progress. The National Floating Breakwater Bill and the Bill for the Disfranchisement of Sudbury have also passed. The attention of the House has been chiefly occupied with the adjourned debate on Mr. Wallace's resolutions for an address to her Majesty respecting the existing distress. The motion was opposed by Ministers, as involving a variety of important topics, without the possibility of any useful result; and the debate was brought to a close last night, when the resolutions were negatived by a majority of 125.

The India mail has reached town since our last. The anticipations excited by the telegraphic despatch of last week have been confirmed, and the intelligence now received is of a very favourable character. The leading facts are, as we stated in our last, the safe arrival of Gen. Pollock at Jellalabad, the death of Shah Soojah, and the intended march of the combined forces on Cabul. Gen. Elphinstone died soon after the departure of the last mail; he is said to have left behind him several documents, which are expected to throw much light on the unexplained circumstances of the late rebellion. Akhbar Khan had sent a British officer to Jellalabad in order to treat for the ransom of the prisoners; but the result of the negotiation is not known. The Governor-General has issued a general order extolling the conduct of Sir R. Sale and the garrison of Jellalabad, and directing various honours and rewards to be paid them for their gallant achievements.— From China there is no news beyond what we stated last week. The Chinese have been repulsed with great loss in two attempts to force the British position; no decisive movement had been made, and the advance on Pekin was delayed until the arrival of fresh troops.—In France the elections, which commence this day, are the great topic of attention. Their general result is expected to strengthen the power of Government, and there is no doubt that all the Ministers who are candidates will be returned by considerable majorities. —In Spain the new Cabinet maintains its ground, and it is not expected that the Opposition will commence any measures of active hostility during the present session. The Ministry are taking effectual measures to preserve tranquillity in the provinces, and to place the navy on a respectable footing.—From Portugal we learn that the Government has been defeated in the elections for the province of Estremadura, which always returns the leading personages of both parties, and consequently is by far the most influential election in Portugal. This result is considered as a serious check to the Ministry, and as likely to embarrass them at the opening of the session.—From Turkey we have the important intelligence that Austria, France, and England have determined on adopting coercive measures against Turkey, in order to compel the Divan to make the concessions demanded by the Powers in regard to Syria. Letters from Beyrout mention that the appearance of a combined squadron of France and England was daily expected; but it was believed that the Porte would submit before the fleet resorted to any hostile demonstration.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Buckingham Palace.—On Sunday morning another attempt was made on the life of the Queen in St. James's Park, as her Majesty was proceeding to divine service at the Chapel Royal.—The Queen took her accustomed airing in the Park on Wednesday.—On Tuesday the King and Queen of the Belgians took their departure from Buckingham Palace, and embarked at Woolwich, on their return to the Continent.—On Thursday the Hereditary Prince and Princess of Saxe Coburg Gotha arrived at Buckingham Palace from the Continent, on a visit to her Majesty.—Viscountess Canning has succeeded the Countess of Charlemont as the Lady in Waiting on the Queen; and the Earl of Warwick and Admiral Sir R. Otway have succeeded Viscount Hawarden and Gen. the Hon. Sir W. Lumley, as the Lord and Groom in Waiting on her Majesty.

Another Attempt on the Life of Her Majesty.—On Sunday afternoon the Metropolis was again thrown into a state of general excitement, by the circulation of a report that another attempt had been made on the life of the Queen, as her Majesty was proceeding from Buckingham Palace to attend divine service at the Chapel Royal, St. James's. The first accounts of this attempt were confused and contradictory; and the secrecy maintained at the Palace and the Home Office, and by the police, had the effect of giving rise to many exaggerated and mistaken statements. The following, however, are now ascertained to be the particulars of this painful occurrence:—About 12 o'clock on Sunday morning, as her Majesty, accompanied by Prince Albert and the King of the Belgians, and attended by her suite, was proceeding along the Mall, in St. James's Park, when about half-way between the Palace and the Stableyard-gate, a youth of deformed appearance was observed to present a pistol at the last carriage of the *cortége*, which contained her Majesty, Prince Albert, and the King of the Belgians, being at the moment slightly in advance of the hind wheel on the off side of the carriage, and within three yards of her Majesty. The fact of such an attempt having been made does not appear to have been observed by the Queen or any of her attendants, as the royal *cortége* proceeded to the Chapel without stopping; and the whole affair, it is thought, would have passed unnoticed had not the act been witnessed by a young man, named Dassett, who states that he observed the person pull the trigger of the pistol and distinctly heard the snap, although he saw no flash. He instantly seized him, as well as the instrument he had in his hand, and seeing no policeman near, dragged him in the direction the royal carriages had gone, until he met a policeman, whom he called upon to apprehend the prisoner, at the same time showing the pistol. The policeman, however, supposing that the charge was a hoax, refused to take the accused into custody. The young man then took him to another policeman who was near, who treated the charge in the same manner, and the young man then allowed the prisoner to escape, retaining, however, possession of the pistol. The proceedings of the young man had by that time attracted a crowd of persons around him, which continued to increase as he related to them what he had seen; and at that juncture another policeman came up, and seeing the pistol in his hand asked him what he was doing with it. The young man explained the circumstances as they had occurred, when the policeman told him that he must accompany him, in order that a proper inquiry might be made into the matter, to the station-house, whither they proceeded, followed by a crowd of nearly 3,000 persons. In the mean time, the report that another attempt had been made on the Queen's life spread rapidly among the large concourse of persons assembled in the Park, and was immediately conveyed to all parts of the Metropolis, creating everywhere the greatest excitement and alarm. Information of the discovery was at once forwarded to the chief office of police, in Great Scotland-yard, and from thence to Sir J. Graham, at the Home Office, Whitehall; and by direction of the police commissioner, a description of the supposed traitor was forwarded to all the station-houses of the Metropolitan and City police, in order that an active search might be made after him. Messengers were also sent to the residences of Ministers and the law officers of the Crown, with information of the occurrence. Within a few minutes after the circumstance became known, the neighbourhood of the office in Scotland-yard was crowded by members of both Houses of Parliament, and individuals of the highest rank, anxious to ascertain the truth of the report. Soon after 1, several members of the Cabinet arrived at the Home Office, for the purpose of entering upon an inquiry into the circumstances. The investigation was conducted, like that of Francis, with closed doors, and the greatest secrecy was observed. Several witnesses were examined, including the young man Dassett and his brother, who also deposed to having witnessed the occurrence, and one or two other persons, whose evidence confirmed the statement of Dassett. The pistol on being examined was found to be charged with powder and small portions of a clay tobacco-pipe. The Council did not conclude the inquiry until 8 o'clock. In the mean time, the order forwarded to the different police stations in the Metropolis, accompanied by a minute description of the accused, was immediately attended to, and an active search instituted after him. It seems that the orders from the Home Office were to apprehend every individual bearing any resemblance to the description given of the supposed traitor; and, in consequence of the anxiety of the police not to allow him to escape, a number of strange and, in many cases, ludicrous scenes took place; almost every humpbacked individual that could be found being apprehended or strictly examined. On Monday, a number of contradictory reports were in circulation with respect to the individual who, it was ascertained, had been apprehended; and at first it was generally believed and stated to be a youth named Oxman, a surgeon's errand-boy residing at Somers' Town, who exactly corresponded with the description given of the accused; and all the circumstances connected with his apprehension, identification, and supposed guilt were minutely detailed in the papers of the following day. It was soon, however, discovered that a mistake had been made, and the real criminal was soon after apprehended. With respect to identity there appears to be no doubt in this instance, as the prisoner has been seen and recognised by the youth Dassett and several other persons who witnessed the occurrence. He is named John William Bean, and is the son of a working jeweller residing at Clerkenwell. It seems he had for some days left his father's house on account of some misunderstanding, and had been living a vagabond life about the streets. On the Sunday, immediately after the attempt, he returned home, where he was apprehended. It has been ascertained that he purchased the pistol used on the occasion a few days previously of a pawnbroker. Immediately after his apprehension, he was conveyed to the Home Office; but the Privy Council having broken up before his arrival, he was not examined till the following day, when he underwent an examination before several of the Cabinet Ministers, and after a long inquiry was remanded until Wednesday. Nothing is known of the proceedings at the Privy Council. In connexion with the subject, it may be mentioned that, on Monday, Mr. Thomas Steele waited on the magistrate at Bow-street, and said that he was presiding the previous evening at a repeal meeting of the Bloomsbury district, when one of the speakers, named Crow, stated that at a public meeting, held some evenings previous, he heard a person state that "Her Majesty should be made away with." He, Mr. Steele, immediately dissolved the meeting, and in consequence of the attempt made on her Majesty's life, he, as chairman, considered it his duty to lay the matter before the authorities. Mr. Crow was sent for, and being questioned by the magistrate, repeated the account given by Mr. Steele, and said the language was made use of at a Chartist meeting, but he considered it merely such a tirade as is usually made use of at their meetings, and that nothing of a threatening nature was intended against her Majesty or any other person. He then gave his address, and promised, should he be required at any future time, to pay every attention to the orders of the Court. The examination of the prisoner at the Home Office, on Wednesday, lasted a considerable time, and a number of witnesses were examined. It is understood that nothing beyond what was already known was elicited. The prisoner stands committed to take his trial for a misdemeanour, the capital charge being abandoned; and as a misdemeanour is a bailable offence, it was intimated to the prisoner that if he could find two sureties in the sum of 250*l.* each for his appearance at the next sessions, he might be liberated from custody. About 5 the prisoner was conveyed back to the Tothillfields Bridewell, where it is expected he will remain until the period of his trial, the amount of bail required being so large.

The Revenue.—From the official report just published, containing an abstract of the net produce of the revenue of Great Britain in the years ending 5th July, 1841, and 5th July, 1842, it appears that the total income for 1841 was 44,672,225*l.*, and for the present year 45,337,400*l.*, showing an increase of 665,175*l.* The decrease on the Excise for the year is 34,000*l.*, on the stamps 37,201*l.*, amounting to 111,201*l.* decrease of the ordinary revenue, to which must be added the decrease on repayments of advances 3,527*l.*, making a total decrease of 114,728*l.* The increase for the year on the Customs is 38,858*l.*, on Taxes 67,843*l.*, on the Post-office 106,000*l.*, on Crown lands 32,500*l.*, Miscellaneous 463,147*l.*, making an increase on these branches of the ordinary revenue of 708,348*l.*, to which must be added the increase on imprest and other moneys 71,555*l.*, making a total increase of 779,903*l.* By deducting from this sum the total amount of decrease, the accounts show an increase on the year of 665,175*l.* as above. The accounts for the quarter just ended show a decrease on the Customs to the amount of 426,395*l.*, to which must be added the decrease of repayments of advances 40,988*l.*, making a total of 467,383*l.* On the other hand, there is an increase for the quarter of 94,788*l.* on the Excise, on Stamps 17,558*l.*, on Taxes 28,543*l.*, the Post-office 25,000*l.*, Miscellaneous 195,552*l.*, amounting to 371,411*l.* on the ordinary revenue; to which must be added imprest and other moneys 69,545*l.*, making a total of 440,956*l.*: by deducting from this sum the total increase as above we find a decrease on the quarter of 26,427*l.* It will be seen that the increase on the year arises from the large sum placed under the head of Miscellaneous, of which, however, no details are given.

The Income-tax.—The following notice was put up on Thursday in the dividend, pay, and transfer offices, at the Bank of England:—"To receivers of dividends, whose total income is under 150*l.* per annum. If your total income is less than 150*l.* per annum, your claim for a return of the tax must be made to the commissioners of the district in which you reside. The assessor of your parish will supply you with the necessary forms."

Church Preferment.—The Bishopric of Van Diemen's Land has been conferred on the Rev. J. R. Nixon, M.A., late Fellow of St. John's College, Oxford. The Rev. T. Parry, M.A., late Fellow of Balliol College, Oxford, has been appointed to the Bishopric of Barbadoes. The Rev. J. Davies, M.A., has been appointed Bishop of Antigua; and the Rev. W. P. Austin, M.A., has been appointed to the Bishopric of Guiana.

Foreign.

FRANCE.—*The Elections.*—The electoral struggle continues to be the all-absorbing topic in the Paris papers; but the details of the proceedings in connexion with it, which are principally of local interest, present nothing that calls for particular notice. The general election commences this day, the 9th inst.; and by Tuesday it is anticipated that the Government will be informed by telegraph of the persons returned as Deputies throughout the country. It is stated that the Ministry still continue confident as to the result: that all the members of the present Cabinet will be re-elected, and that there will be a considerable majority returned in favour of Government. Private letters mention, among other circumstances connected with the addresses put forward by the different candidates, the singular fact, that in an electoral address suppressed by M. Odillon Barrot, soon after he had published it, he states that he was offered office by M. Thiers when the 1st of March Cabinet was constructed, and that he refused to join that Ministry because the Premier failed to procure from the King a *carte blanche* for a dissolution whenever M. Odillon Barrot might think it necessary.

Right of Search Question.—This question, which appeared to have been almost exhausted, has received a fresh impetus, not only from the statement given by the captain of the Two Sisters, reported in our last, but also from the publication of a letter from Captain Bouet, commanding the French station on the western coast of Africa. The letter has been addressed to one of the Paris papers, for the purpose of correcting some errors in that journal relative to the affair of the Two Sisters. Capt. Bouet states, that although he highly approved of the treaties of 1831 and 1833, he had changed his mind as to their intent, being now convinced that England intended them, as well as that of 1841, to put obstacles in the way of French commercial enterprise; and that the execution of the right of search has been a perpetual source of annoyance to French ships on the coast of Africa. Capt. Bouet's letter appears to have produced considerable sensation in the capital, and the Opposition prints make use of it for the purpose of expressing hostility to this country.

Treaty with Belgium.—Private letters from Paris state that the commercial arrangements between the Belgian and French Governments are near their conclusion, and that M. Cunin Gridaine, Minister of Finance, hoped to sign the treaty before he proceeded to the elections, which take place this day, as we have above stated. Belgium, it is said, has consented to lower its duties on French wines, salt, and silks; and France admits Belgian linen and thread, but still refuses to grant any favour to Belgian iron, which the Cabinet of Brussels, it is stated, insists on. This appears to be the only point at present dividing the two Governments. It is further stated that offers have been made to England to come into a treaty, which may compensate her for the French prohibition of her threads, as well as for the adhesion of Belgium to the anti-English commercial union.

Boulogne.—We noticed in a former Number a trial that had taken place in this town, in which the parties concerned were the London Morning Papers and the French Post-office; a prosecution having been instituted by the latter against the courier employed by those papers for conveying despatches from Marseilles under circumstances opposed to the law. The Post-office at that time gained a verdict, and the courier was sentenced to a fine of 150f. and costs. An appeal has since been made by the London journals to the Superior Court of St. Omer, which has reversed the decision of the tribunal of this town. A trial of a similar nature, and arising out of the same circumstances, has come before the Correctional Tribunal of Tarascon, which has also decided against the Post-office.

Algeria.—Despatches have been received by Government from Algiers, dated the 1st inst., stating that the column from Medeah has a second time destroyed the fortifications, partly rebuilt, of the fort of Boghar; and that all the tribes on the route, and even at a distance, have submitted. This division had brought back one piece of cannon and a number of deserters from the regular troops of Bakani, which were completely destroyed; and the despatch adds, the troops had returned because they had no more enemies to combat. All the chiefs of the tribe of Beni Moussa had made their submission, and the whole of the eastern portion of the province is represented as disposed to follow the same course. It is stated that commercial relations were establishing rapidly. The whole of the Kalifat of Ben Salem had applied to make submission, and the chiefs had announced that they would be at Algiers on the 4th or 5th inst. A previous telegraphic despatch from Algiers, dated the 25th ult., states that the Beni Menacers, a large tribe near Cherchell, and the Rhigias, near Milianah, had submitted; and that the whole chain upon the Arach, as far as Cherchell, appertained to the French. Nearly the entire province of Tittery had submitted, and the chiefs were on their way to Algiers. Gen. Changernier had also obtained a number of submissions, and was making great progress in the west of the department of Sidi-Embarak. The internal commerce is represented as being considerable at Blidah. The Ministerial papers, with a view, it is supposed, to the elections, speak in high terms of the successes of the army in Africa, and of the commercial consequences likely to result from the consolidation of the conquest.

Spain.—Our intelligence from Madrid is to the 28th ult. On the 27th the Minister of Finance presented to the Chamber of Deputies a project of law for the levying of the ordinary taxes until the supplies should be voted. At the sitting of the Cortes on the 26th, the Minister of War announced that Gen. Zurbano had been appointed to the command of the expedition to Catalonia, and that Gen. Castaneda was to succeed him in the government of Biscay. M. Sanchos de la Fuente having called on the Ministry to publish the names of the individuals invested with office by their predecessors, previously to their retirement, Messrs. Gonzales, San Miguel, Surra y Rull, and Alonzo, members of the late Cabinet, severally entered into explanations, which were considered satisfactory by the Chamber. A long debate had taken place in the Chamber of Deputies on the Bill fixing the effective of the army for 1842, at 90,000, and the reserve at 40,000. Count de Las Navas contended that 50,000 would suffice for the effective, and that the reserve might be increased according to circumstances. On the 28th ult. the debate terminated by the Chamber dividing, when there appeared a majority of 60 votes to 22 for the law fixing the whole force at 130,000 men. The Ministry have withdrawn the proposed law relative to the provincial deputations. It is expected that the opposition will not commence any measures of active hostility against the new Cabinet during the present session, but that they will reserve their strength for the next. The Cortes were not expected to be prorogued before the end of the present month, as the budget was to be discussed during the present session. The "Gazette" contains a decree dated the 26th ult. dissolving the army of the North. The troops of which it was composed are to pass under the command of the Captains-General of Navarre and the Basque provinces. General Rodil, now President of the Council and Minister of War, was the Commander-in-Chief of the Army of the North, and it is thought that it may be to avoid the embarrassment of finding a successor, or of keeping the post open for himself in the event of a change of Cabinet, that this decree of the Regent has been issued. The Ministry was active in taking precautions to maintain public order, and precise instructions to that effect had been despatched to the provincial local authorities. The journals dwell much on Zurbano's departure for Barcelona. The "Gazette" also publishes a circular of the Minister of Marine to his subordinates, in which he promises to place the navy on a respectable footing, so as to enable it to afford protection to their transatlantic possessions. The editor of one of the Madrid papers had been condemned for libel, and sentenced to imprisonment during four years in a fortress, and to the privation of his office and decorations. It is stated that the Regent's reason for ordering the regiment of Hussars of the Princess out of Madrid, noticed in a former Number, and which had given rise to many conjectures, is now explained. The eldest son of the Infante Don Francisco de Paula holds a commission in that regiment, which was constantly on guard at the palace, or escorting the Queen in her promenades. It was apprehended that the intercourse which this constant communication between her Majesty and her cousin gave rise to might hereafter defeat all the matrimonial projects of diplomacy, and it was consequently deemed advisable that the Prince, on his return to Spain, should not keep garrison in Madrid, and particularly not in the Royal Palace. The papers announce the arrival of the two sons of Don Francisco de Paula at Corunna, on the 1st inst., coming from England. It was said that they were to proceed to Madrid.—Subsequent accounts have been received by telegraphic despatch forwarded to Paris from the Spanish fortress of Figueras, in Catalonia, stating that the celebrated Carlist chief Felip, who had long been the terror of the Eastern Pyrenees, had fallen into the power of the Queen's troops, and was shot at Vic on the 3d inst.

Portugal.—We have news from Lisbon to the 27th ult. Neither the slave-trade nor commercial treaty came signed by the packet which brings our advices, but it is said that the two plenipotentiaries had come to a better understanding. It is also positively stated that the Duke of Palmella was about to join the Administration as Foreign Secretary and President of the Council, and that Senhor Campelo would be replaced in the Marine Department by a statesman more generally approved of.—The following intelligence, which gives the final results of the general elections, was published in a second edition of "The Times" of Thursday:—"Lisbon, Tuesday, June 27, 3 p.m. The scrutiny of the elections for Estremadura has this moment concluded, and the result is, that the Government has been defeated by a large majority, there being 16 of the Coalition and only 6 of the Government candidates returned. This is by far the most important election in Portugal, the candidates on both sides being among the most notable politicians in the kingdom. As a set-off to this triumph of the Coalition, the Government will certainly be victorious in the contested election of Evora in the Alemtejo, their candidates having been returned (as I have just now ascertained by the telegraphic despatch) by a majority of 6 to the *Bureau* which has the management of the electoral scrutiny. There is scarcely a doubt that these candidates will be finally returned by the same majority. The names of the 16 Opposition members returned for the Estremadura district are:—Rodrigo da Fonseca Magalhaes, J. R. de Miranda, A. C. de Vasconcellos, J. G. da S. Sanches, Faintino da Gama, Joaquim Antonio d'Aguiar (late Premier), Avila (late Finance Minister), Vieira de Castro, Garrett, Beirao, M. A. de Campos, Jose Estevao de Magalhaes, Mouzinho Albuquerque, C. Castello Branco, Ottolini, and M. D. Leitao. The Government members returned are—Costa Cabral, the Ministers of Marine and Justice, J. J. Falcao, M. B. d'Oliveira Borges, and J. da C. Carvalho. This result is most perilous, and may prove fatal to the existing administration. Everything is quiet, but the enthusiasm of the Opposition is extreme. In the Coalition List returned there is one Miguelite. The defeat of the Government is owing to the ratting of two individuals, and to three others absenting themselves on the plea of ill-health. They are said to have received 300 milreis each from the Coalition to secure that result."

Germany.—The intelligence brought by the German journals continues to be limited. The Frankfort papers state that the King of Prussia arrived at Posen on the 24th ult.; and that the following great personages are expected to assist at the manœuvres which are to take place in the Rhenish provinces on the King's return from St. Petersburgh:—The Kings of Bavaria, Hanover, Belgium, Holland, Wurtemberg, and Saxony; two reigning Dukes, two French Princes, and a Prince of Sweden.—Private letters from Berlin, dated the 26th ult., state that on the 24th ult. an accident occurred on the Potsdam Railroad, which had nearly proved as fatal as that on the road to Versailles. The sparks of fire from a locomotive set fire to one of the waggons, when the persons inside, perceiving the smoke, endeavoured to open the doors, but they were locked. At length the conductors, having heard the screams of the passengers, succeeded in extinguishing the fire.

Hamburgh.—Accounts received from this city, dated the 1st inst., inform us that the senate had given notice that it had resolved, according to the prescribed form, to order a general fast, on account of the late calamitous fire, and that it had fixed the 7th inst. for that purpose. A general collection in the churches was to be made, the produce of which is to go towards the rebuilding of the churches of St. Nicholas and St. Peter. The Exchange and the Bank were to be closed, and no bills protested on that day.

Belgium.—Advices from Brussels, dated the 30th ult., state that there seems to be every reason to believe that within a year from this time the Belgian railway will be joined to that of Rhenish Prussia, and that this junction is expected with great impatience by the merchants and manufacturers of both countries. It appears that the railway from Antwerp to Germany was commenced in 1833, and as it is to be completed next year, that ten years will have been spent in laying down this line of thirty-one leagues. The works, however, on both sides of the frontier are now said to be carrying on with great activity. It is stated that the Prussian engineers reckon that the railway to the Belgian frontier will be finished in the middle of next summer, and that M. Masui has promised that one portion may be opened in Sept. 1843. The "Moniteur Belge" has promulgated a law for the construction of a canal from Zelzaete to the North Sea.

Switzerland.—Accounts have been received from Geneva, informing us that the celebrated historian, M. de Sismondi, died on the 25th ult., at his country seat near that city, in the 69th year of his age.

Italy.—Private letters received from the frontiers of Italy state that arrests had been made lately at Pisa, in the kingdom of Naples, and in the Pontifical States, and that although numerous bodies of troops are quartered throughout the peninsula, symptoms of serious disturbances manifest themselves on all points. It is added that the Swiss troops at Naples inspire no fear.

Russia.—Intelligence has been received from St. Petersburgh, dated the 23d ult., informing us that on the 21st May a serious fire destroyed the old salt-works of Novo-Usolsky, in the government of Perm, the property of the Stroganoff family. The conflagration spread to the extent of 2½ versts, and lasted three days. Besides the salt-works, with the extensive provisions of all kinds of fuel made for them, from 5,000 to 6,000 inhabited houses connected with the manufactory, a large church, and numerous other objects, have been entirely destroyed.

Turkey and Syria.—Private letters have been re-received from Constantinople, forwarded by extraordinary despatch from Marseilles, containing the important intelligence that the three powers, Austria, England, and France, propose using coercive measures to make the Porte keep the stipulations made to the people of Lebanon; but that Russia, and finally Prussia, though consenting to remonstrate, and agreeing in the necessity of having a Christian governor, still object to coercion. Notwithstanding, however, the objection of the two powers, it is said that the English and French squadrons will repair to Beyrout; and as information has been received that the captive sheikhs have escaped, it is feared that another insurrection will take place in the Lebanon, unless the Porte yields. This is supposed to have been the substance of the important despatch stated in a former number to have been received by Government, which was mistaken for the extra Indian mail, and which has given rise to much speculation. Our ordinary advices from Constantinople, which come down to the 17th ult., make no mention of the above fact, but state that the Syrian question continued to be the all-absorbing topic, although no progress seemed to have been made in it. Accounts had been received from Beyrout to the 10th ult., stating that affairs were again threatening to assume a serious appearance, and an apprehension was entertained that a general rising would shortly take place in the mountain. On the 8th ult. Emir Abdalla, with his two sons, sought refuge on board an English frigate, not choosing to subscribe to a declaration contrary to his conscience. On the 9th ult. the Seraskier Mustapha and Izzet Pacha waited on Col. Rose, the British Consul, to demand the surrender of the Emir. The Colonel having returned a formal refusal to this application, a warm discussion ensued, and the Pachas, it is said, threatened that they would carry him off by force. The Colonel then replied, pointing at the frigate, that he was there, and they might take him if they could. In the morning of the 10th, twelve Sheikhs, all related to the family of Shabab, likewise retired on board the same frigate, having been informed that they would be arrested in the course of the day. Several others who did not avail themselves of the caution were actually apprehended. It is further stated, that the Turks had arranged a plot for seizing by a *coup de main* the Catholic patriarch of Lebanon. Mehmed Pacha, the new Governor of Tripoli, was to leave Constantinople for Tripoli on the 25th ult., taking with him new troops. Tranquillity had been restored at Aivali, lately the scene of insurrection. The Greek negotiations were still stationary. Private letters state that considerable movements were observable among the Turkish troops in Thessaly and Macedonia; that they were busy fortifying Salonica, and had already 250 pieces of cannon mounted on the works.

Malta.—We have accounts from this island to the 25th ult. The Prometheus steamer left on the 20th ult. for Constantinople, with Lady Canning and suite. The English fleet was expected to leave the station on cruise. The affairs of Tripoli continue to create great sensation in the island. Askar Ali Pacha, the Governor-General, who has been recalled from the command, as noticed in a former Number, owing to the formal demands of Sir S. Canning, had been perpetrating great cruelties. The "Malta Times" contains advices, received from Tripoli, dated the 20th ult., announcing that the famous chieftain of Fezzan, Abd-el-Gelil, and his brother, Seif-el-Nasar, had been betrayed by some of his most trusty officers into the hands of Askar Pacha, and decapitated by his orders. Their heads, after being paraded through the streets of Tripoli, and particularly in front of the British Consulate, had been packed up to be forwarded to Constantinople. The three children of Seif-el-Nasar, and a son of Abd-el-Gelil, fourteen years of age, having fallen into the hands of the Pacha, had been likewise beheaded, notwithstanding the interference on their behalf of Col. Warrington and the commander of a British steamer. All who made peace with the Turkish Governor, and surrendered themselves prisoners, experienced the same fate. The remainder of the insurgents, 4,000 strong, had fallen back on Sockna to join Sheik Sady, Abd-el-Gelil's general.

Egypt.—Private letters have been received from Alexandria by the overland mail to the 20th ult. An emir of the Haouran, who sought refuge on board her Majesty's ship Inconstant, had arrived there, and proceeded to Malta. It was reported that Mehemet Ali had offered to the Porte to send 7 regiments of the line to assist in disarming the Syrian mountaineers. This rumour seems to have originated in some military preparations making at Cairo, where a few regiments were organising for an unknown destination. Ibrahim Pacha left Cairo on the 9th ult. for Upper Egypt, to superintend the erection of sugar mills, which he is building for his own account. The Nile steamer was fitting out at Alexandria to convey the Pacha to Damietta. Mr. Brook, an English resident, had died of the plague; and the case had created considerable alarm among the English in Alexandria.

India.—We gave in our last the leading points of the intelligence brought by the Overland Mail, as communicated by the telegraphic despatch from Marseilles. The following are the particulars derived from the papers and letters which we have since received. The dates of our intelligence are from Bombay, May 23, and Calcutta, May 13. From Affghanistan the news is of a favourable character. Gen. Pollock had arrived at Jellalabad, relieving Sir R. Sale and the garrison of that fortress, on the 16th April. He had experienced little opposition on his march, except from some roving tribes, who had only succeeded in cutting off a few camels, and had even been able, when assured of Sir R. Sale's safety, to detach a part of his forces to the assistance of a friendly chief, whose active services in behalf of the British had drawn on him the enmity of Akhbar Khan. Col. Bolton's brigade also, which had been unable to overtake Gen. Pollock in time to accompany him through the Khyber passes, had, with the assistance of our Seikh auxiliaries, and a reinforcement detached from Jellalabad, reached Ali Musjib without difficulty, and were expected to arrive at Jellalabad about the 5th May. Col. Bolton had under his convoy a heavy commissariat train and some artillery, all of which had threaded the passes in safety. The system of purchasing the aid of the Afredis and other predatory tribes appears to have worked well. The combined forces would, it was supposed, maintain their position until about the end of June. In consequence of the death of Shah Soojah, at Cabul, the report of whose murder, brought by the last mail, is now confirmed, Gen. Pollock has changed his intention of returning to Peshawur, and will move upon Cabul as soon as sufficient supplies and carriage can be obtained for the passage of the army. The city and adjacent country are said to be in a state of anarchy consequent on the dissensions between the rebels and the partisans of the late King; and it is thought probable that the British will not meet with any serious opposition in their progress to the Affghan capital. The numerous followers who formerly adhered to the standard of Akhbar Khan have dwindled down to a small party of about 100 horsemen. It appears that Futteh Gung, son of Shah Soojah, who succeeded his father after his murder, did not long retain possession of the throne, having also been murdered by the opposing party; and Timor Shah, another son of the late King, who is said to have been always friendly to our cause, has been set up in his stead. This Prince, it seems, still holds the reins of government, and he is said to be looking out eagerly for the advance of our army, with the expectation of being assisted by us in keeping possession of the throne. The hostages, prisoners, and sick and wounded (between 300 and 400 in number), who were left in Cabul at the time of the capitulation, are said to have received much ill-treatment during the confusion which succeeded the murder of the Shah; but it is hoped that Timor Shah, if he really be on the throne, has taken them under his protection. Affairs once settled at the capital, Gen. Pollock will, it is believed, proceed to Ghuznee, Candahar, and Quettah, and then re-enter India through the Bolan pass. The prisoners have been removed by Akhbar Khan from Lughman, where they were originally confined, to a fort near Tezeen. With the exception of Gen. Elphinstone, who died on 24th April, of dysentery, all are well; and one of them, Capt. Mackenzie, has been allowed to proceed to Jellalabad on his parole, to enter into some arrangement for their release. It is not known what are the terms which have been proposed by Akhbar Khan, or whether there is any probability of a successful negotiation; but it appears from the last accounts, that Capt. M'Kenzie had returned to Tezeen. An enormous ransom is said to be demanded by Akhbar Khan. The day previous to his death, Gen. Elphinstone signed a document containing a detailed account of the proceedings connected with the Cabul insurrection, up to the time of his being taken prisoner; and which, it is said, will, to a great degree, exonerate the General from the charges brought against his personal character. Gen. Elphinstone's report was brought to Jellalabad by Capt. M'Kenzie, and it was currently stated in camp that, at the council of war, held previous to the retreat, Major Pottinger's objections to such a step were overruled. Other narratives also are said to have been prepared by the prisoners; one, by Capt. Eyre, of the Artillery, which is reported to be very full and accurate. It is therefore expected that the mystery, in which so many of the occurrences of the rebellion have hitherto been shrouded, will thus be cleared up. All doubt has been removed as to the author of the assassination of Sir W. Macnaghten; Capt. Mackenzie having asserted that he saw Akhbar Khan himself perpetrate the murder. Akhbar Khan was reported to have died from the effects of an accidental wound, but the rumour was not credited. The prisoners do not appear to have been treated so well as was represented. The letters received have been chiefly from Lady Sale, who is said to have usually written in good spirits, and made light of the hardships and privations to which all the captives were subjected. From a letter written by Lady Sale during the journey, it appears that they all suffered extreme privations, and that the whole party were huddled together at night in close and miserable quarters. On their arrival at Tezeen, matters were somewhat improved, and the prospect of a speedy release from their captivity had put them all in excellent spirits. Four accouchements had taken place since they had been together, and four more were expected. Several camp-followers and others, belonging to the Cabul army, had arrived at Jellalabad, some deficient of toes, and some of fingers, which had been frozen off by the intense cold. Among others, a trumpeter belonging to the 5th Cavalry had arrived, who stated that many more were alive, wandering about the hills. Cornet Wrench, of this regiment, who was supposed to have perished, is also, it appears, safe at Jellalabad. Our intelligence respecting the force lately under Col. Palmer at Ghuznee is scanty. It appears that he left the citadel on the 26th March, and took up his quarters in a portion of the town. There, as in the case of Cabul, the Ghazees, apparently without orders, attacked the troops, and a frightful slaughter ensued. The leader of the insurgents, Shumshoodeen, interfered, and took the officers under his protection, and they are described as now living as prisoners in the citadel. About 100 only of the sepoys are supposed to have escaped. The following is a list of the officers who have been saved:—Col. Palmer; Capt. Alston; Lieuts. Barnes, Poett, and Harris; Ensigns Williams and Nicholson; a doctor, supposed to be Dr. Thompson, 37th B. N. I.; Lieut. Crauford, 3d B. N. I., attached to Shah Soojah's force. Lieut. Lumsden had attempted to escape with his wife, in disguise; but they were detected, and both killed. Gen. England had, it was believed, succeeded in relieving Gen. Nott at Candahar. At Hykulzie, the scene of his former repulse, he had attacked the enemy's position, and carried it without the loss of a single man. Major Reid had reached Dadur with a valuable convoy of treasure and 4,000 camels, with which he was to ascend the Bolan pass on the 3d or 4th May. India itself remained in profound tranquillity. The measures of Lord Ellenborough appear to have given much satisfaction, and with the army especially he was extremely popular. He has issued a general order, expressing his high approbation of the manner in which, under circumstances of great difficulty, Gen. Pollock had carried into effect the orders of the Government, and of the conduct of the troops under him. The Governor-General, at the same time, expresses his high sense of the services of Gen. Sir R. Sale and the garrison of Jellalabad, "terminated by a decisive victory, which would have left nothing to desire had Col. Dennie survived to enjoy it." The Governor-General testifies his opinion of the just claims of that garrison to the gratitude of Government and of their country, and confers several honorary distinctions on the troops composing the garrison, "as a memorial of the fortitude, perseverance, and enterprise, evinced by those several corps during the blockade of Jellalabad." A silver medal is directed to be made for every officer and soldier of the garrison, and a donation to be given to each of six months' batta. The order concludes by requesting the Commander-in-Chief of the Army "to give instructions in due time that the several corps composing the garrison of Jellalabad may, on their return to India, be received at all the stations on the route to their cantonments, by all the troops at such stations, in review order with presented arms."

China.—Our news from Canton is to the 4th April. On the morning of the 10th March, the Chinese troops, estimated at from 10,000 to 12,000 men, attacked Ningpo. The enemy scaled the walls, and advanced to the market-place, in the centre of the city, before they met with any opposition from the British troops. It seems, however, that this did not arise from any neglect on the part of the garrison, all the necessary preparations for receiving the enemy having been made some time previously. It seems that his Excellency was desirous of allowing the Chinese to advance a considerable distance unmolested, with the hope of punishing them severely for their temerity. The enemy were quickly routed and compelled to quit the city, leaving 250 dead in the streets. The artillery rendered good service in the pursuit, the guns being drawn by a number of ponies, previously trained for that purpose. H. M. 49th reg. were sent a considerable distance after the Chinese, and had not returned to Ningpo on the 12th March, the date of our latest intelligence from that place. An attack was made on Chinhae simultaneously with that on Ningpo. This also proved a failure, the Chinese having been repulsed with great loss. The mandarins also contemplated an attempt on Chusan, for which purpose they had collected a considerable force on the island of Taisam. Their intentions were, however, frustrated, by the steamer Nemesis having been sent to reconnoitre, and ascertain the extent of their preparations. A boat having been despatched from this vessel, was fired on by the Chinese, when pulling into a creek; upon which the steamer's crew were immediately landed, and they succeeded, after killing many of the enemy, in capturing 30 junks, supposed to have been intended to convey troops to Chusan. It was remarked that all the Chinese soldiers left dead at Ningpo and Chinhae had a few dollars about them. It is supposed from this that a gratuity was issued to them immediately before they attacked the city, in order to induce them to advance. It is said that the Emperor has ordered that the provinces which are the seat of war shall defray the whole of its expenses; from which it is inferred, that the Cabinet of Pekin do not conceive it necessary to make a great national effort. The inhabitants of the invaded provinces were disinclined to bear the whole of the heavy pecuniary charges necessary for carrying on hostilities; and the Chinese army to the south of the Hangchow river was in want of pay, and destitute of supplies, from which cause the troops were in such a state of insubordination, that it was expected they would shortly disband themselves. The whole of the operations above referred to were effected without the loss of a man on the side of the British. Several skirmishes had also taken place along the coast, but with no decisive result, although in each the enemy had suffered considerable loss. More vigorous measures were, it is said, in contemplation, and a movement to the northward was intended upon the arrival of the expected reinforcements. The preparations for the defence by the Chinese of the river between Whampoa and Canton were still in progress, and nearly completed; and their officers were unremitting in their exertions to practise their artillerymen in the use of great guns. In the mean time trade appears to have been carried on as usual, but, with the exception of cotton, not upon remunerating prices. Barter was the only means of commercial intercourse.

Van Diemen's Land.—Accounts have been received from Van Diemen's Land and Norfolk Island to the 26th Dec. Capt. Maconochie has been for two years residing at Norfolk Island, the colonial penal settlement for the twice and thrice convicted felons, in order to try the effect of his new system of convict management. Capt. M. commenced with 1,200 of the old convicts and 600 new prisoners, assisted by three free overseers and a surgeon. In spite of the obstacles thrown in his way, and the prejudice he has had to contend with, he has succeeded in abolishing flogging and all kinds of vindictive punishment, and has, by moral influence and kindness, effected a complete reformation in men who were before regarded as the most degraded of the human race. The whole body are represented as reduced to the utmost order and discipline, desirous of pursuing some useful mode of life, and anxious for a continuance of the system under which they have derived so many advantages. The superiority of moral influence over the physical force which was formerly applied in the case of these prisoners is represented as extraordinary; and it may, perhaps, be considered a proof of its beneficial influence that the system is violently opposed by all those authorities at Van Diemen's Land who are interested in maintaining the old system and in keeping the convicts subject to the cruel discipline by which they have hitherto been hardened in crime. It is hoped that the knowledge of Capt. Maconochie's success at Norfolk Island may induce the home authorities to carry out his system in the other penal settlements.—The "Tasmanian Journal" publishes an interesting paper, giving an account of Mr. Eyre's expedition overland from South to Western Australia. He left Fowler's Bay on the 25th Feb. of last year, and arrived at the head of the Great Australian Bight on the 3rd March. The privations which he there encountered were so severe that his horses perished, and the native boys who accompanied him deserted; he arrived at King George's Sound on the 7th July, after having travelled over an extent of country which, from sinuosities of the coast line and other obstructions, exceeded upwards of 1040 miles in distance from Fowler's Bay; and for the last 590 miles he was accompanied by no one but a native of King George's Sound. During this journey, Mr. Eyre met with very few natives, but they appeared timid and well-disposed; he found the language spoken by them exactly similar to that of the natives of King George's Sound as far as the promontory of Cape le Grand.

Parliament.

HOUSE OF LORDS.

Monday.—Lord Brougham presented a petition from a Baptist association in Ireland, representing eleven congregations in that country, against the *Regium donum*, and all similar grants.

The Duke of Richmond asked the Secretary for Foreign Affairs whether the reports that had been circulated were true, of an attempt having been made on her Majesty's life. He could assure his noble friend that he did not ask the question out of mere curiosity, and he begged of him not to give an answer if there was any objection to give it; but he thought the house, meeting that day, ought not to separate without asking whether there was any truth in these reports.—The Earl of Aberdeen, in reply, could only say that he entirely sympathised in the feeling which his noble friend had evinced, and which he was sure was felt universally by the House and throughout the country. He had to state that the individual referred to had been arrested, but as he was still under examination, he thought it would be premature for him to express any opinion or to make any statement on the subject at present.

Lord Brougham put a question to the President of the Board of Trade, respecting a matter which he said had given some alarm in the City, particularly among persons connected with the funds. It was understood that the income tax was to be levied on the July dividends, so as to extend back to Jan. instead of April, when it came into operation. It seemed to him that it could be properly levied only upon a moiety of these dividends.—The Earl of Ripon said he would make inquiry on the subject.

Tuesday.—After the presentation of petitions, the Earl of Ripon moved the second reading of the Customs Duties (Tariff) Bill. The necessity of such a measure he considered to have been admitted by the frequent agitation of the question since the conclusion of the war, and the principle upon which the revision should proceed—that of a more free and open trade—had been as constantly asserted. One object of the present measure, in which almost all interests agreed, was the removal of all positive prohibitions; but he thought that although the scale of protection now proposed was lower than that suggested by Mr. Huskisson, it was still abundantly sufficient. After passing briefly over several items of minor importance, the noble Earl then came to the question of admitting foreign cattle at a reduced duty—a measure which, he contended, was rendered necessary by an increasing population, but from which the agricultural interest had little ground for apprehension, as the scarcity of cattle in foreign countries, and the increase of value consequent upon the opening of a new market, would prevent an extensive importation at low prices. He defended the expediency of commencing such a change as the present by a reduction of the duties on a great mass of articles, rather than upon one or two only of first rate importance; and concluded by expressing his conviction that the consumer would be benefited and the prosperity of our commerce promoted by this bill, without a serious injury to any interest.

Lord Stanhope, in moving, as an amendment, that the bill be read a second time that day six months, went into a variety of details respecting the cost of growth and fattening of cattle in different countries, to prove the inexpediency of admitting them upon the proposed rate of duty. He contended at the same time that the arguments by which the measure was supported neutralised each other, one class of evidence being intended to show that the price of food would be greatly reduced, while on the other hand it was confidently asserted that there would be no reduction at all. He was opposed to the principle of free trade; he was convinced that the measure was regarded with apathy by all, except those who expected from it general disorganisation, and a new distribution of political power; and he implored their Lordships not, by thus aggravating the present great distress, to bring about such a consummation.—The Duke of Richmond supported the amendment. He expressed his fears for the effects of the bill, in leading to the abstraction of capital from agricultural pursuits. If Government had consulted the welfare of the agriculturist, they would have permitted the importation of cattle by weight instead of by head. For his own part, he was not prepared to go so far in following up the principles of free trade; for the English agriculturist, with his present load of taxation, could not compete with the foreigner. He was also fearful that the bill would lead to further changes.—The Marquis of Clanricarde would give the measure his hearty support as an important advance towards free trade.—Lord Mountcashel opposed it as injurious in its probable operation both to the colonies and the home producer.—Lord Monteagle supported the bill, though he considered the speech of the Earl of Ripon was calculated to lead to the belief that little or no benefit would result from it. He considered that Sir R. Peel had laid down the principles of free trade in the broadest manner in bringing forward this measure; and expressed a hope that these principles would be applied more extensively than by the present bill. He expressed doubts as to the policy of the duty on the exportation of coal, which would not tend to conciliate foreign countries, or induce them to adopt a more liberal policy with this country.—After some observations from Lord Colchester in favour of the bill, and from the Earl of Ripon in reply, the House divided, when there appeared, for the amendment, 4; against it, 59; majority against the amendment, 55. The bill was then read a second time.

Thursday.—The Sudbury Disfranchisement Bill and the Mines and Collieries Bill were brought up from the House of Commons, and read a first time. On the third reading of the Liverpool Improvement and Police Bill having been moved by the Earl of Shaftesbury, the Duke of Richmond moved to expunge the second clause, which compelled the closing of public-houses till after one o'clock on Sunday.—The Bishops of Salisbury and Norwich, and Lord Skelmersdale, severally supported the clause, and on a division the amendment was negatived by a majority of 48 to 15. Another division took place on the motion of the Duke of Richmond to expunge the clause prohibiting the sale of liquor to persons under sixteen years of age, which was negatived by a majority of six. The numbers being 38 to 32.

On the motion that the House resolve itself into committee on the Customs Duties Bill.—Earl Stanhope said that he could not allow the Bill to go into committee without stating again the objections which he entertained to its passing into law. His Lordship then again went over the grounds of his objection to the different clauses of the Bill, and concluded by saying that he must again entreat the House to pause before it passed a measure, the inevitable effect of which would be to throw out of employment innumerable multitudes of their fellow-creatures.—The Earl of Radnor supported the measure, and said the only complaint he had to make against it was, that it did not go far enough.—The Earl of Wicklow also supported the bill, and said, he was fully persuaded that the course taken by Ministers was one in every respect likely to increase the manufactures, and to promote the industry of the country. He was convinced, under the circumstances in which the country was placed, the improvement which had been made in every department of our manufacture, with our great wealth, and with the means of disposing of our manufactures, we might bid defiance to all competition with the rest of the world, and this was one of the reasons which induced him not to consider the bill now before the House as a final measure.—Earl Fortescue said, the panic the tariff produced among the agricultural classes in Devonshire was past.—The House then went into committee. All the clauses up to 56 were agreed to. On the clause referring to the duties on oxen, bulls, calves, and lambs being proposed, Earl Stanhope proposed, as an amendment, that the duties on those animals should be taken by weight.—Their Lordships divided on the amendment, and the numbers were—For the amendment, 8; against it, 44; majority, 36.—On the schedule relating to seeds being read, Earl Stanhope proposed the omission of the part of the clause relating to seeds. The motion was negatived without a division.—Earl Stanhope also moved the omission of the schedule relating to foreign woods. This motion was also negatived without a division.—The other clauses in the schedule were then agreed to; the House resumed, and the Bill was reported without amendments, and ordered to be read a third time on Friday.

Friday.—On the presentation of petitions on the Mines and Collieries Bill, the Earl of Devon said he should move the second reading on a future day.—The Duke of Richmond mentioned the necessity of a select committee, and the Duke of Wellington said that although the reports of the Commissioners had made great impression on his mind, he thought the House should examine into the mode in which the evidence had been taken. The Bill was then referred to a select committee. The Customs Bill, on the motion of Lord Ripon, was read a third time and passed, on a division, by a majority of 43. The Railway Bill was read a second time.

HOUSE OF COMMONS.

Monday.—There being only 23 members present at the usual hour, the House was adjourned until Tuesday.

Tuesday.—After the presentation of several petitions, Sir H. Hardinge stated, in answer to a question from Lord Worsley, that as soon as the Commander-in-Chief had been informed of a rumour imputing to Col. H. Dundas that he had used expressions disrespectful to her Majesty, he had required him to forward whatever explanation it was in his power to offer. Col. Dundas had, however, failed in exculpating himself from the grave offence laid to his charge, and had in consequence, with the approval of her Majesty and the full concurrence of Government, been dismissed from his appointment as aide-de-camp to the Queen, and removed from the command of his regiment.

Sir J. Graham intimated that a bill is to be brought in this session authorising her Majesty to grant new charters to the Colleges of Physicians and Surgeons. In consequence of there being no House on Monday, the orders which stood for that day became "dropped orders;" and Mr. Wallace, acting on the rule which forbids the bringing on of such orders, except by universal consent or by a renewed appointment, objected to the resumption of the adjourned debate on his motion respecting the distress of the manufacturing classes, unless the order were regularly renewed. Accordingly that debate, and the business of the supply, as well as the Committee on the Poor Law Amendment Act, were postponed to Wednesday and other days of the week.

The order of the day having been read for the last stage of the Dean Forest Ecclesiastical Districts Bill, Mr. Hume, on the motion for the Speaker's leaving the chair, proposed a series of resolutions adverse to any grant from the revenue of the Crown lands for the endowment of clergy or the maintenance of the fabric of churches. He contended that, as the public now pay to the Sovereign a life annuity by way of equivalent for the Sovereign's life interest in the land revenue, the land revenue belongs to the public; and consequently, that any grant for ecclesiastical purposes from that land revenue is tantamount to a grant for those purposes from the consolidated fund. He observed that there are a great number of parishes not containing 100 inhabitants each; and he thought that the population and the ecclesiastical provision ought to be averaged together by a general reform, before the introduction of any such measure as this. He thought that the present time was peculiarly unsuitable for it, since, but for the income-tax, the Exchequer would now be bankrupt. There was an ecclesiastical commission for applying the fund produced by certain abolished sinecures of the Church to its real wants; and to that commission he considered that Government ought to have made application for the spiritual endowments which might be wanted for the Forest of Dean.—Sir J. Easthope seconded the motion.—Lord Lincoln briefly opposed the resolutions, insisting upon the great increase of population in that district, while the revenue derived from it had risen from 800*l.* a year to 5,000*l.* After some observations from Mr. Williams, the House divided, when the resolutions were rejected by 177 to 44.

The House then resolved itself into committee on certain resolutions respecting the South Australian Government. Lord Stanley stated that the resolutions which he intended to lay before the House related to the financial arrangements of the colony. The financial affairs of South Australia had been, from the commencement, in the hands of their own commissioners, while its political affairs were entrusted to a Government board appointed by the Crown. He thought that this divided authority was injurious to the exertions of each. The insufficiency of the sums which had been raised by the colony had also thrown its finances into great confusion. He, therefore, proposed that the general government of South Australia should be placed on a similar footing to that of our other colonies. The bill would place the government of the colony in the hands of the Crown, reserving for her Majesty the prospective power of modifying its present provisions. The noble Lord further pointed out the financial necessities of the colony; and concluded by moving a series of resolutions in accordance with the propositions he had laid down. After a brief discussion, in which Messrs. Williams, Mackinnon, V. Smith, and Ward joined, the resolutions were agreed to.

Lord Ashley moved the further proceeding on the third reading of the Mines and Collieries Bill.—Mr. Ainsworth presented petitions against the bill, and argued that the measure would have the effect of seriously injuring the working classes concerned, many of whom would be driven to the workhouse. The commissioners who had inquired into the matter had made, at least in many cases, a one-sided report, and had drawn a very exaggerated picture of the existing state of things.—Mr. Bennett strongly supported the bill.—Mr. Villiers vindicated the motives of those who objected to the bill, and who were anxious that one evil should not be committed in correcting another.—Mr. Attwood believed that the bill had been passed rather hastily through the House, and considered that interference with the employment of boys might be productive of evil.—Mr. Stansfield also objected to many of the provisions of the bill.—Messrs. Brotherton, Hawkes, and Fielden then commented on the bill; and Lord Ashley called the attention of the House to a letter which he had received from a gentleman largely connected with collieries, which he said was only one of a large number of testimonials in favour of the bill. He felt deeply grateful for the attention which the House had bestowed upon the bill.—Lord Palmerston expressed a hope that the bill would speedily pass into a law unaltered, which he thought it would, if Government cordially supported it in the House of Lords.—The bill then passed its final stage.

Wednesday.—The National Floating Breakwater Bill was read a third time and passed, after some opposition to it by Sir C. Douglas and the Marquis of Douro, by a majority of 32 to 20.—Some clauses proposed by Mr. Blackstone in the Sudbury Disfranchisement Bill, for the purpose of extending the franchise to the adjacent hundreds, were negatived by 134 to 53. The Bill was read a third time and passed.—Mr. Roebuck withdrew his motion for the attendance of Mr. Cochrane before the Bridport Committee, and Mr. Cochrane then declared that having examined the precedents that bore on the case, he would attend the Committee on Thursday.

The debate adjourned from Friday night, on Mr. Wallace's motion relating to the distress of the country, was resumed by Mr. Williams, who dwelt on the great extent and severity of the suffering among his own constituents at Coventry. He insisted on the necessity of a change in the Corn-laws; but warned Lord J. Russell that an 8*s.* duty would be very little better than the system lately enacted. He objected to the Income-tax, which he said would have the effect of taking 4,000,000*l.* from the poorest people in the country.—Mr. Aldam, while admitting that the distress in Lancashire was more severe than in the manufacturing districts of Yorkshire, was convinced that the suffering would rapidly increase amongst the Yorkshire woollen manufacturers, who have hitherto been a manly, honest, independent race of men. After describing the condition of Leeds and the adjacent districts, he intimated an opinion that, as a measure of temporary relief, the opening of the ports for the free admission of foreign grain, say up till next Christmas, would give such a stimulus to trade and commerce as might, with the aid of the Tariff, obviate for some time longer any further change in the Corn-laws.—Sir B. Hall produced a statistical document, exhibiting that in the parish of Marylebone, the residence of the wealth and aristocracy of London, the number of paupers rose and fell with the price of corn.—Mr. Brotherton likewise bore testimony to the extent and severity of the distress in his own district.—After some observations from Messrs. James and Attwood, Viscount Howick thought that Mr. Wallace's motion was neither suitable nor satisfactory. He doubted the propriety of postponing the prorogation of Parliament, in order to go into an undefined inquiry. He would rather wait to see how the new financial measures operated; and if they failed in giving relief, then again to summon Parliament at an early period, and resort to a removal of those commercial restrictions which he believed would be the only effectual remedy. He hoped that Government would seriously reflect on the frightful condition of the country, and carry out the principles which they had avowed; for himself he looked forward to the approaching winter with dread. Averse as he was for further political movements, he could not disguise from himself the fact, that a great change was coming over the sentiments of the middle classes, which might lead to serious results.—Mr. Morrison saw no reason to believe that the distress would be permanent. Our coal-beds and our capital were not exhausted; and our manufacturing power was still superior to that of every other country. The Tariff would do some good, but, he thought it would not give so great a relief as Sir R. Peel had promised from it. He regretted that the fixed duty on corn had not been adopted, and commented on the uncertainty which he considered inseparable from the the sliding-scale. The rapid increase of our population would, ere long, he was persuaded, compel the abolition of the duties upon food.—Mr. G. Palmer argued that the distress arose from a vicious system of credit, which enabled our manufacturers to overstock every market in the world.—Mr. Ellice reviewed the history of the commercial reactions from 1819, the date of Sir R. Peel's Currency Act, and assigned, as a main cause of the distress, repeated tampering with the currency by the Bank of England. He believed that the existing distress would be mitigated by a change in the Corn-law.—Sir C. Napier thought that the Corn-bill was as effective as the old one in keeping corn out of the country.—After some observations from Capt. Layard, and Messrs. Scholefield and S. Crawford, in support of the resolutions, Lord Palmerston expressed his regret that the motion was so framed as to prevent him voting for it. At the same time he thought that, considering the extent and nature of the distress, Government, instead of sitting by with apparent apathy, and expecting some miraculous interposition of Providence, should be prepared with some practical measures of relief. For a plentiful harvest they could not hope, for this summer sun could not repair the mischiefs of the last autumn's rains. Did they look, then, to the Tariff? or to private charity, in its very nature limited? or to a vote of public money? They had nothing to propose, and they asked the Opposition for a proposal. The answer of the Opposition was, that the channels of trade were choked, and ought to be cleared; and that the remedy for the distress would be found in a removal of the duties upon corn and upon sugar. He considered that the distress arose from causes within our own control; and as commercial jealousy in France, and the effect of our laws in Germany, prevented expectations from continental Europe, we must look to America, South and North. In India the great measure taken by the late Government in Affghanistan had opened a wide field for British commerce. He had a right to say that the Ministers themselves approved that policy; since they had written to Lord Auckland very shortly after their accession, requesting him to continue in his government. In China, too, the measures taken by the late Ministers had laid the foundation of an extensive commerce. But it would take time to bring these resources into operation, and meanwhile the distress required a present remedy.—Lord Stanley said, that in assuming the possible apathy of Ministers during the approaching vacation, the noble Lord took a very inadequate view of the difficulties which he and his colleagues had left behind them. At home Government looked forward to a better and an earlier harvest than late years had yielded. But they could turn their eyes to scarcely any foreign quarter of the globe where they did not see our commerce paralysed by the policy of the last Administration. In Europe, Lord Palmerston had admitted that there was little to be hoped. In North America we were met with quarrels and jealousies, festered by the policy of the noble Lord. In South America the same hand was visible in disputes and blockades. To China he turned with pain, for he saw there a doubtful war against an unwarlike people. In Central Asia, to establish an imaginary bulwark against an imaginary foe, the noble Lord had brought upon us a series of anxieties and losses. The noble Lord, however, concurred with him in one conclusion—in condemning the present motion, as involving a variety of important topics without the possibility of useful results. One speaker pointed out one cause of distress,—another, another. The topics of such a debate were far too wide to be dealt with in the way proposed by these resolutions.—Mr. O'Connell then moved the adjournment of the debate, but Sir R. Peel entreated that it should be closed. Mr. O'Connell, however, persisted; and said that the people were starving, and not a hope was held out to them.—Mr. Hume said, that many Members still wished to speak; among others, Mr. Ferrand.—Mr. Ferrand said, he had wished to speak, merely for the purpose of making it known that the working-classes regarded the talkers on the opposite benches as a set of "humbugs." He had abstained from rising, only because he had been given to understand that it was material to the public business that the debate should close.—Mr. Hawes resented the word "humbugs," and wished to know why Ministers had not made a House on Monday.—Mr. Cripps stated, that at four o'clock on Monday a great number, perhaps 30, of the Members who support the motion of Mr. Wallace appointed for that evening, and on whose sincerity on the subject of public distress the gentlemen accustomed to collect the House had unfortunately relied, refused to come in, and went away boasting that they "whipped out" the House.

Sir R. Peel assured his hearers, that the Ministers, who had been occupied till half-past four o'clock with the investigation into the cowardly attack upon her Majesty, had been greatly disappointed at the failure on Monday. He reminded the House that the supply had been postponed only because the public interest required that priority should be given to the Tariff.—Mr. Baring confirmed the statement of Mr. Cripps.—The House divided: against the adjournment, 173; for it, 84; majority, 89.—Mr. Hume then moved the adjournment once more.—Sir R. Peel yielded; and after some further conversation, the debate was accordingly adjourned.

Thursday.—After the presentation of petitions, Mr. Hume moved for a select committee to inquire into the proceedings of the Commissioners for the Reduction of the National Debt, &c., from 1836 to 1841, with reference to the amount of 5,395,569*l.* Three per Cent. Stock being added to the debt without the previous sanction of Parliament.—The Chancellor of the Exchequer said he could not accede to the motion; an opposition in which Mr. F. T. Baring coincided.—After some remarks from Messrs. Williams and Escott, Mr. Hume pressed his motion to a division, and was defeated by 173 to 34.

Mr. Sergeant Murphy rose to move that on the 13th inst. the House should resolve itself into a committee of the whole House, to take into consideration the Act entituled "An Act for provision of ministers in cities and corporate towns, and making the church of St. Andrew's, in the suburbs of the city of Dublin, presentative for ever," with a view to the repeal of so much thereof as relates to the provision of ministers in cities and corporate towns in Ireland. The object of the motion was that the House should pledge itself to consider the propriety of abolishing what is called "Ministers' Money" in Ireland.—Mr. Sergt. Jackson felt bound to meet the motion with a decided negative.—Mr. Sheil said that the motion was only a portion of a large and important question—one which was not dead, but only dormant, and which was likely to be revived with great force during the next session of Parliament.—After some conversation, in which Messrs. Shaw, M. J. O'Connell, and Sir R. Inglis joined, Lord Eliot expressed his surprise that this grievance should now be brought forward for the first time.—After which the House divided, when the motion was rejected by 85 to 56.

Mr. Hardy, pursuant to notice, moved that the petition of William Roberts, on the Anatomy Act, be taken into consideration, and proposed that a committee be appointed to inquire and report on the working of the act, and, if necessary, to suggest amendments on the same.—Sir J. Graham thought the subject little calculated for discussion in that House. The Anatomy Bill had accomplished the important objects it had in view. The allegations that had been made against Dr. Somerville had been laid before the commissioners appointed by him (Sir J. Graham) to inquire into them, namely, Mr. Rodgers, the Queen's counsel, and Mr. Green, the surgeon, and they had reported on the subject, after the fullest examination. The substance of that report was, that some irregularities had taken place, which had been checked by him: but that, on the whole, Dr. Somerville's intentions were good and his conduct correct. The object of Mr. Roberts's petition was to obtain remuneration for a discovery of a fluid to prevent bodies from undergoing decomposition; but his method had been tried, and had proved a complete failure.—Mr. Hardy withdrew his motion.

Sir R. Inglis moved that parties implicated or accused should be present of right at the proceedings of the election compromises and bribery committees.—Mr. Roebuck hoped that the House would not withdraw its confidence from the committee during the remainder of its proceedings, unless upon actual accusation of a misuse of its powers. After a few observations from Messrs. Escott and Labouchere, Sir R. Peel briefly opposed the motion; when Mr. T. Duncombe moved as an amendment the previous question. To this amendment Sir R. Peel objected, preferring a direct "Aye" or "No" to the original motion. On this a farther and prolonged discussion followed, ending in a division on the "previous question," which was carried by 121 to 49.

Mr. Bannerman, in pursuance of notice, brought forward his motion for affirming the expediency of vesting in her Majesty, with the advice of the Privy Council, a power of regulating or discontinuing the duty on foreign corn, should circumstances so require, during the recess of Parliament.—Mr. Wallace seconded the motion.

Mr. Gladstone, while expressing respect for any proposition which was directed to the relief of the existing distress, opposed the present one, on account of its dangerous character. The circumstances attending the precedents adduced were different from those of the present time. There were also strong constitutional objections to giving such large discretionary powers to Government; it would be the more legitimate course to ask Parliament to repeal the Corn law. He hoped that the new Corn-law, in conjunction with a favourable harvest, of which we have a fair prospect, would cause such a quantity of corn to be liberated from bond as would be a very seasonable relief to the country.—Mr. Ward thought that a great emergency existed, to be met by an extraordinary effort; and he supported the motion, as the best thing that could be done with a view to the immediate and temporary relief of the country.—Lord Worsley was convinced that great danger would result from giving such powers to Government, and that great injury would be inflicted by it on the agriculturists.—Mr. M. Milnes regretted that Government would not adopt the proposition, in order to alleviate the appalling distress.—Mr. P. M. Stewart, as one of a small but increasing section in the House who were opposed to all duty on corn importation, said he should support the motion.—Mr. Wallace addressed the House in support of the motion, and intimated his determination to endeavour to moot the Corn-law question once more before the House before the close of the Session. After a few remarks from Mr. Parker, Sir R. Peel explained the circumstance attending the precedent of 1826, when a similar measure had been adopted, and which, he said, had been adopted from a conviction of the evils of the existing Corn-law, and which was followed by the contrivance of the "sliding scale," a contrivance which it was hoped at the time would supersede all future necessity of such extreme measures. But two months after a re-adjustment of the Corn-law to adopt the proposition before the House, would introduce confusion and uncertainty into the Corn trade, give a bonus to speculators, and aggravate instead of relieving the distress.—Lord Howick argued, in reply to Sir R. Peel, that the measure of admitting corn for a temporary period free of duty, or at a low rate, would give relief without injuring the trade, by compelling the speculators to come into the market. He admitted that there were grave objections to the motion; but these were comparatively of a minor character when contrasted with actual circumstances.—Lord J. Russell said that every discussion on the Corn law exposed the unsoundness of the principle of a sliding scale. He could not support the motion; but if circumstances arose which might imperatively call for such a measure during the recess, he thought Government might then assume the responsibility, and that Parliament would grant indemnity. After some observations from Mr. Hume, in support of the motion, the House divided, when there appeared, for the motion, 113; against it, 175; majority against it, 62. The other orders of the day were then disposed of.

Friday.—After several notices of motion, the adjourned debate on Mr. Wallace's resolutions respecting the distress of the country was resumed by Mr. O'Connell, who dwelt mainly on the distress in Ireland.—Lord Eliot replied, and exposed the way in which appearances of distress are exaggerated by the Irish journals.—A long discussion ensued, in which the motion was supported by Mr. P. Stewart, Mr. M. Phillips, Mr. Ewart, Mr. C. Buller, Mr. Cobden, Mr. Roebuck, and Mr. Villiers; and opposed by Mr. Borthwick, Mr. Grimsditch, and Mr. Ferrand. After which Mr. Fielden moved the adjournment of the debate.—Mr. Wallace requested him to forbear; but Mr. Fielden persisted.—Sir R. Peel protested against this course, and appealed to the justice as well as courtesy of the House.—The question, however, was put, and defeated by a majority of 231.—Another adjournment was immediately moved and defeated; when Mr. Fielden a third time renewed the motion, which was equally unsuccessful. At last a division was taken on the original question, and Mr. Wallace's resolutions were negatived by a majority of 125.

CITY.

Money Market, Friday.—Consols have declined ¼ per cent.; they closed for money and account at 91⅛; Exchequer bills, 2d issue, 45s. to 47s. premium; ditto, 2¼d. issue, 48s. to 50s. premium; 3 per Cents. Reduced, 91⅝; 3½ per Cents. Reduced, 100⅜ to ⅝; New 3½ per Cents., 99⅝ to ⅞; and India Stock, 247 to 249.

Metropolis and its Vicinity.

Court of Aldermen.—On Tuesday a Court was held for the despatch of business. Alderman Wilson, after some observations upon a letter written by the Lord Mayor, expressive of his lordship's wish that the chief magistrate's visit to Rochester should not take place in his mayoralty, moved that the Lord Mayor be requested to take the survey on the days appointed by him, viz., the 21st, 22d, and 23d inst., before any objection was offered to the proposition that it should be taken out of the septennial course. He stated that as the present Lord Mayor was particularly well acquainted with the river in consequence of the nature of his commercial pursuits, and as an extensive survey of the river had been made under the authority of the Admiralty, and at considerable expense, it would be more desirable that the visit should be paid in the present than in the succeeding mayoralty. The Lord Mayor said he would much rather decline taking the survey; but he was in the hands of the court, and if they required him to act, he would not flinch from what, if they agreed upon the subject, he certainly should consider to be his duty. Alderman Thompson said that the survey was a septennial one, and would properly occur in the next mayoralty, and he could see no reason for departing from the general rule, unless some strong case of necessity were made out. Alderman Lucas seconded the motion that the present Lord Mayor be requested to take the survey on the days specified by Alderman Wilson; and after some discussion the motion was carried, eight hands having been held up for it and none against it, in a court consisting of thirteen members. The survey will take place on the 21st, 22d, and 23d inst.

Common Council.—On Thursday, a court was held to choose eight persons, four of whom to be aldermen to be returned to the mayor and aldermen for commissioners under the income tax act. The following aldermen were chosen:—Sir J. Duke and Messrs. Fairbrother, Gibbs, and Magnay. The following commoners were then elected commissioners:—Messrs. John Dixon, Cope, Knott, and Eyton. The Town Clerk informed the court that they were immediately to proceed to elect under the 32d section, by which it was enacted, "That the mayor, aldermen, and common council of every corporate city throughout Great Britain, or any three or more of them, not in any case exceeding seven, should be commissioners for executing the act, and the powers therein contained in relation to the public offices or employments of profit in such city, and in every guild, fraternity, company, or society, whether corporate or not corporate, within such city." Upon the motion of Alderman Copeland it was resolved that five persons should be appointed commissioners to perform the duty specified in the section just read. The following gentlemen were then appointed to act as commissioners under the 32d section of the act:—Messrs. Brown, Bridge, Finnis, Lart, and Westwood. Mr. Hall brought up the report on the subject of ventilating the courts of law in the Guildhall. It recommended the adoption of Mr. Day's plan of ventilating these courts, as better adapted to their situation and circumstances than that of Dr. Reid, which would cause extensive alterations, and the permanent employment of an engineer, and other inconveniences, which it was considered judicious to avoid. Mr. Hall believed the expense would amount to between 600*l.* and 650*l.* The saving of expense, however, was not the object. The report was agreed to, and referred back to the committee to be carried into effect as to its recommendations.

University College.—On Saturday the annual meeting of the Council and Professors of this College took place for the purpose of distributing prizes to the youths who had distinguished themselves in the Faculty of Arts. Lord J. Russell took the chair. There was an unusually numerous attendance of ladies and gentlemen; and his Lordship, in presenting the prizes, warmly congratulated the students. The proceedings being over, the chairman addressed the meeting at considerable length on the flourishing condition and prospects of the institution. He alluded to the original intentions of those who founded the institution, as one required by the circumstances of the times. One of these, he said, was that persons dissenting from the Church of England, or being of a different persuasion from it, could now obtain those distinctions to which learning, science, and moral excellence were entitled. They had at first to contend against the prejudice, that the mere fact of being situated in the Metropolis would be an impediment to the new institution; they had also had other prejudices to struggle against; it could not, therefore, be expected that the success of the University should be at once rapid; still he had the gratification of finding that, since its foundation, not less than 4,000 students had received, or were receiving, instruction within its walls, and that it had expended upwards of 100,000*l.* in the promotion of education. His Lordship noticed the high character of the general attainments of the pupils of the institution, and alluded to cases where several had particularly distinguished themselves. He enlarged on the advantages resulting from a good general education to every individual, whatever station in life he might be about to fill; and concluded by expressing his earnest wish that the University might be aided by the blessing of God in its progress, so that, in addition to the other institutions of the country, they might look upon it as one more by which knowledge and science were promoted, and in which honest and religious characters might be formed.

The Wilkie Statue.—On Saturday an adjourned meeting was held of the committee appointed to consider the best mode of commemorating the name of the late Sir D. Wilkie, for the purpose of electing an artist to carry out the resolution agreed to at the last meeting, for erecting a statue to the memory of that distinguished artist. Sir R. Peel presided, and said, that it would be desirable to appoint a sub-committee for the purpose of superintending the work of the artist who should be selected by the meeting, before the election took place. He had a list of names, and he hoped that no gentleman would object to serve upon the committee, as the duty would not be onerous. The Right Hon. Baronet then proposed that the sub-committee should consist, in addition to the already appointed officers, of the Dukes of Sutherland and Buccleuch, Lord Mahon, Sir J. Clark, Sir T. Mahon, Sir M. A. Shee, Sir W. Newton, Mr. Phillips, Sir M. Montefiore, Mr. Burnett, Mr. Rogers, and the Right Hon. Henry Labouchere. The following artists were then proposed, and a ballot commenced, viz., Mr. Bailey, Mr. Campbell, Mr. Weeks, Mr. Lough, Mr. Watson, Mr. Marshall, and Mr. Joseph. The following was the state of the ballot at its close: For Mr. Joseph, 26; for Mr. Campbell, 13; for Mr. Bailey, 5; for Mr. Watson, 3; for Mr. Weeks, 2; for Mr. Lough, none; for Mr. Marshall, none. The sum of money for the purposes of the testimonial now in the hands of the treasurer exceeds 1,700*l.*, which it is believed will be almost enough. It is expected that the statue will be finished in the course of twelve months.

Public Meetings.—On Saturday a meeting was held of the shareholders of the Commercial Steam Navigation Company, to adopt resolutions for the dissolution of the company. The meeting was called pursuant to a proposal at the preceding meeting, that in order to relieve the company from its liabilities the whole of the property should be disposed of. It then appeared that the sum of 112,000*l.* was offered for their vessels, which left the sum of 28,000*l.* to be raised. It was also stated that it was proposed to raise two new companies, which would be open to the shareholders of the company for the investment of their shares on favourable conditions. The secretary read the minutes of the previous meeting, which were confirmed, and a statement was given as to the best mode of the final adjustment of the affairs of the company. This being approved of, a resolution was unanimously agreed to, subject to confirmation, that the dissolution of the company forthwith take place.—On Saturday a meeting of the proprietors of the London Dock Company was held, for the purpose of declaring a dividend for the half-year ending the 30th ult., and for other business. The secretary read the report of the directors, which stated that during the six months ending the 31st May, there had entered the London Docks 482 vessels, measuring 104,319 tons, and in the corresponding period of 1841, 414 vessels, of 87,762 tons, being an increase in favour of the present year of 68 vessels, and 16,557 tons. The income to the company to May 31, this year, was 169,694*l.*, and to May, 1841, 166,377*l.*, being an increase of 3,386*l.* The expenditure during the same period, from the extension of business, had been increased by 814*l.* A dividend at the rate of 1*l.* 15*s.* for the half-year was recommended by the Directors, and also the appropriation of a sum of 10,000*l.* towards liquidating the amount outstanding for the erection and completion of new works. The Chairman stated that out of an increase of about 21,000 tons which entered the port of London in the past half-year, the London Docks had secured, by the united exertions of the directors and the proprietary, no less than 16,000 tons.—On Tuesday, the half-yearly meeting of the proprietors of the Colonial Bank was held. From the report it appeared that the debts of the company were as follows:—Circulation, 139,675*l.* 4*s.* 2*d.*; deposits, &c., 1,033,437*l.* 13*s.* 7*d.*; paid up capital, 500,000*l.*; reserve fund, 21,147*l.* 2*s.* 9*d.*; bad debts, 3,067*l.* 13*s.*; profits for the half-year, 15,104*l.* 9*s.* 7*d.*; the assets were, specie, 473,242*l.* 10*s.* 2*d.*; other assets, 1,240,683*l.* 14*s.* 4*d.*; balance, 11,505*l.* 18*s.* 7*d.*, making a total on both sides of 1,715,432*l.* 3*s.* 1*d.* The available balance of profits was 14,104*l.* 9*s.* 7*d.*, from which a dividend of 2½ per cent. for the half-year ending the 31st Dec., 1841, was recommended. The directors regretted that the unfavourable state of things in the West India colonies had not enabled them to announce a higher dividend. Mr. Levy complained that it did not sufficiently appear what the assets consisted of, and a proprietor asked the amount of the bad debts, to which the chairman replied that it would be impossible to enter into all the details the proprietor wished, and that the amount of bad debts could not be correctly given at present. The report was then adopted, and a resolution for the payment of the dividend was passed.

Anti-Corn-Law Conference.—The members of this conference, who have again assembled in London, met on Monday, and have continued their sittings during the subsequent days of the week, for the purpose of taking into consideration the present distresses of the country, and the causes of that distress. Deputies from each of the Associations throughout the country forming the Anti-Corn-Law League, and from the numerous branches of the Metropolitan Anti-Corn-Law Association, were present. Mr. P. A. Taylor presided, and briefly introduced the subject for which they were met. He commented at length on the distress throughout the country at the present moment, and which, if not speedily relieved, he believed "would ere long make itself heard in a voice of thunder, which would frighten the Government and the legislature from its propriety." Several persons addressed the meeting at great length; and the different delegates from the country reported to the meeting statistical details of the distress prevailing in their respective towns and neighbourhood. These reports and speeches occupied the meeting until Thursday evening, at which time no definite resolution had been come to with respect to the future operations of the conference, or the course which it might be advisable hereafter to adopt. The chairman stated that no answer had been received by the committee to an application which they had made for an interview with Sir. R. Peel. He said that when an answer was received, they should be better able to decide upon the course which it might hereafter be proper to adopt.

Post-office.—The following statement has been published of the number of letters delivered in the United Kingdom during the week ending June 19, 1842:—3,858,360; ditto June 20th, 1841, 3,773,136; ditto, Nov. 24, 1839, 1,585,973; increase since 1841 on the week's letters, 85,224; ditto 1839 ditto, 2,272,387.

Thames Tunnel.—It is stated that the atmospheric railway apparatus is likely to be laid down in the Thames Tunnel, and that it is proposed to apply it to the ascent and descent, not only of passengers, but horses, carriages, and goods, by means of the existing passenger shafts, so as to obviate the necessity of further openings, which would prove expensive. It is expected that the cost of the apparatus will not amount to one-tenth of the sum necessary to form carriage approaches, as originally intended.

Newgate.—On Saturday a reprieve was received by the Sheriffs at Newgate for John Francis, who attempted the life of the Queen. The life of the convict has been spared, but he is to be transported to the penal settlements, and kept to hard labour for life. On Tuesday he was removed from Newgate to the South Western Railway station, and thence conveyed to Gosport, where he was put on board a transport ship about to sail immediately for the Australian Colonies.—On Monday Thomas Cooper, convicted of the murder of the policeman Daly, was executed at Newgate, in the presence of a smaller number of spectators than usual on such occasions. No one was admitted into the chapel on the previous day; and all were excluded from the prison on the day of execution, in accordance with the recent resolution of the Court of Aldermen on this subject.

Mortality of the Metropolis.—The following is the number of deaths in the Metropolis, from all causes, registered in the week ending Saturday, the 25th ult.:—Total, 742; weekly average in 1841, 912.

Provincial News.

Cambridge.—The long-announced festival in this town in honour of the installation of the Duke of Northumberland, as Chancellor of the University, the preparations for which have for some time occupied public attention, commenced on Saturday, and has proved highly interesting and attractive. The town has been crowded with distinguished visitors, and the greatest difficulty has been experienced in procuring accommodation. The fineness of the weather has also added to the general gaiety and interest of the festival. The greater number of visitors, among whom were the Duke of Cambridge and several of the Cabinet Ministers, arrived on Saturday; on the evening of which day, a selection of sacred music, both vocal and instrumental, was performed at St. Mary's Church. On Sunday the Vice-Chancellor and leading authorities of the University assembled at St. John's, and accompanied his Grace, the Chancellor of the University, to St. Mary's Church, where a sermon was preached by Professor Whewell. Early on Monday morning the town was thrown into a state of great excitement, in consequence of the rumoured arrival of a Cabinet messenger with despatches for the Duke of Wellington, Lord Lyndhurst, the Chancellor of the Exchequer, and other Ministers, announcing another attempt on the life of her Majesty. It was consequently feared that the Duke of Wellington, who was expected that morning from Bourn, the seat of the Earl of Delawarr, would be prevented from attending. This anticipation, however, proved erroneous, and about ten the approach of the Duke was announced by the firing of several pieces of artillery. Soon afterwards, his Grace, dressed in the robes of a Doctor of Civil Law, made his entry into the town in an open carriage, from which the horses had been detached a mile or two from the University, by a body of gownsmen and other inhabitants who had gone out to meet the procession by which the Duke was accompanied, and who drew it into Cambridge amidst the cheers of the crowds assembled to witness his arrival. The road for some distance was strewed with boughs of laurel, and the tenantry of the Earl of Delawarr formed an equestrian procession, preceding the carriage. The Duke was drawn to the gates of St. John's, where he alighted, and proceeded to attend the levee which the Duke of Northumberland, as Chancellor of the University, was holding in that college. The levee, which was numerously attended, was not concluded until nearly twelve. After the levee, the Duke of Northumberland, with all the distinguished visitors, went in procession to the Senate House, where a number of honorary degrees were conferred by his Grace. In the evening a banquet, which is said to have been of a very splendid description, was given by the Rev. Dr. Archdall, Vice-Chancellor of the University, to the Duke of Northumberland and a large party of the visitors; and there was also a concert at the Senate House. On Tuesday there was another meeting in the Senate of all the authorities of the University, the distinguished visitors, and a numerous assemblage of spectators. Several degrees were conferred, after which the prize poems were read, several of which were much applauded. The public orator then pronounced the Installation ode, an elaborate complimentary composition in Latin, and was loudly cheered during its delivery, particularly in the parts referring to the Duke of Northumberland and Lord Lyndhurst. After the close of the meeting a brilliant *fête* was held in the grounds of St. John's College, and in the evening there was another concert. The Duke of Wellington and the other Cabinet Ministers left for London during the day, in consequence of the announcement of the attempt on her Majesty's life. There was also in the evening a display of fireworks in the grounds of Jesus College, where great numbers of the townspeople assembled, and remained till a late hour. On Wednesday morning the oratorio of the "Messiah" was performed at St. Mary's, to a numerous audience; and in the evening a ball, which was numerously attended, took place in the Fitzwilliam museum. The master of Trinity also gave a banquet in the hall of that College. A promenade, which took place on Thursday, at the Fitzwilliam museum, brought the festivities to a close; and on Friday almost all the visitors had again quitted the town.

Carlisle.—The local papers inform us that the celebrated floating island on Keswick Lake made its appearance on Thursday, the 23rd ult.; being earlier this season than usual.

Leeds.—On Monday the flax-spinners of this town held a meeting, at which it was resolved to memorialise the Lords of the Treasury respecting the serious effects of the recent ordonnance of the French Government on the linen trade of England, and requesting Government to endeavour, by a commercial treaty involving mutual concessions, to avert the calamity. Fears appear to be entertained that the flax-spinners of this town, who have not yet worked short time, or reduced their wages, will be obliged at the approach of winter to run their mills only four and a half or five days in the week; a measure which will add seriously to the distress of this district.—A local paper informs us that, a few days since, as one of the clerks of the Post-office in this town was in the act of stamping a letter, some detonating powder, or other combustible material inside the letter, immediately exploded. Though there was little or no report, there was a bright flash of light, followed by a vapour that had a strong sulphurous smell. The letter apparently received no damage, except having a small hole burnt in it. It had been received from London by the mail, and was addressed to a lady residing near Otley. It has been forwarded to its destination, and the Postmaster-General has been made acquainted with the circumstance.

Manchester.—A public meeting has been held in this town, of parties interested in the manufacture and sale of worsted and woollen goods, mixed worsted and silk, and worsted and cotton fabrics, convened by twenty-four of the principal firms in these branches of trade, "to consider what measures ought to be adopted to prevent the increase of duty on those fabrics contemplated by the Prussian Commercial League." The meeting was attended by nearly all the merchants and manufacturers in these branches of business. Several speeches were made, and ultimately it was resolved that a memorial be drawn up, stating the importance of this branch of trade in this district, and the injury that would accrue to it if an increased duty were imposed by the Prussian League. The chairman, Mr. E. P. Thomson, and two other gentlemen, were requested to draw up the memorial, and to take the necessary steps for promoting its object. It was also resolved that circulars be sent to all the towns interested in the matter, requesting them to take measures to forward similar memorials to the Government. The memorial agreed to by the meeting, after having been signed by 25 merchants, 18 printers, and nine manufacturers, was forwarded to Mr. T. M. Gibson, M.P., for presentation to Sir R. Peel.—The serious distress prevailing among the working classes in this town has been increased by the discharge, within the last few days, of a considerable number of workmen. It is stated that the whole of the machinery in the extensive mill occupied by Mr. R. Roberts ceased working on Saturday, and that the Hanover mills will also be stopped next Saturday; that a large spinning and weaving establishment in the Oxford-road will cause 400 looms to be laid up, and spinning machinery to a corresponding extent; and that the firm of Messrs. Sharp, Roberts, and Co., extensive machine and locomotive engine makers, have given notice to between two and three hundred hands that their services will not be required after the present week. It is calculated that altogether there are likely to be no fewer than 1,500 additional hands thrown out of employment.

Portsmouth.—The Board of Admiralty has ordered two new ships of the line, the first to be called the Prince of Wales, of 110 guns, and the second the Princess Royal, of 90, to be built at this dockyard; and they are accordingly already on the stocks.—Sir Charles Metcalfe, late Governor of Jamaica, arrived in this town on Saturday, on his way to London, after an absence from England of nearly forty-two years, having been thirty-eight years in the East, and four years in Jamaica.

Wakefield.—The local papers state, as a proof of the great extent to which crime has increased in this town and neighbourhood, that on Saturday last there were no fewer than 820 prisoners in the House of Correction.

Worcester.—It is stated that the London mail which runs through this town to Ludlow will shortly be taken off the road, and that the letter-bags for this town, Ludlow, and the intermediate towns, will be sent on the Great Western and Birmingham railways, and conveyed to such towns from the nearest stations by mail-carts. It is added that Lord Lowther, the Postmaster-General, has determined to abolish mail-coaches, where it is practicable to do so, and has also intimated his intention to dispense with mail-guards on railways. It is said that the payment by the Post-office of the staff of mail-guards necessary before railroads were completed, would have increased the expenses of the department by an item of 70,000*l.*

Railways.—The following are the receipts of the principal railways during the past week:—Great Western 14,087*l.*; South Western 7,184*l.*; Greenwich 855*l.*; Northern and Eastern 1,457*l.*; London and Birmingham 17,502*l.*; Birmingham and Gloucester 1,838*l.*; Birmingham and Derby 1,286*l.*; Manchester and Birmingham 489*l.*; Manchester and Leeds 4,581*l.*; Hull and Selby 1,000*l.*; Midland Counties 2,784*l.*; North Midland 4,338*l.*; York and North Midland 1,732*l.*; Edinburgh and Glasgow 1,819*l.* A special general meeting has been held of the directors and proprietors of the London and Birmingham Railway, for the purpose of considering the propriety of empowering the directors to purchase the interest of the proprietors of the Warwick and Leamington Railway, and also to enable them to raise funds for that purpose by creating, from time to time, new shares. The chairman, G. C. Glyn, Esq., after shortly stating the object of the meeting, proposed two resolutions for the sanction of the proprietors, for the purpose of carrying that object into effect. After some conversation the resolutions were unanimously agreed to.—On Friday, the 1st inst., that portion of the Bristol and Exeter Railway which connects the towns of Bridgewater and Taunton, being a continuation of the Great Western Railway, was opened as far as Taunton. Considerable interest was felt on the occasion throughout the whole line the train had to pass; and an unusual number of passengers availed themselves of the opportunity to proceed from Bristol to Taunton. On arriving at Bridgewater, the train, which consisted of a great number of carriages, was met by a large concourse of spectators, who lined the banks on either side of the rail; and at Taunton almost the entire population came forth on the occasion—the day being kept as a general holiday. The train arrived in Taunton at about eleven o'clock; the journey from Bridgewater, 11½ miles, occupying 20 minutes. No accident or obstruction of any kind took place.—On Saturday a fire broke out in one of the trains of the Birmingham and Gloucester Railway, while on its way to the latter city. It commenced among the goods contained in one of the trucks, and is supposed to have been occasioned by a spark falling on it from the chimney of the engine. The engineer, who perceived that the truck was on fire, did not stop the train, but proceeded at a greater speed towards Eckington station—supposing, it is said, that he should there procure assistance and a supply of water to put out the fire. In the meantime the rapid motion of the train caused the fire to spread rapidly, and four trucks containing goods were soon involved in the flames. The passengers who were behind the trucks, and were thus able to see the fire before them, were thrown into great alarm. The train arrived at the station without any accident to the passengers, and every exertion was then used to get the fire under; but it was found impossible to save the four trucks, which with their contents, containing goods to the amount of 800*l.*, were entirely destroyed.

IRELAND.

Dublin.—It has been announced that the clerks in the post-office of this city whose salaries exceed 150*l.* per annum, are subject to the demands of the income-tax though resident in Ireland.—The expense of taking the census of the population of Ireland last year amounts to 3,500*l.* The "First of July" seems to have passed over without any disturbances in the north of the country; and the Lord Lieutenant's proclamation seems to have produced the desired effect, as the papers contain no account of the usual processions, collisions, or toasts calculated to create any disturbance of the peace.

Ennis.—The Commission for the County of Clare Assizes was opened in this town on Saturday. The case of the provision riot, and the committal of thirty-eight policemen and two officers upon a charge of homicide, has drawn a large share of public attention to these assizes. Mr. Baron Richards, after the commission had been opened on Saturday, said he would defer addressing the grand jury until Monday. The court re-assembled on that day, when Mr. Baron Richards addressed the grand jury at great length, principally in connexion with the case of the policemen committed for firing on the mob during the late riots. His Lordship detailed all the circumstances in connexion with the subject, and explained the law as it applied to the case; after which the grand jury ignored the bills. The accused parties will in consequence be liberated. Some unimportant trials occupied the court up to the time of its adjournment.

Limerick.—The local papers inform us that serious apprehensions have been entertained of a disturbance of the peace in this part of the country, where great distress is said to prevail; and that a few days since, in consequence of an unexpected representation from the magistrates of Rathkeale, Col. Mansel, district adjutant-general, forwarded a detachment of Guards from this town for Rathkeale, in aid of the civil power. No disturbance of the peace, however, had since taken place, although some apprehensions seemed still to be entertained of provision riots. About the same time a troop of Guards, and two companies of the 36th reg. were also sent to Bandon in aid of the civil power, in consequence of an apprehension of party riots. The local papers state that the detachment of Guards, stationed in Ennis since the provision riots, has been ordered to return here.

Tipperary.—The special commission appointed by Government, as noticed by us in a former number, for the purpose of disposing of a portion of the numerous criminal cases on the calendar in this county, and also with a view to suppress the disposition to crime and disturbance that has for some time prevailed in this part of the country, commenced its sittings at Clonmel last week; and having disposed of all the cases that came under its notice, closed its labours on Saturday. The cases which came before the commission were murders and acts of violence. In all of them, with the exception of William Kent, tried as accessory to the murder of Mr. Hall, the Crown has been successful, and verdicts have been obtained from mixed juries without hesitation. Kent was acquitted in consequence of the insufficient evidence adduced in corroboration of the testimony of the approvers. In proof of the good effects produced by this measure, it is stated that, since the announcement of the determination of Government to issue a special commission, there has been a complete abstinence from outrage in those portions of the county where crimes were previously of daily occurrence; and a confident hope now pervades the well-disposed of every class, that the demonstration of the power and authority of the law, which has been made during the past week, will have the effect of converting that temporary lull into a permanent calm. At the close of the proceedings, the Attorney-General for Ireland stated that "no exertion shall be spared on his part, or on the part of the Government, to rescue the county of Tipperary from the disgrace which hangs over it, as the consequence of these deplorable calamities;" and that "the whole power of the State, the whole authority of the law, will be exerted, until this domination and tyranny are put down."

Waterford.—The latest accounts received from this city state that there is every reason to anticipate the early restoration of the Marchioness of Waterford. The immediate danger from the effects of the serious accident she met with last week has now passed; and the last medical report states that her ladyship is free from pain and fever, and is going on in the most favourable manner.—It is announced that the Municipal Act will be put in force in this city in November.

THEATRICALS.

ITALIAN OPERA.—On Wednesday Rossini's last work, the "Stabat Mater," the announcement of which created a good deal of interest, was performed at this theatre for the first time. It is a sacred piece, of which the sorrows of the Virgin before the Cross are the theme. Nearly the whole vocal and instrumental force which this theatre can command was mustered on the occasion, to give effect to its execution, and the interest excited drew together a crowded house. The whole performance was received by the audience with loud applause, and many of the pieces were encored. The chief singers were—Mesdames Persiani, Moltini, and Gramaglia; and Signori Rubini, Lablache, Ronconi, and Guasco. Prince Albert, under whose immediate patronage the "Stabat" was executed, was not present; but it is expected that he will attend its repetition on Wednesday next.

Miscellaneous.

The Gold Coinage.—On Monday the Bank of England issued the following notice:—"The public are informed, that, as the Rotunda will be required for the payment of dividends, no further amounts of light gold can be received in that office after the 6th inst.; but the receipt of amounts from 20*l.* to 80*l.* will be resumed at the earliest possible period." It is also announced that the Bank will continue to receive amounts from 80*l*. to 500*l*. in the Hall, and from 500*l*. and upwards either in the Bullion Office or the late Post Bill Office, until further notice, between the hours of nine and three. It is thought that this alteration will not cause any great inconvenience, the larger part of the light coin having been already withdrawn from circulation. It is stated, that notwithstanding the Bank of England has issued for the last fortnight a large quantity of new half-sovereigns to meet in some degree the run made upon them for silver, they are not yet able to meet the demand. The Bank is having a large quantity of silver struck at the Mint to meet the emergency, and in a few days, it is said, the new half-crowns, shillings, and sixpences, will be ready for circulation. The quantity of light gold presented at the Bank since the late proclamation exceeds 1,500,000*l*. sterling. As the light coinage is received at the Bank, it is put apart in another branch of the establishment, and sent to the Mint to be re-coined into sovereigns and half-sovereigns, the Mint not taking less sums than 10,000*l*. sterling. By this means Government expects to be able soon to call in all the old gold coinage of George III. and George IV. from 1817 to 1830. The same practice is observed with the silver which is deficient in weight; as it is paid into the Bank, it is not reissued again to the public. The demand for silver in France, Belgium, Holland, and Hamburgh is also great, and during the last week a considerable quantity in specie and in bars has been exported by the bullion dealers in London to the latter port.

Slave Trade.—Accounts received from Patras state, in proof of the ineffectual manner in which the execution of the Greek law prohibiting the trade of slaves is carried out, that two vessels with slaves from the Barbary coast had lately anchored at the port of Navarino, one under the Ottoman flag, and the other under that of Samos; and that the latter was in that port on the 12th March, and was not molested by the Greek Government. The "Hampshire Telegraph" informs us that on Sunday the 6th Feb., when in lat. 26° 20′ S., and long. 43° 25′ W., H. M. brig Partridge, Lieut. Wm. Morris, commander, proceeding from the River Plate to Rio de Janeiro, with the mail, fell in with and captured a very fine brig of 240 tons, under Portuguese colours, and called the St. Antonio. The vessel had a slave-deck laid, and was furnished with water and provisions for 600 slaves; she had left St. Sebastian only a few days previously to her capture, and was bound to Ambriz, where a full cargo of slaves was said to be ready for her.

Metropolitan Police.—From the annual statement lately published by the Commissioners in Scotland-yard, of the number of persons who were taken into custody by the Metropolitan police in the year 1841, we learn that 8,573 persons were apprehended charged with offences against the person; 244 with offences against property, committed with violence; 13,477 with offences against property without violence, 2,134 with malicious offences against property, 868 with forgery and offences against the currency, and 43,665 with other offences not included in the before-mentioned classes; making a total of 68,961, of which number 46,358 were males, and 22,603 females. Out of the total number, 5,418 were charged with common assaults, 2,168 with assaults on the police, 1,210 with larceny from the person, 5,108 with simple larceny, 2,990 with misdemeanours with intent to steal, 1,919 with unlawful possession of goods, 2,082 with wilful damage, 12,795 with being disorderly characters, 15,006 with drunkenness, 4,889 as suspicious characters, and 4,841 as vagrants.

SPORTING.

Newmarket July Meeting.—These races commenced on Tuesday, and were on the whole well attended. The weather was fine, and added greatly to the interest of the sport. The races commenced with—

Handicap Sweepstakes of 20 sovs. each. New T. Y. C. (9 *subs.*)

Mr. Rogers's Bridegroom	(Bartholomew)	0	1
Lord Exeter's Abydos		0	2
Lord G. Bentinck's Proof Print		3	0
Col. Peel's Hawk's-eye		4	0
Mr. Thornhill's Equation		5	0

Betting—3 to 1 each agst Bridegroom and Hawk's-eye, and 7 to 2 agst Equation (taken). After the dead heat, even betting. Hawk's-eye took the lead at a good pace, followed by Abydos and Bridegroom, the others lying up. At the plantation corner Hawk's-eye resigned, and the running was taken up by Abydos, Bridegroom waiting on him to the last, when he made his rush, and finished with a dead heat: Proof Print a respectable third. In the deciding heat Bridegroom made all the running, defeated a desperate challenge within the cords, and won by a neck.

The July Stakes of 50 *sovs. each. New T. Y. C.*—Mr. Thornhill's Sister to Euclid (Pettit), 1; Lord Exeter's f. by Jerry, out of Macremma, 2; Col. Peel's Murat, by Slane, out of Hester, 3. The following also started:—Lord Albemarle's Filcho; Lord Orford's gr. f. by Clearwell, out of Goldpin; and Lord G. Bentinck's Farintosh. Betting—2 to 1 agst Lord Exeter's filly; 4 to 1 agst Farintosh; 5 to 1 each agst Murat and Goldpin. Sister to Euclid took a slight lead at starting, Murat lying at her shoulders, and the others close alongside. The pace was bad at starting, but mended sufficiently to dispose of Murat, Filcho, Lord Orford's filly, and Farintosh, before they had cleared the corner of the plantations. The Jerry filly then went to Sister to Euclid, and ran her a smart but unsuccessful race, the latter winning by half a length.

WEDNESDAY.—*Sweepstakes of* 10 *sovs. each. Last half of B. M. The winner to be sold for* 200*l*. (5 *Subs.*)—Lord Orford's gr. f. by Clearwell, (Nat), 1; Capt. Colquit's Pickpocket, 2; Mr. Rogers's c. by Hornsea, 3; Duke of Grafton's ch. f. by Bolero, dam by Sultan, 4; Duke of Beaufort's c. by Ishmael or Achmet, 5. Betting, 2 to 1 agst the winner. The Hornsea colt made the running to the Plantation, where Pickpocket and Lord Orford's filly took it from him and finished the race, the latter winning by a head. The Hornsea colt came with a rush at the last, and was a respectable third: the other two were beaten off.

Sweepstakes of 10 *sovs. each. New T. Y. C. The winner to be sold for* 100*l*. (5 *Subs.*)

Mr. Crockford's b. c. by Bentley	(Rogers)	0	1
Duke of Grafton's b. f. Lisburn		0	2
Mr. Goodwin's Drummer Boy		3	0

The following also started, but were not placed:—Mr. Beresford's Indolence, and Lord Orford's f. by Clearwell, out of Chapeau d'Espagne's dam. Betting, 5 to 2 agst Drummer Boy, 7 to 2 agst Lisburn, and 4 to 1 agst the Clearwell filly. Lisburn made all the running to the cords, where she was joined by Drummer Boy and the Bentley colt. The race between the three was contested with great spirit, and was so near a thing at the finish that the judge pronounced it a dead heat between the Duke of Grafton's and Mr. Crockford's colours, the Drummer Boy losing the chance of a second race by a head only. Many of the bystanders thought he had won. In the deciding heat 11 to 8 was laid on the Bentley colt, which won cleverly by half a length, and was claimed.

Fifty Pounds. From the Starting Post of T.M.M. to the end of R.C. Mr. Pettit's St. Francis, aged, walked over.

THURSDAY.—*Handicap Sweepstakes of* 15 *sov. each, from the starting-post of B.M. to the end of new T. Y. C.* (5 *subs.*)—Duke of Rutland's f. by Bizarre (J. Howlett), 1; Mr. Price's The Oneida Chief, 2; Mr. Pettit's Langolee, 3; Mr. Thornhill's Menalippe, 4. Betting, 2 to 1 agst Langolee, 3 to 1 each agst Bizarre filly and Menalippe, and 5 to 1 agst The Oneida Chief. Menalippe and Langolee laid in front in the early part of the race, but were headed by the other pair at the hill, the Bizarre filly winning easy by a length.

The Chesterfield Stakes of 30 *sov. each. Last half of B.M.* 23 *subs.*—Gen. Yates's ch. c. Canton by Cain (Nat.), 1; Lord Exeter's f. by Jerry, out of Macremma, 2. The following also started, but were not placed: Captain Colquitt's Pickpocket, Duke of Richmodd's f. by Physician out of Young Sweet Pea, Lord Chesterfield's ch. c. by Gladiator out of Anchorite's dam, Lord Exeter's f. by Beiram or Sultan out of Fanny Davies, Mr. Coleman's Jamal (late Bacon), Mr. Thornhill's Extempore (9 lbs. extra), and Duke of Orleans' Sister to Jeffy. Betting, 2 to 1 agst Lord Chesterfield's colt, who coughed repeatedly, and had no backers; 7 to 2 agst Young Sweet Pea, 4 to 1 agst Canton, and 10 to 1 agst any other. The running was made by the Fanny Davies filly, the favourite following her, the ruck, headed by the Young Sweet Pea colt, lying up. This order was maintained with scarcely any change to the rise of the hill, where Canton and the Macremma filly singled themselves out to finish. The filly, however, with the extra weight on her back, had no chance, and was beaten easily by a length. Extempore and the favourite were third and fourth, and everything else tolerably well up, with the exception of Jamal, who assisted Pickpocket in making several false starts, (in one of which he got rid of his jockey), lost start, and never was able to reach the front. The winner is in the Derby.

The Town Plate of 50*l*. *B.M.*—Mr. Rogers's Bridegroom (Rogers), 1; Mr. Newton's Ma Mie, 2. The following also started, but were not placed: Mr. Townley's b. c., by Hymen, dam by Perchance; Mr. Arnull's Miss Sally, Mr. Pettit's Espartero, Gen. Yates's Seahorse, and Lord Kelburne's c. by Retainer, dam by St. Patrick. Betting, even on Seahorse, 3 to 1 agst Ma Mie, and 5 to 1 agst the Hymen colt. Seahorse and Bridegroom occupied different positions at the commencement of the race, the first leading, and the other bringing up the rear; at the top of the hill, however, the favourite cried *peccavi*, and Bridegroom going in front with Ma Mie, defeated her with difficulty by a head; Seahorse third, and Lord Kelburne's c. fourth.

Betting after the Races.

GOODWOOD CUP.

11 to 2 agst Mr. Bell's The Squire.
8 to 1 — Mr. Ramsay's Middleham.
12 to 1 — Duke of Orleans' Nautilus.
13 to 1 — Lord Chesterfield's Marshal Soult.
20 to 1 — Mr. Theobald's h. by Priam, out of Seamew.
9 to 1 — Seamew and Monæda (taken.)

ST. LEGER.

6 to 4 on the field.
Offers to take 10 to 1 about Cabrera.

Law.

PRIVY COUNCIL.—*Escott* v. *Mastin.*—Their Lordships gave judgment in this case, which has excited considerable interest in the Church, and among dissenting bodies. It was an appeal from the Ecclesiastical Court, in a suit against the Rev. Mr. Escott, vicar of Gedney, in Lincolnshire, for refusing to read the burial service over the body of a child, the daughter of Thomas and Sarah Cliff, on the 16th and 17th Dec., 1839, on the ground that she was unbaptised—*i. e.* had been baptised by a Wesleyan minister, which, according to the appellant's construction of the canons and rubrics of the Church, amounted to no baptism at all. The foundation of the suit was the canon of 1603, entitled, "Ministers not to refuse to Christen or Bury," by which it was ordained that "No minister shall refuse or delay to christen any child according to the form of the Book of Common Prayer, that is brought to the church to him upon Sundays or holidays, to be christened; or to bury any corpse that is brought to the church or churchyard, convenient warning being given him thereof before, in such manner and form as is prescribed in the said Book of Common Prayer; and if he shall refuse to christen the one or bury the other (except the party deceased were denounced, excommunicated, *majori excommunicatione*, for some grievous and notorious crime, and no man able to testify of his repentance), he shall be suspended by the bishop of the diocese from his ministry for the space of three months." The sentence of the judge below was, "That the Rev. Thomas Sweet Escott, clerk, be accordingly suspended for the space of three months from all discharge and functions of his clerical offices." Lord Brougham, after disposing of a preliminary objection to the incompetency of some of the witnesses, on the ground that they had done acts subjecting them to excommunication, went at great length into the arguments on the part of the appellant, on which it was contended that baptism by a person who had not received episcopal ordination, was of no more effect than baptism by a layman, and that laymen were forbidden, by the canons and rubrics, from performing this rite; that consequently the rite so performed was invalid, and the person receiving it unbaptised; and if so, the ministers of the church were not only justified in refusing to read the burial service in such a case, but were bound to do so under severe penalties. Their Lordships were of opinion that taking Wesleyan and other ministers, not episcopally ordained, to have no more authority to baptise than laymen, there was nothing in the Canon of 1603, or the Rubrics of Edward the Sixth and Elizabeth, to show that lay baptism was invalid. There were passages in each which showed that cases were contemplated in which the attendance of a clergyman could not be procured from want of time or distance of place; and although lay persons were subject to ecclesiastical censures if they obtruded themselves unnecessarily into this or any other office of the church, it was plain that the rite was valid, by whomsoever administered, if done in the prescribed form, viz., by the sprinkling of water, and in the name of the Trinity. This had been declared expressly and repeatedly by competent authorities, and amongst others by Bishop Hooker, in his "Ecclesiastical Polity." It had been contended that the Act of Uniformity, and the changes in the Rubric which then took place, had had the effect of making lay baptism altogether invalid, but no such intention was expressed: and as the old and new regulations might very well stand together, their Lordships were of opinion that the old ecclesiastical law upon this subject remained unaltered. That this was not repugnant to the principles and usages of the church was clear from the case of marriage, which was a sacrament in the Romish church, and yet that rite might be performed by laymen both in Protestant and Catholic countries. In England it had been so until the Marriage Act of the 26th of George II., and was so in Scotland to this day. After going at length into the other points, his Lordship concluded by expressing their Lordships' strong disapprobation of the language in which a judgment of Sir John Nichol in a former case (in which he had come to the same conclusion) had been spoken of by the appellant and "other reverend persons," and which he could only ascribe to "that heat of temper which is unfortunately too commonly found in theological controversies;" and stated that the sentence of the court below must be affirmed with costs.

COURT OF EXCHEQUER.—*Thornton* v. *Byng and others.*—On Saturday the Court was crowded at an early hour to hear the trial of this cause, which arose out of circumstances connected with "the Gurney affair," to which we have alluded in a former Number. Great interest was manifested in the proceedings, and many of the leading men on the turf were present, and almost every well-known sporting character at Tattersall's. The counsel for the plaintiff opened the pleadings by stating that this was an action brought by the plaintiff against the defendants, the Honourable G. Byng, the Duke of Bedford, and Col. Anson, to recover damages for a libel which had been published in the newspapers by the defendants in their capacity of stewards of the Jockey Club, and in which it was stated that the plaintiff was a defaulter in the payment of his bets according to the practice of the turf, and which publications were of a nature to do the plaintiff's character serious injury. The defendants had put upon the record a plea of "Not guilty," and a justification of the truth of the facts contained in the alleged libel. The damages were laid at 5,000*l*. The case arose out of certain transactions connected with the Epsom Races of 1841, which have already been noticed in this Paper, and need not now be repeated. The Solicitor-General addressed the Court at great length in behalf of the plaintiff, and Sir T. Wilde supported the case of the defendants. A great number of witnesses were examined to prove the case on either side; after which, Lord Abinger summed up. After recapitulating the evidence, he put it to the jury, whether they considered the publication which had been read was one likely to have an injurious effect on the plaintiff's character? Was it a libel on the plaintiff? He would likewise call their attention to this point: supposing the Jockey Club had acted strictly according to their jurisdiction, supposing they had a right to call the plaintiff before them, and he had attended and refused to pay his bets, they had a right to exclude him from Newmarket or from Tattersall's; they might send to the Duke of Portland to warn him from coming on the ground of the Jockey Club; but were they justified in publishing him as a defaulter in the newspapers? He thought they were not justified in doing so. The very offence of a libel consisted in the publication. That which was not a libel while contained in a man's pocket, became so if he published it. There was a part of the justification, too, which he did not think proved. He then laid it down broadly, that though the decisions of the Jockey Club might be considered as binding on their own members, and even on others who had agreed to submit themselves to its decision, in which case it became a simple matter of arbitration, yet the case was widely different where the parties did not agree to be bound by their decision, and where one of them openly dissented from being bound by their dictum; in which case he considered that the Jockey Club had not a right to publish a man as a defaulter. After commenting upon all the circumstances, his Lordship left it to the jury to say whether, on the one hand, it was a libel; and, secondly, whether, presuming they believed the facts, they considered the circumstances proved, under the particular situation of the parties, a sufficient justification for the publication in question.—The jury returned a verdict for the plaintiff—Damages 200*l*.

MARK LANE, FRIDAY, JULY 8.—The weather has become unsettled, but not sufficiently so as to do any injury to the growing Crops. Some runs of Essex Wheat were left over from Monday, and that day's prices have been realised.—There has been a tolerably good sale of free Foreign Wheat at the rates of Monday, and a few cargoes of bonded afloat from Odessa have been disposed of at rather declining prices.—Barley is a dull sale, and there is not much offering.—Peas and Beans are in limited demand, and Irish Oats are still declining in value, whilst English maintain Monday's currency.

GAZETTE OF THE WEEK.

INSOLVENTS.—L. Durblacher, 15, Old Burlington-street, St. James's, Westminster, dealer in pictures—C. Brayshaw, Great Castle-street, Regent-street, tailor—D. Low, Adam's-court, Old Broad-street, city, merchant—G. Lamerte, Providence-row, Finsbury, blacking manufacturer.

BANKRUPTCIES SUPERSEDED.—J. Ellison, Leeds, nail manufacturer—R. Catlin, Leicester, horse dealer.

BANKRUPTCY ANNULLED.—J. Monteith, Totnes, Devonshire, mercer.

BANKRUPTS.—E. Poore, Bampton, Devonshire, druggist—J. Smith, Hoo-mill, Haselor, Warwickshire, miller—J. Johnson, Manchester, quilling manufacturer—R. Hentig, Kingston-upon-Hull, merchant—T. Aspinall, Clark bridge mill, Halifax, Yorkshire, worsted-spinner—J. Robinson, Dundalk, Louth, commission merchant—G. Hawley, Goole, Yorkshire, coal merchant—G. Rennoldson, South Shields, Durham, miller—C. Ratherham, Birmingham, builder—R. F. Watkinson and W. Haigh, now or late of Huddersfield, Yorkshire, woollen cloth merchants—J. Hawkins, Maidenhead, butcher—H. Wood, Manchester, stuff and mousseline de laine merchant—J. Johnson, Manchester, quilting manufacturer—J. Sparhum, Froston, Suffolk, miller—J. P. Graves, Mortimer-street, Cavendish-square, auctioneer—J. Hooper, Regent-street, Waterloo-place, carriage dealer—J. Brookbanks, Worcester, draper—T. Wilson and W. Wilson, Manchester, hat trimming manufacturers—S. Evans, Oswestry, linen and woollen-draper—D. Paul, Red Lion-wharf, Upper Thames-street, coal merchant—G. T. F. Johnson, Norwich, chymist and druggist.

SCOTCH SEQUESTRATIONS.—R. Bowes, Glasgow, joiner—G. Forsyth, Coatbridge, merchant—D. M'Gregor, late of Beith, innkeeper, and now of Glasgow—J. Moncur, Haughend by Dunkeld, distiller—J. Thomson, Leith, corn merchant.

BIRTHS.—On the 7th inst., at Clapham, the lady of E. Thornton, Esq., of the Bengal Civil Service, of a daughter—On the 7th inst., at Porchester-place, Hyde Park, the lady of Lieutenant-Colonel J. J. Underwood, Madras Engineers, of a son—On the 27th ult., the lady of the Rev. E. Bowlby, Rector of Thurrock, Essex, of a son—On the 1st inst., at 90, Oxford-terrace, Hyde Park, the lady of R. C. Edwards, Esq., of a son.

MARRIED.—On the 5th inst., at Lee, Kent, the Rev. W. H. Hanson, Rector of Hockwold, Norfolk, to Julia, youngest daughter of the Rev. G. Lock, Rector of Lee—On the 5th inst., at Trinity Church, Bath, F. J. S. Hepburn, Esq., Captain in Her Majesty's 61st Regiment, to Margaret Henrietta, only surviving child of the Rev. J. H. Michell, Rector of Buckland and Kelshall, Herts—On the 6th inst., at Swanscombe, Kent, W. Leedham, Esq., of Westbury, near Bristol, to Henrietta, second daughter of J. B. White, Esq., of Swanscombe-cross—On the 6th inst., at Godmanchester, Mr R. Birkett, of Upper Clapton, to Emma Georgina, youngest daughter of W. H. Maule, Esq., of Godmanchester—On the 6th inst., at Hove Church, Brighton, Captain G. J. Johnson, of the Coldstream Guards, eldest son of W. P. Johnson, Esq., of Walton House, Cumberland, to Frederica, 2nd daughter of Col. Sir F. Hankey, G.C.M.G.—On the 7th inst., at St. Mark's, Kennington, R. St. J. Shaw, Esq., eldest son of Brigadier-Gen. Shaw, Bengal Artillery, to Isabella Ross, only daughter of N. Macvicar, Esq., Kennington, Surrey—On the 7th inst., at St. Margaret's, Westminster, E. Hamilton, Esq., M.D., son of the late C. Hamilton, Esq., of [illegible], to Emily Wansey, only child of the late J. Wansey, Esq., of Walthamstow.

DIED.—On the 12th of May, at Kamptee, Major-Gen. Home, C.B., Madras Establishment, commanding the Nagpoor division of the army—On the 30th ult., at Chessington, Surrey, Mr. J. Cooper, aged 56—On the 3rd inst., at Bishopsteignton, Devon, Harriet, relict of the late C. Gill, Esq., a Captain in the Royal Navy, having survived her husband six days only—On the 6th inst., at Richmond, Mr. W. G. Elvin, comedian, aged 34—On the 7th inst., the wife of Mr. C. P. Bartley, of 20, Somerset-street, Portman square.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 9, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 29—1842. SATURDAY, JULY 16. PRICE 6*d.*

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Aloe, curious morphosis of . 455 *a*
Amateur's Garden . . . 452 *c*
Araucaria Braziliensis, tender 457 *a*
Ash-trees, insects injurious to 454 *a*
Asparagus, to pick seeds from 457 *b*
Bignonia radicans, to flower . 457 *b*
Budding, how performed . . 451 *a*
Canker, to check in Fruit-trees 457 *b*
Cauliflower Fritters, to prepare 455 *c*

_ Persons showing in Classes B, F, and I, are requested to attach the names of the Dahlias.

No Exhibitor to be entitled to receive more than one Prize in each description of article exhibited, with the exception of the single Specimens of Dahlias, and for Fruits and Vegetables.

The Judges have power given them to award extra Prizes to any articles of merit not included in the Schedule, and to withhold the Prize from any Article which does not appear to them to deserve it.—The Judges will be directed to disqualify any Dahlias they consider mutilated.

REGULATIONS, &c.

The Grounds will be opened at One o'clock. Admission from One o'clock until Three, 2*s.* each: and after Three o'clock until Five, 1*s.*; Children under 14 years of age; Half-price Tickets may be had after the 20th of July, of Mr. Sotheran, Bookseller, Coney-street, and on the day of Exhibition at the Entrance to the Grounds. The Exhibition will close at Five o'clock, at which hour it is necessary that the Grounds be immediately cleared, in order to the removal of the articles exhibited.—No charge will be made for articles exhibited.—Exhibitors will be allowed to take their Plants, &c. into the Grounds, to be delivered to the persons appointed to stage them.—The Committee pledge themselves to use their utmost exertions to restore the different specimens sent for exhibition with the least possible injury.—All articles to be exhibited by persons residing in York, or within one mile of the City Walls, must be upon the Grounds before Ten o'clock, otherwise they cannot be admitted: if the Exhibitors reside at a greater distance, they will be allowed until half-past Ten o'clock, after which time no article whatever can be received. All articles intended to be exhibited must have been the property of the Exhibitor or of his Employer for at least one month previous to the day of Exhibition. These Rules will be strictly enforced.—Dishes for Fruits and Vegetables, and Bottles for Single Specimens, will be supplied by the Society.—Every attention will be paid by the Committee of Management to the comfort of the Exhibitors and Visitors.

WM. HATFIELD, Esq., Chairman of the Committee of Management.
Mr. W. HARTLEY, Fossgate, York, Secretary to the Committee of Management.

KINGSTON.

THE ROYAL HORTICULTURAL SOCIETY has fixed their ANNUAL EXHIBITION for THURSDAY, SEPT. 15th, 1842.—For particulars apply to,

JAMES JACKSON, Hon. Sec.,
Thames-st., Kingston, Surrey.

"MANETTIA BICOLOR."

MESSRS. VEITCH and SON have now ready for delivery Plants of this beautiful New Greenhouse Climber, at 42*s.* each.

N. B.—A Medal was awarded to this Plant at the Horticultural Society's Meeting in Regent-street, in April last.

Exeter, July 6, 1842.

NEW AND SPLENDID FUCHSIAS.

MESSRS. YOUELL have much pleasure in referring the admirers of the above beautiful Tribe to their List as advertised in the *Gardeners' Chronicle* of the 18th of June, which they continue sending out per post, free, upon the terms there named.—Great Yarmouth Nursery, June 23, 1842.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l.* for whole term of Life.

Age.	Annual Premium payable during				
	1st five years.	2d five years.	3d five years.	4th five years.	Remainder of Life.
20	£1 1 4	£1 5 10	£1 10 11	£1 16 9	£2 3 8
30	1 6 4	1 12 2	1 19 1	2 7 4	2 17 6
40	1 16 1	2 4 4	2 14 6	3 7 3	4 3 4
50	2 16 7	3 9 4	4 5 5	5 6 3	6 13 7

PETER MORRISON, Resident Director.
A liberal commission allowed to Solicitors and Agents.

---

* Owing to some inaccuracy in entering this plant, it is not known to whom it belonged.

WESTERN LIFE-ASSURANCE SOCIETY.—OFFICE—49, PARLIAMENT STREET, WESTMINSTER.
Capital 500,000*l.*—10,000 Shares, 50*l.* each.
Deposit 5*l.* each Share.

This Society is established for the Assurance of Lives, upon principles combining economy with perfect security.

Directors.

Henry Edgeworth Bicknell, Esq.	**John Arscott Lethbridge, Esq.**
William Cabell, Esq.	Edmund Lucas, Esq.
Thomas S. Cocks, jun., Esq.	George Kennet Pollock, Esq.
George Henry Drew, Esq.	James Lys Seager, Esq.
William Evans, Esq.	John Bazley White, Esq.
William Freeman, Esq.	Joseph Carter Wood, Esq.
Francis Fuller, Esq.	Henry Wrench, Esq.
James Hunt, Esq.	

Trustees.—William Whateley, Esq.; L. C. Humfrey, Esq.; George Drew, Esq.

Auditors.—Ormus Biddulph, Esq.; John Freeman, Esq.; John Bazley White, jun., Esq.

Consulting Counsel.—William Page Wood, Esq.

Conveyancing Counsel.—Samuel Jay, Esq.

Physician.—William Richard Basham, Esq., M.D., 17, Chester-street, Grosvenor-place.

Surgeons.—Alfred Leggatt, Esq.; George David Pollock, Esq.

Bankers.—Messrs. Cocks, Biddulph, and Co., Charing Cross.

Solicitors.—Messrs. J. L. Bicknell and J. C. Lethbridge, 25, Abingdon-street, Westminster.

TABLE OF PREMIUMS to assure £100 for the whole term of Life.

Age.	Ann. Pre. £ *s.* *d.*	Age.	Ann. Pre. £ *s.* *d.*	Age.	Ann. Pre. £ *s.* *d.*
20	1 14 2	35	2 11 0	50	4 3 3
25	1 18 11	40	2 19 6	55	5 5 4
30	2 4 8	45	3 9 1	60	6 15 8

The object of this Society is to afford to the Assured all the benefits of Life-Assurance, at a great reduction in the rates of Premium.—FOR EXAMPLE—A person aged 30, may with this Society assure his life for 500*l.* by the annual payment of 11*l.* 3*s.* 4*d.*, which in a Society where the bonus is held out as a main inducement, would cost him 13*l.* 7*s.* 4*d.*, or, in other words, for the same annual premium he could at this Office assure very nearly 600*l.*, whereby he derives AN IMMEDIATE AND CERTAIN BONUS OF 100*l.*

All particulars as to Shares, Loans, Assurances, &c., may be obtained on application to the Secretary; and, if required, forwarded to the country.

Parties in the country eligible for undertaking Agencies are requested to apply.

A very liberal Commission allowed to Solicitors and Agents.

EDW. T. RICHARDSON,
Actuary and Secretary.

ECONOMIC LIFE ASSURANCE SOCIETY,
No. 34, BRIDGE STREET, BLACKFRIARS, LONDON.
Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding in a decked, sailing, or steam vessel from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by **the hands of justice, are not void** as respects the interests of **parties to whom they may have been** legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

SPLENDID SALE of the WOODHALL COLLECTION OF EXOTICS.

There will be Sold by Auction, within the Gardens of Woodhall, in the parish of Bothwell, and County of Lanark, lying 10 Miles east of Glasgow, between Airdrie and Holytown, on THURSDAY, the 28th day of JULY next, and following day, commencing at 11 o'clock each day, the whole of that extensive and celebrated COLLECTION of HOTHOUSE and GREENHOUSE PLANTS, consisting of numerous rare and valuable species, among which are many magnificent specimens of Camellias, Heaths, Epiphyllums, Citrons, Oranges, Shaddocks, Zamias and other Palms; with a very extensive and superior variety of Pelargoniums (Geranium), Indian Azaleas, and other miscellaneous Greenhouse and Stove Plants; of which Catalogues may be had by applying to Mr. Murray, of the Botanic Gardens, Glasgow; Messrs. Austin and M'Aslan, Nursery and Seedsmen, Trongate, Glasgow; Woodhall Office, 33, Buchanan-street, Glasgow; or to the Gardener by Holytown.

The collection of Camellias is well known as not surpassed by any in the Empire, the specimens being of the very finest growth, many of them from 15 to 20 feet in height. The Heaths also afford numerous specimens of the finest sort, which for size and furnishing, it is believed, far surpass any collection ever shown.

The whole of the Plants are in the very best state of health; and as the operations of the mineral workings on the estate have already encroached upon the garden, they must be sold off, as it is, in consequence of the said operations, to be entirely broken up: therefore, great bargains may be expected. The Plants will be set up in Lots to suit purchasers, beginning with the Camellias, Heaths, Epiphyllums, &c.

The collection may be viewed any day prior to the Sale, by applying at Woodhall Garden. Further information learned, and particulars given, on applying to the Factor, Woodhall-house, Holytown.

BARCLAY and SKIRVING,
Auctioneers.

Woodhall-house, May 1842.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. J. C. and S. STEVENS will Sell by Auction, at their Great Room, 38, King-street, Covent Garden, on Wednesday, 20th July, and following day, at 12 for 1 o'clock precisely, a large and valuable Consignment of ORCHIDACEÆ, just arrived in most beautiful condition, and collected from a range of country comprising upwards of 300 Miles, in the neighbourhood of Guatemala, in Central America, and consists principally of the hardy cold-climated Plants adapted for the Greenhouse.—May be viewed the day previous and Mornings of Sale, and Catalogues had of Messrs. J. C. and S. STEVENS, 38, King-street, Covent-garden.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are **complete without furnaces or setting in brickwork, moveable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards.** Further particulars, with plans and estimates for heating any description of building, may be obtained as above: where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating **not only very efficient, but very simple, and have combined** durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the **works of their splendid Conservatory, lately erected at Chiswick.**

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, **and removes the nuisance and disfigurement of smoke**, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in **every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.**

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

SHADES FOR GREENHOUSES.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's Road, Chelsea, Horticultural Builders, &c., have invented a most simple and easy contrivance for shading Horticultural erections. The principle upon which it acts is so simple and effectual, that it only requires to be known to be universally adopted. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

This day is published, in Royal 8vo, Vol. 1, price 30*s.*, bound in cloth,

THE BOOK OF THE FARM,—Detailing the Labours of the FARMER, STEWARD, PLOUGHMAN, SHEPHERD, HEDGER, CATTLE-MAN, FIELD-WORKER, and DAIRY-MAID. By HENRY STEPHENS. Illustrated with Seventeen Engravings on Steel and nearly Two Hundred Woodcuts.

William Blackwood and Sons, Edinburgh and London. Publishers to the Highland and Agricultural Society of Scotland.

⁂ A Second Volume will complete the work, the first Part of which will be published on the 30th of September.

IMPORTANT AGRICULTURAL WORKS,
Published by Ridgway, Piccadilly, and to be had, by order, of every Country Bookseller.

A POPULAR TREATISE on AGRICULTURAL CHEMISTRY, intended for the use of the practical Farmer. By CHARLES SQUAREY, Chemist. Price 5*s.* bound in cloth.

"The writer of this work has succeeded with great skill and ability in simplifying a subject generally considered too abstruse for a large portion of the agricultural body."—*Farmers' Journal.*

2. THE NATURE AND PROPERTY OF SOILS. By JOHN MORTON. Third edition, enlarged. Price 7*s.*

3. ON FERTILISERS; being a complete Guide to every kind of Manure—to what Lands each is adapted, and the best means of application. By CUTHBERT W. JOHNSON, Esq. Price 12*s.*

4. THE COTTAGE FARMER'S ASSISTANT. By CUTHBERT W. JOHNSON, Esq. Price 1*s.*, or for distribution 9*s.* per dozen.

5. SINCLAIR ON GRASSES. A new edition, with coloured plates. Price 30*s.*

This Day, Post octavo, 5*s.*,

PRACTICAL CHEMISTRY for FARMERS and LANDOWNERS.
By JOSHUA TRIMMER, F.G.S.

By the same Author, octavo, with 200 Illustrations, 12*s.*,

PRACTICAL GEOLOGY and MINERALOGY, and the CHEMISTRY of METALS, with an Introductory Discourse on the Nature, Tendency, and Advantages of Geological Pursuits.

London: John W. Parker, West Strand.

WANTS a SITUATION as GARDENER.—John Halliday is about to leave his present employer, Lord Sondes, and is desirous of obtaining another situation. He has a good practical knowledge of his business in all its different branches, and can obtain most satisfactory testimonials from his present employer. Address, J. Halliday, *Gardeners' Chronicle* Office.

WANTS a SITUATION as GARDENER or GARDENER and BAILIFF, a Married Man, 38 years of age, who has lived in some of the first Noblemen's establishments in England: has been very successful in forcing of Pines, Grapes, Peaches, &c., as also in the culture of Stove and Greenhouse Plants: can be highly recommended by some of the first Horticulturists of the day whom he has formerly lived under, as well as by the Gentleman he has just left, who will be very happy to answer satisfactorily the fullest inquiries of any Nobleman or Gentleman. W. H., 54, Milton Street, Dorset Square.

WANTED a SITUATION as GROUND FOREMAN in a Nursery. The advertiser has a thorough practical knowledge of the profession, having been in the Nursery and Seed business all his life; is married, without encumbrance, and aged 33 years. The highest testimonials as to abilities, &c., can be given.—Address, post paid, D. E., Mr. Pearson's, Eschol Nursery, Hampstead Road.

WANTS a SITUATION as UNDER GARDENER, or a Single-Handed place, a Young Man, aged 22, who can give an unexceptionable reference to the place he is about leaving.—Address A. Z., Tollington Nursery, Hornsey Road, Islington.

WANTS a SITUATION as GARDENER, a Married Man, aged 30, without incumbrance: has a thorough practical knowledge of early and late Forcing; Fruit, Flower, and Kitchen Gardening; and the management of Meadow Land, if required. The most satisfactory character will be given by a highly-respectable Family he is about to leave.—Address A. D., care of Mr. Alex. Russell, Turnham Green, Middlesex.

WANTS a SITUATION as GARDENER, a Single Man, 32 years of age, with a practical knowledge of Gardening in its various branches. He would have no objection to take charge of a few Acres of Land, or to act as Gamekeeper where there is a small preserve. Six and a half years' character can be given from the place he has just left.—Address A. B. C., Exotic Nursery, Canterbury.

IMPORTANT TO AGRICULTURISTS, &c. &c.
Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1*s.*,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.
By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15*s.* per cwt. cash.—Chemical Works, Upper Fore-street, London.

Just published, in 2 vols. 8vo. cloth, price 24*s.*

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.* Edward Moxon, Dover-street.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief, is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2*s.* 6*d.*, 4*s.* 6*d.*, and 8*s.* each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3*s.* each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

GREAT AGRICULTURAL MEETING AT BRISTOL.
Agriculturists are informed that

POTTER'S ARTIFICIAL GUANO is ready for delivery in any quantity, in Casks or Sacks, at 15*l.* per ton.

"We advise our agricultural friends to give Mr. Potter's Artificial Manure a fair trial."—*Gardeners' Chronicle*, June 4th.

Analyses of Soils carefully performed, and the mode of improvement pointed out.—Chemical Works, Upper Fore-street, Vauxhall, London.

☞ Ask for POTTER's Guano.

HODGSON and ABBOTT's PALE ALE.—The above celebrated Beer, so strongly recommended by the **Faculty, is to be procured only from E. ABBOTT,** Brewery, Bow, **Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.**

City Office, 98, Gracechurch-street.

GARRETT'S DAHLIA & FLOWER PRESERVER, an Effectual Remedy against Insects of all kinds, so destructive to these Flowers, has been tried with success, patronised by the Nobility and Gentry, and totally destroys all Insects, without injury to the choicest Flowers.—Sold in bottles, 3*s.* 6*d.* each, at 41, Union-street, Bishopsgate-street Without, and by the following Agents:—Charlwood, 14, Tavistock-row, Covent Garden; Littlejohn and Son, King William-street, City; R. Johnstone, 68, Cornhill; and Price and Co., Lombard-street.

Orders per post, with Post-office order, will be attended to.

W. DAVIS, 34, Wych-street, Strand, London, begs to inform the Nobility, Gentry, and Horticulturists, that he has adopted a system for heating Forcing Houses and other buildings by Hotwater, upon the most simple, efficient, and economical principles; as a proof he will refer them to his work completed, for the most noble the Marquis of Salisbury; Sir Simon Clark, Bart., Oak Hill, Barnet; Abel Smith, Esq., M.P., Woodhall Park, Herts, &c. All orders conferred upon him will be punctually attended to.

COPY of a Communication addressed to Messrs. Rowland and Son, No. 20, Hatton Garden, London.—

GENTLEMEN,—Being called upon to attend a Lady who had had a complaint in her head about a year before, and in consequence had lost nearly all her hair; I found very few hairs remaining, and those just like down, with no appearance of any fresh roots. She stated her desire to use your Macassar Oil, but I felt I could not conscientiously recommend anything for its recovery, as I considered it too far gone. She however determined to try one bottle, which was used in about a month, and then sent to my shop for another, stating her hair to be much improved; she has now used eight bottles in as many months, during which time I have frequently pointed it, and have now the pleasure to inform you that it is quite thick and long; and she is so much pleased with the change, that she says the expense is nothing, and she will never be without it. If you think this statement of facts worth publishing, you are at liberty to do so; and remain, yours respectfully, JOHN LICKLEY, Hair-cutter.

Middle-street, Ripon, April 19, 1842.

⁂ On purchasing, ask for "ROWLAND'S MACASSAR OIL."

Just published, price 6s. cloth,
THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. Caunter, Esq.
London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

The Gardeners' Chronicle.

MEETINGS IN THE ENSUING WEEK.

Tuesday . . . . . { Horticultural . . . . 3 P.M.
{ Floricultural . . . . 2 P.M.
Saturday . . . . . Royal Botanic . . . . 3½ P.M.
Country Shows.—July 21, Hoddesdon Cottagers'. 22, Spilsby.

We have for some years had much at heart the creation of English names for all our Garden and Native plants, in lieu of the hard and unattractive words employed in systematical Botany; we have received many letters upon the subject urging us to take it up, and we have occasionally promised our correspondents to consider it. We have, however, been disheartened by the apparently insuperable difficulty of the task, and the improbability of our succeeding in establishing a system of names more agreeable than those in use. No one, in fact, except he who has tried the experiment, is aware of the nature of the task.

Some observations in the last Number of the Quarterly Review, in an article called the "Flower-Garden," evidently written by a scholar and a man of taste, as well as an amateur well acquainted with the subject, now lead us to introduce the topic. The writer says:—

"Before we have done with the florists and botanists, we must say one word about their nomenclatures. As long as the extreme vulgarity of the one and the extreme pedantry of the other continue, they must rest assured that they will scare the majority of this fastidious and busy world from taking any great interest in their pursuits. Though 'a rose by any other name would smell as sweet,' there is certainly enough to prejudice the most devoted lover of flowers against one that comes recommended by some such designation as 'Jim Crow,' or 'Metropolitan Purple,' or 'King Boy,' or 'Yellow Perfection.' When, indeed, Calceolarias and Pansies increase to two thousand 'named varieties,' there must of course be some difficulty in finding out an appropriate title for every new upstart; but, in this case, the evil lies deeper than the mere name. It consists in puffing and palming off such seedlings at all, half of which are either such counterparts of older flowers, that nothing but the most microscopic examination would detect a difference, or else so utterly worthless as to be fit only to be thrown away. This is an increasing evil; and if anything gives a check to the present growing taste for choice flowers, it will arise from the dishonesty and trickery of the trade itself.

"Meanwhile, let there be at least some propriety in the names given. We cannot quite agree with Mr. Loudon, who seems to approve of such names as 'Claremont-nuptials Primrose,' and 'Afflicted-Queen Carnation!' though they do point to the years 1816 and 1821 as the dates of their respective appearances; neither will we aver that Linnæus was not something too fanciful in naming his 'Andromeda,' and in calling a genus Bauhinia, from *two* illustrious brothers of the name of Bauhin, because it had a *double* leaf; but surely there is marked character enough about every plant to give it some simple *English* name, without drawing either upon living characters or dead languages. It is hard work, as even Miss Mitford has found it, to make the Maurandyas, and Alstrœmerias, and Eschscholtzias—the commonest flowers of our modern gardens—look passable, even in prose. They are sad dead letters in the glowing description of a bright scene in June. But what are these to the *pollopostemonopetalæ* and *eleutheromacrostemones* of Wachendorf, with such daily additions as the native name of *istactepotzacuxochiil icohueyo*, or the more classical ponderosity of Erisymum Peroffskyanum—

'— like the verbum Græcum,
Spermagoraiolekitholakanopolides,
Words that should only be said upon holidays,
When one has nothing else to do.'

As to poetry attempting to immortalise a modern bouquet, it is utterly hopeless; and if our cultivators expect to have their new varieties handed down to posterity, they must return to such musical sounds as Buglosse, and Eglantine, and Primrose, before bards will adopt their pets into immortal song. We perceive some attempt made lately in 'Paxton's Magazine,' and the better gardening journals, to render the names somewhat more intelligible by Englishing the specific titles, as Passiflora Middletoniana—Middleton's Passion-flower, and the like; but this is not enough: the combination of a little observation and taste would soon coin such names as 'our plainer sires' gave in 'Larkspur,' and 'Honeysuckle,' and 'Bindweed,' or even in 'Ladies'-smocks,' and 'Ragged Robin,' and 'Love-lies-Bleeding.'

"As names run at present, the ordinary amateur is obliged to give up the whole matter in despair, and rest satisfied with the awful false quantities which his gardener is pleased to inflict upon him, who, for his own part, wastes hours and hours over names that convey to him no information, but only serve to puff him up with a false notion of his acquirement, when he finds himself the sole possessor of this useless stock of 'Aristophanic compounds and insufferable misnomers.' Crabbe, whom nothing was too minute to escape, has admirably ridiculed this botanical pedantry:

'High-sounding words our worthy gardener gets,
And at his club to wondering swains repeats;
He there of Rhus and Rhododendron speaks,
And Allium calls his Onions and his Leeks.
Nor weeds are now; from whence arose the weed,
Scarce plants, fair herbs, and curious flowers proceed;
Where cuckoo-pints and Dandelions sprung,
(Gross names had they our plainer sires among,)
There Arums, there Leontodons we view,
And Artemisia grows where Wormwood grew.'

"To make confusion worse confounded, our botanists are not satisfied with their far-fetched names; they must ever be changing them too. Thus it is a mark of ignorance in the world of flowers to call our old friend Geranium otherwise than Pelargonium; the Glycine (G. sinensis), the well-known specimen of which at the Chiswick Gardens produced more than 9,000 of its beautiful Lilac, Laburnum-like racemes from a single stem, is now to be called Wistaria; the new Californian annual Œnothera is already Godetia; while the pretty little red Hemimeris, once a Celsia, is now, its third designation, an Alonsoa; and our list is by no means exhausted.

"Going on at this rate, a man might spend the morn of his life in arriving at the present state of botanical science, and the rest of his days in running after its novelties and changes. We are only too glad when public sanction triumphs over individual whim, and, as in the cases of Georgina proposed for Dahlia, and Chryseis for Eschscholtzia, resists the attempted change."

We must, in the first place, remark, that the force of this criticism is much diminished by its exaggeration. No such words as those we have put in Italics were ever in use, although they are to be found in books; and it is no more fair to charge upon Botanists the follies of a few eccentric persons, than upon artists the vagaries of—no matter whom. We would next remark, that if the critic is serious in his objection to such a word as Andromeda, which, whether we regard its classical origin, or its agreeable sound, or its universal adoption, seems to us by no means to be complained of, we see no hope for any general improvement in nomenclature. For suppose some English word, say Pipe-stem, or Sorrel-tree—names actually in use in the United States—were to be substituted for Andromeda, should we not experience more inconvenience in the change of a name "familiar as household words," than we should derive benefit from the substitution of English for Latin?

That a recognised English nomenclature for all plants would be a great advantage, we freely admit; but we should regard a word like Andromeda as admissible as Julia; for, whatever its origin, it is a child adopted by the English. We acknowledge, to its fullest extent, our opinion, that the language of science cannot be made the language of common parlance, without putting in peril the very existence of systematical Botany in this country; and we agree with those of our correspondents who consider its nomenclature as the greatest bar to the diffusion of Botanical knowledge among us. But we are, what our correspondents are not, aware of the serious practical obstacles opposed to all change. The habit of the mass of the public—and, we fear, their taste as well—is against the change; in corroboration of which, we may refer to the "Botanical Register," which is the great magazine of new plants. For some years past, the Editor has been endeavouring to supply the place of the technical names of Botany by popular English equivalents: for instance, in the volume for last year we find *Cyrtopodium* translated by Curvefoot, *Brachycome* by Swandaisy, *Colea* by Reirei, *Æschynanthus* by Blushwort, *Strobilanthus* by Cone-head, and so on. But who employs these names? No one. On the contrary, the universal practice is to adopt the so-called Latin names, and to toss the English ones overboard. Whether this is caused by the feeling of the public being against the English terms, or because the latter are ill-contrived, we will not pretend to say; but such is certainly the fact. Perhaps the public agree with a friend of ours, from whose letter, now before us, we are tempted to select a passage:—

"I fear you will find an attempt at a standard English nomenclature very objectionable. You would be obliged to take names already in use; but these are so often so absurd, contradictory, or uncertain as to be very unmanageable. If a white-leaved plant is called Chrysophyllum, it is no great matter, for few care for the original meaning of a Greek word; but an English misnomer, such as Red Oak, or an absurd name, such as Goosegrass, strikes one directly; besides, that they are are generally local, and if you adopt the meaning of one locality, you lead others, who attach a different meaning to the word, into error. For instance, in some places, Lamiums are called Nettles, and Urticas Stinging-Nettles; in others, Urtica is a Nettle, and Lamium a dead Nettle. Goosegrass is here a Potentilla, there a Galium. Witch Elm is in some districts Ulmus montana, in others a variety of U. campestris, as opposite as possible to U. montana, and so on; and I assure you, that even in Ladies' Botany, there are names applied to plants in the East of England which are quite unintelligible in the West, where they belong to very different plants. It is much easier to have a totally new scientific name learnt, than to induce any one to unlearn a common name, and substitute another unscientific one for it."

Be it observed, we do not put forth these objections as our own, but as those of an extremely sensible man, to whom we mentioned our project of attempting a uniform English nomenclature.

One part of such a plan would necessarily be the abandonment of two-thirds at least of the names now in use; and how little encouragement may be expected in that respect, although it is inevitable, may be collected from the Quarterly Reviewer himself, who complains of all changes, even although Chryseis the classical be substituted for Eschscholtzia the barbarous.

For ourselves, we admit with regret, that our hopes of seeing a recognised English nomenclature of plants waxes fainter and fainter. What with the capriciousness of individuals, the inherent difficulties of the task, the refusal of so many people to acknowledge any authority whatever, the extraordinary ignorance of some of the dealers in plants, and the inconvenience of unlearning even a barbarous nomenclature, we fear that we can hold out no reasonable hopes of a change for the better. The gentle public is not like a political party; there is no apparent bond of union to be caught hold of; and as for harmony of opinion, we fear that that at least is to be met with only in the regions of Utopia.

The period at which the common Laurel should be pruned is one of those subjects about which there is much difference of opinion among gardeners. As happens in so many other cases, this difference is more apparent than real, and is produced by circumstances which are unobserved, but which materially influence the effect of the operation.

For instance, there are those who advocate autumn pruning for all Evergreens; and the reason assigned does not appear open to objection. It is alleged that when Evergreens are cut back in the autumn, the roots, which are not affected by the pruning, continue to absorb food during the whole winter, and to render all the mutilated branches turgid with sap against the return of spring; the consequence of which is, that every bud pushes with great vigour. It is also said that if pruning Evergreens is delayed till the spring, the removal of branches filled with the sap, which would otherwise have been concentrated in the trunk or stock, produces the effect of weakening the tree, and rendering its sprouting thickly less certain. We believe that in mild situations, where there is no danger from severe frost, this mode of reasoning is correct. But is it so when Evergreens are grown in cold climates?

It is to be recollected that the greater part of our Evergreens are natives of countries much warmer than our own. The common Laurel is from the Black Sea, the Portugal Laurel from Portugal and Madeira, the Phillyrea from the coast of the Mediterranean, and the Alaternus, the Arbutus, the Evergreen Oak, and many more, from similar climates. It is true that such trees are sometimes exposed to severe frost; but their winters succeed extremely hot summers, which have the effect of ripening the wood so thoroughly as to render it far more capable of resisting cold than with us under even the most favourable circumstances. It is found in practice in this country that if Evergreens are cut down in the autumn, a hard winter is certain to injure them severely, partly, perhaps, because the natural protection afforded by the leaves to the soil they grow in is removed, and partly, no doubt, because the turgid state to which the naked branches are brought by the influence of the roots, above adverted to, renders the wood more susceptible of cold. It is notorious that a given plant suffers from cold in proportion to the quantity of fluid it contains.

Autumn pruning Evergreens, then, is positively disadvantageous in cold climates; for the adverse action by frost is much greater than the favourable effect of the accumulation of sap.

There are those who prefer midsummer, to all other periods, as the season for pruning Evergreens; and there is no doubt that in many instances they will break freely; but it is invariably found that if a hard winter succeeds midsummer pruning, the trees suffer severely—no doubt because the shoots, produced late in the summer, have not time to ripen.

Upon the whole, then, spring is to be recommended for pruning Evergreens. Nowhere in the world are the Laurel hedges more beautiful, or in better order, than at Dropmore; and the practice of Mr. Frost, who has the management of them, entirely bears us out in this opinion. He has had great experience in the matter, and he has invariably found the months of March and April most advantageous; indeed, if the weather at the end of March remains severe, he altogether defers the operation till April. In cutting down Laurels, he recommends leaving the stems at various heights, from one foot to four feet or higher, and not to fell them close to the ground; it is evident that, independently of all other reasons, the trees will have more means of forming young shoots in the former than in the latter case.

For the result of the last exhibition in the Garden of the Horticultural Society, we refer our readers to the ample report in another place. The weather was unfavourable; light showers fell without much intermission; and consequently the number of visitors did not exceed 3,500; but the exhibition itself was the best we have ever seen in July. One hundred and thirty-seven medals were awarded.

The most remarkable plants were a handsome new pink Echites, with a blue Cinchonaceous plant, from Messrs. Veitch and Son, of Exeter; and a new Mexican Oncidium, with large rose-coloured flowers, from Mr. Brocklehurst's garden at the Fence.

Of the Fruit, we shall only say that it was worthy of the best times of English gardening. We would point more especially to the Peaches and Nectarines, amongst which those from Mr. Sheills, Lord Blantyre's gardener, Mr. Errington, gr. to Sir Philip Egerton, and Mr. Lauder, gr. at Downton Castle, were conspicuous.

We regret to add that some one was dishonest enough to steal a large and valuable Pine-apple, belonging to Sir George Beaumont, the legal proceedings connected with which will be found in our police report as soon as they become the subject of judicial examination.

MECHANIC'S COTTAGE.

Agreeably with your request, I send you the plans and elevation of a mechanic's cottage. It is supposed to be built in a locality where stone may be had for the external walls, and brick for the interior divisions. This cottage occupies less space than one of the model cottages in your Paper of the 18th ult.; and as its cubic contents are not more, we may conclude that the expense of building would be much the same; the effect in the present elevation being produced by the following simple means:—

The quoins are projected 1½ in. beyond the coursed work of the wall, but are not dressed or chamfered. The plinth is formed by two courses of wall-stone projecting 2 inches; the effect of the blocks at the easing is produced by continuing the common rafters 6 in. over the walls; the labels over the windows are formed by inserting pavement in the coursed work; the corbel-stones of the gables are projected in the manner shown to give character; and the coping over these, together with the pinion-tables, are merely 3 in. thick pavement.

In like manner the lintels, jambs, sills, &c., project from the face of the wall, with blocks under the sills; the mullions and transoms of the windows of wood are bevelled, and painted like oak. The ornamental porch is composed of simple fillets of wood, nailed upon a frame in ornamental forms, &c.

Now, with regard to the accommodation of the internal arrangement. We have a trellis-porch (*a*); lobby and staircase (*b*), 5 ft. 6 in. wide; closet under stairs (*c*); living-room (*d*), 16 ft. by 12 ft.; back kitchen (*e*), 12 ft. by 10 ft.; pantry (*f*), 8 ft. by 3 ft. 10 in.; coal-house (*g*); ashes (*h*); and privy (*i*). The chamber plan contains three bed-rooms (beds placed as shown) and a closet. Now, to give Messrs. Wilson and Marks (who, *en passant*, are sadly out in the cubic contents of the model cottage, and in making the doors of fig. 2,050 only 1 ft. 6 in., with an elevation of 18 in. by the scale, shorter than the plan) some idea of my notions of comfort in a small house; I would say that the Honeysuckle and other ornamental creepers should be trained up and around my trellis-porch:

> Around my ivied porch shall spring
> Each flower which sips the morning dews.

And although I do not intend that the wife should spin and sing in the porch, I should have a seat there for her to sit and sew on fine summer evenings; while the husband took the opposite seat with his book, or was busied in his garden. In the right-hand corner of the lobby as we enter, I should have the 30 hours' clock, in a well-polished elm case; and that part of the closet under the stairs, not occupied with Potatoes or other roots, should hold the man's tools, so that they might not be littering about the rooms; while, at a proper height, between the living-room and closet-doors, would be fixed a peg-rail for hats, &c. My living-room fireplace should have a small oven, and boiler on either side of the grate; and the bay-window splayed with a seat all round, where the wife can sew and the husband read in cold or wet weather. On either side of the bay-window are recesses: that next the front should have a cupboard in the lower part for holding groceries, &c., about 3 ft. high, and the glasses and better sort of china displayed on the top. On the corresponding side would be placed the family squab, or common sofa; and just above its back, the recess would have a shelf corresponding to the top of the cupboard, for holding the books; and if the occupant was fortunate enough to possess many of these, the recess might have shelves all the way up, with a neat chintz curtain to let down at cleaning times. When we have placed the tables in the space between the door and back wall, with a smaller table in the angle next the porch, a flower-stand in the bosing of the front window, and a few prints, in plain, oak, bevelled frames, being opposite the lights, with the regular complement of chairs, &c., I think our living-room will be pretty tidy; and it must be kept tidy too, if the wife has any value for domestic comfort. The back kitchen has a boiler for washing or brewing, and a fireplace, as all the dirty work must be performed here; with a back-door, for ready access to the coals, &c.; a slop-stone in the window; and two rows of shelving where shown, for holding saucepans, &c. &c. The pantry will have a stone bench and wooden shelving; and opposite the door there is a snug corner for holding the small barrel of beer, for the wakes or Christmas. The outbuildings will have a shed-roof over them, and speak for themselves, as also will the chambers, in regard to the position of the doors, windows, beds, &c.; so that no draught may pass across the beds. The closet at the top of the stairs is to be shelved at one end, for holding the bed and other linen; and a peg-rail is to be put up in it for hanging gowns, &c., on: so that the chambers may always be kept tidy. I believe all will agree with me that a cottage of this kind, placed on a slight declivity, would have a pleasing appearance, as well as prove exceedingly comfortable for a person in the station of life for whom it is designed.

Having now so far disposed of the house, we will proceed to the garden and its arrangements.

a a are plots of Grass, upon which, in convenient situations, a detached China Rose or other choice plant may be placed.

b b are irregular lines of flower border, planted with the dwarfest flowers next the grass, (or each point may be reserved for a separate florist's flower). This will create a pleasing effect from the windows, for it frequently happens that cottagers take the greatest pride in placing their choicest flowers where they can be most readily seen by passers-by, without seeming to care whether they can be seen from the house or not; and this is unfortunately not done because they wish to gratify the love of flowers in others, but from self-pride in their productions, which would be laudable when rightly directed; to which end we would advise the first endeavours to be—giving all the gratification we can to those at home who share in and soothe so many of our cares, and then yield as much pleasure as leis in our power to our fellow-men. This can be done by inviting those of our neighbours, of similar tastes, to view and admire our flowers; which would be a poor gratification, if daily seen as they passed. The sides next the boundary fence should be occupied with dwarf flowering shrubs, as the scarlet flowering Currant, Persian Lilacs, Rhododendrons, Laurels, &c.

c is the drying and play ground, in which may be planted a few Dwarf Apple-trees, and the fence may be covered with Black Naples Currant; which if eaten by the children, will do them no harm, being gentle aperients, and as a jelly are invaluable in a family, in such cases as sore throats, allaying thirst in fevers, &c., &c.

d d are herb borders.

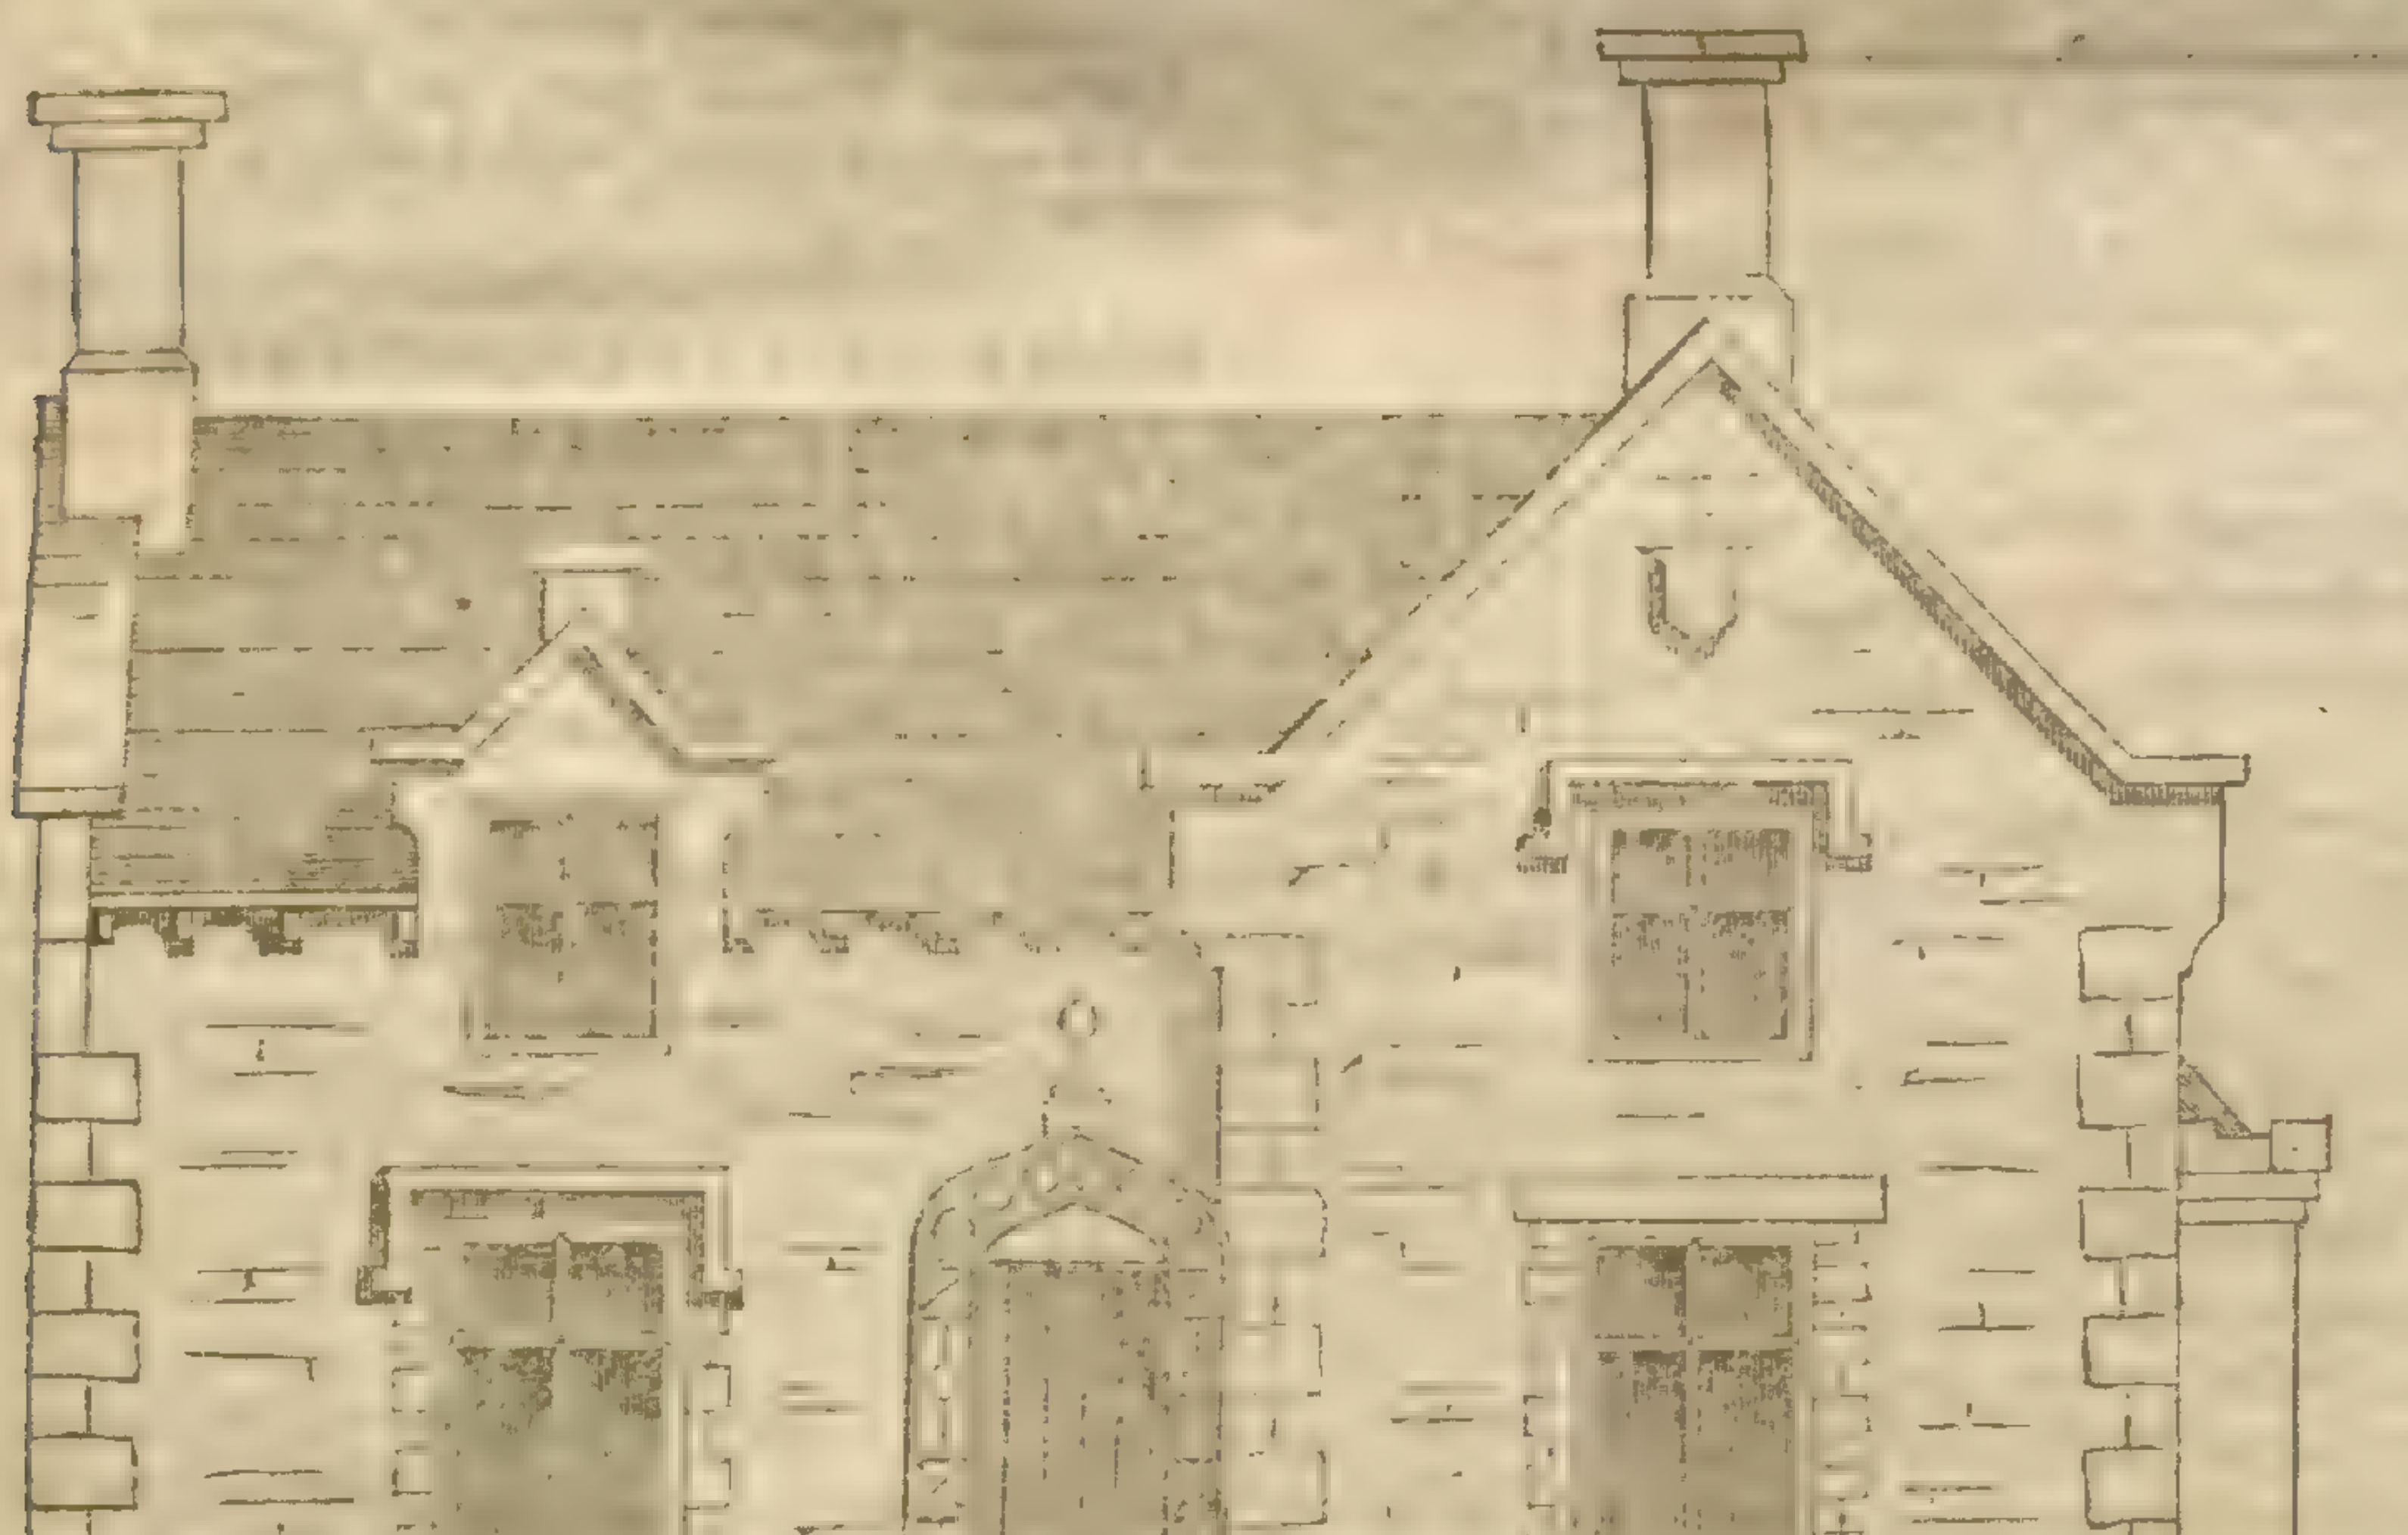
e a west border suitable for early Potatoes or Peas, and after Celery or late Cauliflowers.

f south border for earliest productions, as first Peas, Radishes, Lettuce, Cauliflower, seed-beds, &c.

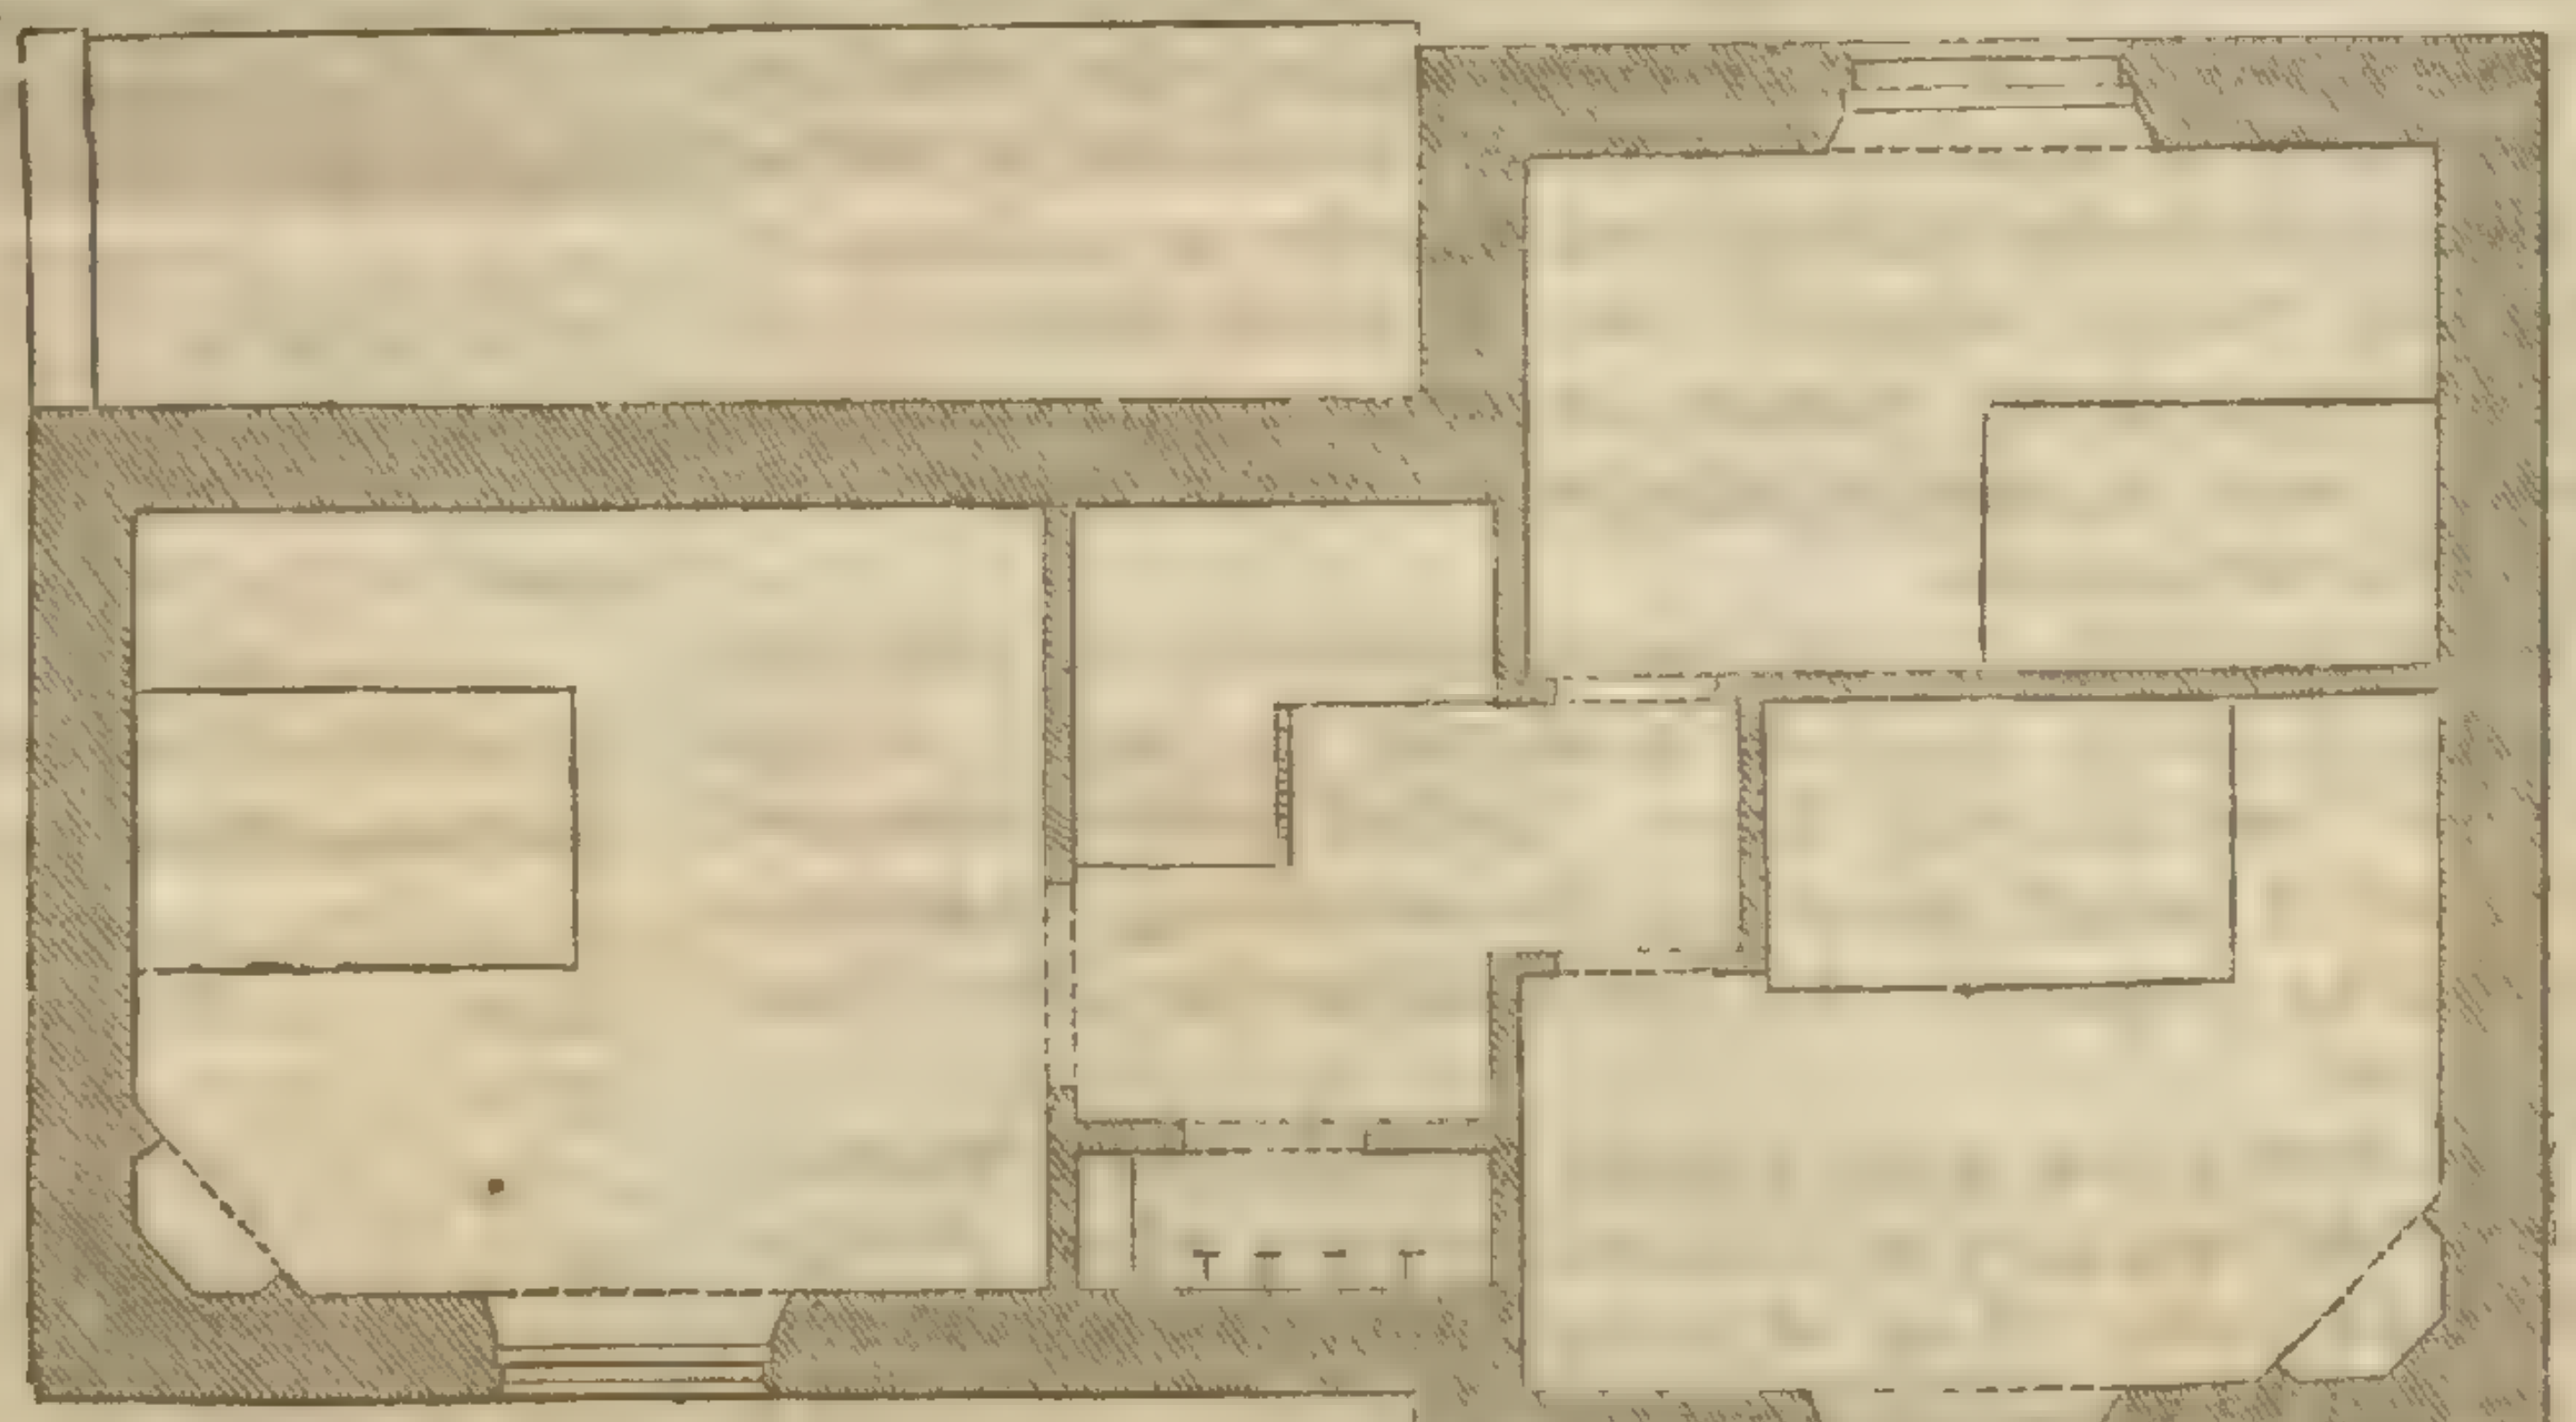
g east border for Rhubarb, Sea-kale, and Strawberries.

h Raspberries.

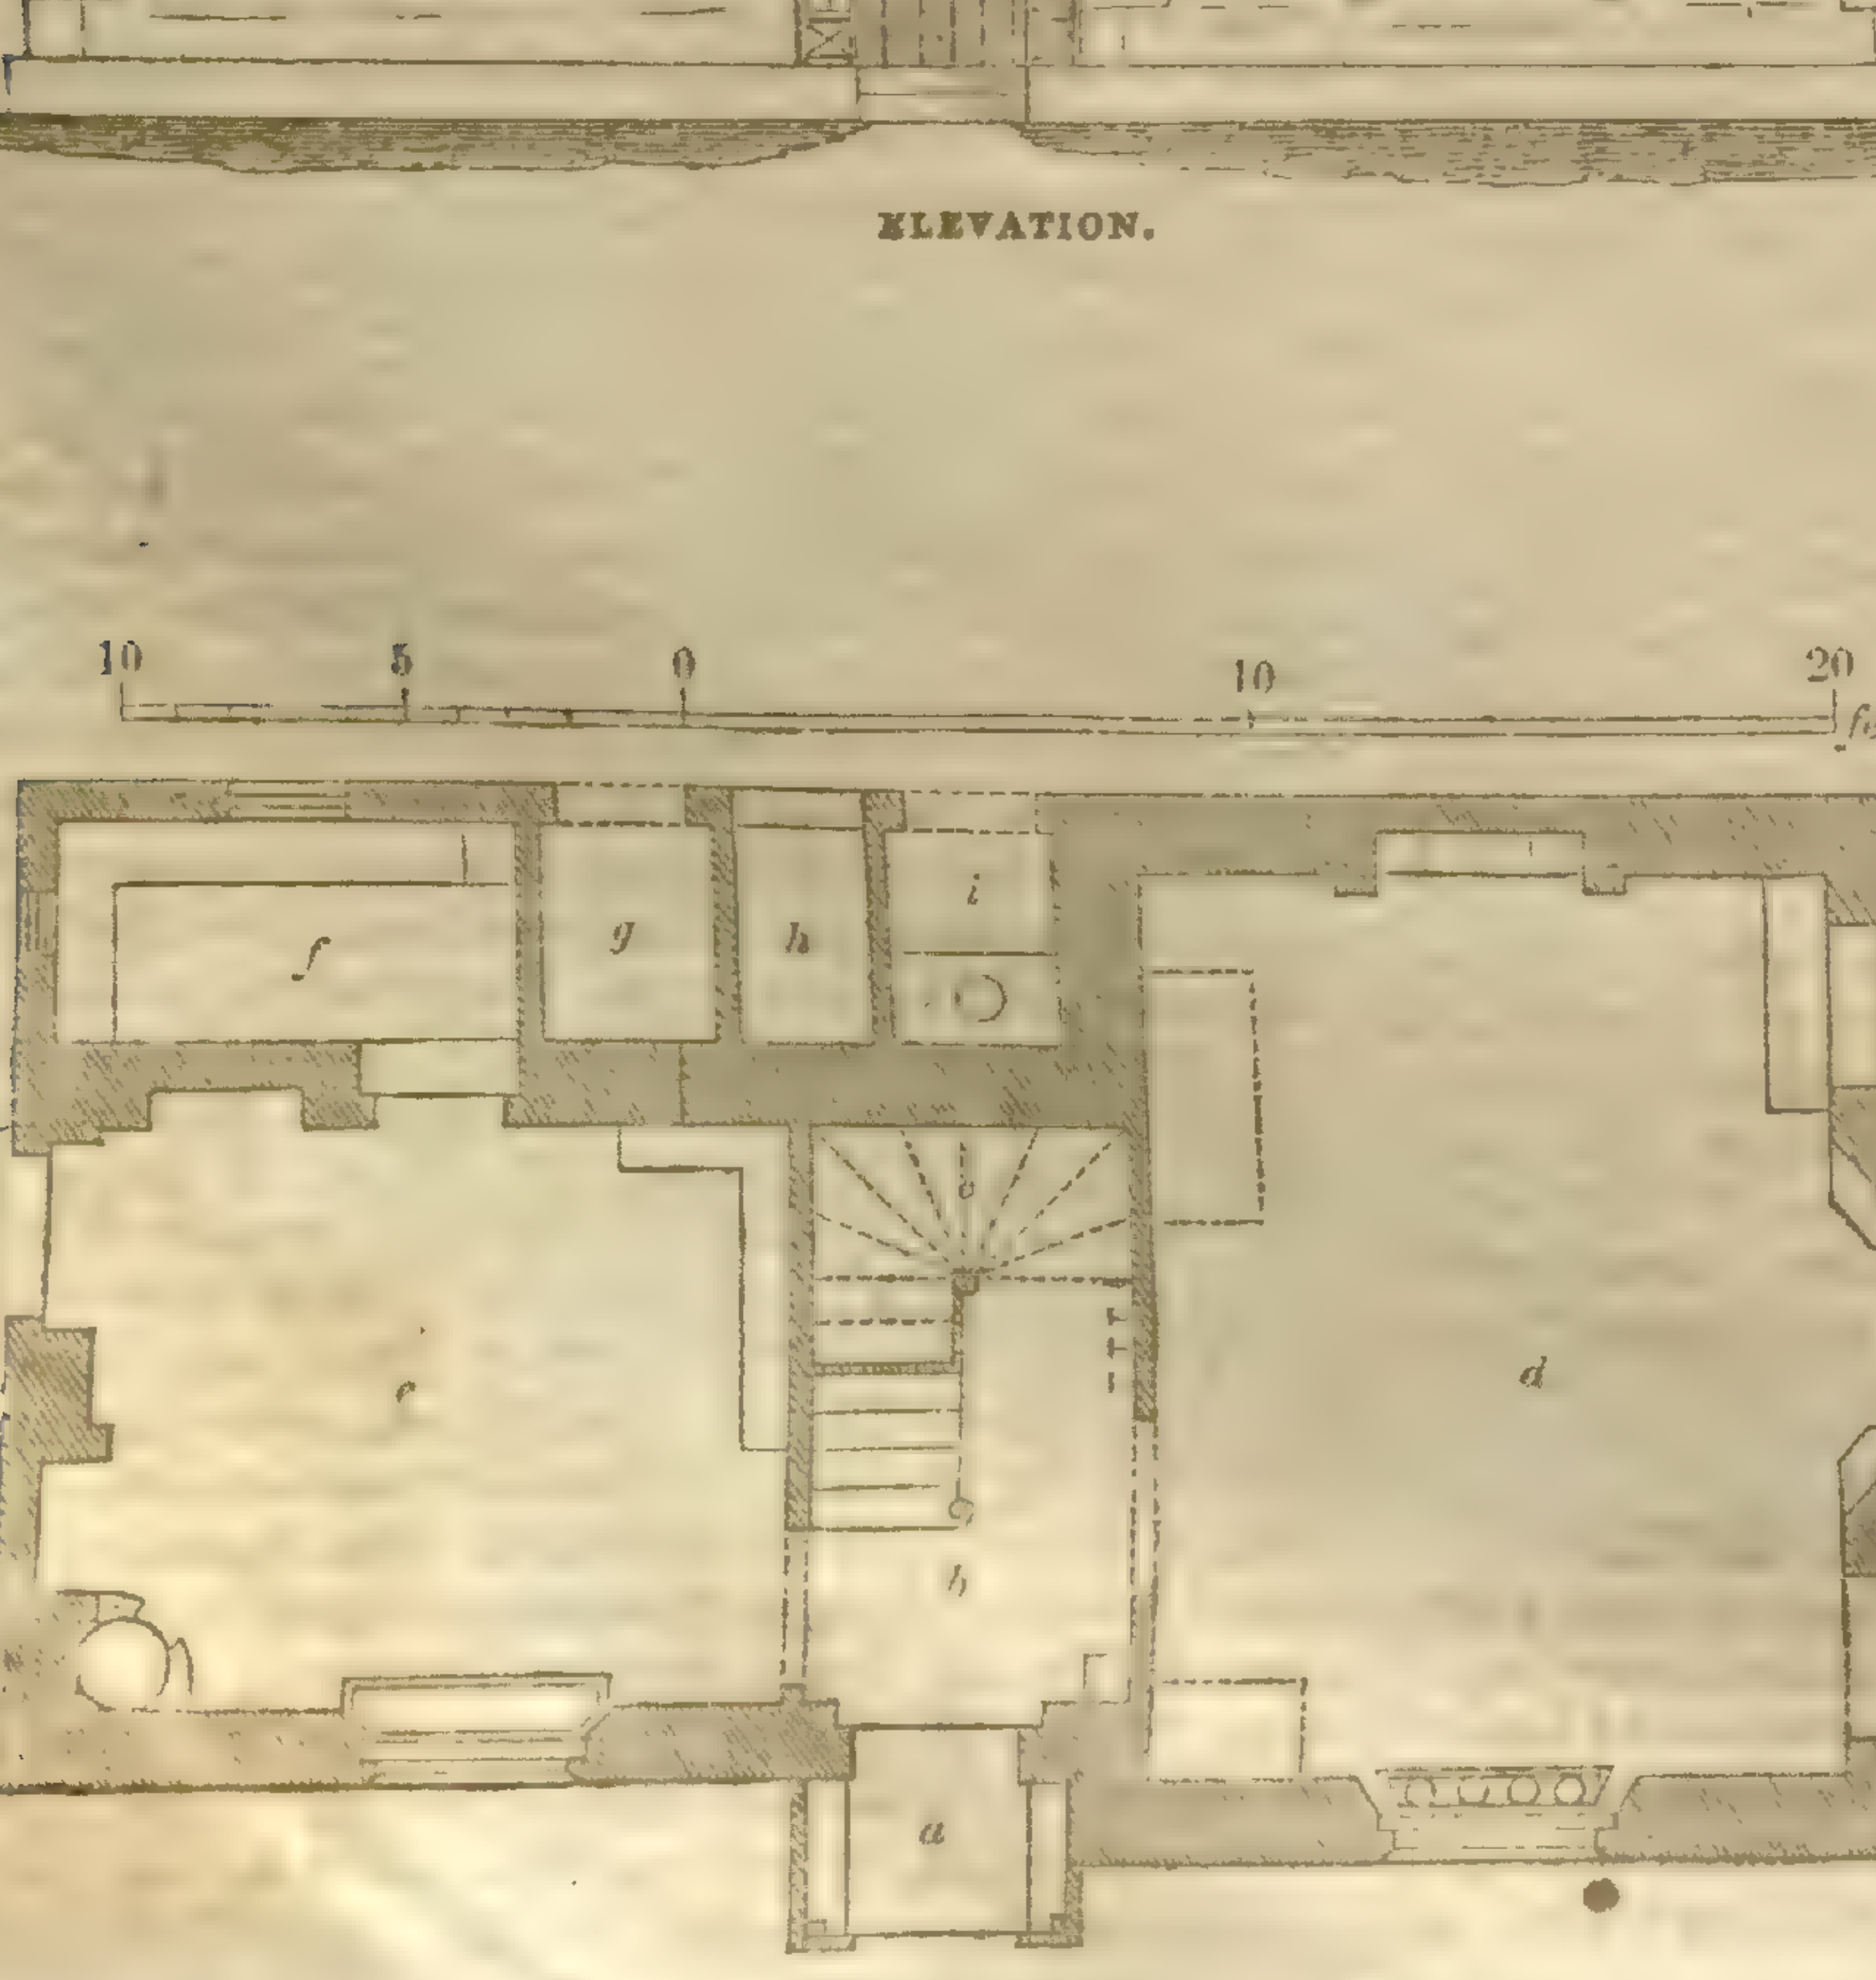
The central portion of the garden is divided into three



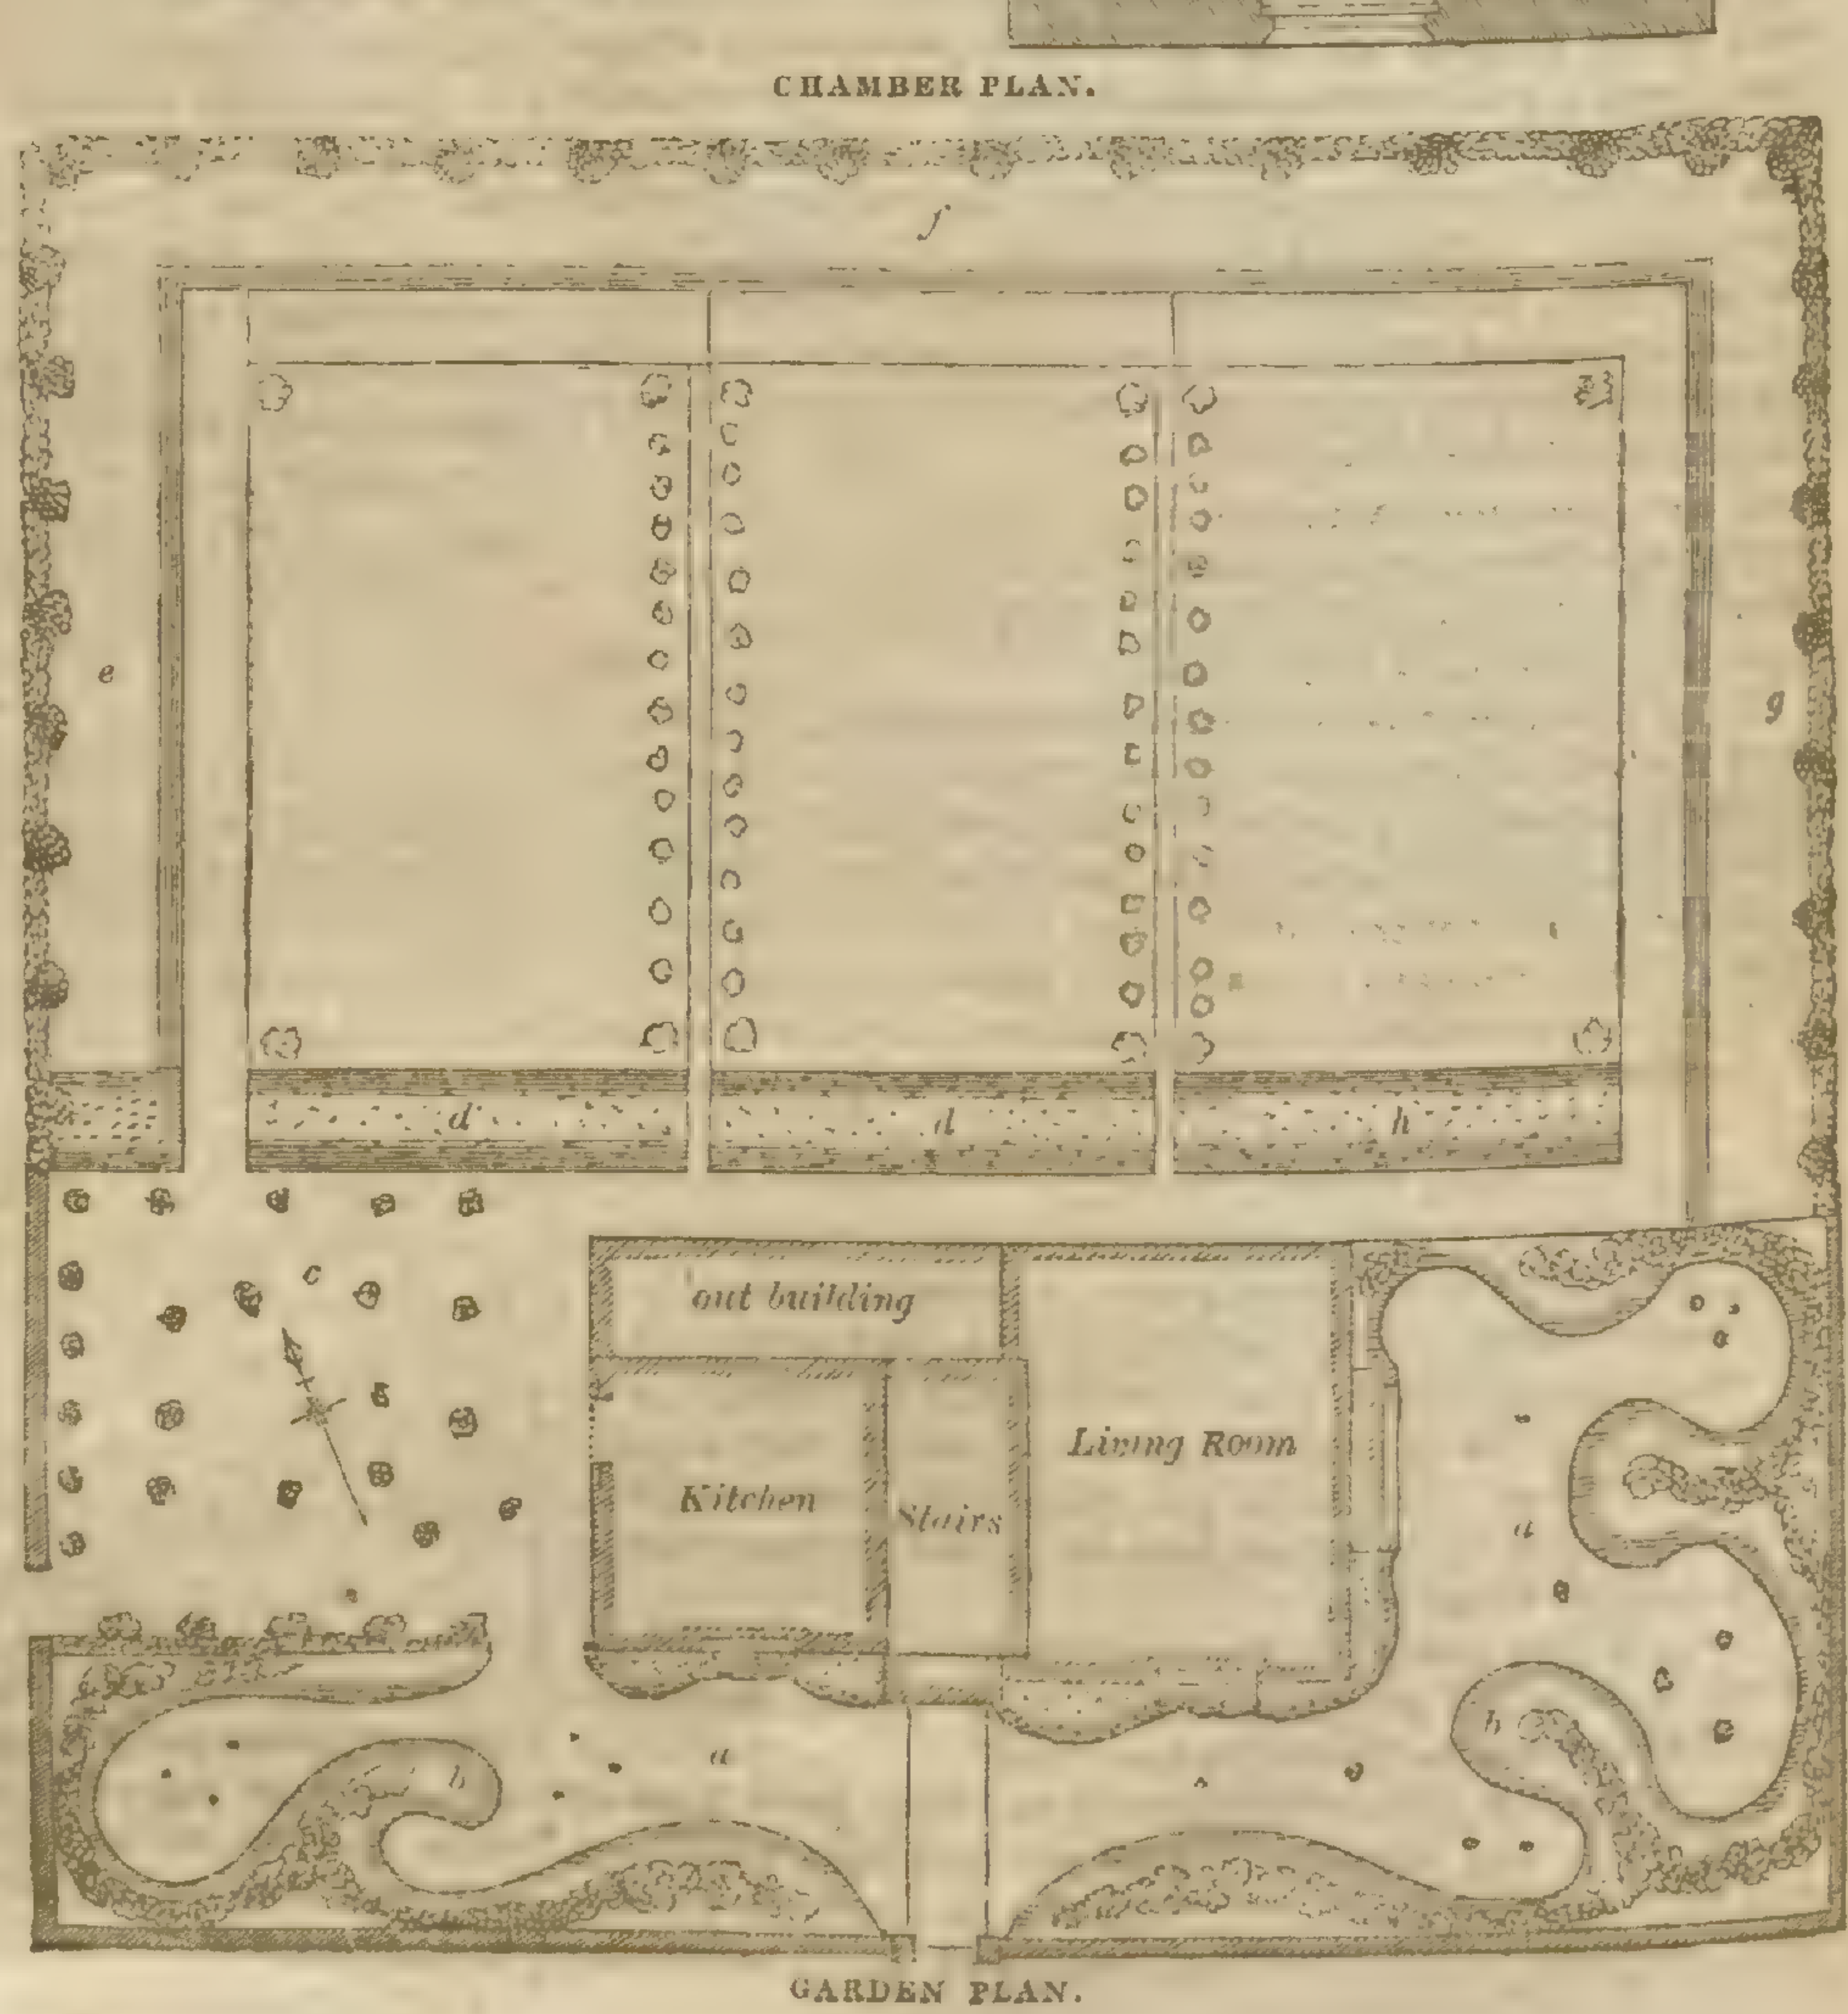
ELEVATION.



CHAMBER PLAN.



GROUND PLAN.



GARDEN PLAN.

equal divisions, one of which, or more, according to the wants of the family, must be cropped with Potatoes, leaving the remainder for the main crops of Cabbage, Onions, Peas, Beans, &c. On either side of the narrow walks, are rows of Currants and Gooseberries; and at each corner is a pyramidal Pear-tree. By dividing the garden into three or more equal divisions, a system of rotation cropping may be carried on; which should always be practised, as neither Potatoes nor any other vegetable should be grown two years upon the same ground. The trees round the boundary may be Apples, Pears, Plums, and Cherries.

The area occupied by the house and garden is about one-eighth of an acre, which, we doubt, will be considered too great a space of ground for a mechanic to cultivate properly; but this will not be found the case if he is industrious, and certainly not if he is fond of gardening as a recreation, and we believe the great advantages of such a garden, well cropped, to a family, none will deny.

"Amicus Loudoni," in your last Number, instead of refuting my objections to the Mechanic's Model Cottage, asserts that they were anticipated by Mr. Loudon, and that I have attacked that gentleman with weapons borrowed from himself. This is not the fact; for Mr. Loudon has only noticed two points repeated by me, and these but slightly—namely, the entrance by the back kitchen, and the situation of the fire-place; as any one may see by referring to pages 407 and 436 of your Journal. Mr. Loudon has therefore overlooked the principal defects which I pointed out; and he has authorised them virtually by recommending the "Model design" in preference to any in the supplement. Will "Amicus" show us a practicable section through the staircase of the model cottage?—*Scrutator.*

ON THE CULTURE OF THE RANUNCULUS.

HAVING seen Dr. Horner's excellent paper on the culture of the Ranunculus in a late *Chronicle*, I wish to express my approbation of it, and to add a few suggestions of my own. It is now nearly seven years since I wrote an article on the same subject for the "Horticultural Journal;" since which time further experience has confirmed me in the opinion I then gave of the necessity of preparing the beds at an early period, so as to ensure a general bloom. Dr. Horner recommends October: I would prefer doing this work in August, or not later than the beginning of September. In the former month, the cultivator has many chances of fine weather to get the surface soil of his beds thoroughly sweetened, by frequent turnings and exposure to the sun and air. He also obtains the autumnal rains requisite to consolidate his beds, so as to make his success almost certain in the cultivation of this flower.

I quite agree in the advice given to keep the beds low, (the wood-edging should not exceed an inch and a half, or two inches, above the paths); and likewise in having a retentive loam for the subsoil. But I would demur to the use of soil from an old pasture, except every particle (sods included) were minutely examined for that pest of the florist—the wire-worm.

I would also insist on the use of cow-dung at least one year old; if older, more of it should be used. I have sometimes used old dung from a hotbed without any evil result; but I would rather use the cow-dung, on account of its cooling property. To put manure low down is entirely waste.

Dr. Horner gives good advice to cultivators when he recommends February as the only month when planting should take place. I am of his opinion, and for the same reasons that he so ably expresses. I would say, plant so soon as the surface soil of the beds is sufficiently dry to rake; and I would recommend the same distance between the rows, and between the plants. Some of the vigorous new seedlings would require to have six inches apart allowed them; and even at that distance, when the flowers are in bloom, the surface of the beds will be covered with a mass of tangled foliage. I prefer planting in drills; to regulate the depth, I use a very simple instrument, viz., a piece of wood that extends across the bed, with a notch at each end 1½ in. deep After marking the rows on the surface, I scoop out a little earth from each drill with a trowel, then press down the piece of wood till the projecting parts rest upon the framework of the bed.

If the lower part is covered with tin or lead, it will prevent the soil adhering, and cause it to work with facility; the back serves for a strike. Two persons, by holding it down close to the wood-edge, can draw the superfluous soil toward the centre of the bed; when it can be removed, and by means of it the bed made perfectly level.

Another instrument, equally simple, may also be used. It consists of a piece of wood with knobs 1½ inches deep, and of sufficient diameter to allow of a root being easily placed in the hole formed by each. The knobs ought to be covered with some substance to prevent adhesion of the soil, and placed five inches apart; this will make a good and ready dibber. The cultivator has here a choice of two instruments—both good—with which the operation of planting can be performed by two persons very expeditiously. When the roots are placed in their position, press them gently to make them firm, and prevent worms from casting them out.

I would also condemn the practice of removing 1½ inch of the surface soil previous to placing the roots, and afterwards filling up the bed with loose soil.

The situation of the beds should be on a level part of the garden; and since such cold wet summers have been recently experienced, I would prefer an open, airy situation, exposed to the full sun, so as to have something like a certainty of having my roots ripened before the season was too far advanced.

The placing them in a situation where they are exposed only for a few hours to the morning sun may answer perfectly well for the old sorts, which in general are ready for taking up at the time when they ought to be in bloom; but I would advise an open situation for all the new sorts which are of vigorous habit, and which are later in perfecting their roots. Last year, in a situation such as I have mentioned, it was the month of September before I had the last of my roots taken up. Had they been in a shaded situation, I would have run every risk of losing many of my sorts. Persons wishing to compete at flower-shows may have a spare bed of duplicate roots, in such a situation as Dr. Horner recommends, for the purpose of prolonging their bloom.

Under the head of General Management, the advice given by Dr. H. cannot, in my opinion, be amended. My practice is, when the plants are well up, and when the surface soil is moderately dry, to stir the soil between the rows and about the plants, to the depth of about an inch, and to break it fine. I then sprinkle over the whole surface about ¼ inch in thickness of exhausted Auricula compost; this prevents the surface cracking, helps to keep the plants cool, and answers for a top-dressing.

During the whole of last April there was no rain in this part of the country; the sun shone fiercely throughout the day, accompanied by a cutting east wind, and invariably by frost during the nights. Yet during this trying time, I never watered my Ranunculuses; consequently, my plants received no check from this cause; yet I had a fine and strong bloom. When water is given, let it be pond-water if possible: if spring-water, let it be exposed to the sun for some hours before it is used, to soften it and raise its temperature. If this precaution is not adopted, the cultivator will to a certainty scald his foliage, and most probably destroy a number of his roots. Whenever there is any indication of frost, water should on no account be given. With respect to taking up the roots, I would insist on the cultivator not waiting until the whole of his roots are ready to take up before he commences that operation, but to take them up singly whenever they are ripe, and deposit them in safety in the bag or drawer appropriated to the sort. The beds should be frequently looked over; and as the roots attain to maturity, let them be taken up, till the whole are secured.

To accelerate the ripening of the roots of late sorts, I have adopted with success the practice of cutting the fibres a few inches below the surface with a trowel, and gently raising the ball of earth about the root, half an inch above the level of the bed. By this method, I have saved many valuable seedlings, and I have never found plants treated in this manner to be at all the worse for it. I am confident had I not done this, many fine sorts which I now hold would have been totally lost.

I would also recommend the awning being kept in readiness to ward off heavy rains after the bloom; gentle rains will increase the size of the roots, but heavy rains, by saturating the beds, will retard the ripening of the roots, even if it does not cause renewed vegetation; and will cause rot, to a certain extent, to take place among some of the roots.

I have had many applications made to me by various persons for instructions to prepare Ranunculus beds; I will, therefore, again state my method. The depth of soil in my beds is 2½ feet; the subsoil is from the Carse of Falkirk. It is a rich, clayey, friable loam, very retentive of moisture; about six or eight inches from the surface is a rich light loam, of a sandy nature. I prepare my beds next month; I remove the whole of the soil with the remains of the dung given last year, and turn up the subsoil a whole spade in depth, breaking it well. If the beds are allowed to remain in this state for a day or two, to sweeten the subsoil, I consider it to be an advantage. I then place upon the subsoil a layer of cow-dung, at least one year old, three or four inches thick; when this is equally distributed, I scatter over it the fine powder of new-slackened lime, to correct any acidity and destroy the worms. By using lime, I am seldom annoyed by worms disturbing my beds; I then fill up with new light soil, generally taken from the surface of my Tulip bed, which has for some weeks before been frequently turned to sweeten it, and I prefer to have it in a dry state when placed upon the dung; I also reserve a portion to fill up with from time to time, as the beds subside. I keep my beds always full, to allow for subsidence through the winter, as I would much rather have some soil to take from the surface when I plant, then have to add fresh to it. I have found a light soil, from which a crop of early Potatoes has been raised, suit most admirably for the surface of Ranunculus beds; but I would advise that it should be turned several times before it is used. I rake the surface frequently, filling up well toward the edge.

The cultivation of the Ranunculus is very simple, provided the grower will only be at ordinary painstaking, and follow the excellent advice given by Dr. Horner, and any suggestions, by way of improvement, which this paper may supply. For the last fourteen years, I have never failed to have a strong and general bloom, during which time my beds have been prepared in the manner I have detailed.—*George Lightbody, Falkirk.*

AMATEUR'S GARDEN.—No. XXIX.

PELARGONIUMS in the greenhouse which are now going out of flower may be removed to a situation in the open air, and fully exposed to the sun. In the course of two or three weeks the wood will be sufficiently ripened, which will be visible by the green colour of the stems changing to brown; and the plants may then be cut down and removed to a less exposed situation until they start again into growth. Now, when it is so fashionable to grow large specimens for exhibition at the horticultural shows, the operation of cutting down is perhaps the most critical in the management of this favourite flower. If this is not done properly, no after management will compensate for it, and the plants will either be badly formed, or they will have few flowers. Having the plant before him, the amateur should in the first place determine the particular shape which he intends it to assume the following year. He should then examine the branches, and see how they may be made to take that form, and cut them to it; at the same time taking care not to cut them lower than is actually necessary. When they are cut too low, it is possible to grow the plant to a large size, but it will generally flower indifferently. The matter which is formed in autumn in the ripened stems, is doubtless a storehouse which supplies the flowers of the following year; and hence we see how well plants flower which are only cut partially, or not at all. But if they are left in this state, they would be deficient in foliage, and would have fewer flower-stems—besides, it would not be possible to renew the soil without giving them a check which they would not easily recover. In practice, therefore, it is found best only to cut as low as will enable the plant to fill up, and become bushy from the top to the bottom. After the stems have begun to grow, the plants should be turned out of the pots, and the balls of earth reduced. The roots should be pruned at the same time, and the plants re-potted in pots considerably smaller than those which they have been in during their period of flowering. After this operation they ought to be put in a situation which is well shaded from bright sunshine, until they commence to form new rootlets for their support, when they may be more exposed, in order to prevent them from being drawn. In the autumn, before the stormy weather commences, they must be taken into the greenhouse.

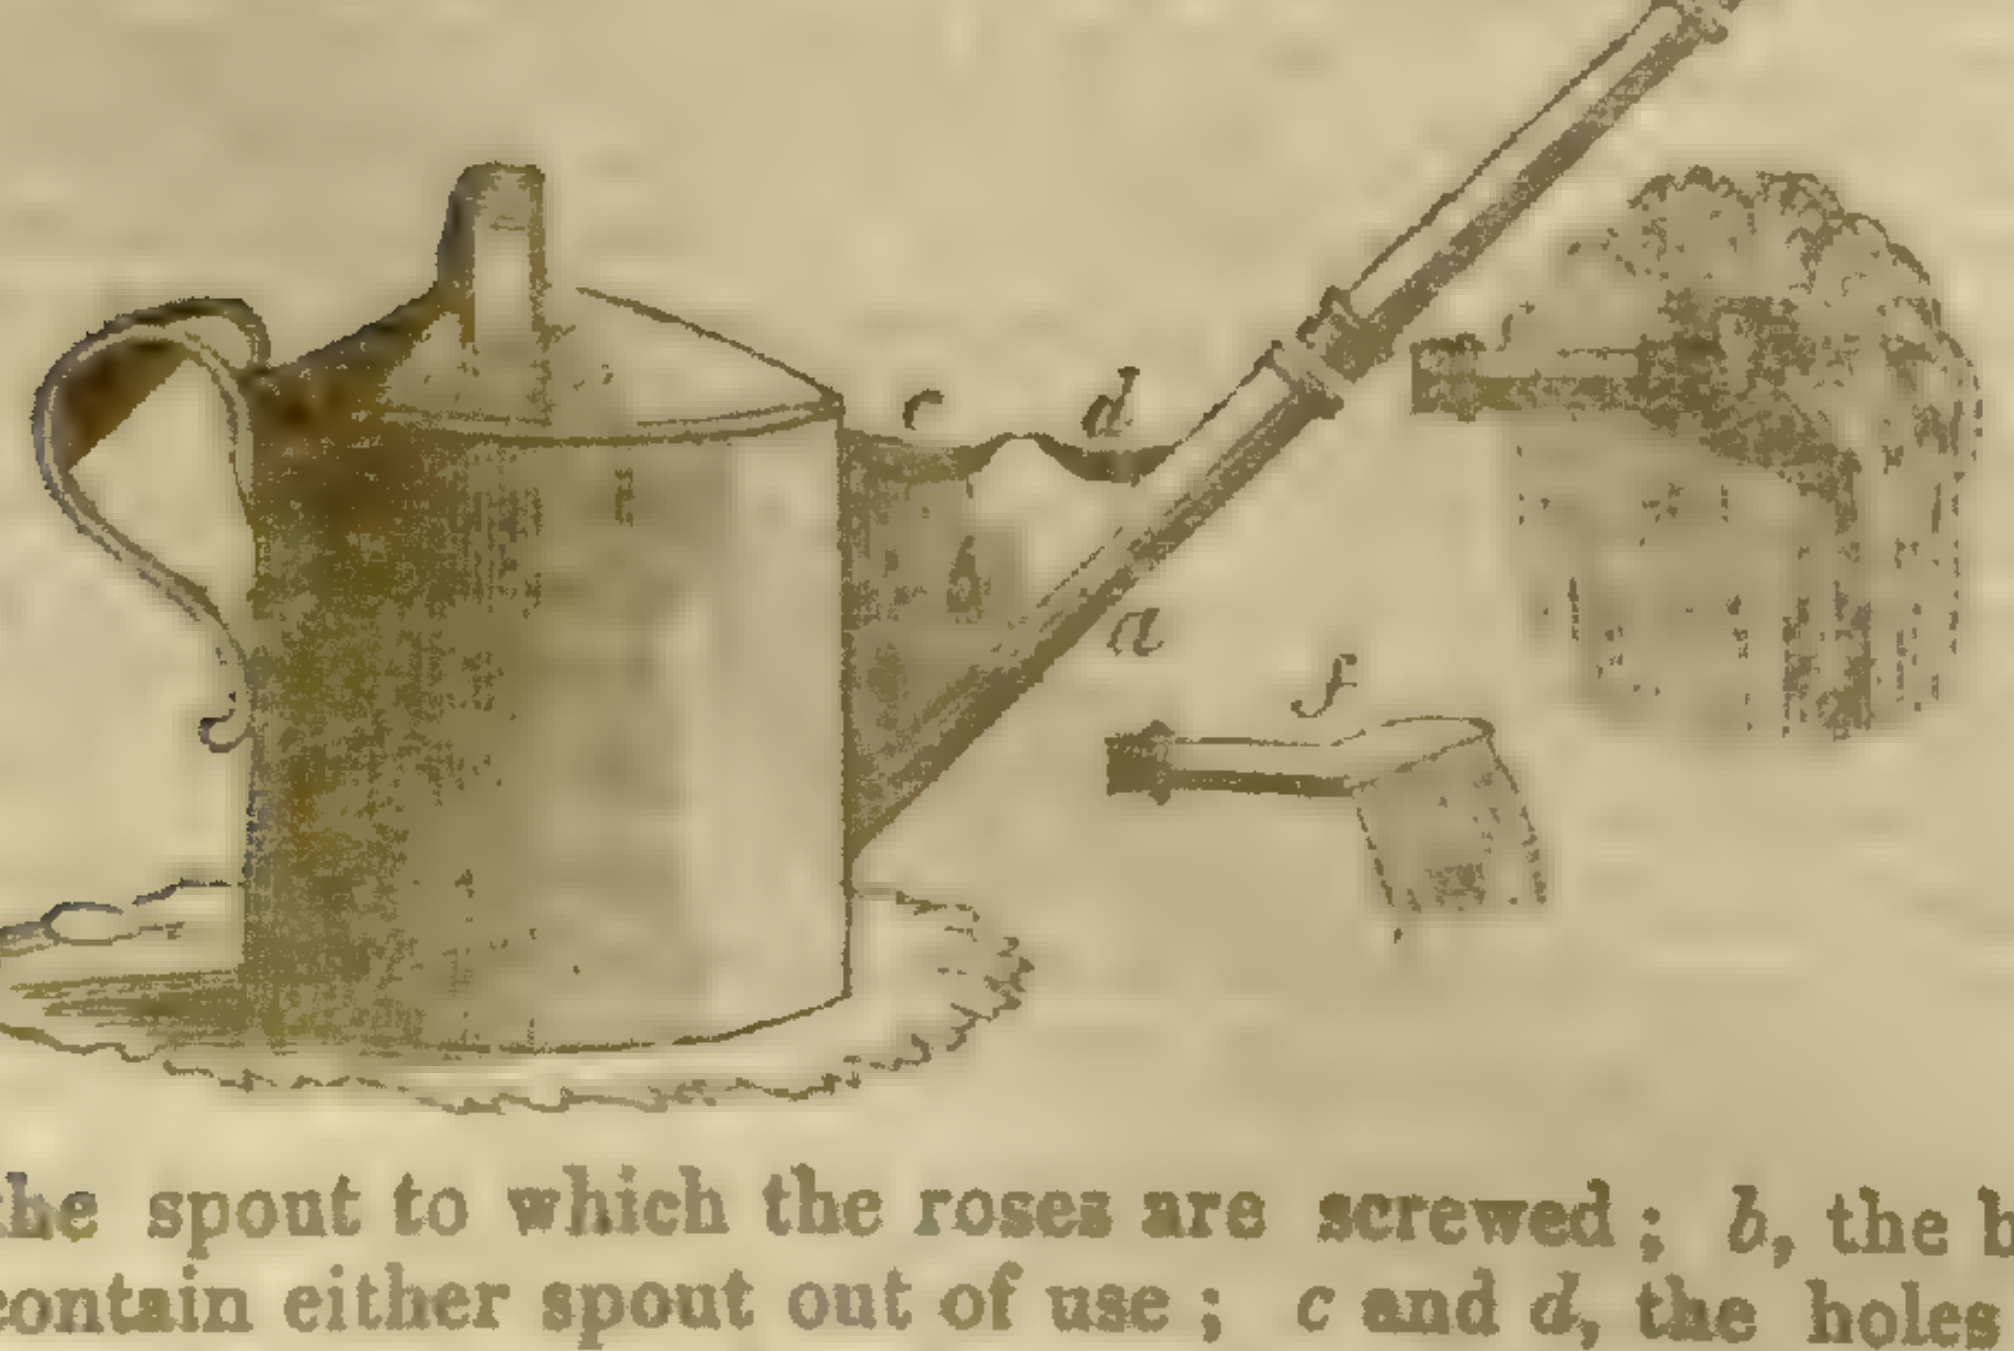
Where Pelargoniums are not intended for exhibition, I think the amateur should never attempt to grow them to a large size. They are much neater in small houses, and are better adapted to his purpose, when they are grown in such pots as 16's, 24's or even 32's, than when in 12's, 8's, and 6's. Besides, a much greater variety can of course be grown, and the whole will not present such a formal appearance as we are now accustomed to see. The quality of the flowers should also be a principal object, for the beauty of those which were raised six or eight years ago will bear no comparison with those of a more recent date. The florists' standard of beauty may be called arbitrary, and in some things it perhaps is so; but in so far as the Pelargonium is concerned, I think any one, who knows anything about the properties of a good flower, if he has his choice of two, would choose the good in preference to the bad one. There is something in the full round form, the thick velvety petal, the clear rich colours, and the clean eye, which attracts universal notice and admiration. Cuttings struck now, or small plants procured in the autumn or spring, will flower beautifully next summer.—*R. F.*

HOME CORRESPONDENCE.

Liebig's Agricultural Chemistry.—In the course of the late meeting of the British Association at Manchester, during a discussion which followed upon the reading of Professor Liebig's second communication to that body, I took occasion to advert to the strictures on his former report which had just appeared in the *Gardeners' Chronicle*, and if I had not found myself anticipated by Dr. Gregory in many of my remarks, should now request your permission to give them a wider circulation by transferring their substance to your columns. But, under present circumstances, I am content to leave the question in other hands; for although it may be true that your correspondent has not entered into a detailed enumeration of Dr. Schleiden's arguments, yet I am persuaded that this labour will be spared us both by Professor Liebig himself, or by some of his numerous disciples in Germany, if not on account of the weight of the objections urged against his views, at least in consideration of the reputation belonging to the individual who has assailed them. I shall therefore merely attempt to remove from your country readers any prepossession that may have been created in their minds by a hasty perusal of the articles in question, against those principles of Rural Economy which, on the authority of Professor Liebig's widely-diffused and justly popular treatise, are beginning to obtain currency amongst farmers. These views I am happy to find, in all essential particulars, unshaken, I might almost say, untouched, by the criticisms alluded to; nor can it fail to be regarded as a strong corroborative proof of their correctness, that an author, so eager to fasten upon all the weak and dubious points of the work he professes to criticise, as Schleiden has shown himself to be, should either expressly or by implication admit the greater part of those principles which, mainly in consequence of this work, are exerting so important and so beneficial an influence upon British agriculture. I ought not, however, to conclude without deprecating the tone of disparagement which Dr. Schleiden has throughout assumed in speaking of the labours of an individual whom Germany has reason to regard as one of her brightest ornaments, regretting at the same time that it should have been in any degree provoked by language of undue depreciation applied by Liebig himself to the Botanists and Physiologists of his own country. I must, however, remark, that in his case some justification of a style of criticism, which I should wish to see altogether banished from scientific disquisitions, may be collected from a perusal of Dr. Schleiden's own critique, as, at the very time he is accusing a Chemist of entertaining erroneous notions regarding the structure and functions of plants, he himself evinces a degree of ignorance on matters connected with Chemistry and Physics, which one is surprised to meet with from so accomplished a Physiologist. Witness his citing Faraday as an example of scientific eminence attained by one *not* brought up in a laboratory, as well as his inferring that the soil must contribute to the nourishment of plants, because, if it did not, the quantity of carbonic acid in forests would go on accumulating. Of course I do not deny the conclusion, which indeed, notwithstanding certain ambiguous passages in his work, I do not believe it was the intention of Professor Liebig to controvert, as a general truth, seeing that the entire substance of his theory respecting humus appears to proceed upon such an assumption. But with regard to the ground alleged, I can only say that it seems to imply on the part of Schleiden a want of familiarity with the laws concerning the diffusion of gases, which, in consequence of the researches of Dalton and of Graham, are known in this country to every tyro in science. I may also observe, that the severe comments which Liebig has passed upon the naturalists of Germany, when speaking of the function which plants discharge in imparting oxygen to the atmosphere, appear to me palliated to an extent for which I was not prepared by the contents of the paper of which you have given us a translation. When a Physiologist of the 19th century, so distinguished as Meyen, denies that the atmosphere is improved by the functions of vegetation, and when Schleiden himself contends that plants vegetating in a confined portion of air do not change its constitution, either in its qualitative or its quantitative relations, one ought not so much to wonder that a Chemist, regarding such eminent persons as the type of the body to which they belong, should animadvert rather strongly upon the Naturalists of his own country, for their apparent neglect of those lights which they might have borrowed from another science to clear up the obscurities of their own. Foreign Naturalists, however, who have no wish to interfere in these personal disputes, but are interested in the diffusion of the discoveries by which both these distinguished men have enriched the common patrimony of science, cannot but regret that either of them should have adopted a tone of controversy calculated to impede the reception of truths in which the well-being of society is concerned, by shaking the confidence of the public in each others authority as experimentalists or as reasoners.—*Charles Daubeny, Professor of Rural Economy, Oxford.*

Model Cottages.—A friend of Mr. Loudon's complains that your correspondents only repeat his own objection as to the passage through the back-room into the front. But inasmuch as, after all, the engraving of the cottage is left with this defect, of what value is Mr. Loudon's remark? It becomes merely an admission that the defect is irremediable in the model plan. Instead, therefore, of so much criticising, the best course for Mr. Loudon's friend would be take up "Stump's" challenge, and show where and why these model cottages, with such a multitude of counsellors and improvers, are better than those commonly built, during the present century, by ordinary country workmen. For my own part, I agree with "Stump," that the *majority* of the recently-erected double five-roomed cottages are very much better than the best of those in question. In fact, I should say of the model plans, that the first is common-place, and the last ingeniously inconvenient; while the transition cottage (No. 2,049) is unquestionably the paragon of absurdity.—*Philo-Stumpi.*

Improved Watering-Pot—We have received the accompanying engraving of an improved pot from Mr. G. B. Thompson, 390, Oxford-street, who states that it is superiority consists in the roses being so formed as to give the water thrown from them the nearest resemblance to a gentle shower of rain, which renders it peculiarly suitable for watering seedlings or other tender plants. As the brass joints which connect the roses to the spout are made water-tight, there is no danger of its returning outside, to the annoyance of the person using it.



a, the spout to which the roses are screwed; *b*, the box to contain either spout out of use; *c* and *d*, the holes in which the joints are placed; *e*, a large rose for watering flower-beds; *f*, a smaller rose for watering plants in pots, &c.

Effects of Guano.—As I see many questions in the *Chronicle* concerning Guano, I send you, for the benefit of your readers, the following observations which I have made during a period of 16 or 17 months; having used it both in its natural and liquid state. I find the following method of applying it to succeed best on soil which is of a light sandy nature, on a red sandstone formation. For Peas, Beans, Onions, &c., and all other crops for which the ground is prepared in the autumn, it should be used at the rate of 1 lb. to 4 square yards (mixed with half its own quantity of wood ashes, where they can be procured); when used in spring or any other season, it should be well dug into the ground before planting or sowing; for if seeds come into contact with it during germination, the stimulus is too strong for them. The Cabbage tribe seem particularly benefited, as it not only promotes their luxuriance, but prevents them from clubbing. Our Cauliflowers have this year been very fine, and free from that pest; whereas last year they were literally devoured; and I attribute it entirely to Guano having been used this year instead of other manure. I may also mention, for the information of those who are troubled with slugs, that if they will dust the ground now and then with it, these enemies will very soon disappear. Potatoes, Turnips, Lettuce, &c., and in fact everything for which it has been used as a manure, show its beneficial effects; when the crops are gathered, I will send the comparative weights of the produce of it and other manures. When used in a liquid state, 4 lbs. will be sufficient for 10 gallons of water; and in this way I prefer it for all plants in pots, having used it for Camellias, Pelargoniums, and many other things, with the most gratifying results. I water with it twice a week; the leaves of the Camellias are dark green, and from their shining appearance seem as if they had been washed. They have made good wood, and show abundance of flower-buds for the next season. Cucumbers also, watered twice a week with the liquid, assume a healthy green peculiar to Guano; we have cut many this season 22 in. and 2 ft. long (a cross between Kenyon's and Walker's), grown at the back of a Pine stove, and watered as before stated. The Pine-apple also luxuriates under similar treatment, and I have now about 40 Black Jamaicas swelling fine fruit, which I think would not have been half the size if they had not been watered with the liquid twice a week. I may state that I allow it to stand 12 hours after mixing; and I prefer using it before it has stood too long, as it then gives off its ammonia.—*J. Selkirk, Aigburth, near Liverpool.*

Effects of Liquid Manure upon Fuchsia fulgens.—In last week's "Notices to Correspondents," you state that strong liquid manure, applied to Fuchsia fulgens, will probably cause it to drop off its flowers; and I can safely assert that such is the case. I have a plant six feet high, and thinking to improve the colour and size of its flowers, I applied manure water to it, when all the flowers that were formed dropped off, the leaves turned yellow, and, in fact, the plant was nearly destroyed. Imagining the cause, I desisted from applying the manure water, when it entirely recovered, and is now one of the greatest ornaments in the conservatory.—*Davie Gilletely.*

Effect of Soap-suds on Cabbages.—I believe it will be a thankless piece of service for one gardener to teach another how to grow Cabbages and Cauliflowers; yet as these crops of vegetables have failed this season in various parts of the country, the following notice may perhaps be of use to your cottage readers. Wherever soap-suds have been used plentifully, Cabbages and Cauliflowers have grown luxuriantly. I have made several inquiries of others who have used them, and in no instance have I heard of a failure where soap-suds have been applied. I intend to try them over Broccoli, to see if they will prevent them from clubbing. Others may do so likewise, and make known the results. Whether the alkali in the water has prevented the enemy from destroying the roots, or given the roots more vigour to resist the attack, I do not know; but one thing is certain—where such matter has been applied, it has produced the most beneficial results. I think cottagers may take a lesson from this, and save that which would nourish their languishing crops; for it is a pity to see a pool of filthy water polluting the neighbourhood with its stench, while, within a few yards of it, the vegetables of a garden are dying of starvation.—*P. Mackenzie.*

Effects of Ammoniacal Liquor upon Slugs and Worms.—I have tried ammonia water, in a diluted state, upon slugs and worms; the former relish it as little as they do a pinch of Scotch snuff sprinkled over their bodies. The gray slug is sometimes difficult of detection, its colour being nearly similar to that of the earth; but when the water reaches it the tentaculæ are instantly drawn inwards, the body appears convulsed, and is soon encased with a white, slimy covering, by which it is easily detected. When the ammonia water touches the worms, they jump out of the earth in as great a hurry as if a dozen moles were in pursuit of them.—*Peter Mackenzie.*

Coal-tar.—Coal-tar, judiciously applied to the stems of Apple-trees, certainly prevents the destructive effects of their decortication by Rabbits, without the slightest injury to the growth of the tree. I have lately witnessed numerous proofs, in different places, of this successful application, and mean to adopt it myself.—*J. Murray.*

The Sting of a Wasp.—Ammonia, or that called "Spirits of Hartshorn," I have found an effectual antidote to the sting of a Wasp. I remember, two summers ago, on sailing from Guernsey to Sark, a Wasp alighted on the arm of a child, and inflicted a wound, acutely painful. I applied liquid ammonia immediately, and the pain was instantly subdued. I cannot doubt that it would prove as efficient in the cure of the sting of a Bee. —*J. Murray.*

The Common House-fly.—If you have made any observation on the presence of the common house-fly this season, as to whether they are more or less frequent than usual, or whether there is the average supply of them, or should any of your readers be disposed to favour me with their observations upon the subject, I shall be greatly obliged. We have scarcely any, nor have I seen any common butterflies; since the end of May and beginning of June I have met with only two cockchafers, very few moths, and not half a dozen wasps; but it may, perhaps, be too early for them yet. Is the presence of the fly indicative of a wholesome atmosphere or otherwise? I have heard it stated that they are most numerous in the most salubrious air. What has become of the swallows?—*H. B., Essex.*

Summer Pruning of Wall-trees.—As my summer management of Pears and other free-growing Wall-trees, on the spur system, differs from the general practice, a short description may probably not be uninteresting to your readers. About the end of June I commence with the strongest-growing shoots, by laying in the necessary young wood, according to the mode of training practised, and, with the finger and thumb, carefully breaking down each superfluous shoot, leaving it about a fourth of its original length, with two or three eyes at the base. The young wood lives in this pendulous form, and the leaves continue slowly to perform their functions until September, when the shoots should be removed, by pressing them upwards with the hand. This removal invigorates the trees, by assisting the eyes upon the spurs to become plump fruit-buds; therefore it should not be delayed after the danger is past of the upper eyes pushing into leaf. In the autumn I root-prune the trees, by divesting them of half the strong roots, three or four feet from the trunk, with a sharp instrument; repeating the summer and autumn treatment every season, until the trees are reduced to a healthy fruitful condition, which is effected in a few years. At this winter pruning, the rough ends of the new spurs should be cut smooth with a sharp thin-bladed knife. Experience has shown me that, by the recumbent form of the summer shoots, the sap juices are choked in their free circulation, and the eyes at the base partake so moderately of the secretions of the leaves, that they soon become fruitful. It is well known that the too free application of the knife in summer management of fruit-trees is the source of great evil, and should therefore be avoided. It must be wrong to deprive a tree, in the middle of its growth, of so much young wood, every leaf being a vital organ to give life and strength; therefore this summer cutting must reduce the resources of the tree and hasten decay.—*H. Bowers, Laleham.*

Forest Pruning.—If my good friend Mr. Billington or any other writer make use of wrong terms to express their ideas (mental images), they must not be surprised, nor need they be offended, if they are sometimes misunderstood. I had formed the notion that Mr. B.'s system, whatever it is, and whether the "true one" or not, is still a system of "pruning." By pruning, as applied to trees, most people understand taking off or amputating some part ostensibly for the benefit of the whole; but, by what now appears, the term "pruning" should never have been applied to Mr. B.'s "system" at all, and I am really glad to find we are so near of one opinion, and I beg to assure Mr. B. that it never was my intent to do him the slightest injustice, and should be glad to peruse his book on this controverted subject—were it comeatable. Had you, sir, thought fit to print the verbosity of my former letters, Mr. B. would have seen with how much personal respect I spoke of him, though I have never "seen his face in the flesh." If, in fact, the alteration of Mr. B.'s term from "pruning" to "training and preventive" has been the means, as he alleges, of "bringing out this no-pruning system," then he may congratulate himself on having rendered the tree-pruning public a very essential service. I beg to inform all whom it may concern that my notice was attracted to the subject by the articles of several correspondents in your earlier columns; but long previously to the appearance of the *Gardeners' Chronicle* my opinions were pretty well settled on the matter, and I have as yet seen nothing calculated to disturb them. Now for a word or two about "Originality." It is very flattering to human vanity to be able to lay claim to originality in any useful invention. Fulton in America, and Symington at Grangemouth (N.B.), each applied the steam-engine to propel vessels on the water about the same period, totally unknown to each other. Which of the two was the original?—or were they not both? At one time when young I was partly, as formerly stated, a disciple of Pontey on tree-pruning. My present opinions are entirely the results of unaided experience and observation. Am I not then as much an original on that subject as Miller or Duhamel, or even my friend Billington himself? But I must have done. It is matter of regret that Pontey's system still has its followers. I hope what has appeared from time to time in your columns will at least help to cap it with the extinguisher.—*Quercus.*

The Laburnum.—I can assure your correspondent that neither the wood, bark, nor leaves of the Common Laburnum are injurious to cattle; for my cows, with a flock of from 50 to 100 sheep, became at large a short time since in the plantations, and the only shrub they appeared to attack was the Laburnum, which I find has rather improved their health than otherwise; and the seed, I should say, is not injurious, as I find an equal portion of that gone also.—*H. C.*

Araucaria Braziliensis.—In the *Chronicle* of the 9th instant, you have stated in the "Notices to Correspondents," headed "E. T. O.," that "Araucaria Braziliensis will not stand the winter in this climate;" whereas towards the autumn of last year I tried the experiment in my garden with a plant which I had raised from seed in a hothouse; and I beg to say that it has stood during the whole of last winter, without any cover or protection whatever, and is now in a healthy and growing state.—*J. S. Balham.* [We apprehend some mistake here. All the Brazilian Araucarias that we have known to be exposed to the winter have invariably perished.]

Disease in Firs.—In No. 28 of the *Chronicle*, "F. G. C." has observed that upon almost all his Larches one branch has withered, and that he suspects the disease will increase. Two years ago I noticed the extremity of one branch upon a Silver Fir, about 30 years old, to have become yellow for the length of two or three joints, about two-thirds of the distance up the tree. The disease did not spread, but last year the tree was covered with insects which adhered to the bark in millions. When I saw the tree this spring it was in the same state, covered with insects, and the yellow spray still remaining as before. Now I have very little doubt but this spray was the original nidus of the insect which afterwards spread over the tree; and it is probably the same with "F. G. C.'s" Larches. I recommend him, therefore, to cut away all the sickly branches, except he will leave a few for the sake of verifying my conjecture, and to send specimens of them to you for examination. Since I expect the Silver Fir which I speak of will die, though at present it bears up well, and as it conceals an obnoxious object, I shall wish to leave the trunk and cover it, if possible, with strong climbers, which may form a tall bush about it as long as it will stand. My present notion is to plant Roses round it, and I shall be obliged if you would name some of the quickest-growing ones, which have fine bunches of flowers and which blossom plentifully during the autumn, as well as the quickest-growing and most ornamental of the evergreen Roses.—*N-Tom-Ologist.* [The quickest-growing Roses are the Boursault, Elegans, and Gracilis; Madame D'Arblay and the Garland, hybrid climbing Roses, will flower plentifully during the autumn; and the best evergreen Roses are Donna Maria and Rampant, the latter of which also blooms freely in the autumn.]

Cause of Mildew in Peas.—I some time ago gave my reasons for forming the opinion that the cause of mildew on the foliage of Peas, was an over-supply of moisture. Your correspondent *J. M.* thinks that the want of moisture is the cause of mildew in his crops. How, then, is this difference of opinion to be accounted for? We both appear satisfied that every effect must have a cause; and in both cases there is reasonable presumption for grounding the statements we have made. Perhaps one intermediate fact will solve the difficulty, and harmonize the apparently opposing statements. In the generality of cases, it will be found that damp or moisture is the cause of mildew. The currier and leather-cutter can prove that it attacks their dressed leather when deposited in damp cellars; the mariner knows that, when his sails are stowed away in a damp state, they are soon seized with the "canvas mildew;" the possessor of old folios knows that, when they are allowed to remain in a damp situation, they soon become marbled with mildew; and writers on Horticulture admit that the cause of mildew on the leaves of the Peach-tree proceeds from the tree being planted in a damp situation, or from "cold damp weather;" others affirm that the mildew on the leaves of the Hawthorn is occasioned by the want of moisture, as in the case of *J. M.*'s crops of Peas. But if we would bear in mind that Fungi are part of Nature's scavengers, ever ready to act upon decaying matter, and render it fit to enter into new combinations, then, perhaps, we shall be enabled to see our way more clearly. It is said that Fungi never appear upon or attack vegetables or timber while in a healthy state; yet, from their extreme smallness and the general distribution of their spores, they are always in readiness for acting if circumstances render their action necessary. It is probable that the dry sandy soil in the garden of *J. M.* contains a considerable quantity of the oxide of iron, or some other ingredient pernicious to the welfare of the crop; these, together with the want of moisture, may cause a stagnation in the juices of the plant, and prepare it for the Fungi to act. An over-supply of moisture will also prove injurious to certain crops; and, in conjunction with this, the chilly nights sometimes experienced in autumn, will prepare the way for the mildew to work its ravages. Much may depend upon the nature of the soil, and the ingredients which the water may dissolve; but the soil in which my Peas grew, which were attacked with mildew, was chiefly peat. Such a soil is very likely to hold water in excess, and water, too, of an antiseptic nature, from the tannin in the peat. It also contains a considerable quantity of acid matter, which, according to Lord Meadowbank, is of the nature of gallic acid. If we receive it as a general maxim that some diseased state of the plant must precede the attack of Fungi, then we may conceive it possible for crops of Peas to fall into bad health, both where there is an abundance of water, and where there is a deficiency. Further investigations in vegetable nosology may throw more light upon the subject.—*Peter Mackenzie.*

Vegetable Monsters.—I inclose a flower of Fuchsia mutabilis, in which some of the anthers are tipped with the petals.—*John Wedgwood.*—[This is a curious case of vegetable transformation. The petals are in a state of transition into stamens, having lengthened into a thread equivalent to the filament, and contracted into a hollow purple point, approaching the structure of the anther. It is not a little interesting to find how entirely all these instances of unusual structure confirm the doctrine that every part of a flower is made up of leaves.]

Double Canterbury Bells.—There has lately been sent to the Horticultural Society, by Mr. S. F. Gray, of St. James's-street, some remarkably fine specimens of this flower. They were both dark and light coloured, very large, and in most cases produced by the mere addition of a second corolla. The number of flowers in the usual distorted state was inconsiderable.

Sale of Orchidaceous Plants.—Our readers will perceive in the advertising columns of last week, that an extensive sale of these very valuable plants will shortly take place at Stevens's Auction Room, Covent-garden. We learn from a correspondent that the collection contains a fine mass of Barkéria spectábilis, noble plants of Læ'lia superbiens, and a large quantity of Cattleya Skínneri. There are also large masses of Stanhópea venusta, and Maxillária cruenta, with 20 plants of a species of Mormodes, and immense quantities of the comparatively hardy Odontoglossum grande and Oncidium leucochilum. The plants are stated to be in excellent health. Mr. Skinner has announced his intention of being present at the sale, in order to explain to buyers the quality of the lots.

Marchand de Bouquets.—I observe in the *Chronicle* of July 2d a notice of my shop, wherein you state it to be in Conduit-street. I shall feel obliged by your correcting the mistake, as it is in Clifford-street, Old Bond-street.—*C. T. Harding.*

The Vitality of Seeds.—In the proceedings of the British Association, held at Manchester, the Vitality of Seeds is questioned; and no clear understanding appears to be arrived at as to the length of time the embryo will remain in a perfect state under favourable circumstances. The following may or may not be interesting. About four years ago, when the Birkenhead and Chester Railway was being formed, a good portion of which was excavated, I was frequently passing that part of the line which is cut through several old meadow-fields, about 14 ft. deep. This part of the line was in active formation from November to March following; the soil, from about a foot from the surface to the bottom of the cut, was strong adhesive loam, and, from its regular appearance, I concluded that no human effort had ever been employed to disturb the subsoil before. In the month of April, on either side of the slope, the Charlock (Sinapis arvensis) was visible, springing up in millions; and by the beginning of June it was one dense mass of yellow flowers, at least a quarter of a mile in length. Now, as there is no arable land that may produce Charlock within the distance of half a mile, where did the seed of the Charlock originate from? I cannot, without further instruction, come to any other conclusion than that this seed had remained in a perfect state ever since Nature's great eruption.—*C. Penny.*

The Princess Royal Strawberry.—We have received a note from Mr. Morris, of Deptford, complaining that plants of this Strawberry, sold to him last year as a new sort, by Mr. Newsome, of Dewsbury, at the rate of 5*l.* per hundred, and which were to weigh 12 to the lb., have proved to be nothing more than the Elton. We have also seen a letter from Mr. Newsome himself, who, in answer to the complaint, merely says that "there may be some resemblance to the Elton Pine, *but he raised them from seed.*" Now if plants are called new and sold at such a high price merely because they have been raised from seed, we have no hesitation in saying that the public is imposed upon. We know nothing personally of this Princess Royal Strawberry, but it looks very much as if it were an instance of this practice.

Asparagus grown in Tin Tubes.—Since growing Asparagus in bottles has failed, it may be interesting to your readers to know that in a gentleman's garden in Ireland they insert tin tubes over the heads, and thus obtain very fine ones. These tubes, of course, neither have narrow necks, nor admit the light—to which you attribute the failure of the bottle system. I am not aware that this practice is universal in Ireland; but more information shall be obtained on the subject, and, if desirable, sent to the *Gardeners' Chronicle*, either immediately or at a more seasonable time.—*J. A. P.*—[We have seen this method practised, and an exceedingly good one it is.]

FOREIGN CORRESPONDENCE.

Paris.—The "Paulovnia imperialis" has lately bloomed in the Jardin des Plantes of this city; and the botanists here consider themselves entitled to no little merit, for having introduced so noble an addition to the Park and Lawn. It is, without doubt, a valuable acquisition, and will be in much request. Its robust habit, enormous leaves, and numerous panicles of large blue flowers, give it a gay and striking appearance. Too great expectations had probably been formed of the beauty and magnificence of the blooms; neither the colour nor style of flowering being such as had been anticipated. Instead of several flowers opening at the same time on each bunch, one or two only were to be seen; and these were not flesh-coloured, but of a bluish lilac. It, however, possesses one valuable property, which was not expected: five years' experience have proved it to be perfectly hardy; and if sufficiently robust to withstand the winters of the Continent without protection, little danger need be apprehended from the climate of England, where the seasons are usually less severe. Even the flower-buds, which were formed last autumn, remained unhurt, and expanded early in the spring. It may be said that last season was less rigorous than usual; but the frost of 1840-41 was sufficient to destroy Laurels, Magnolias, China Roses, &c. &c.; yet the Paulovnia even then escaped untouched. Let it not, however, be inferred from this, that very young or tender plants would bear this treatment; it is possible they might, but a slight protection of leaves or straw is advisable for the two first winters, after which no particular care will be required. French nurserymen appear to be fully alive to the value of this tree, and knowing with what eagerness plants really good are sought after, especially on the other side of the Channel, they have called into exercise all their skill and activity to multiply it in every possible manner. Roots, layers, cuttings, and leaves have all been put into requisition; so that by next October there will certainly be not less than 20 or 30,000 saleable plants. This is no exaggeration, since I speak from facts which have come under my own observation. Last autumn a plant was worth from 50 to 80 francs: now it can be got at 8 or 10, and I should not at all be surprised at the price being 5*l.* or 7*l.* per hundred in September. It is in the possession of every nurseryman, and no two persons demand the same price for it. All seem decided upon one thing—that large quantities will be required from every part of Europe and North America, and that they cannot have too many of it; without, perhaps, considering that it is already extensively circulated in Belgium and Germany, as well as in all the principal nurseries of London. This forced multiplication cannot fail to be highly injurious, and very few will be able to realise anything for their trouble and original cost. The most extravagant statements have been circulated as to the supposed foreign demand; I was told, only a few days since, that one English house had advertised for 5,000 plants, and that it would not be possible to execute one half the commissions already received. This must be a delusion; since a new thing is seldom much reduced in price in one year, if the supply is not more than equal to the demand. The circumstance of several hundred plants having been sent to one London house last autumn, is now becoming generally known; and the fear that it has been equally multiplied there will prompt French nurserymen to sell as early and as cheap as possible; because the demand for home will be comparatively small, and, after next season, will hardly pay for the expense of propagation.

Norfolk Island, Dec. 26th, 1841.—The vegetation here is very rich and varied; yet with a soil and climate suitable to grow every fruit found within the temperate or tropical zones, there is not one kind worth gathering; the few sorts to be met with having been raised from seeds brought over by persons totally unacquainted with the rules of cultivation. In the valleys the heat is tropical; but on the hills and the coast the temperature is cool, even in the height of summer, from the never-failing sea-breeze. The Tree-ferns grow to the height of 40 or 50 feet, their long wavy leaves being fanned by the slightest breeze; while the gigantic Pine, peculiar to the island, throws out its huge dark arms, protecting from wind and rain the more delicate offspring of nature. The other trees are not large, but their foliage is of endless variety and of a vivid green; while a profusion of creepers twine around every naked stem, as if to hide each unpleasing object. With the exception of a few varieties of Convolvuli, the native herbaceous plants are few and insignificant. There is a Wistária, with bright shining leaves, which bounds from tree to tree, hanging in cord-like festoons for the more delicate creepers to cling to. Lemons are extremely abundant, whole woods being formed of them; and Oranges once were plentiful, but the trees have been destroyed. A few roots of Narcissus Polyanthus, which I brought two years since from Europe, have increased rapidly, and produced heads of flowers of a size seldom seen in their native country. A few seeds of Hybrid Gladioli, at least five years old, which I sowed in May after my arrival, came up in a month, and flowered the following September. Fresh crops of fine Potatoes are obtained every three months; and a graft will bear fruit the first year. A double Dahlia, raised from seed sown in September, flowered in the following November. All this is scarcely credible, but is, nevertheless, quite true; the purity of the atmosphere, the depth and richness of the light vegetable mould, with sufficient moisture, unite to make this island the most prolific spot in this hemisphere. We are in sad want of a gardener, to be the head over an agricultural and horticultural school, as many here would gladly learn gardening for a future honest livelihood, and no trade is so well paid in our colony.

PROCEEDINGS OF SOCIETIES.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

We borrow from the "Athenæum" the following additional matter, which our own reporter overlooked, in the Chemical Section:—A paper was read from Mr. R. Hunt, on the influence of light on the germination of seeds and the growth of plants. The subject had been intrusted to Mr. Hunt, for experiment, by the Association. He had provided six boxes, so constructed that no light could enter except through glass of different colours—the first being deep red, the last deep green. In these boxes he had raised Ranunculuses, Tulips, and other plants. The Tulips he found germinated the first under the orange glasses, and last under the blue and green. Under the blue glass, the plants, although slower in germination, were more healthy, and promised to come to maturity, and be perfect flowers; while under the orange they were more forward, but sickly. A curious result was noticed with respect to the red glass. Under all other circumstances, plants bent towards the light, but those under the red glass bent away from the light. In nearly all cases germination had been prevented by the absorptive power of the yellow rays.—Dr. Daubeny, as one of the committee appointed to investigate the subject with Mr. Hunt, hoped the committee would continue the grant to the latter gentleman. The results at present obtained seemed indecisive; and he thought Mr. Hunt ought to have a further opportunity of establishing his principle that chemical rays produced a specific and positive influence on the germination of plants.

"On the agricultural importance of ascertaining the minute portions of matter derived from organic sources that may be preserved in the surface soil, and on the chemical means by which its presence may be detected," by Dr. Daubeny. The researches of Sprengel and Liebig, by showing the manner in which minute quantities of certain ingredients may impart to the soil into which they enter as constituents entirely new properties with reference to the purposes of agriculture, have given additional interest to the methods of analysis, which aim at determining the chemical composition of the surface and of the substratum from which the former principally derives its chief ingredients. The rude mechanical method adopted, even by such chemists as Sir H. Davy, is no longer considered sufficient. The nature, as well as the amount of the organic matter present, and the existence of phosphates, &c., in the proportion of one-thousandth, or even one ten-thousandth part of the entire mass, are points deserving investigation, and afford a clue to the description of manures most likely to be useful, and to the general treatment which the land may require. It is also obvious that the same importance attaches to a knowledge of the constitution of the sub-soil, since the advantages of exposing to atmospheric influences, and thus disintegrating the portions underneath by deep ploughing, and other methods of bringing the sub-soil to the surface, will in a great degree depend upon its containing ingredients which the crop requires for its subsistence, and of which the superficial soil has been already in a great degree exhausted. Thus for example, it will often become a question with the farmer, whether it will be more economical to mix with the soil a given quantity of phosphate of lime, or to incur the labour of so breaking up a portion of the subjacent rock, as to un-lock, as it were, for the use of the crop, that quantity which it contains in close union with its other constituents. This inquiry, however, presupposes a knowledge on his part of the existence of phosphate of lime in the soil, and of the relative proportion it bears to the other ingredients—data which can only be obtained through the assistance of refined chemical analysis. A few simple and easy calculations may show how very small a proportion of this ingredient might suffice, during a long period of time, for the demands even of those crops which require the largest amount of it for their nutrition. Suppose the subsoil of a single acre of ground, turned up to the depth of a foot, to weigh 1,000 tons: now if this rock should be found to contain only one-thousandth part of phosphate of lime, it will follow that no less than a ton of this substance might be extracted from the uppermost foot of the subjacent rock, by the action of the elements, or by chemical means. Now one ton of phosphate of lime would be adequate to supply 125 tons of Wheat, or 680 tons of Turnips. And if we reckon the average crop obtained from an acre of land to be, of Wheat, one ton, and of Turnips, 15, it is evident that we have at hand as much phosphate of lime as would be necessary for 125 crops of the former, or for 45 crops of the latter. Dr. Daubeny said he had great reason to believe that many of our secondary rocks, those especially which contain organic remains, and which appear, in a great measure, to be made up of shells, would be found, if examined, to contain as large a quantity of phosphate of lime as that mentioned. Though the soil of Great Britain be found deficient in the phosphates there is reason to believe the subsoil might, in many cases be made, by proper management, to impart to it what was wanting. It is now some years since the discovery, by Mr. Buckland, in the lias and other secondary rocks, of the solid fæces of certain extinct animals, consisting of phosphate of lime, induced Dr. Daubeny to test a variety of specimens of limestone, with a view of ascertaining whether traces might be found in them of the same ingredient. The result was, that phosphate of lime in minute quantities was much too commonly distributed to be attributed to coprolitic matter, or to afford any independent evidence of its presence. When, indeed, we recollect that the shells of invertebral animals contain from three to six per cent. of phosphate of lime, and that, according to Mr. Connel, the scales of extinct fish, taken from rocks as old as the coal formation, possess no less than 50 per cent. of the same ingredient, it would be wonderful, indeed, if all traces of this substance had disappeared from rocks, which appear often to be made up, in a great degree, of the debris of shells and other marine exuviæ. Dr. Daubeny was, therefore, not surprised at being informed, by M. Schweitzer, who is intrusted with the management of the German Spa at Brighton, that he had detected, in the chalk of Brighton Downs, as much as one-thousandth part of phosphate of lime. From experiments since made by Dr. Daubeny in the same rock, taken from various localities, he was inclined to believe that minute portions of this substance are present not uncommonly in that formation. The frequent occurrence of phosphate of lime in calcareous rocks, and the probability of its having been derived from the shells, or bony matter of the living beings contained in the calcareous rock, led Dr. Daubeny to suspect that traces also of the organic matter which contributed to make up the animal structure, might likewise be found accompanying it. To determine this, the Doctor had applied a test to about 50 different specimens of limestone selected from his cabinet, and found, that whilst the solutions of the pure marble, such as that of Carrara, continue unaffected, equally pure and white limestones taken from the chalk and tertiary formations in general become distinctly darkened by the addition of nitrate of silver. With regard to the presence of organic matter in the subsoil, its detection may be a matter of some agricultural interest, when we remember that the small quantities of nitrogen which are required for the growth of those vegetables that first start up in a new country could not have taken place from an accumulation of mould by the decay of antecedent plants, but must have been derived in a great measure from the animal matter which is contained in the rock upon which they grew, and which proceeds from the exuviæ of races of beings belonging to a former period of creation. In a more advanced period of vegetation, this same material may be of some value to the crops that occupy the soil. Dr. Daubeny suggested whether the more compact texture of certain calcareous rocks than of others, might not be connected with the existence in them of organic matter, which, by its interposition, may prevent a crystalline arrangement of its particles from taking place. It may be that the attraction between the particles of matter, which, if uncontrolled, would prove too powerful for the agents of decomposition to overcome, may be weakened by the presence of organic matter, and thus be enabled to supply the vegetables that take root in it with the solid matter which their structure requires. To the geologist, too, it cannot but be of interest to trace the several steps by which the organic matter, which primarily must have constituted so large a portion of the bulk of the various extinct animals and vegetables, have disappeared from the strata which enveloped them.—Mr. WEBB HALL wished, as a question of practical interest, to know whether the Doctor's discoveries would influence the mode in which calcareous matter was applied to the soil, so as to increase the fertilizing effect. —Dr. DAUBENY said, he doubted whether, in ordinary cases, the small quantity of organic matter which limestone contains could be of great importance. Still, it was useful to know from what the first vegetables derived the nitrogen they required.

HORTICULTURAL SOCIETY.

Exhibitions at the Garden, July 9th.—A scantiness of such flowers as can alone be brought to these exhibitions is invariably experienced in the present month, and the July show is, therefore, never so brilliant nor so well attended as the two preceding ones. On this occasion, the usual conditions were not altered; and the day being both dull and rainy, the number of visitors was comparatively limited. The lawns had recovered their verdure, and everything in the gardens had a much more vigorous appearance than in June; but the dampness of the grass and the frequency of the showers rendered the promenade far from pleasurable. In the conservatory, the plants are particularly handsome, and the introduction of flowering Orchidaceæ among them, together with the splendid patches of Achimenes longiflora, Brachycome iberidifolia, Lobelia heterophylla, and others, produced a very showy effect.

When it is stated, however, that the exhibition was not so good as those of May and June, it must be understood that only the general collections are spoken of. The specimen plants in some of these, and such as were shown by themselves, were remarkably handsome and finely cultivated: while the Orchidaceæ were certainly finer and more numerous than we ever remember to have seen them. On this account, they will stand first in our notice. Had we before been unaware of the circumstance, the Orchidaceæ exhibited would have distinctly proved to us that different cultivators, who each adopt for the most part a uniform system of treatment, succeed to perfection with certain species, genera, or groups, and with those alone. It may, therefore, be deduced, apart from experience, that a discriminative mode of management, in which these peculiar tribes are placed in conditions varying with the respective stages of their growth, and with their individual habits, is the most suitable. To become acquainted, then, not merely with their natural peculiarities, but with those which they evince under artificial tendance, should be the aim of the cultivator; and he will thus be able to give to each its proper attention. And though it may hardly be found practicable to effect this last in one house; pits, stoves, or even greenhouses, can be employed to furnish the requisite repose at a fitting period. Besides, it is almost inconceivable to what an extent variety of treatment may be attained under one roof, by making use of a few little contrivances, or taking advantage of existing circumstances. Temperature, shade, and atmospheric moisture, no less than compost, water, and receptacles, admit of application, to a very great diversity of degree, in the same structure. Plants suspended over a cistern will be always surrounded with moisture; and a thick shading will tend to retain that moisture about them, as well as to keep them cooler. Those, again, that are almost without shading, and remote from any reservoir of water, will be hotter and drier. The one state analogizes with the growing stage in their native country; the other with their resting period. Ventilation, too, can be readily adapted to the wants of individual plants. Some species luxuriate in a position where there is a constant current of air during summer, and many will not endure such an infliction. To set the former near the place where the air enters, and the rest at a distance from it, is a work which none will have any difficulty in performing. But beyond the changes of treatment necessary to different species, one point, which is too much disregarded, may be held indisputable. It is that numbers of Orchidaceous plants are grown in too hot and humid an atmosphere, to their manifest injury. That many exotic shrubs, which were maintained on their first introduction in a higher temperature than they needed, suffered materially from this cause, is generally acknowledged; and it is alike admitted that, in a cooler place, they not only flourished more healthily, but flowered in richer abundance, and were altogether more beautiful. The application of these facts to Orchidaceæ leaves no room to doubt that a considerable proportion of them also would be immensely benefited by being rendered hardier; and experiment has, in not a few cases, demonstrated the truth of the statement. It were out of place to enter here upon the details of cultivating Orchidaceæ. We wish merely to indicate the point at which cultivators have arrived, as shown by the specimens produced on Saturday. Still, there are one or two other things that should be mentioned, and among these is the suspension of the plants from the roofs of the hothouse. The natural situation of the principal kinds, hanging, as they do, around the stems and branches of trees, seems to direct a preference to be given to the mode of suspending all that can be conveniently so treated, because their blossoms can be much better seen when above, or on a level with the eye, than when they have to be looked down upon. As a general suggestion, the caulescent species, or those having true stems instead of pseudo-bulbs, are best suited for hanging up in baskets, unless they grow to too great a size. Some of the pseudo-bulbous species, too, should be suspended; particularly those which have pendulous flower-scapes, such as the Stanhopeas and Gongoras of Saturday's exhibition; and where these are of too great dimensions to be hung up with safety, they ought to be elevated on posts or pedestals, around which their blossoms might hang down. Another feature that should determine the position of a plant is the situation and nature of its roots. If these are on the stem of a caulescent plant, or on the ascending rhizoma of a pseudo bulbous one, and are copious, flowing, and conspicuous, they impart an epiphytal character which should be sustained by suspension. But when the species has diminutive roots, that penetrate the soil, or are concealed from view, if nothing else make its suspension desirable, it will be proper to preserve its more terrestrial aspect by keeping it on a stage. For all suspended plants, baskets of wood, wire, shells, or other material, or rough wooden logs, are the most appropriate. The baskets should be as open as possible, to secure good drainage, and likewise, as with Stanhopeas, to allow the descending flower-scape to issue from them without interruption. Baskets may further be used for the staged plants that would be best suspended, but are too large for it; and for any specimens that may require much water. Moisture drains through them much more certainly than through pots, and they have a more characteristic appearance when they can be aptly substituted. The flower-stems of Orchidaceæ, moreover, sometimes need support. This should not be given save where absolutely necessary; for nothing looks more graceful than flexible shoots waving in the air, provided they are not awkwardly arranged, or removed too far from the eye, or apparently in danger of being broken. The many and lengthy stems of several Oncidia require some kind of support. They must not, however, be tied to an erect stake, seven or ten feet in height, according to their character, but twined neatly over a trellis, or collected into the comparatively small compass of from 2ft. to 3ft. high. Examples of both these plans were seen at the late exhibition; and no particular refinement of taste is needed to say which was the most agreeable. Oncidium divaricatum, trained to a strong upright stick, 7ft. or 8ft. in height, was deprived of very much of its elegance, and would have assumed a totally different aspect had it been fastened loosely to a small stick about 3ft. high, and left to rest on another, scarcely so long, a foot or more distant from the former. There were, again, Broughtonia sanguinea, Calanthe veratrifolia, and Epidendrum ionosmum, all capable of supporting themselves, attached to thick stakes. And while we willingly believe that these, in most of the instances specified, were furnished solely to assist in packing them safely, the ease with which they could be taken away in the morning and replaced at night, and the manner in which they detract from the beauty of the plants, would strongly enjoin their avoidance.

The Orchidaceous plant which united novelty, loveliness, and superior culture in the most extraordinary manner, was Barkeria spectabilis, described in the last Number of this Paper, p. 455. It was sent by Mr. Brewster, gr. to Mrs. Wray, of Cheltenham, and had eight noble spikes of flowers, each bearing about nine or more enchanting blossoms. The plant was growing in a wooden basket, and had evidently been kept in a comparatively dry and cool house. As a model of perfect cultivation, there was a fine variety of Aerides odoratum, from Mr. Mylam, gardener to S. Rucker, Esq. Wandsworth, Surrey. The exquisite delicacy and fragrance of the flowers is generally familiar; but this specimen had upwards of twenty racemes, stronger, and with larger blossoms than usual. The breadth and intense verdure of the leaves with the general luxuriance of the specimen, were much noticed. For superbness of colour, we may select the Cattleya violacea, exhibited by Mr. Goode, gr. to Mrs. Lawrence, Ealing Park. The species has tall slender stems, and blooms like C. Harrisoniæ, with similar flowers; which are, however, of a much darker purplish or violaceous crimson hue, the lip being paler. It had two racemes, each composed of the uncommon number of six blossoms. Likewise from Mr. Goode, and eminent for an astonishing exuberance, was Mormodes citrina. It had two long and large half-drooping racemes of showy orange-yellow flowers, tinged with brown. There were at least 20 blooms on each raceme. The rare Angræcum caudatum, conspicuous for the pure whiteness of its elegant blossoms, and their singular length of appendage or tail, was shown, well-flowered, by Mr. Mylam, gr. to S. Rucker, Esq. A charming species of Aerides, like affine, with blossoms in which various shades of pink and white, with a few spottings, are happily blended, was brought by Messrs. Rollisson, of Tooting. It has a broad flattish labellum; and the specimen was producing two very long and densely covered racemes of inflorescence. Mr. Appleby, gr. to T. Brocklehurst, Esq., sent a new Oncidium, somewhat like O. Galeotti in the appearance of the pseudo-bulbs, which are stout and shining. It has flowers which, in their outline, may be likened to those of Odontoglossum pulchellum. They are large, nearly flat, of a beautiful pinkish white tint, with a little yellow in the centre of the lip. The flower-spikes are short and upright, and the blossoms are collected closely together at their summits. It is very lovely. Odontoglossum læve, another new plant, though not so interesting as the previous one, was communicated by Mr. Fielder, gr. to W. Linwood, Esq. The sepals and petals are narrow, yellowish, banded with brown, and the lip is of a purplish lilac colour, white at the point. The entire flowers have a stiff and rather dull appearance. Messrs. Rollisson, of Tooting, sent Calanthe Masuca, a novel species, from the North of India, with very rich purplish flowers, which change their hue to a dingy brownish purple, after having been expanded for some time. From Mr. Edwards, gr. to his Grace the Duke of Devonshire, was exhibited the curious and very pretty Polystachya reflexa, collected by Mr. Whitfield, in Sierra Leone. Its remarkable form, and bright purple, yellow, and pink colours, joined to the dwarfness of its habit, and its appropriateness for growing to a block of wood, throws around it a peculiar interest. On the same log was another species of Polystachya, also from Sierra Leone, the pseudo-bulbs of which set close to the wood and to one another, looking not unlike smooth miniature oyster shells. It has dark yellow flowers, which are by no means uninteresting. Of Stanhopeas some splendid plants were contributed, and they filled the tent with their delicious odour. S. tigrina was brought by Mr. Mylam, gr. to S. Rucker, Esq.; the magnificence of the markings in the flowers, recall vividly to remembrance the gorgeous clothing of the animal after which it is named. S. oculata, with many scapes of its prettily spotted blossoms, which give out a highly aromatic perfume; and a pale yellowish-flowered kind, with indistinct and few spottings, resembling S. aurea, were further brought by Mr. Mylam. Messrs. Rollisson sent a variety of S. Wardii, called pallida, with peculiarly light-coloured blossoms, destitute of marks, except at the base of the lip, which is of a deep yellowish brown. They had, besides, a very handsome variety of S. oculata, in the flowers of which the spots were much larger, darker, and clearer than those in the original species. There was, too, another dark variety of S. oculata, from Mr. Goode, gr. to Mrs. Lawrence. Messrs. Rollisson, and Mr. Mylam, cultivate their Stanhopeas, most successfully, in a far cooler house than that appropriated to the majority of Orchidaceæ. From Mr. Appleby, gr. to T. Brocklehurst, Esq., was a new species of Brassia. Its flowers have a darker than ordinary cream-coloured ground; the sepals and petals are narrow, short, with dark blotches, and the lip is particularly large, with few spots. Brassia verrucosa, distinguishable by the wart-like elevations on the labellum of its flowers, was from Mr. Mylam, gr. to S. Rucker, Esq., who further produced a specious variety of Oncidium pubes. The flowers are half as large again as in the common form, and instead of being dull and dingy, combine the most brilliant yellow and brown colours. A good specimen of Oncidium pulvinatum was sent by Mr. Lee, of Hammersmith (?). It is one of the most pleasing of the yellow and brown flowered species, as well from the liveliness of its blossoms as from the elevated white cushion in the middle of their labellum. The flower stem was judiciously trained over a low flat trellis. From Mr. Barnes, gr. to G. W. Norman, Esq., Bromley, was a collection comprising an extremely well-grown Broughtonia sanguinea, with several large spikes of its rich purplish crimson blossoms; a pale-lipped variety of Oncidium Lanceanum; a Gongora, with pretty dark-spotted flowers; Oncidium altissimum, 6ft. high, very elegant, but trained to too great a height; Oncidium luridum, 4ft. in height, and therefore having a better effect than the last, because the flowers were more concentrated; and Calanthe veratrifolia, with a great quantity of fine stems, profusely laden with snowy flowers. Mr. Appleby, gr. to T. Brocklehurst, Esq., showed a group containing Epidendrum ionosmum, which has not showy flowers, but the blossoms of which are redolent with the odour of violets; Oncidium divaricatum, 9ft. high, very handsome, and remarkable for being so late in bloom; Cycnoches Loddigesii, in a particularly thriving condition, and flowering most liberally; the strange Coryanthes macrantha, which, but for its abundant variegation, might be considered some part of an animal skeleton; a Maxillaria, with the name of *aurea*, which has solitary flowers, large yellow sepals, pale small petals, and a striped lip; with the delightful little Burlingtonia venusta, bearing two racemes of transparent pinkish white blossoms, which have a blotch of yellow in the centre of the lip. It is popularly distinguishable from B. candida by the deep tinge of pink in the sepals and petals of its flowers. The collection furnished by Mr. Goode, gr. to Mrs. Lawrence, Ealing Park, included Chysis aurea in a healthy state, which is rarely witnessed; a singularly rich specimen of Cycnoches Loddigesii, the flowering pseudo-bulb or stem of which was growing out of that of the previous year, and throwing its roots around the latter, without any covering; Oncidium Lanceanum, very strong, gorgeously tinted, and with a splendid dark lip; Zygopetalum intermedium, poorly flowered; and Gongora atropurpurea, in a pot, with another in a wire basket. The two last plants were of an immense size, and equally large in all their parts, besides being finely in flower. That in the basket must have had an admirable effect when suspended, seeing that all the racemes of flowers are long, slender, and drooping. An exhibition from Mr. Redding, gr. to Mrs. Marryatt, Wimbledon, was made up of Zygopetalum maxillare, valuable for the fine blue frill-like character of its labellum, and the great length of time which the flowers continue open; Vanda Roxburghii, a variety mottled with light brown on its sepals and petals, and having a bright crimson lip; Cymbidium aloifolium, in excellent health,—another of the plants which require suspending in order to exhibit its pendent racemes of lively flowers; a plant, between 4 and 5 ft. in height, of Oncidium flexuosum, with an abundance of stems, and flowering most prodigally; Epidendrum variegatum, the flowers of which are covered with small dark spots on a dull cream-coloured ground; a variety of Oncidium ampliatum, with enormous pseudo-bulbs, and a very dwarf thick flower-stem, well laden with bright yellow blossoms; and the Maxillaria aromatica, famous for the profusion of its showy orange blooms, and the rich aroma which they diffuse through the atmosphere around them. Mr. Mylam, gr. to S. Rucker, Esq., produced beyond those already referred to, Oncidium Harrisonianum, improperly named O. hians, very nicely cultivated; the pale-flowered variety of Vanda Roxburghii, identical with that above noticed among Mr. Redding's plants, and a dark variety, mottled with deep brown on a greenish ground, and having a handsome bluish purple lip; Oncidium roseum, with its neatly chequered red and white blossoms; Cirrhæa tristis, completely surrounded with densely clothed pendulous racemes of curious flowers; Cirrhæa pallida, also richly laden with paler blooms; and both species peculiar for their graceful elegance and superior culture. Oncidium luridum guttatum, the variegation of the flowers of which is indescribably attractive, completed the group. The space devoted to Messrs. Rollisson, of Tooting, was filled with a good specimen of Cycnoches Loddigesii; a small plant of the delicate Cattleya intermedia; the light variety of Vanda Roxburghii; Bifrenaria atropurpurea, seldom seen, and developing almost numberless chocolate-coloured blossoms close to the pseudo-bulbs; with a variety of Phaius albus which has no stripes or marks in the lip, but has altogether pure white flowers. The Cycnoches chlorochilum was shown by Mr. Appleby, gr. to T. Brocklehurst, Esq., with only one gigantic yellowish-green flower; and Cattleya crispa, in by no means a flourishing or highly floriferous state, was from Mr. Fielder, gr. to W. Linwood, Esq. A new Oncidium, with gracile twining flower stems, which has been promising to bloom for several months, was exhibited by Messrs. Rollisson; the blossoms are small, of the ordinary yellow and brown colours, and not at all striking.

Taken as a distinct natural tribe, the Heaths should follow the Orchidaceæ in point of excellence. Defective specimens, it is true, were not thinly interspersed with those of the highest quality; yet, on the whole, a favourable opinion must be pronounced upon them. We observed that, by dint of constant shading during the day, some cultivators had managed to preserve, in tolerable perfection, plants that were at the former show. But while we would commend the practice to the attention of those who may adopt it for private purposes, we think it a pity that the same specimen should be shown twice or sometimes thrice in the season. Heaths that are brought twice will probably be in perfection on the first occasion; but the next time, they will at least be beginning to fade, and are likely to create an unfavourable impression. It may be mentioned here, too, that other greenhouse plants are occasionally brought in May with the flowers imperfectly opened, in June with the whole of them fully expanded, and in July having a withered or withering appearance. It would surely be wiser to produce them only in June, and thus to show the species to the greatest advantage; instead of wearying the spectator with a repetition of the same thing in an inferior condition. Perhaps the finest Heath present was Erica ampullacea, from Messrs. Lucombe, Pince, and Co., of Exeter. The specimen was about 2 ft. high, and 4 ft. across; the entire upper surface being densely clothed with large heads of handsome white blossoms. The flowers also extended round the sides of the plant, as well as the top, and down to the very edge of the pot. Scarcely differing from it in any respect, was the E. ampullacea of Mr. May, gr. to E. Goodhart, Esq. Both were magnificent specimens of culture. The E. ampullacea major, from Mr. Jackson, of Kingston, was 3 ft. in breadth, closely grown, and extremely beautiful. E. Irbyana, which is well known to be a difficult one to manage, was sent, nearly 3 ft. in height, and proportionately bushy, by Mr. Dawson, of Brixton, Surrey. This, and the E. Massonii from the same individual, the plant being about 3 ft. high, and richly furnished with its handsome heads of bloom, were exceedingly handsome and healthy. A deep pink variety of E. ventricosa, exhibited by Mr. Green, gr. to Sir Edward Antrobus, Bart., and Mr. Fraser, of Leyton, Essex, was particularly splendid. The bunches of flowers were singularly numerous and large, some being fully 6 or 7 in. long, and from 3 to 4 in diameter. Immense plants of E. viridiflora were contributed by Mr. Bruce, gr. to B. Miller, Esq., and Mr. Goode, gr. to Mrs. Lawrence. The dark green hue of the flowers prevents them from being very beautiful; but their astonishing numbers, and the luxuriance as well as symmetrical shape of the specimens, rendered them extremely interesting. E. tricolor superba, the handsomest variety of one of the most showy Heaths cultivated, was brought by Mr. Catleugh, of Chelsea. It was 18 in. high, and spreading and floriferous in proportion. Mr. May, gr. to E. Goodhart, Esq., had two specimens of E. radiata, one 3ft. high, the other 2ft. high, and branching amply. The flowers have a rich crimson tube, which passes into white at the top. Their beauty is very striking. Erica Savillea, a pretty dwarf species with a brilliant robe of small purplish blossoms; and E. tricolor, low, but in beautiful condition, came from Mr. Pawley, of Bromley. A handsome little tree of E. Bowieana, appeared in Mr. Goode's largest collection. It was 4ft. high, with a strong stem, well branched at the top, and bearing very fine spikes of its lovely white blooms. Among Mr. Barnes's plants were an E. elegans, dwarf and healthy; E. depressa, a pyramid of intensely green foliage and bright yellow flowers; E. tricolor, 3 ft. high, the same breadth, and splendidly in flower; and E. Massonii, most superbly grown and bloomed. Mr. Goode, gr. to Mrs. Lawrence, supplied E. vestita coccinea, 3 ft. high, finely cultivated, and bearing many large bunches of deep scarlet flowers; E. tricolor, in a pleasing dwarf condition; E. ventricosa carnea, 3 ft high, and magnificent; E. depressa, forming a charming cone, 18 in. in height; and another good plant of E. Bowieana. From Mr. Jackson, of Kingston, there appeared a small and very close plant of E. elegans, with the flowers fading; E. ventricosa superba, 5 ft. in height, a most extraordinary specimen; E. tricolor, very large, yet slightly straggling, and not sufficiently provided with foliage; and E. comosa alba, 9 in. high, bushy in the extreme, and literally enveloped in neat white blossoms. A great many other Heaths were exhibited, and some of them were highly meritorious; we deem it needless, however, to give the names of any but those which most arrested our notice.

Of Cacti, the lateness of the season precluded any display. There was, nevertheless, a very noble plant of Cereus speciosissimus, the perfection of the blooms of which must have surprised every one. It was certainly equal to anything of the kind in June: Mr. Green was the exhibitor of this plant. By Mr. Green likewise, a seedling Epiphyllum, with the habit of E. Ackermanniæ, but with stouter and somewhat triangular stems, and flowers of unusual dimensions, was produced; and, further, another similar seedling, with less blooms, having a decided dash of the blue tint, so much admired in the blossoms of Cereus speciosissimus. The most distinct seedling we have yet seen, however, was one from Mr. Pamplin, of Walthamstow; in habit it approximates most nearly to Cereus Jenkinsonii, while the flowers have the colour and figure of C. speciosus, being, besides, nearly twice as large, of a deeper and richer pink tint, and rather fuller of petals.

At the previous shows we had to deplore the scantiness of the Climbers, and they were even more deficient on Saturday; only one collection was furnished, and this contained plants which had been sent in May and June, with others which were nearly destitute of flowers. Whether the tribe is slighted from apathy or ignorance, we cannot pretend to determine; yet do we repeat our assurance that they deserve to be better thought of by every cultivator. Those supplied by Mr. Goode, gr. to Mrs. Lawrence, comprised Ceropegia elegans, on a trellis 3 ft. high, well cultivated and flowered; Thunbergia alata alba, on a fancy flat trellis, and making a lively appearance from the contrast between its delicate white blossoms and their dark centre; T. aurantiaca, trained to a similar trellis, and favourably grown; Manettia cordifolia, on an upright barrel-shaped trellis, 4 ft. high, splendidly studded with bloom; and two plants of the same species on globular-shaped trellises, presenting a sheet of the finest scarlet inflorescence; Mandevilla suaveolens, 8 ft. high, supported by a cylindrical trellis, with scarcely any flowers; Thunbergia grandiflora, very healthy, and amply clothed with leaves to the height of 9 ft., yet having but few blossoms; Gompholobium polymorphum, a handsome specimen; and Allamanda cathartica, extremely luxuriant, and producing its noble yellow flowers in great liberality: the last-named plant was attached to a barrel-shaped trellis, 4 ft. high, and, in conjunction with the Manettias, was deserving of the highest praise. Scattered throughout the more comprehensive collections, was a Gompholobium polymorphum, from Mr. Barnes, gr. to G. W. Norman, Esq., closely covering a trellis 4 ft. high, which partially enveloped the pot; the plant was flowering beautifully. Stephanotus floribundus, twined round a cylindrical trellis from 3 ft. to 4 ft. in height, was exhibited by Mr. Barnes, and Mr. Pawley, of Bromley. The specimens were highly verdant, and loaded with their sweet-scented blossoms; proving that the species can be both grown and bloomed to perfection in a small compass. Mr. Pawley had, moreover, a Thunbergia aurantiaca, grown to a low, barrel-shaped trellis, from which the blossoms protruded on all sides in rich profusion; and Russellia juncea, a broad and dense mass, 4ft. high, of weeping branches, though not flowering freely. Passiflora kermesina, covering a cylindrical trellis of about 4ft. in height, was blooming very handsomely, from Mr. Frazer, of Leyton, Essex, who also sent Sollya heterophylla, with the aspect of a self-supported shrub or bush, and Sollya linearis, having very dark and beautiful blue flowers, with more scanty foliage. Mr. Jackson, of Kingston, had another fine plant of Sollya heterophylla. Exhibited as single specimens, was Tropæolum pentaphyllum, surrounding a trellis 4ft. high, and forming a very engaging object. It was from Mr. Baile, of Covent Garden. An extremely fine specimen of the Pitcher-plant, Nepenthes distillatoria, was shown by Mr. Mylam, gr. to S. Rucker, Esq. It was 5ft. high, unusually healthy, with spacious pitchers hanging from the ends of its leaves, and a long, half-pendent spike of dull brown flowers issuing from the top of the stem. Messrs. Veitch, of Exeter, produced branches with flowers on them of two new species of Echites. One, obtained from Brazil, had distant joints, slender stems, small shining leaves, and dark brownish-purple flowers, about an inch or an inch and a half in diameter at the margin. The other had very long, broad, wrinkled foliage, and peculiarly large blossoms. They were from two to three inches across, and pale pink or blush-coloured, with a darker throat. This was one of the handsomest novelties in the exhibition. The strange Tamus elephantipes, with a tuber extravagantly large, was sent by Mr. Holland, gr. to Miss Tunno. Although producing its small twining stems, it had not arrived at a blooming state.

Both new and old varieties, with some of the more recent species of Fuchsia, were largely exhibited. F. corymbiflora was present, from Mr. Goode, gr. to Mrs. Lawrence, and Messrs. Lane, of Berkhampstead. Both plants were from 4 to 5ft. high, very broad, and copiously decorated with their pendent bunches of deep crimson flowers. They were alike dense and handsome. Of F. fulgens, there was a particularly vigorous specimen, 5ft. in height, from Mr. Baile, of Covent Garden, and a variety of that species termed superba, of the same size, with shorter and thicker flowers. F. Standishii, grown to the height of 4ft., came from Mr. Redding, gr. to Mrs. Marryatt, of Wimbledon. It attested the capacity of that sort for being rendered in the highest degree ornamental. In a slate tub, which seemed to suit it thoroughly, F. formosa elegans was shown by Mr. Beck, of Isleworth. Being one of the most showy varieties, and admirably cultivated, it had a very prepossessing aspect. A hybrid called Prince Albert, from Mr. Brown, of the Bedford Nursery, has pale pink sepals and crimson petals to its flowers; it is not of much value. Another seedling, bearing the name of conspicua arborea, of an upright, strong habit, with long flowers, which have pinkish sepals and scarlet petals, and one named Una, having crimson petals and light red sepals, tipped with whitish, were contributed by Mr. Catleugh, of Chelsea. F. Buistii, also from Mr. Catleugh, s very near F. formosa elegans; but F. roseo-alba, from the same grower, is quite distinct. It has a slender habitude, and small foliage. The flowers are graceful, with a reddish corolla, and a nearly white calyx. F. Laneii has immense flowers, of the globose kind, somewhat like those of F. Standishii, but shorter, larger, and more expansive. It is a really good variety, and was abundantly exhibited by Messrs. Lane, of Berkhampstead. A very splendid plant, perfectly grown, of a variety designated ignescens, was from Mr. Beck, of Isleworth. Ordinary crimson sepals and purple petals compose the flowers; but the plant would have been considered a model of cultivation had there not been one much finer, of a variety called pulcherrima, from Mr. Storey, of Isleworth. The flowers of this were hardly distinguishable from those of the other. The plant was, however, 4ft high, and 5ft. across, the stems constituting a perfect thicket, and being richly bedecked with blossoms. Excepting that F. pulcherrima was the larger of the two, both these plants may be described as heretofore unapproached in beauty, and as indicating the extent of cultivation of which Fuchsias are susceptible.

The valuable class of dwarf greenhouse shrubs comprehended many specimens of great beauty. Roella ciliata, which is generally met with in a straggling and shabby state, was brought by Mr. Goode, gr. to Mrs. Lawrence, a foot high, and eighteen inches in diameter, literally a mass of fine blue blossoms. It is an admirable plant for late summer and autumnal purposes. Crassula coccinea (by some called Kalosanthes coccinea), was another of Mr. Goode's plants, of which he had two specimens. Both were about four feet from the pot, and had a prodigious quantity of bloom. One had a stem like a small tree, and its flowers were of an uncommonly deep scarlet hue. Mr. Goode exhibited, in addition, Mahernia pinnata, presenting an impenetrable cone, four feet high, including the pot, which was enveloped in branches; and the whole of this cone was thickly besprinkled with pretty red bells, which, however, did not expand nicely. Siphocampylus bicolor, highly cultivated, only three feet high, yet very dense, and flowering splendidly; and Swainsonia galegifolia, displaying its elegant crimson flowers, together with the white-blossomed variety, both handsomely cultivated. Phænocoma prolifera, two feet high, and singularly compact and bushy, was producing its crimson everlasting flowers, from Mr. Barnes, gr. to G. W. Norman, Esq. There was a Lechenaultia formosa, as beautifully in blossom as any that were exhibited in June, from Mr. Green, gr. to Sir E. Antrobus, Bart., and a good Helichrysum pumilum, the flowers of which were fading in the centre, from Mr. Bruce, gr. to B. Miller, Esq., as well as from Mr. Barnes, gr. to G. W. Norman, Esq. Statice arborea, one foot high, with enormous heads of bloom, was shown by Mr. Goode, and a plant two feet in height, flowering richly, by Mr. Frazer, of Leyton. Statice puberula, about six inches above the soil, and blossoming finely, was a beautiful object, from Mr. Redding, gr. to Mrs. Marryatt. Gardoquia Hookeri, 18 inches high, prettily grown and flowered; and Erythrina crista galli, not more than two feet high, blooming superbly, were from Mr. Catleugh, of Chelsea. The interesting Geranium tricolor, in a compact mass, two feet from the pot, and Hibiscus Cameronii, kept down to three feet, with a profuse supply of branches and flowers, came from Mr. Jackson, of Kingston. Triptilion spinosum, a plant that always looks shabby, but bears showy blue blossoms, was sent, in its ordinary condition, by Mr. Redding, gr. to Mrs. Marryatt. From Mr. Barnes, gr. to G. W. Norman, Esq., was forwarded a species of Campanula, with variously-formed leaves, and very showy expansive blue flowers. It was trained on the concave side of a hemispherical trellis, in the centre of which was a smaller hemisphere, with the convex side uppermost. Its effect was most ornamental. Other detached specimens from Mr. Barnes were Swainsonia coronillifolia, four feet high, and charmingly in blossom. Boronia viminea, a bush, impervious to the sight, copiously bedecked with simple pink flowers; Burtonia violacea (or conferta), surprisingly healthy, and just unfolding its handsome purple blossoms; and Polygala cordifolia, three feet in height, and wonderfully dense, with large foliage and flowers. The two last specimens betokened great skill in their culture. More properly a greenhouse than a stove plant, Achimenes longiflora came from Mr. Frost, gr. to Lady Grenville, at Dropmore; from Mr. Bruce, gr to B. Miller, Esq., of Mitcham; and from Mr Cock, of Chiswick. The first was a poor specimen, the second had rather pale flowers; and the third produced the darkest blossoms. Mr. Goode, gr. to Mrs. Lawrence, brought Erinus Lychnidea, about two feet in breadth, and though the flowers want showiness, they were exceedingly profuse, and the specimen was decidedly fine. Mr. Goode had again a good plant of Babingtonia camphorosmæ, of which the flowers were only in bud; the same cultivator furnished, of larger greenhouse plants, Abutilon Bedfordianum, a new species, with broad cordate leaves, and large upright striped flowers, quite distinct from A. striatum A double pink-flowered variety of Nerium Oleander was sent from Mr. Pawley, of Bromley; and a much handsomer specimen from Mrs Ronalds, of Chiswick. Banksia speciosa, eight feet high, growing luxuriantly, and putting forth its strange heads of flower, was contributed by Mr. Edmonds, gr. to his Grace the Duke of Devonshire, Chiswick; Chelone barbata, which is nearly hardy, came from Mr. Clarke, gr. to Lady Limond. It was a fine specimen, and blooming in extreme profusion.

Plants requiring the heat of a stove were not very abundant or varied; Cuphea Melvilla, which will succeed in a cool stove or warm greenhouse, was shown by Mr. Goode, gr. to Mrs. Lawrence, who brought two capital specimens, five feet high, with stems innumerable, and each terminated by a cluster of highly coloured flowers. Mr. Goode supplied, moreover, Brugmansia floribunda, with spacious leaves, and long racemes of bright orange coloured blossoms; Achimenes rosea, one of the new species raised by the Horticultural Society, with the flowers larger than those of A. coccinea, deep crimson, and spotted; Euphorbia splendens, 5 ft. high, an immense specimen, and very full of flowers; Columnea scandens, with its branches and bright crimson flowers partly hanging over the sides of the pot; Rondeletia odorata, 4 ft. high, trained to a front, and particularly well-bloomed; Clerodendrum squamatum, with splendid cones of scarlet inflorescence, 4 ft. in height; Gardenia florida, quite a tree, and blossoming freely; Hedychium coronarium, garlanded all over with its fine whitish and odoriferous blossoms; and Gesnera mollis, 10 ft. above the pot, very extraordinary. By Mr. Barnes, gr. to G. W. Norman, Esq., were sent a species of Gesnera, like Cooperi, with many stems of 3 ft. in height, and terminated by numbers of glowing scarlet flowers; Ixora coccinea, a blaze of gorgeous red blossoms; Clerodendrum squamatum, splendidly flowered; Clerodendrum speciosissimum, with a prodigiously large spike of bloom; with the beautiful little Gesnera rupestris, bearing leaves and flowers to an extent that would astonish those who have only witnessed it in its usually stunted condition. There were magnificent plants of Clerodendrum speciosissimum, from Mr. Green and Mr. Bruce; equally good ones of Rondeletia odorata, from Mr. Green and Mr. Pawley; and the same of Ixora coccinea, from Mr. Bruce, Mr. Pawley, and Mr. Catleugh. Gloxinia rubra was shown, handsomely flowered, by Mr. Green, gr. to Sir E. Antrobus, Bart.; Lantana spectabilis, with broad pink and white flowers, by Mr. Catleugh, of Chelsea; a species of Pothos, having long leaves, and curious spikes of inconspicuous flowers; with Crinum americanum, producing a dwarf stem, crowned with whitish blossoms, by Mr. Redding, gr. to Miss Marriatt, Wimbledon; Plumbago rosea, a beautiful spreading plant, and Angelonia grandiflora, bearing tall spikes of dark purple-spotted blossoms, by Mr. Jackson, of Kingston A peculiarly fine specimen of Begonia semperflorens, throwing its graceful branches and elegant white flowers about in all directions, and yet maintaining a due degree of compactness, was from Mr. Pawley, of Bromley: it bore an amazing quantity of flowers. Mr. Pawley further supplied a plant of Ardisia crenulata, in flower and fruit, 5 ft. in height, with a bare stem of about 3 ft.; the peculiarly copious clusters of uncommonly large red berries, sheltering amongst the fine evergreen foliage, and having above them a free production of pretty white flowers, united in occasioning a striking effect. Mr Cuthill, Nurseryman of Camberwell, produced Lisianthus Russellianus, in good health, and giving the assurance of a fine display of flowers, though no more than one had developed itself. A rare bulbous plant, Hæmanthus multiflorus, the blossoms of which appear like an aggregation of very strong red threads or wires, but which nevertheless, from their numbers, have a showy aspect, was sent by Mr Edmonds, gr. to his Grace the Duke of Devonshire, Chiswick. Messrs. Veitch, of Exeter, furnished a Cinchonaceous plant from Brazil; it has long tubular blue flowers, which are truly ornamental. From Mr. Lee, of Hammersmith, there was a species of Echinocactus, with a large and handsome whitish flower. Lastly, Mr. Appleby, gr. to T. Brocklehurst, Esq., brought Gymnogramma chrysophylla, an elegant little fern, having all the backs of its leaves covered with a golden powder, which imparts to it a high degree of beauty.

We now turn to a group made up of Pelargoniums, Roses, Pansies, Picotees, Pinks, Carnations, &c. It was generally anticipated that the tent occupied by the Pelargoniums would not on this occasion (from the lateness of the season) have been so attractive as usual: this idea, however, was dissipated immediately on beholding the splendid specimens which composed the two collections contributed by Mr. Cock: we do not remember any former occasion when he had been so successful in producing his plants in such perfect condition; they were large and healthy, the foliage clean, and the flowers in the greatest profusion; the plants were trained with the lower branches spreading outwards, that the upper part of the pots were hidden, thus forming a broad head of bloom. Such specimens as Clarissa, Lady Carlisle, Orange Boven, and Oliver Twist, can seldom be seen, and the encomiums passed upon them excites no surprize. How Mr. Cock could have produced the latter flower in such vigour and style is incomprehensible to those who know the weakly habit of the plants; this specimen measured 4ft. across, and was literally covered with its brilliant flowers, and though unworthy of so much labour and attention, will be grown until its high colour is transferred to a flower of better properties. For these two collections Mr. Cock received the highest rewards—they contained the following varieties: Britannia, Clarissa, Lord Mayor, Mabel, Lady Flora, Flash, Orange Boven, Acme, Annette, Wonder, Jupiter, Penelope, Lady Carlisle, Oliver Twist, Eliza Superb, Clarissa, and Prince of Waterloo. Mr. Bourne, gr. to Sir E. Paget, obtained the second prize for 12 neatly grown plants; they were not large, but uniform in size, and displayed good management. Matilda was a beautiful object in this collection. The third prize was given to Mr. Garrett, gr. to Sir Herbert Jenner Fust, who appears not to be accustomed to growing plants for the purpose of exhibiting—the sorts shown were very injudiciously chosen, being deficient in variety, and consisting principally of old sorts unworthy now of cultivation. The contest in the Nurserymen's class was between Mr. Gaines and Mr. Catleugh; both collections were good for the season, the superiority appearing in favour of the former, he received the gold medal. In these, and also in their smaller collections, some noble specimens were shown; but no novelty appeared, with the exception of a fine plant of the Witch, among Mr. Catleugh's plants, and the Rising Sun was a conspicuous object in Mr. Gaines's collection. The tent in which the seedling Pelargoniums were exhibited formed an attractive and interesting object; it was, as on former occasions, crowded with visitors, and the facilities afforded for seeing the flowers, owing to the better regulations enforced within the tent, were so well managed, that no person who wished to obtain a sight of them, quitted the gardens without being gratified. The seedlings were numerous, and those selected by the judges form an index to the *élite* of the collection. Additional interest was given to this department in consequence of the special prizes offered for the best seedlings of the current year by the Pelargonium Society This distribution will in future seasons take place at the June meeting, the month when more seedlings are in bloom and in better condition than at a late period of the year: but owing to unavoidable circumstances, a necessity occurred in the present season for postponing it to July. The silver Knightian medal was awarded to Mr. Whomes, gr. to E. Forster, Esq., for a fine seedling Pelargonium named the Lord Chancellor; this is a beautiful and high-coloured flower, of good form, the lower petals broad, of a bright rosy salmon colour; the upper petals have an intense spot, terminating abruptly, and surrounded by a broad band of bright scarlet crimson. The same medal was also obtained by Mr. Pamplin, for a very attractive high-coloured variety, named Count D'Orsay, the under petals of which are of a fine rosy salmon, the spot in the upper petals large and deep, surrounded by a dash of scarlet, which again changes to a rosy colour at the margin. This flower differs from the Lord Chancellor in being of a deeper and more rosy colour; in the Lord Chancellor the scarlet tint predomidates. The silver Banksian was awarded to Actæon, a seedling from the collection of E. Forster, Esq.; and to one named Constellation, raised by the Rev. R. Garth; the former a clean bright flower, with a large deep spot in the upper petals; the latter a large flower of good substance, with spot nearly covering the upper petals. Certificates were also granted to the Prince of Wales, a fine variety, belonging to Mr. Pamplin; and to the Duchess of Sutherland, from Mr. Gaines, a large bright clean flower, with a small clearly-defined spot in the upper petals, a showy distinct variety. Many of the seedlings so strongly resemble varieties that are already in cultivation, that they cannot be recommended as sufficiently distinct, and these principally predominate in the rose-coloured family in which our greenhouses abound; high coloured flowers, and decided varieties are now required and sought after, to make a change and enrich our collection; such flowers as Count D'Orsay, the Lord Chancellor, and Beauty of Essex attract more attention than varieties in which those brilliant colours do not appear. The Seedlings selected by the judges, for the prizes offered by the Pelargonium Society, were the following varieties, Seedlings of 1842:—1st class, *Forster's Sultana:* The general form of the flower is fine, of a slightly cupped shape; the under petals are short, well rounded, of a rosy salmon colour, the upper petals are scarlet crimson, with a large deep spot; a deep, rich, and attractive flower. 2d class, *Actæon (Forster's):* The flower is of a good form, lower petals delicate salmon colour, a large and deep spot in the upper petals gradating to the edge, which is of a bright salmon colour; this flower is clear and bright in appearance; it has a *fold* in the upper petal, which appears permanent *Flambeau (Forster's):* Lower petals rosy salmon, short, and rather narrow; the upper petals are remarkably fine, having a large, deep, rich, velvety spot, surrounded with bright scarlet salmon. *Milo:* This flower is of bright rosy crimson, with a delicate tinge of blue in the centre; the upper petals have a dark spot terminating abruptly, surrounded by a broad band of scarlet crimson: there is a fold in the upper petal of this flower, which is bright, clear, and beautiful in colour; of a good form *Eros (Forster's):* Delicate salmon under petals, the upper petals distinct, being of a scarlet crimson; the spot, which is not dark, gradually softens to the edge; delicate and distinct in appearance. *Constellation (Garth's):* The centre of this flower is white, with the remainder of the under petals pink, with a deep spot in the upper petals which nearly covers them; this flower is very large, of good substance, and finely formed. *Prince of Wales (Pamplins):* The general form is good, the petals firm, keeping the flower in a fine cupped shape; the dark spot covers the surface of the upper petal, with the exception of a narrow rim of rose colour; lower petals rose, getting lighter as they approach the centre; an excellent variety. *Sir Isaac Newton (Pamplin's):* Top petals have a large dark spot, gradually getting of a rosy colour at the edge; lower petals short, of a delicate pink; general form good.

That portion of the large tent in which the Picotees and Carnations were exhibited, appeared to create general interest, never have we seen at the Chiswick Gardens so fine a display of these beautiful flowers. The stands were more numerous than on any former occasion, and the exhibitors had evidently prepared for a friendly contest, for all the stands bore evidence of great care and skill in the management of the flowers. The Picotees were in very fine condition; the flowers were clean and the edging fine in colour; and what we had great pleasure in noticing, the flowers were not overdressed; though put in order, they still retained their natural appearance. The season has not been favourable for the Carnation, and the white generally is of a pouncy character; a few blooms only in all the stands were free from this blemish; and we noticed in the various collections many old favourites, and a few new varieties in both classes, in high condition. Among the Carnations Puxley's Prince Albert, Holmes' Count Paulina, Colcutt's Brutus, Lord Brougham, Young's Earl Grey, and Cartwright's Rainbow, were very fine in the Bizarres; and Brook's Flora's Garland. Wilson's Harriet, Willmer's Endymion, Knott's Alfred the Great, Addenbroke's Lydia, Willmer's Solander, and Hogg's Colonel of the Blues we noticed as being very superior in the Flakes. The Picotees were certainly finer in their class than the Carnations, and more difficult to select from. Wood's Agrippina, Gidden's Teaser, Brinkler's Masterpiece, a rather better flower than Teaser, Sharp's Gem, a new and fine variety, Sharp's Criterion, Pollen's Lady Peel, Dickson's Trip to Cambridge, &c., &c., were conspicuous among the finest varieties. T. Barnard, Esq., took the lead among amateurs in the Picotees, for a stand of very beautiful flowers, containing the following varieties:—Willmer's Queen, Russell's Lady Hardwick, Kirtland's Duke of Wellington, Brinkler's Lady Chesterfield, Giddens's Teaser, Giddens's Sir Robert Peel, Barnard's Mrs. Barnard, Garret's Lady Dacre, Giddings' Miss Desborough, Annesley's Plenipo, Annesley's Sanspareil, Lady Ackland, Dickson's Trip to Cambridge, Hogg's Queen of England, Brinkler's Mrs Drake, Brinkler's Masterpiece, Lady Maclean, Green's Queen, Kirtland's Princess Augusta, Giddens' Diana, Wilson's Harry, Wood's Pamela, Dearlove's Favorite, Seedling. A Picotee of good properties from Mr. Smith, named *Prince Albert*, received a certificate of merit, and a similar prize was awarded to a crimson bizarre named *Venus*, from Mr. Alloway, in which the white was of good quality; it possessed also a well-formed petal, with an even edge, the marking clear, and the colour well distributed. A seedling Verbena from Mr. Kyle, called *V. speciosa* was exhibited, and received a certificate; it appears to be a distinct variety, and its colour is bright vermilion. Mr. Burrup's stand of winning Carnations consisted of Colonel of the Blues, Bucknall's Ulysses, Davison's No. 1, Coleutt's Brutus, Knott's Alfred the Great, Eley's Manego, Christian's Excellent, Holmes's Count Paulina, Lady Chetwynd, Brooks's Flora's Garland, Mansley's Beauty of Woodhouse, Clegg's Harkaway, Puxley's Prince Albert, Martin's Mars, Jacques's Georgiana, Young's Earl Grey, Christian's Mary Christian, Wilson's Harriet, Hogg's Princess Marie, Smith's Princess Augusta, Greasley's Lord Brougham, Hufton's Rosa, Wakefield's Magna Charta.

Among the Seedling Calceolarias, two only were selected as distinct varieties, possessing desirable qualities, the remainder varying little from the sorts now cultivated or about to be sent out: these were Floribunda and Pulchella; the former a dark mottled claret-coloured variety; of fine form, the latter having a bright brown spot upon a delicate lemon ground.

Fruit is always more liberally supplied at the July show than at either of the others; and this circumstance, together with the stimulus given to growers in a late leading article of the present paper, no doubt tended to fill the tent devoted to that section. Taking a cursory survey of the whole, it may be remarked that the Pine-Apples were mostly of a first-rate description. The Grapes, too, had generally large berries, yet many of them lacked that depth of colour which gives them such a rich appearance, and others had been robbed of their bloom by travelling. Peaches and Nectarines were chiefly excellent, and very few had been injured in the transmission. The Melons were likewise fine for the most part. Two novel fruits were on the tables; one, that of Sabal Blackburniana, a kind of Fan Palm, was in a very long and branching raceme, covered with greenish fruit, about the size of small nuts, and consisting mainly of an excessively hard kernel, which does not seem to be edible. This was shown by Mr. Nicholson, gr. to J. J. Blackburn, Esq., near Liverpool. The other was the pulpy berry of Physalis edulis, commonly called the Cape Gooseberry, which is eaten as a dessert fruit. It was exhibited by Mr. Paxton, gr. to His Grace the Duke of Devonshire, Chatsworth. Of Pine-Apples, there were three fine Queens from Mr. Fielder, gr. to E. Linwood, Esq.; three still better from Mr. Parsay; a very good one from Mr. Henderson, Coleorton Hall; and many handsome Providence and other sorts from different cultivators, whose names, where their productions were thought worthy of reward, will occur in the prize list, to which, once for all, we may refer for an account of the merits of the fruit exhibited. Black Hamburgh Grapes were in good order from Mr. Henderson, of Coleorton Hall; pale, but large, from Mr. Clarke, gr. to W. Block, Esq.; extremely fine from Mr. Spencer, gr. to the Marquis of Lansdowne; very good from Mr. Mitchell, of Brighton; handsome, yet wanting colour, from Mr. Fielder, gr. to W. Linwood, Esq.; in an enormous bunch, with large berries, from Mr. Wilson, of Millichope; good from Mr. Rolfe, of Woodham, Essex; and similar, though light-coloured, from Mr. Lumsden, gr. to H. Bevan, Esq.; in all respects splendid, from Mr. Spencer, gr. to the Marquis of Lansdowne; fine, but wanting bloom, from Mr. Elliott, gr. to Earl Tyrconnel; very fine from Mr. Dodds, gr. to Sir G. Warrenden, Bart.; in dense bunches of diminutive but peculiarly black fruit from Mr. Redding, gr. to Mrs. Marryatt; well-ripened from Mr. Davis, gr. to A. Smith, Esq., Woodhall; and intensely black, as well as covered with bloom, though rather small in the berry, from Mr. Chapman, of Vauxhall. The Grizly Frontignac was nicely ripened by Mr. Roberts, Eshton Hall; the Cannon Hall Muscat was particularly good from the same grower. There were some fine white Sweetwater from Mr. Paxton, of Chatsworth, Mr. Redding, gr. to Mrs. Marryatt, Mr. Jones, gr. to Sir Moore Disney, Bart., and Mr. Rolfe, Woodham, Essex; with immense but unripe Cannon Hall Muscats from Mr. Nicholson, gr. to the Earl of Orkney; and pretty good Muscat of Alexandria from Mr. Spencer, gr. to the Marquis of Lansdowne. There were excellent Nectarines, and large yet pale Peaches from Mr. Davis, of Oak Hill; good Peaches and Nectarines from Mr. Dodds, gr. to Sir G. Warrender, Bart.; splendid Peaches and admirable Nectarines from Mr. Wilson, of Millichope, and Mr. Nicholson, gr. to the Earl of Orkney; fine though injured Peaches, from Mr. Shiells, Erskine House Gardens; very superior Downton Nectarines from Mr. Lauder, gr. at Downton Castle; noble Peaches from Mr. Errington, gr. to Sir P. Egerton, Bart., and capital Peaches, from Mr. Paxton, of Chatsworth. Particularly good Bigareau Cherries came from Mr. Davis, of Oak Hill, and Mr. Redding, gr. to Mrs. Marryatt; with superior May Dukes from Mr. Leslie, gr. to J. Fleming, Esq., Stoneham Park. Well-grown Bokhara Melons were sent by Mr. Henderson, of Coleorton Hall; six fine Windsor Prize Melons by Mr. Appleby, gr. to T. Brocklehurst, Esq.; and a very large green-fleshed Melon by R. Barnard, Esq.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

July 14.—The show of stock, implements, seeds, &c., at the long expected Bristol meeting took place to day, and was most numerously attended; in fact, every thoroughfare in the city which led in the direction of the show-yards was crowded with persons hurrying towards the busy scene. The exhibition of cattle was exceedingly good. The prizes were awarded as follows:—Short Horns: Class 1: *Bulls calved previously to the 1st of January*, 1840, 1st prize, 30*l*., to Messrs. J. Parkinson and J. Booth of Cotham; 2, 15*l*., Mr. T. Forrest, of Stretton. Class 2: *Bulls calved since the 1st of January*, 1840, 20*l*., the Rev. C. Mordaunt, of Badgworth Rectory. Class 3: *Cows in Milk*, 15*l*. Mr. J. Booth, of Catterick. Class 4: *In-calf heifers*, 15*l*., Mr. J. Forrest, of Stretton. Class 5: *Yearling heifers*, 10*l*., Mr. R. M. Jaques, of Silton Hall, Yorkshire. Herefords—Class 1: 1, 30*l*., Mr. J. Yeomans, of Moreton-on-Legg; 2, 15*l*., Mr. J. Price, Upton-upon-Severn. Class 2: 20*l*., Mr. J. Price, of Poole House, Upton-upon-Severn. Class 3: 15*l*., Mr. J. Yeomans. Class 4: 15*l*., Rev. J. R. Smythies, of Lynch Court, near Leominster. Class 5: 10*l*., Mr. J. Walker, of Burton, near Worcester. Devons—Class 1: 1, 30*l*., Messrs. J. S. Bult and J. Bond, of Kingston and Heathfield, for a bull, bred by Mr. J. Quartley, of Molland; 2, 15*l*., Mr. C. H. Webber, of Barnstaple, for a North Devon bull, also bred by Mr. Quartley. Class 2: 20*l*., Mr T. Stephens, of Atherstone. Class 3: 15*l*., Mr. J. Quartley, of Molland, for a cow bred by Mr. F. Quartley, of the same place. Class 4: 15*l*., Mr. J. Quartley. Class 5: 10*l*., M. J. Davy, of North Molton, Devon. Any Breed or Cross—Class 1: 15*l*., Mr. T. Child, of Arlington. Class 2: 20*l*., the Hon. M. W. B. Nugent, of Hinchley, for a long-horned bull, bred by Mr. Horton, of Sherborne. Class 3: 15*l*., Mr. R. P. Rich, of Chippenham, a mixed or cross-bred cow, bred by himself. Class 4: 15*l*., Mr. T. J. Penson, of Leigh, near Tewkesbury, for a pure long-horned in-calf heifer, bred by himself. Class 5: 10*l*., the Hon. M. W. B. Nugent, for a pure Leicester or long-horned heifer, bred by himself. Horses—Class 1: *Cart Stallions for Agricultural purposes*, 1st, 30*l*., Mr. Neeld, of Grittleton; 2nd, 20*l*., Mr. H. Heath, and J. C. Gadd, of Weare, near Axbridge, for a cart stallion, bred by Mr. J. Bibby, of Rodney Stoke, near Wells. Class 2: *Two years old cart Stallions*, 15*l*., Mr. R. Daintree, of St. Ives, Huntingdon. Class 3: *Cart Mares and Foals*, 20*l*., Mr. G. Thomas, of Shirehampton. Class 4: *Two year old Fillies*, 10*l*., Mr. R. Daintree. Class 5: *Thorough-bred Stallions*, 30*l*., Mr. H. Reeve, of Wroughton, Wilts, for Emilius, bred by the Duke of Cleveland. Sheep, Leicester—Class 1: *Shearling Rams*, 1st, 30*l*., Mr. J. Bennett, of Tempsford, Bedfordshire, for a ram 16 months old; 2nd, 15*l*., Mr. S. Bennett, of Bickerings Park, Bedfordshire. Class 2: *Rams of any age above two years*, 1st, 30*l*., Mr. S. Bennett, for a ram, 40 months old, bred by himself; 2nd, 15*l*., Mr. J. Bennett, for a ram 32 months old, bred by himself. In Class 3 the prize was withheld from want of merit. Southdown and other short-woolled Sheep—Class 1: 30*l*., Mr. S. Grantham, of Stoneham, Lewes, for one 15 months old; 2nd, 15*l*., Mr. J. Webb, of Babraham, near Cambridge. Class 2: 1st, 30*l*., Mr. J. Webb, for a Southdown ram, 64 months old, bred by himself; 2nd, 15*l*., Mr. J. Harris, of Hinton, Berks, for a pure Southdown ram, 28 months old. Class 3: *Shearling Ewes*, 1st, 10*l*., Mr. S. Webb, of Babraham, for a pen of fine Southdown shearling ewes, 16 months old, bred by himself; 2nd, 5*l*., Mr. J. Beavan, Jun., of Thornham, Wilts, for a pen of 5 do., 17 months old. Long-woolled Sheep, not qualified as Leicesters: Class 1: 1st, 30*l*., Mr. C. Large, of Broadwell, Oxford, for a new Oxfordshire shearling ram, 16 months old; 2d, 15*l*., Mr. C. Large, for a new Oxfordshire long-woolled do., bred by himself. Class 2: 15*l*., Mr. C. Large, for do., 28 months old. Class 3: 1st, 10*l*., Mr. E. Smith, of Charlbury, for a pen of 5 shearling long-woolled Oxfordshire ewes, 15½ months old, bred by himself; 2nd, 5*l*., Mr. C. Large, for a pen of 5 shearling long-woolled ewes, bred by himself. Pigs: Class 1: *Boars*, 1st, 15*l*., Mr. Jos. Thomlinson, of Liverpool, for a Leicester boar, 2½ years old, bred by Mr. T. Crofton, Durham; 2nd, 5*l*., Mr. Barnard, M.P., of Gosfield Hall, Essex, for an improved Essex boar, bred by himself. Class 2: *sow of any age*, 10*l*., Mr. J. Thomlinson, of Laverock Bank, for a Leicester sow, bred by Mr. W. Doneld, of Salway House, Cumberland. Class 3: *pens of breeding sows*, 10*l*. Mr. Barnard, M.P., for 3 improved Essex sow pigs, 8 months old. A great number of extra stock was also exhibited, many of which were highly commended, but only four received a prize, viz., Mr. J. Yeomans, an award of 5*l*. for a Hereford yearling heifer, bred by himself; Mr. T. Miller, of Castle Farm, near Sherborne, 2*l*., for a 5-months-old calf, bred by himself: Mr. W. Ellison, of Kendal, 1*l*., for a Sizergh boar, and also 1*l*. for a sow of the same breed, both reared by himself. The exhibition of implements was very extensive, but the prizes had not been affixed to them when we left the show-yard. Mr. J. Smyth, of Yoxford, sent a new Turnip seed and manure drill; the principal advantages which this possesses over others are in its having steerage levers, with joints, by means of which the coulters are readily guided upon the ridges; the manure and seeds fall separately, so that a portion of earth divides them, which prevents the heat of the manure from injuring the vegetation of the seed; the drill is formed upon the sliding principle, which allows the rows to be drilled of any required distance: also a drill for corn and general purposes. From Mr. W. Groundsell, of Louth, a drill for corn and general purposes; the coulters and drills being removed from this machine, an apparatus filled with dust may be affixed to it, which being drawn over Turnips, or any other young crop, will scatter it upon the fly and destroy it; if filled with lime, it would probably assist in the destruction of slugs. Mr. R. Garratt, of Saxmundham, sent a newly-invented horse drag rake, for the purpose of raking hay or corn on any surface, however uneven, by means of the teeth working independently of each other; they are cleared by a pair of eccentric pulleys, which are moved by pulling down a lever handle behind the rake: an iron field roll, made with three separate revolving cylinders, so as to turn without injury to the crops; a patent horse hoe, which may be increased or diminished in size, by means of a movable axletree, so that the wheels may be readily kept between the rows of plants; the shafts, also, are readily altered, so that the horses may walk either in the furrows or in any place where the crop is least liable to be injured: an improved portable threshing machine; a drill for corn and other general purposes; a turnip and manure drill, with a slip axletree to vary the drill to different widths from 2 to 3 ft., or by shifting the coulters the rows of seed may be deposited as near as 12 inches; this drill is so constructed that Turnip and Mangel Wurzel-seeds are taken up by the cups separately, and deposited together down the conducting apparatus; besides these, Mr. Garratt sent a large quantity of other farming implements. From Mr. E. D. Falkner, of Fairfield, were a pair of Arched Harrows, for clearing weeds from ridges of Potatoes and other crops; the pressure being regulated by a wheel lever, which also clears the teeth, if choked by weeds; the teeth are moveable, and the centre ones may be taken out when not required; a light Single-horse Plough, weighing 10½ st.; a plough, for two horses, either yoked abreast or singly, for general purposes; and an expanding horse-hoe of a new construction. Mr. T. Huckwale, of Over-Norton, sent a newly-invented turnwrist plough, which possesses a double-acting share, and this, with the mould-board, can be easily turned from one side to the other: a set of implements combining a manure and turnip-drill, a fluid-drill, and a horse-hoe for hoeing and thinning Turnips; and various others. Messrs. Ransome, of Ipswich, exhibited a portable and locomotive steam-engine, for agricultural purposes, with threshing-machine attached; also portable threshing-machines of one, two and four-horse powers; several patent chaff-cutting engines; a Kent turnwrist plough, on an improved principle, made under the direction of Mr. W. Smart, of Rainham; the ploughman can easily shift the rest and coulter, without leaving his place at the handles, and effect any alteration in the dip of the plough; and no less than 13 other ploughs of different descriptions. From Mr. Crosskill, of Beverley Woods, a portable Potatoe-steamer; an improved two-horse power Hay and Straw-cutting machine, in which the knives are brought very near the rollers, which prevents the machine from becoming choked; A patent clod roller; a drill for sowing soot, which answers well, even when the soot is damp—the quantity sown being regulated by means of wheels; a single-row turnip drill, and numerous other implements of husbandry. From Mr. J. B. L. Farrant, of Maidstone, a single-hand turnip drill; a hoe for beans and peas; a threshing machine; and a small clod breaker, suitable for hop gardens, but which appears as if it would soon be choked in stiff soils. From Mr. R. Stratton, of Bristol, no less than 12 waggons and 15 carts, of different descriptions, with 61 other implements of various kinds, not for competition. From Mr. B. Ury, of Newport, a 4-horse-power and a 2-men-power hand-threshing machines. Mr. T. Wedlake sent various machines for making hay, breaking oil-cake, sowing seed broad-cast, &c. Mr. A. Dean, of Birmingham, a patent hydraulic machine, for irrigating land with liquid manure, watering streets, &c., and which may be easily converted into a fire-engine of great power; a patent portable mill for grinding flour; and various other machines. Numerous implements were likewise exhibited by Mr. R. Law, of Glasgow; Mr. H. Carson, of Warminster; Mr. J. Richmond, of Salford; Mr. J. Ferrabee, of Stroud; Mr. R. Edwards of Bambury, and different other gentlemen. Messrs. T. Gibbs and Co., Piccadilly, exhibited samples of the most approved Grass seeds for laying down land, consisting of 22 different sorts, with dried specimens of the same. The few Turnips which were shown belonged principally to Messrs. Gibbs; the large Green Globe appeared to be the best of these. Among the seed Wheats, those named Berkshire Triumph, Le Couteur's Belle Vue Talavera, Vilmorin, and Ely's Gigantic White, were remarkable for the size of ear. Mr. H. Cormack, of Manchester, also exhibited specimens of Grasses, and of the new Egyptian Vetch, both in a dried and a growing state; with samples of Sir J. Murray's new patent fertilisers or manures (in which lime seems to be a principal ingredient). Mr. C. Williams, of Cardiff, exhibited models of various agricultural implements. Mr. J. Read, Piccadilly, hydraulic, fire, and other engines. Specimens of cheeses were sent by Mr. E. Churche, of Axbridge; Mr. E. Jones, of Somerset, Mr. J. Leonard, of Water End, Gloucestershire; Mr. W. Norris, of Glastonbury, and numerous others. The Queen's cheese (the produce of the milk of 737 cows), was likewise exhibited; its form is an octagon, about 2½ feet across, and 20 inches deep, bearing the royal arms upon the upper surface.

COUNTRY SHOWS.

Aberdeenshire Horticultural Society, June 21.—The second exhibition of this institution was held in the New Markets, which were fitted up for the occasion. Prizes were awarded as under:—Ranunculuses: 1 and 2, Mr. D. Gairns, gr., Glenbervie: 1, 2, and 3, Mr. Alex. Mackie, gr., Arbuthnot. *Seedling*, 1, G. Williamson, Esq. Pelargoniums: 1, Mr. Alex. Mackie; 2 and 3, Mr. G. Cardno, gr., Cornhill; 4, Mr. D. Gairns. *Cacti*, 1, Mr. T. Darling; 2, Mr. J. Booth. Heartsease: 1 and 2, Mr. Alex. Mackie; 3, Mr. W. Smith. Irises: 1, Mr. J. Watt; 2, Alex. Forbes, Esq. Melon: Mr. Alex. Mackie; 2 and 3, Mr. J. Jamieson, gr. to Alex. Blackie, Esq. Preserved Apples: 1 and 2, Mr. N. Glennie. Cherries: 1, Mr. D. Gillon; 2, Mr. D. Smith; 3, Mr. J. Clark; 4, Mr. J. Wood. Strawberries: 1, Mr. J. Wood; 2, Mr. F. Deans; 3, Mr. T. Robertson; 4, Mr. J. Pirie. Peas: 1, Mr. W. Barron; 2, Mr. J. Wood; 3, Mr. D. Smith; 4, Mr. J. Forbes. Turnips: 1, Mr. Alex. Mackie; 2, Mr. A. Cooper; 3, Mr. W. Barron. Carrots: 1, Mr. A. Mackie; 2 and 3, Mr. J. Wood. Cauliflower: 1, Mr. N. Glennie; 2, Mr. J. Forbes; 3, Mr J. Wood; 4, Mr. T. Darling. Cabbages: 1, Mr. J. Silver; 2, Mr. J. Meffett; 3, Mr. T. Robertson. Ornamental Greenhouse Plants: 1, Mr. T. Darling; 2, Mr. W. Joss. *Six plants*, Mr. G. Cardno. Border Flower: 1, Mr. R. Hardy; 2, Mr. J. Forbes; 3, Mr. W. Walker. Home-made Wine: J. Birnie, Esq. Extra Prizes: Mr. G. Cardno, for an Orange Tree; Mr. A. Mackie, for Fuchsia Corymbiflora; and Mr. G. Gammie, for Rhododendron Ponticum.

Bath Royal United Horticultural Society, June 23.—The third exhibition took place at the Sidney Gardens. The following is the list of prizes:—Florists' and Cut Flowers. *Class* 1, *for Nurserymen: Pinks*, 8 *varieties*, 1, Mr. Sealey; 2, Mr. Miles. *Roses*, 18 *bunches*, 1, Mr. Cole; *best* 18, 1, Mr. Cole; 2, Messrs. Salter and Co. *Pansies, collection of* 24, 1, Mr. A. J. Maule; 2, Mr. Cole; *Seedling*, 1, Mr. Cole. *Ornamental collection of Cut Flowers*, 1, Mr. Lidiard; 2, Mr. Kitley. *Class* 2, *for Amateurs: Ranunculuses*, 5 *blooms*, 1, Mr. Bennett; 2, Mr. G. D. Fisher. *Pinks*, 5 *blooms*, 1, Mrs. Nias; 2, Mr. Parker. *Roses*, 12 *blooms*, 1, Hon. Capt. Howard; 2, Miss Bayley; 6 *blooms*, 1, H. Collison, Esq.; 2, Hon. Capt. Howard. *Pansies, collection of* 24, 1, Mr. G. D. Fisher; 2, Mr. W. Salter. *Ornamental collection of Cut Flowers*, 1, Mr. Pyatt; 2, Mr. Ford.—Plants in Pots. *Class* 1, *for Nurserymen: Stove Plants, best* 6, 1, Messrs. Salter and Co. *Greenhouse Plants, best* 12, 1, Messrs. Salter and Co. *Pelargoniums, best* 12, 1, Messrs. Salter and Co. *Calceolarias, Shrubby*, 1, Messrs. Salter and Co.; *Herbaceous*, 1, do. *Cape Ericas, best* 4, 1, Messrs. Salter and Co. *Herbaceous Perennials, best* 4, 1, Mr. Tyler. *Fuchsias*, 6 *varieties*, 1, Messrs. Salter and Co. *Ornamental Basket of Plants*, 1, Messrs. Salter and Co.; 2, Mr. Drummond. *Class* 2, *for Amateurs: Orchidaceous Plants, collection of* 3, 1, J. Jarrett, Esq. *Stove Plants, collection of* 6, 1, J. Jarrett, Esq. *Greenhouse Plants, collection of* 6, J. M. Yeeles, Esq.; *single Specimen*, ditto. *Pelargoniums, best* 12, 1, Miss Bayley; 2, J. Jarrett, Esq; *Light*, 1, G. C. Tugwell, Esq.; 2, Miss Bayley; *Pink*, 1 and 2, Miss Whitehead; *Red*, 1 and 2, do.; *Dark or Mottled*, J. M. Yeeles, Esq. *Cape Ericas, single Specimen*, J. M. Yeeles, Esq. *Amaryllis, single Specimen*, Mr. G. Shaw. *Calceolarias, collection of* 8, J. M. Yeeles, Esq.; *Herbaceous*, J. Jarrett, Esq. *Fuchsias, collection of* 3, J. M. Yeeles, Esq. *Alstremœria*, Mr. G. Shaw. *Ornamental Basket of Plants*, 1, Miss Bailey; 2, J. M. Yeeles, Esq.—Fruit. *Pine-apples*, Mr. Spencer, gr. to the Marquess of Lansdowne. *Grapes, Black*, 1, Mr. Sturge; 2, Mr. Spencer; *White*, 1, do. *Strawberries*, 1, Mr. Wheeler; 2, Mr. Kitley; 3, —— Emerson, Esq. *Cherries*, 1, — Emerson, Esq. *Currants, White*, 1, Mr. J. Cooke; *Red*, 1, Mr. Lidiard; *Black*, 1, Mr. J. Cooke. *Raspberries*, 1, Mr. Lidiard; 2, Mr. Sparkes. *Melons*, 1, Hon. Capt. Howard; 2, Mr. Spencer. *Apricots*, 1, R. S. Cruttwell, Esq. Vegetables: *Collection of Lettuces, Onions, Turnips, Potatoes, and Broad Beans*, 1, Mr. Lidiard; 2, Mr. Kitley; 3, Mr. J. Cooke. *Collection of Carrots, Cauliflowers, Green Peas, and Asparagus*, 1, Mr. J. Cooke; 2, Mr. Lidiard. *Salad*, 1, Mr. Cooper; 2, Mr. J. Cooke. Extra Prizes: *Fruit of the Musa Cavendishii*, J. Jarrett, Esq. *Strawberries*, Mr. Cole. *Orchidaceous Plant*, Messrs. Maule. *Pelargonium, seedling*, Messrs. Garraway. *Fuchsia*, Messrs. Garraway. *Herbaceous Plant*, Messrs. Salter. *Calceolaria*, J. Jarrett, Esq. *Fuchsia, seedling*, Miss Bayley. *Gloxinia*, Miss Bayley. *Æschynanthus*, Miss W. Maule. *Fuchsias*, J. M. Yeeles, Esq. *Ornamental Device in Cut Flowers*, T. Emerson, Esq. *Cauliflower*, T. Emerson, Esq. *Cockscombs*, J. M. Yeeles, Esq. *Ericas*, J. M. Yeeles, Esq. Society's Plate Prize, value one guinea, for the best stand of 18 *Roses*, Mr. Bennett. Mr. Jarrett's Prizes: *Pelargoniums, Best* 12, 1, J. Jarrett, Esq.; 2, G. C. Tugwell, Esq. *Six*, 1, J. M. Yeeles, Esq.; 2, J. Jarrett, Esq. *Three*, 1, Miss Bayley; 2, Mr. Geary. Mr. J. M. Yeeles's Prizes: *Roses, collection of* 18, 1, Mr. Bennett; 2, Mr. W. Salter; 3, H. Collison, Esq. Various prizes were given to cottagers residing within 4 miles of the Guild-hall, Bath, for vegetables, fruit, and flowers.—*Bath and Cheltenham Gazette*,

Birmingham and Midland Floral and Horticultural Society.—Second Exhibition, June 23.—Roses: *Premier*: Yellow Noisette, J. Gough, Esq. *Moss*: 1, Provence, Mr. J. Moore; 2, Blush, J. Gough, Esq.; 3, Crimson, Mr. J. Coudrey. *White*: 1, Unique, J. Gough, Esq.; 2, Princess de Lamballe, Mr. Coudrey; 3, Globe White Hip, Messrs. Pope and Sons. *Pink*, 1, Coutarde, Mr. J. Cowdrey; 2, Blush Belgie, Mr. Moore; 3, Belle Marie, Mr. Coudrey. *Blush*, 1, Duchesse d'Angoulême, Mr. J. Coudrey; 2, Ruga, Messrs. Pope and Sons; 3, Belle Auguste, Mr. Coudrey. *Red*, 1, Athelin, Mr. E. Phillips; 2, Ne Plus Ultra, Mr. Coudrey; 3, Gigantic Velvet, Mr. Coudrey. *Purple*, 1, George the Fourth, Mr. J. Cole; 2, Violet Blue, J. Gough, Esq.; 3, Princess Augusta, Mr. Coudrey. *Dark*, 1, George the Fourth, Mr. Coudrey; 2, Tuscany, do. *Striped or Mottled*, 1, Queen of Beauty; 2, Rosa Mundi; 3, Painted Damask, Messrs. Pope and Sons. *Noisette or Cluster*, 1, Ornament de Parade, Mr. E. Phillips: 2, De Meaux, Mr. Moore; 3, La Grande, J. Gough, Esq. Pinks: *Premier*, Duke of St. Alban's, Mr. J. Haines. *Dark Laced*, 1, Duke of St. Alban's Mr. Haines; 2, Eliza, Mr. Coudrey; 3, Elizabeth, Mr. Haines. *Red Laced*, 1, Rainforth's Prudence, Mr. Coudrey; 2, Duke of Buckingham, do.; 3, Emperor, Mr. Haines. *Plain*, 1, Lea Arrow, do.; 2, Seedling, Mr. Flindell; 3, Seedling, Mr. Haines. *Seedlings*, 1, do.; 2, do. Ranunculuses: 12—1, Mr. Britten; 2, Mr. Mellon. 6 do.—1, Mr. Phillips; 2, Mr. Mellon. Pansies: 1st twenty-four, Mr. W. Earl, with Zaphara, Eclipse, Prince Albert, Angelica, Maid of Milan, Jehu, Imogene, Jupiter, Lady Lucy, Jewess, Earl of Clarendon, Amulet, Marmion, Rufus, Launcelot, Mulberry Superb, Brilliant, Lovely Bride, and six seedlings; 2d do., Mr. T. Mellon, with Miracle, Imogene, Eclipse, Paul Pry, Model of Perfection, Jewess, Doctor Lindley, Duke of Wellington, Giant's Bride, Antagonist, Argus, Juliet, Flora Major, Model, Mdlle. Celeste, Uncas, Garrick, and seven seedlings, 1st twelve, Mr. Earl, with Hope, Imogene, Jewess, Victoria splendens, Jupiter, Jehu, Maid of Milan, Marmion, Angelica, and three seedlings; 2nd twelve, Mr. Mellon, with Eclipse, Imogene, Paul Pry, Model of Perfection, Jewess, Dr. Lindley, Giant's Bride, Napoleon, Antagonist, Model, and two seedlings. *Seedlings*, 1, 2, Mr. Earl. Orchidaceæ: 1, Oncídium altíssimum, A. Kenrick, Esq.; 2, O. flexuosum, do.; 3, Aérides oderatum, do. Stove Plants: 1, Epiphyllum, Mr. Moore; 2, Euphórbia splendens, Messrs. Pope and Sons; 3, Gloxínia rubra, J. Gough, Esq. Greenhouse Plants: 1, Pimelea decussata, J. Gough, Esq.; 2, Fúchsia corymbiflora, Mr. M. Kellett. 3, Nérium splendens, A. Kenrick, Esq. Ericas: 1, ampullacea, Mr. Coudrey; 2, tricolor, Messrs. Pope and Sons; 3, fúlgida, Mr. Moore. Pelargoniums: 1, Sylph, Mr. Coudrey; 2, Victory, A. Kenrick, Esq.; 3, Foster's roseum, do. Roses in Pots: 1, White Moss, Mr. Belliss; 2, Waterloo, Mr. Moore; 3, Fairy Rose, J. Gough, Esq. Calceolarias: 1, Seedling, A. Kenrick, Esq.; 2, Seedling, J. Mason, Esq.; 3, Lady of the Lake, Mr Kellett. Hardy Shrubs: 1, Pernéttia, sp., Messrs. Pope and Sons; 2, Kálmia latifólia, Miss Bellamy; 3, Genista tinctória, Mr. Moore. Herbaceous or Frame Plants: 1, Verbena Phillípsii, J. Gough, Esq.; 2, Gladíolus Colvíllii, Mr. Moore; 3, Campánula macrantha, do. Best Eight Greenhouse Plants, Messrs. Pope and Sons. Best Eight Stove Plants, J. Mason, Esq. Best Six Cut Roses, Mr. J. Cole. Sweepstakes for Pot Roses: 1, Mr. E. Phillips; 2, Messrs. Pope and Sons. Sweepstakes of Three Pansies, Messrs. Pope and Sons. Honorary Prizes: R. L. Chance, Esq., for Keene's Seedling Strawberry; J. Upfill, Esq., for Pope's Seedling Fuchsia; Mr. M. Kellett, for Fúchsia Chándleri; and do. for Fúchsia Stándishi. *Grapes*, 1, Black Hambro', R. L. Chance, Esq. *Melons*, 1, Green Flesh, A. Kenrick, Esq. *Strawberries*, 1, Keene's Seedling, Mr. J. Mist; 2, Imperial, Mr. Coudrey. *Cucumbers*, 1, Roman Emperor, A. Kenrick, Esq.; 2, Manchester Improved, J. Mason, Esq. *Peas*, 1, Early May, J. Mason, Esq. *Beans*, 1, Johnson's Wonderful, J. Gough, Esq.; 2, Long Pods, J. Mason, Esq. *French Beans*, 1, A. Kenrick, Esq. *Cabbage*, 1, Nonpareil, J. Gough, Esq. *Cauliflower*, 1, 2, Mr. J. Rodway. *Rhubarb*, 1, Green Giant, Mr. J. Gold; 2, Myatt's Victoria, Mr. J. Mist. *Potatoes*, 1, Ash-leaf Kidney, Mr. W. Baker; 2, Hawberry, Mr. I. Davies. *Onions*, 1, Tripoli, Mr. J. Rodway; 2, White Spanish, Mr. J. Haines. *Carrots*, 1, Early Horn, Mr. I. Davies. *Turnips*, 1, Dutch, R. L. Chance, Esq.; 2, Stone, Mr Baker. *Lettuce*, 1, Golden Cos, Mr. Baker; 2, Drumhead, Mr. Baker. Various Cottagers' Prizes were also distributed.

Birmingham Horticultural Society, June 16.—The following is a list of the prizes awarded to the successful competitors at the exhibition which took place at the Society's Gardens:—EXOTIC ORCHIDACEÆ: 1, Cattleya Ackländiæ, G. Barker, Esq.; 2, Oncídium crispum, do.; 3, Cyrtochilum hastatum, do.; 4, Oncídium altissimum, A. Kenrick, Esq. *Ditto, six plants*: 1, Cattleya Móssiæ, C. Móssiæ superba, C. Móssiæ lútea, Peristéria guttata, Brássia verrucosa, and Stanhópea saccata, G. Barker, Esq.; 2, Oncídium crispum maculatum, Epidendrum cuspidatum, Oncídium pubes, Vanda Roxbúrghii, Oncídium pulvinatum, and Epidendrum ciliare, do.: 3, Chysis aúrea, Oncídium hians, Maxillária tetragona, M. víridis, Cattleya sp., and Oncídium bifólium, J. Willmore, Esq. STOVE PLANTS: 1, Ceropégia élegans, J. Willmore, Esq.; 2, Hibiscus Rosa-sinensis plena, D. Houghton, Esq.; 3, Gloxínia speciosa, do.: 4, Lantana aculeata, do. GREENHOUSE PLANTS: 1, Diosma tenuifólia, J. Willmore, Esq.; 2, Gompholóbium polymorphum, do.; 3, Nérium splendens, A. Kenrick, Esq.; 4, Fúchsia fulgens, J. Gough, Esq. ERICAS: 1, ventricosa superba, T. W. Belles, Esq.; 2, exímia, A. Kenrick, Esq.; 3, vestita alba, Messrs. Pope and Sons; 4, ventricosa carnea, do.: *six plants*: J. Willmore, Esq. PELARGONIUMS: 2, Victory, A. Kenrick, Esq.; 3, Garth's Perfection, T. W. Belles, Esq.; 3, Priory Queen, A. Kenrick, Esq.; 4, Louis Quatorze, T. W. Belles, Esq.; *six plants*: J. Uphill, Esq. Titchener, 1, for *Cut Pelargoniums*; 2, for *Specimen do.* Mr. Fielder, gr. to C. S. Dickins, Esq.; 2, *Black and white Grapes, Bouquet, and Peas*. Mr. Hall, gr. to M. Snooket, Esq., 1, for *Lettuce*; 2, for *Strawberries*.

Cork Horticultural Society, June 22.—This exhibition took place at the Corn Exchange, and was numerously attended. We subjoin a sketch of the various contributions:—From the Earl of Kingston's gardens a collection of Pelargóniums, Heaths, Calceolárias, Verbenas, and Fúchsias; also well grown specimens of Abútilon striatum, Eutáxia pungens, Diplacus puníceus, Stephanotis floribundus, Fúchsia fulgens, and Polýgala oppositifólia; with some well ripened Grapes, and a large assortment of vegetables. From J. S. Barry, Esq., of Lota, a collection of Pelargóniums, Fúchsias, Calceolárias, and other greenhouse plants; an assortment of annual flowers and vegetables. From the Marquess of Thomond's garden, some splendid Oranges; and from Viscount Berehaven, a dish of immense Shaddocks and Oranges. Mrs. B. Fitzgerald contributed some choice Pelargóniums and Ericas, fine specimens of Sóllya heterophylla, Borónia serrulata, Diplacus puníceus, and Swainsónia galegifólia; also, Grapes, Cherries, Strawberries, and a collection of vegetables. From Mr. Alex. Moore, a showy lot of Pelargóniums, and Fúchsias; also Lettuces and other vegetables. From Col. Longfield, two dishes of well-grown Peaches and Nectarines. Mr. W. Parker sent a collection of Pansies, and a glass globe filled with honey, taken from one of Nutt's beehives. Mrs. Morrogh sent a large assortment of Greenhouse and Herbaceous plants; amongst them a fine specimen of Fúchsia Chándleri, and Calochortus lúteus. From W. M. Reeves, Esq., large specimens of Fúchsia fulgens and corymbiflora, Gladíolus insignis, Alstrœméria psittacina, Clèmatis Sieboldi, and Lychnis coronata; also some splendid Rhubarb and Cauliflowers. From Mrs. Haynes, a large collection of Roses, tastefully arranged, and some seedling Pelargóniums. From D. Leahy, Esq., well grown Balsams and Cockscombs; many new Pelargóniums and Greenhouse plants; Cucumbers and other vegetables. Capt. Hill sent a large collection of Pelargóniums, Dahlias, and an assortment of fruits and vegetables. Miss Lyons sent a variety of Greenhouse plants, Balsams, and other tender annuals. Counsellor Hewitt had a variety of Roses, specimens of Brugmánsia sanguínea and lútea, Erythrina crista galli, Fúchsia fulgens, and Vallota purpúrea; also some Balsams and Pelargóniums. Mrs. Foley sent a varied assortment of Greenhouse plants, a Bouquet, and some Pansies. From Sir W. Chatterton, Roses, hardy Annuals, and a Cactus, dish of Cherries and Strawberries, a large Bouquet; with fruits and vegetables, in great variety. J. T. Cramer, Esq., sent specimens of various flowers and vegetables. C. Crofts, Esq., a Bouquet, Pinks, Ixias, Ranunculuses, and Cherries and Strawberries. From J. Lindsay, Esq., a Bouquet, and a collection of Pinks; some Cherries, Strawberries, Currants, and vegetables. From Mr. H. K. Feath, Roses, and a variety of well-grown vegetables. Mr. M. Conway contributed some Pelargóniums, Verbenas, Petúnias, and Fuchsias. Lieut. Friend, Strawberries, Gooseberries, Currants, and Apples. There were also some fine Apples of 1841, from the Rev. — England. Mr. Bradford had a collection of Heaths, Pelargóniums, and other Greenhouse Plants, and a collection of Pinks, Roses, and Pansies. From Messrs. Haycroft, a beautiful plant of Fúchsia corymbiflora, six feet high, in full flower, and a large collection of Greenhouse plants. Mr. Cutter contributed some Fúchsias and Calceolarias. The competition for native plants was confined to Mr. D. Murray, gr. to Counsellor Reeves, and Mr. D. Sullivan, gr. to P. Maylor, Esq.—The next exhibition will take place on the 27th of July.

Felton Florists' Society, June 27.—The florists of Felton and its vicinity held their annual exhibition of Ranunculuses and Pansies at Mrs. Hine's, Northumberland Arms Inn, when the following prizes were awarded:—RANUNCULUSES: *Variegated*. 1 and 2, Mr. A. Gowens; 3, Dr. Grahamsley; 4, Mr. W. Harrison; 5 and 6, Mr. Gowens. *Selfs*, 1 and 4, Rev. Jos. Orrell; 2, Mr. Harrison; 3, 5, and 6, Mr. Gowens. PANSIES: 1, *Stand of six*, Mr. J. Jeffrey, Rolla, Ne plus ultra, Thompson's Victoria, Isabel, Pilot, and Maid of the Mill; 2, Mr. Forsyth, gr. to A. J. B. Cresswell, Esq., M.P., Thompson's Eclipse, Isabel, Pilot, Forsyth's Jewess, Champion, and Counsellor; 3, Mr. J. Jeffrey, Negro Boy, Lord Durham, Agnes, Isabel, Victoria, and Pilot; 4, Rev. Jos. Orrell, Rolla, Victoria, Pilot, Wellington, Isabel, and Unknown; 5, Mr. Forsyth, Isabel, Champion, Jewess, Anna, Fanny, and Bloomsbury. 6, Rev. J. Orrell, Rolla, Wellington, Victoria, Pilot, Isabel, and Joan of Arc. *Seedling prize*, Mr. Forsyth, for Isabella. The show of Ranunculuses was very good, although many were rather too old. The stands of Pansies were far superior to any ever exhibited here before; the numerous Seedlings shown by Mr. Forsyth were generally admired. The next show, for Pinks and Roses, was appointed to take place at Mr. Liddle's, on Monday, the 11th July.

Guernsey Horticultural Society, May 25.—This exhibition exceeded all others which have hitherto taken place in this island. The following were among the more successful exhibitors:—Mr. Hoyle, for *Cucumbers, Pelargoniums, Heartsease* and *Stove Plants*: Mr. Vidamour, for *Roses, Ericas*, and *Calceolárias*: Sir O. Carey, for *Grapes, Oranges* (the latter grown in the open air), *Peas, Cucumbers*, and *Lettuces*: Mr. C. de Jersey, for *Collections of Flowers* and *Vegetables, Pelargoniums*, and *Auriculas*: Captain Appleton, for *Ranunculuses*, a collection of *Annuals*, and a *Bouquet*; Mr. J. Dobree, for *Tulips, Greenhouse Plants, Ixias*, and *Pelargóniums*; Mr. H. O. Carre, for *Dessert Pears*. T. and W. Handasyde, for Beauty of Soutra Hill, Miss Stainforth, Bridesmaid, Prince Albert, Brown's Curion, Duke of Cornwall, Brown's Flora, Duke of Devonshire-Paul Pry, Brown's Duncan, King Alfred, Angelina, Ada, Mrs. Bannet, Hecate, Robin Adair, Edmonton Hero, Black Knight, Victoria splendens, Beauty of Hitchin, Archbishop of York, Brown's Victory, Jessie, Queen Superb, Golconda, Unique, Superb, Lord Durham, Model of Perfection, Bonny Bessie, Mrs. Wyse, Lovely Bride, Queen, Courier, Lovegrove's Coronation, Wellington, Regina, and Earl of Aberdeen. PINKS, 2*l*: Mr. G. James, gr. to J. Balfour, Esq., for Princess Victoria, Omnibus, George the Fourth, Queen Victoria, Neptune, Warrior, Village Maid, Robert Burns, Candidate, Miss Johnstone, James's Conqueror, James's Prince Albert, splendens, Egyptian Prince, Pattison's Queen Victoria, Suwarrow, and James's Renown. Besides the articles sent for competition, both tents presented a brilliant display of plants for exhibition only. The small tent was occupied by a collection from Messrs. J. Dickson and Sons. This contained many well-grown Pelargóniums, Fúchsias, Calceolárias, and some splendid specimens of plants, either new or rarely seen in flower. Amongst these may be noticed, Scutellária splendens, Gloxínia rubra, Rosa Devoniensis, Oncídium flexuosum, and Nepenthes distillatória. Mr. A. Cameron, gr., Trinity Cottage, also contributed liberally to the exhibition. A basket containing several curious species of Echinocacti, for exhibition by Mr. Robt. Hall, gr. to G. Forbes, Esq., was much admired, and a premium voted for it. Among the plants suspended from the roof of the pavilion were two fine specimens of Orchidaceæ, from Dr. Neill, remarkable for rarity and beauty. Of these, Oncidium pulvinatum attracted much notice, having a flower-spike five feet long, on which were upwards of 500 blooms. From Granton House there were likewise several specimens of heaths and other plants. Many rare plants were exhibited from the Society's collection; amongst which were several remarkable for their mode of culture. Two specimens of Acróstichum alcicorne were suspended from the roof of the tent; one of which had been growing about two years in an inverted position, and the other in its natural position, the roots of both having been previously covered with Hypnum moss. There was also suspended from the roof a fine plant of Ardísia crenulata, covered at this time with fruit and flowers; the plant being nourished wholly by water, (conveyed to it by means of worsted threads acting as syphons from a vessel of water above, and which has been growing in this way for three years past. Other curiosities of a similar description were also exhibited.

Harleston Horticultural Society, June 21.—At the second exhibition of this Society the productions were very good, and the prizes were awarded as follows:—1st, *for Melon and Greenhouse Plants*, 2nd *Pelargoniums extra*, Mr. W. Hewett, gr. to Rev. Archdeacon Oldershow; 2nd *Cut Flowers*, Rev. W. P. Spencer, Starston; 2nd *Melon*, 2nd *brace of Cucumbers*, and *best Cut Flowers*, Mr. J. Brewster, gr. to Rev. W. Leigh; *best Cherries* and *Peas*, J. Whittleton, gr. to Rev. N. White; 3rd *Strawberries*, 2nd *Peas*; 2nd 12 *Roses*, T. L. Taylor, Esq.; *best* 24 *Pansies*, 12 *best do.*, *best* 24 *Roses*, *Cut Flowers extra*, J. Jeffes, Esq.; 2nd *Strawberries*, 1st and 2nd *Potatoes*, *best Lettuces*, 2nd *Greenhouse Plants*, R. Priest, Esq.; *best collection of Pelargoniums*, Mrs. Priest; *Roses and Cut Flowers*, Rev. W. J. S. Donnison; *best* 12 *Roses*, W. Bunn, Esq.; *Cut Flowers*, Mr. Francis; *best Strawberries*, Mr. Hill; *best Ranunculus*, Mr. Nichols; *best brace of Cucumbers*, Mr. Pearman. 20 Cottagers also received prizes.—*Norwich Mercury.*

Sandbach Floral and Horticultural Society, May 18.—The first meeting for the season took place at the Town-hall, and was numerously and respectably attended. The collection of Flowers, Fruits, and Vegetables, was excellent; and a few specimens of the Orchidaceous Plants, exhibited by J. Brocklehurst, Esq., M. P., were much admired. Wilson, Walthamstow; 2, Mr. B. Daly, gr. to F. R. Redwell, Esq., Walthamstow. *Specimen of Stove Plant*, 1, Mr. S. Gad, Plaistow. 12 *Geraniums*, 1, Mr. Pamplin, Nurseryman, Walthamstow, who obtained first prize for Seedling Geranium; his collection of Seedlings, raised by Mr. J. Wilson, attracted much attention, they having been generally considered as not yet surpassed. 12 *Geraniums, Gardener's Class*, 1, Mr. B. Daly. 6 *ditto*, Mr. J. Kyle: 2, Mr. J. Monk, gr. to W. W. Drake, Esq., Walthamstow. 6 *ditto, Amateurs*, 1, Mr. R. Poole, Leyton; 2, Mr. J. Brock, Barking. 12 *Calceolarias*, 1, Mr. W. Wright; 2, Mr. J. Kyle. *Seedling do.*, 1, Mr. Kyle: 2, Messrs. F. and A. Smith, Nurserymen, Cambridge Heath. *Single Cactus*, 1, Mr. J. London, gr. to S. Gurney, Esq., Upton. 6 *Balsams*, 1, Mr. B. Daly. 6 *Cockscombs*, 1, Mr. S. Murray, gr. to C. Tebbutt, Esq., Leytonstone; 2, Mr. J. Bravender, gr. to J. Wheen, Esq., Leytonstone; 3, Mr. W. Green, gr. to J. Sheppard, Esq. *Collection of Fuchsias*, 1, Mr. F. Fraser; 2, Mr. J. Pamplin. *Ditto, Amateur's Class*, Mr. R. Poole, Leyton. 3. *Hydrangea*, 1, Mr. W. Green; 2, Mr. R. Forster. *Bouquet*, 1, Mr. W. Wright. *Cut Flowers*, 1, Mr. Kyle; 2, Mr. S. Gad. 24 *Heartsease*, 1, Mr. Joseph Monk; 2, Mr. B. Daly. 24 *ditto, Amateurs*, 1, Mr. W. G. Breavington, Castle House Farm; 2, Mr. K. Poole. 24 *Roses*, 1, Mr. F. Frazer; 2, Mr. R. M'Pherson, Jun., Nurseryman, Plaistow. 12 *ditto, Amateurs*, Mr. Poole. 12 *Carnations*, 12 *Picotees, Seedling Carnation* and *Picotee*, 1st prize to each, Mr. Norman, Florist, Woolwich: these were most perfect flowers, and much admired. *Queen Pine*, 1, Mr. W. Wright. *Black Grapes*, 1, Mr. J. Black, gr. to C. T. Holcomb, Esq., Valentines, Ilford, who obtained 1st prize for *White Grapes* and *Strawberries*. *Black Grapes*, 2, Mr. J. London. *White Grapes*, 2, Mr. J. Morris, gr. to E. N. Buxton, Esq., Leytonstone. *Green Fleshed Melon*, 1, Mr. J. Morris; 2, Mr. D. Robertson, Edmonton. *Scarlet Melon*, 1, Mr. S. Allen, gr. to G. Sharpe, Esq.; 2, Mr. Lindley Murray. 1st *Black and White Cherries*, Mr. D. Robertson, also 1st for *Gooseberries, Red Currants*, and *White Currants*. 2nd, Mr. J. Carter, gr. to Mrs. Hall, Ilford, for *Gooseberries, Red Currants*, and *White Currants*. *Collection of Fruit* (6 varieties), 1, Mr. J. Kyle; 2, Mr. Robertson. *Cucumbers*, 1, Mr. J. Duck, Plaistow; 2, Mr. G. Statcher, gr. to R. F. Reynolds, Esq., Upton. 1st prize to Mr. L. Murray, and also to Mr. Duck; 2, Mr. G. H. Lovegrove, West Ham. Upwards of 30 prizes were awarded to Cottagers for fruit and vegetables, mostly grown on the allotments let out by S. Gurney, Esq., Upton: they thus receive a double reward, in the superior quality and abundant crop, and also the value of the prizes—varying in amount from 5*s.* to nearly 30*s.* each.

Sudbury Horticultural Society, July 5th.—The first show for this season was held at the New Corn Exchange; the award of prizes was as follows: An extra prize was given to Mr. Davis for a *design in flowers*, and to W. Wright, Esq., for a fine *Cucumber*, grown in the open air, without any assistance from glass. Messrs. Bass and Brown's extra prize of 6 *Pelargoniums*, to the amateur who obtained the greatest number of prizes, was awarded to the Rev. W. Syer. Amateurs. *Pelargoniums*, 1, Mr. Fulcher; 2, W. R. Bevan, Esq. *Pansies*, 1, Rev. W. Syer; 2, Mr. S. Q. Viall. *Roses*, 1, Rev. W. Syer; 2, J. Sikes, Esq. Nurserymen.—*Pelargoniums*, Messrs. Bass and Brown. *Pansies*, Mr. Chater; *Roses*, 1, Messrs. Bass and Brown; 2, Mr. Elliston. *Best* 12, Mr. Chater. General Prizes.—*Tender Plant*, 1, W. R. Bevan, Esq.; 2, N. C. Barnardiston, Esq. *Cactus*, 1, N. C. Barnardiston, Esq.; 2, Mr. Fulcher. *Balsams*, N. C. Barnardiston, Esq. *Cockscombs*, Rev. W. Syer. *Bouquet*, W. R. Bevan, Esq. *Design in Flowers*, 1, Mr. Barwick; 2, Rev. W. Syer. Fruit and Vegetables.—*Apples*, 1, E. Stedman, Esq.; 2, Col. Meyrick. *Peas*, 1, J. Sykes, Esq.; 2, Mr. Fulcher. *Onions*, 1, Rev. W. Syer; 2, Mr. Davis; 3, J. Sikes, Esq. *Strawberries*, 1, Rev. W. Syer; 2, P. E. Stedman, Esq. *Cherries*, 1, Mr. Chater; 2, Mr. Davis. *Gooseberries*, 1, Col. Meyrick; 2, P. E. Stedman, Esq. *Rhubarb*, N. C. Barnardiston, Esq. *Cucumbers*, 1, J. Sikes, Esq.; 2, Mr. S. Q. Viall. *Cauliflowers*, 1, Mr. Davis; 2, Mr. S. Q. Viall. *Potatoes*, 1, R. Jones, Esq.; 2, Mr. S. Q. Viall. *Lettuces*, 1, Mr. Davis; 2, Col. Meyrick. *Turnips*, 1, Mr. Fulcher; 2, Rev. W. Syer. *Carrots*, 1, E. Stedman, Esq.; 2, R. Jones, Esq. *Cabbages*, 1, Col. Meyrick; 2, J. Sikes, Esq. *Beans*, 1, Mr. Davis; 2, N. C. Barnardiston, Esq. *Basket of Vegetables*, 1, N. C. Barnardiston, Esq.; 2, Rev. W. Syer. English Wild-Flowers, *Rarest 25 specimens*, Mr. Chater.

Thornbury Floricultural Society, June 22.—This exhibition took place in the ruins of Thornbury Castle, when the following pieces of plate were awarded:—Pansies: 24 *blooms, open to all England*, 1, Mr. A. L. Maule, a piece of plate; 12 *blooms*, 1, Mr. Rich. Cornock, a piece of plate. The following pieces of plate were awarded to subscribers living within the distance of 10 miles, viz.:—24 *blooms*: Mr. R. Cornock, a piece of plate. 12 *blooms*: Mr. R. Cornock, a piece of plate. *Seedling*: J. M. Baxter, Esq., a piece of plate. Ranunculuses: 1, Mr. R. Cornock, a piece of plate. Numerous other prizes were awarded, and were paid in cash. The Dahlia show will take place some time in September (of which due notice will be given), when two handsome pieces of plate will be given. Some pieces of plate will likewise be given to subscribers living within the distance of 10 miles.

Whitehaven Rose and Pink Show, June 30.—The following is an account of the prizes awarded:—Roses: *Moss, best three*, 1, A. C. Gibson; 2, Mrs. Spedding; 3, 5, M. Lithgow, gr. to T. Hartley, Esq.; 4, J. White; 6, D. Gates, gr. to T. Ainsworth. *China*, 1, Mrs. Jefferson; 2, J. White; 3, R. Elliot, gr. to G. W. Hartley, Esq.; 4, 6, J. and J. Gaitskell; 5, J. Steele, gr. to W. Peile, Esq. *Scotch*, 1, 5, Mrs. Spedding; 2, 3, 4, J. and J. Gaitskell; 6, J. White. *Noisette*, 1, 4, J. and J. Gaitskell; 2, D. Gates; 3, M. Lithgow; 5, Mrs. Jefferson; 6, A. C. Gibson. *Crimson, garden*, 1, J. White; 2, M. Lithgow; 3, 4, 6, J. and J. Gaitskell; 5, D. Gates. *Red*, 1, 2, J. and J. Gaitskell; 3, M. Lithgow; 4, J. Steel; 5, Mrs. Jefferson; 6, A. C. Gibson. *Blush*, 1, J. White; 2, 5, J. and J. Gaitskell; 3, D. Gates; 4, M. Lithgow; 6, R. Elliot. *White*, 1, J. and J. Gaitskell; 2, 5, R. Elliot; 3, M. Lithgow; 4, 6, J. Steel. Pinks: *Purple Laced*, 1, 3, 6, H. Gird; 2, 5, Miss Mossop; 4, J. White. *Red Laced*, 1, 2, 3, 4, 5, H. Gird; 6, J. Steel. *Black and White*, 1, 2, Miss Mossop; 3, 4, J. Steel; 5, 6, J. and J. Gaitskell. *Best Pan of Pinks*, 1, J. White; 2, J. and J. Gaitskell. Pansies: *best Pan of Twenty*, 1, T. Williamson; 2, J. White; 3, J. Steele; 4, A. C. Gibson; 5, M. Lithgow. Heaths: 1, 3, 4, J. and J. Gaitskell, with Erica ventricosa superba, E. quadræfólia, and E. curviflora; 2, R. Elliot, Erica ventricosa superba. Pelargoniums: 1, I. Fisher, gr. to J. Hartley, Esq., with Sylph; 2, 3, 4, 5, 6, S. Dodd, gr. to the Earl of Lonsdale, with Forsteri roseum, Alarm, Garth's Perfection, Jewess, and another. Greenhouse or Stove Plants: 1, 5, 6, I. Fisher; 2, 4, S. Dodd; 3, R. Elliot. Plants *sent solely for Decoration*: 1, S. Dodd, 43 varieties; 2, I. Fisher, 30 varieties; 3, R. Elliot, 15 varieties; 4, W. M. Hobson, 19 varieties; 5, Mrs. Vickers, 4 varieties. British Plant: 1, J. Steel; 2, R. Elliot, Orchis maculata. Bouquet: 1, R. Elliot; 2, W. M. Hobson; 3, M. Lithgow; 4, J. and J. Gaitskell; 5, D. Gates; 6, Mrs. Spedding. *An extra prize was awarded to No. 5 for beauty of design.* Bouquet of British Plants: 1, R. Elliot; 2, M. Lithgow. Bouquet of Annuals: 1, J. and J. Gaitskell; 2, D. Gates. Peaches: 1, 2, R. Elliot, Royal George. Currants: *Black*, 1, T. Davidson; 2, Mrs. Spedding. *Red*, 1, T. Davidson; 2, T. Mann. *White*, 1, T. Davidson; 2, T. Mann. Gooseberries: 1, H. Frears; 2, J. White. *Heaviest Dish of* 25, 1, 2, J. and J. Gaitskell. Cherries: 1, M. Lithgow; 2, R. Elliott. Strawberries: 1, J. White; 2, I. Fisher. *Heaviest Dish of* 25, 1, 2, J. White. Raspberries; 1, T. Mann; 2, T. Gates. Cauliflowers: 1, T. Mann; 2, H. Frears. Cucumbers: 1, I. Fisher; 2, R. Elliot. Peas: 1, T. Mann; 2, T. Davidson. Extra Prizes: *Best Collection of Pinks (irregular)*, S. Dodd; *Alstræmeria aurea*, R. Elliot; *Bouquet (for beauty of design)*, D. Gates; *Grapes (Red Hambro')*, R. Elliot; *Pine Apples*, S. Dodd; *Collection of Sweet Williams*, Mrs. Buckham.—*Whitehaven Herald.*

Worcester Horticultural Society, June 22.—The third exhibition took place on Tuesday, when the following prizes were awarded:—Ranunculuses: *Dark and Dark Purple*, 1, 2, 3, Mr. Bond. *White Ground, Striped, Spotted, and Edged*, 1, 2, 3, Mr. Bond. *Yellow Ground, Striped, Spotted, and Edged*, 1, 2, 3, Mr. Bond. *Orange and Yellow Selfs*, 1, 2, Mr. Bond. *Scarlet and Crimson Selfs*, 1, 2, Mr. Bond. *Light Selfs*, 1, 2, Mr. Bond.—Pinks: *Stands of Six Blooms*, 1, Mr. Hooper; 2, Mr. Barnes. *Single Blooms, Purple-laced*, 1, Mr. Biddell; 2, Mr. Cook. *Red-laced*, 1, Earl Coventry; 2, Mr. Barnes. *Plain*, 1, Mr. Barnes: 2, Mr. Cook.—Roses: 1, Barnard's Perpetual, Mr. Thompson: 2, Unknown, Mr. T. Hooke; 3, Unknown, Mr. Smith: 4, Catafalque, Mr. Smith; 5, Yellow Noisette, Mr. Cook; 6, Celestial, Mr. Smith; 7, Boula de Nanteuil, Mr. Hooper; 8, Julia, Mr. Smith; 9, Bath White Moss, Mr. Smith; 10, Moss, Mr. Thompson; 11, Duchess of Angoulême, Mr. Brown.—Pansies: 1, Mr. Tyler; 2, Mr. Hooper. *Collections*, 1, Mr. Smith; 2, Mr. Bennett.—Stove Plants: 1, Euphórbia splendens, Mr. Burlingham; 2, Epiphyllum Ackermanni, Mr. Smith; 3, Gloxínia violácea, Mr. Smith; 4, Xylophyllum latifólium, Earl Coventry.—Greenhouse Plants: 1, Erythrina laurifólia, Mr. Tyler; 2, Fuchsia globosa, Mr. Bennett; 3, Státice arbórea, Rev. G. Woodcock; 4, Fuchsia Youellii, Mr. Bennett.—Pelargoniums: 1, Conservative, Mr. Burlingham; 2, Sylph, Mr. Burlingham; 3, Priory Queen, Rev. G. Woodcock; 4, Alexandrina, Mr. Tyler.—Hardy Shrubs: 1, Rhododendron hirsutum, Earl Coventry; 2. Clematis Sieboldi, Mr. Bennett. Herbaceous Plants: 1, Calceolária, Mr. Burlingham; 2, Pentstemon gentianoides coccínea, Mr. Cook. *Cut Specimens*: 1, Earl Coventry; 2, Fuchsia corymbiflora, Mr. Cook. Heaths: 1, Erica ventricosa stellata, Mr. Smith; 2, E. vestita, Mr. Smith. Annuals: 1, Phlox Drummondi, Rev. G. Woodcock; 2, Clintónia pulchella, Mr. Hooper. Nosegays: 1, Mr. Keeley; 2, Mr. Ball. Pinks: 1, Earl Coventry; 2, Earl Coventry. Melons: 1, R. Nuttall, Esq.; 2, R. Nuttall, Esq. Grapes: *Black*: 1, Mr. Thompson; 2, Earl Coventry. *White*: 1, Mr. Thompson; 2, Earl Coventry. Peaches: 1, Mr. Thompson. Nectarines: 1, Mr. Thompson. Cherries: 1, Mr. Eaton; 2, Mr. Bennett; 3, Mr. Bennett. Strawberries: 1, British Queen, Rev. G. Woodcock; 2, Mr. Thompson; 3, Mr. Bennett. Cauliflowers: 1, Mr. Bennett; 2, Mr. Tyler. Peas: 1, Earl Coventry; 2, Earl Coventry; 3, Mr. Thompson. Beans: 1, Mr. Bennett; 2, Earl Coventry. Lettuce: 1, Mr. Presdee; 2, Mr. Presdee. Extra Prizes: *Collection*, Mr. T. Hooke, jun.; *Cymbídium Aloifólium*, Mr. Bennett; *Alstræméria Pelegrina*, Mr. Thompson; *Spléndidum*, Mr. T. Burlingham, jun.; *Campánula*, Mr. Stanton, ——, Earl Coventry; *Peaches*, Mr. Thompson; *Cucumbers*, 1 and 2, Earl Coventry; *Erica Bowieana*, Mr. Smith.—*Worcester Herald.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

E'ria polyura. Many-tailed Eria. Orchidáceæ, § Meláxeæ. Gynándria Monándria. (*Stove Epiphyte.*)—Of the now very numerous species of Eria this is one of the more graceful, producing from the sides of long leafy fleshy stems a profusion of delicate tails of flowers, each nearly six inches long. They resemble little semitransparent bells just tinged with pink, and having a rich purple and yellow céntre. The latter appearance arises from the labellum, which is ovate, heart-shaped, and a rich port-wine purple, with a bright yellow tip. Mr. Cuming found it in Manilla, and sent it to Messrs. Loddiges, with whom it flowered in October 1841. It is a plant of the easiest cultivation, but requires a hot damp atmosphere, such as that of an Orchidaceous house where Dendróbiums and such plants flourish. The general treatment ought to be the same as is given generally to the extensive race to which it belongs.—*Bot. Reg.*

Helleborus orientalis. Eastern Hellebore. (*Greenhouse Herbaceous Plant.*) Ranunculáceæ. Polyándria Pentagynia.—The roots of this species were sent to the Horticultural Society from Bithynian Olympus. It is undoubtedly hardy, although, on account of its great rarity, it has at present been kept in the greenhouse. If so, and it should flower at the same time as the Christmas Rose, as is probable, it will be a welcome addition to our collections. In the greenhouse it produces its purple flowers in February and March, and requires rather a damp shady situation, with peaty soil to grow in. It is easily increased either by dividing the old plants, when sufficiently large, or by seeds, which should be sown directly they are ripe.—*Bot. Reg.*

MISCELLANEOUS.

New Zealand Coniferous Plants and Ferns.—We extract the following memoranda from an interesting account of the New Zealand Vegetation, by Mr. Colenso, published in a late Number of Sir W. Hooker's *London Journal of Botany*:—"Nothing can equal the elegant appearance of the fruit of *Podocarpus ferrugineus*, when fully ripe. Its carmine-coloured drupes, besprinkled with a glaucous powder, present a most beautiful and tempting object to the traveller. Unfortunately, the flavour possesses so very much of that turpentine-like gust (or smack) peculiar to the Pine tribe, as to cause these fruits to be invariably rejected, after a single trial, by the European visitant. The fleshy receptacle, which bears the naked ovule, in *Dacrydium excelsum*, is much milder, and a favourite article of food with the natives. I have partaken of this pretty freely myself, and can assure you that it is by no means bad eating. So also the fleshy receptacles in *Dacrydium cupressinum (Rimu)* and *Podocarpus Totarra* (the *Totara*), are consumed by the aborigines; but being much smaller, they are not so highly esteemed. The receptacles in all the species are coloured from orange to crimson, and in their season assume a most splendid appearance. The New Zealanders have told me about a *Kahikatea (Dacrydium excelsum)* which bears its ovules on a *white* receptacle. I have not yet seen it, though I have made assiduous search, and therefore cannot pronounce whether it be merely a variety of *D. cupressinum*, or a distinct species. The *king of the whole lot* is my *new Pine*, from the high hills near the Eastern coast. For many years I had heard of this tree from the aborigines, but could never obtain a specimen, no one knowing where it was to be found. They had heard of such a Pine, and some of the oldest chiefs had occasionally seen it when hunting or shooting in the forests; but all agreed that it was very rare, only growing singly. The reason, too, for its unfrequent occurrence was this: Taue, one of their illustrious demi-gods, hid it! Still it existed—a distinct tree—which never rotted! As a proof of all this, the people, wherever they could find one, reserved it for a coffin to hold the remains of a chief. These statements, you may well suppose, only inflamed my desire to possess this wonderful tree. I sought and sought, but all in vain; wherever I went, making inquiries and offering rewards for it, until I actually gained a name among the natives for doing so. At last, rather early in this year (1841), after a toilsome march through unfrequented spot and jungle to the place where I had been informed that one grew, I found it! I will not attempt to describe my satisfaction, which was much increased by observing that the specimens I had acquired were in fruit. The tree *(for a Pine)* is not large—about 50 ft. high, and 2½ ft. in diameter; but, from the New Zealanders' account, its chief value resides in its resisting rottenness. In appearance it somewhat resembles the *Kahikatea (Dacrydium excelsum)*; and I venture to suppose that it may constitute a new and connecting genus between *Phyllocladus* and *Dacrydium*. I leave, of course, the bestowing of an appellation to you. I also send a specimen of the wood. The bark on the trunk is deciduous, but not like that of the *Totara*, which is fibrous; this is only scaly and brittle, as in the *Dammara Australis*. Subsequently, on the same range of hill, I saw two other of these *Pines*, of nearly similar size. Among them is a true Pine (*Podocarpus Totara*), perfectly formed, with root, foliage, and fruit, yet only three inches high! The branches of this pigmy tree were brachiate and recumbent, and formed a circle of a foot in diameter. A friend, who lives at Rotorua, one of our Mission stations, about three days' journey from Tongariro, gathered and gave me these minute specimens, having himself performed the adventurous journey to the top of this volcano. The Arborescent Ferns attain a great size in New Zealand. I lately observed a prostrate, though still living stem, perhaps, of *Cyathea medullaris*, which measured 42 feet in length, as it lay; *i. e.*, from the end of the trunk to the apex, exclusive of the petioles of its fronds. It had been recently felled by a native, who had lopped off its leafy honours; it had, however, subsequently, while in that condition, shot out two new fronds. The pith of the C. *medullaris* is eaten by the New Zealanders, and constitutes one of the best and most nutritive of all their indigenous articles of food. The fronds of this most graceful Fern form a droop, often of 18 feet; and when seen to advantage, growing (as it frequently does) singly, on the bank of a purling rill of delicious water, it presents such an object as may well entrance the beholder's gaze. The main stalk seldom attains a great height, from 12 to 14 feet up to the springing of the petioles. *Dicksonia squamosa*, a truly stately Fern, may often be seen in groups of from 10 to 40, their average height from six to ten feet. The *Cyathea dealbata* is the most light and airy of all our Tree-ferns—recalling, in its general appearance, those Palms which form so striking a character in Oriental scenery. At Owae, on the east coast, I once sent my little native lad, called 'Ruru,' to the top of a *Cyathea*, in order to ascertain its height. He gained the apex, and sate, rocking like a monkey, on the crown; the line which he cast down I accurately measured, and found it to be more than 38 feet in length. An owl may often be seen, umbrageously secluded from 'Sol's glaring eye,' perched on the petiole of one of its fronds. The '*Para*' of the natives is also a *Tree-fern*, and used to form one of their favourite articles of food, to which its present scarcity is probably now owing. It is apparently the *Marattia ele-*

gans of Endlicher. It is remarkable for the joint-like process by which its frondlets are attached to the stipes, and which, in the living state, act like joints, permitting the delicate foliage to play up and down with every breeze of wind. *Lomaria Fraseri*, a very pretty Fern, often when growing in its favourite humid woods, attains an arborescent character. Once, when returning from Wangerei Bay, I passed through a dense and wet forest, where this graceful plant abounded. I gathered two specimens (one of which I now forward to you) and much wishing to preserve them entire, I carried them both for many a weary mile through thick jungle and forests; sometimes protecting them with the flap of my coat, and sometimes with my body, from the *Rubus* and other shrubs which seemed determined on destroying my prizes. But I had the satisfaction of bearing them home uninjured."

Rooks, Grubs, and Slugs.—It is of great importance, in all cases, *to know accurately* the enemy we are called to contend with. The farmer spares no labour to extirpate the weeds from his soil; but he, in many cases, knows not what to do in order to avoid the depredations of grubs, slugs, wireworms, flies, beetles, caterpillars, mildew, field-mice, &c.; and, while he sits bemoaning his fate, a Druid accosts him, and among other precious advices bids him invite the rooks to his ground, protect their sacred nests, and leave the vermin to their care.—The larvæ of the crane-flies are almost the only species of grubs known to be extensively hurtful in the fields. These grubs breathe by their hinder extremity, by small pores having coverings fitted to protect them while the insect mines its way below ground (this shows their adaptation for creeping below ground); while slugs breathe by an orifice near their front, through gills (this shows them little fitted for working their way under ground). Grubs feed on the tender roots of the grasses (including corn); while slugs devour the tender leaves. Grubs feed wholly below ground; while slugs feed chiefly, if not wholly, above ground. Grubs are killed by moisture only at the time of their first transformation (into the pupa state); slugs cannot at any time live without moisture. Grubs never come above ground, at least during the day; slugs, in wet weather, are seen above ground at all hours, and in dry weather they come out at night, or during the dews. Grubs can live for a time, and crawl freely, in dry soil; slugs have a slime on their body, which unfits them for creeping except on moist surfaces. Grubs begin to live in October or November, and do most injury in April and May; I know not when slugs begin to live, but in the middle of February they are little larger than pin heads, and do no material injury till June, or the end of May. The slug here referred to is the common white one, which injures the turnips, oats, and wheat.—Nothing can be more unfounded than the opinion that the rooks, either in winter or in spring, destroy grubs to any valuable extent. The grubs work below the surface, where the rooks cannot reach them. I have had good lea of four or five years old. I have often gone over it in spring, and attentively examined it with a magnifying glass where I knew that grubs abounded, yet I never saw one of them above ground. But when I cut the turf, I found plenty about an inch from the top. The grubs are said to come above ground at night; and it is in belief of this that farmers roll their oat-fields during night, in hope of thus killing the grubs. And they tell us that the roller becomes clagged over with the bruised grubs. It might be worth their while to ascertain whether they had not killed earthworms and slugs instead of grubs. In young oats, I have sometimes found a grub within half an inch of the top; but I never knew a case of rolling decidedly killing the grubs to any great extent. On heavy clay soils, rolling, though it does not at once kill the grubs, will so compress the soil that the injury done by them will be greatly diminished, and (if the ground is not rolled till after the plants are fully formed above ground) vegetation will thus be allowed to advance with little injury from them. But where the soil contains light moss, rolling for grubs is utterly useless. But rooks so seldom visit the lea-fields in winter or spring, that their visits are by country folks viewed as portentous of storm. How, then, can any maintain that they destroy grubs in winter or spring? I have felt interested in seeking to discover what rooks are employed about on these occasions, and therefore I have followed them to the spots where they alighted, sometimes immediately after they sat down, and at other times after they had been for some time on the ground. I found many casts of earth-worms, and sometimes several small white slugs on the surface, but no grubs; and my conclusion from these observations was, that the rooks were employed in seeking earth-worms, and perhaps small slugs. I express doubt of their eating the slugs, because I have never heard of any person who ever saw a rook take a slug in his mouth, or had any satisfactory evidence that they ever taste slugs; while, on the contrary, every ploughman has an hundred times seen them devouring earth-worms. The rooks have in winter been accused of rooting up whole crops of clover. If they were then in search of grubs, their services were dearly bought. But who ever saw rooks tear up grass on old lea, where grubs chiefly abound? They have not strength enough for this; and without tearing up the grass, they cannot get the grubs at its roots. How foolish would it be, how unlike the sagacity of rooks, to labour so hard for grubs, at a season of the year when an hundred (I may say five hundred) would scarcely be a meal to one of them, and when they can so much more easily tear up wheat plants, and get plenty of earth-worms! But if the rooks do not eat grubs in winter or early spring, I am told that they take them afterwards to their nests, and feed their young with them. I believe there is some little truth in this. They turn over a few of the clods after, but not before, the oats germinate on the sown fields, and below these they find either grubs or earth-worms; but after germination, it would be vain to expect many grubs under clods. By far the greater part of them are then dispersed over the soil, and preying on the roots. I sowed a few acres of a five-years-old lea field on 17th ult., and have often examined it since: and I aver, that during the first week after the seed was harrowed, I found many, I may say hundreds of places scraped by the rooks, exactly as the hens scrape; and, from attentive inspection at different times since the oats germinated, I estimated the average number of grubs on a square foot of the sowed ground to be at least ten, and the average number which the rooks might take, by turning over the clods, one on every ten or twelve square feet of surface. It is easy to distinguish where clods have been moved after rain has fallen on the soil. The above estimate makes it impossible for the rooks to take more than one per cent. of the grubs from the germinated oats; a small compensation for the mischief done by them at all seasons! If any person doubt that so many as ten grubs may be found on a square foot, Messrs. Kirby and Spence will tell him that 210 have been found on one square foot. It will naturally be inquired, 'How are we to save our crops on fields which have been late ploughed, and where we find grubs abound?' I shall copy part of an article from the 'Northern Agricultural Magazine' for September, 1828, as describing the best method I am acquainted with:—'During the last fourteen years,' says the writer, 'I have invariably got rid of them (grubs) by dibbling; and though in 1818 I had upwards of sixteen acres which, to all appearance, were gone, so much so that my neighbours advised me to plough them up, I persevered, had an excellent crop, and sold the whole for 11*l.* 14*s.* per acre; while those around me who persisted in rolling during the night sustained a total loss. The process is simple, and the expense from 3*s.* 4*d.* to 4*s.* 2*d.* per acre. When the braird turns sickly and yellow, be assured the grub has been busy. Lose no time in rolling (which is merely to smooth and firm the surface), then put two or three women on each ridge, according to its breadth, with iron-shod potato dibbles, and let them proceed, entering it about six inches, and turn it round, leaving the holes entire and smooth, and about twelve or fourteen inches separate every way. As night approaches, the worms (grubs) move about, and falling into the holes remain there. I have often found eight to sixteen in each. In the morning they soon die, and in the course of the day they have the appearance of a spoonful of common train oil. And unless it be from this very substance affording additional nourishment to the roots, I am at a loss to account for the crop, when thus infested and treated, being always the best in the field.'—I shall now state a few facts with respect to the farmer's enemy, the white slug. I have mentioned the supposition that rooks may, in winter and in early spring, eat a few small white slugs. I know that they devour earth-worms at all seasons of the year, because I have often seen them follow the plough and pick them up; but I never saw them eat slugs, though I have often seen them pass places where slugs abounded. Therefore, I consider their eating slugs as a mere supposition unproved. But it is no supposition—it is a notorious fact that their services against the slug are utterly without value to the farmer. The facts of last season alone may set this question for ever at rest. The winter and spring of 1840, mild and moist till 15th February, gave the rooks at least the usual facility of destroying slugs; but what were the effects? I had a field of four-years-old lea, a superior gravelly loam, pretty uniform in quality, and only from three hundred to five hundred yards distant from an extensive rookery. Circumstances compelled me to plough and sow this field in different lots, and at different times. Lot 1st was ploughed between the 9th and 13th of March, and sowed on 30th and 31st. No slugs were on its plants on 29th June; at least I found but one slug in going over four or five acres, and the plants had no appearance of being in the least injured by slugs. The crop on this lot then looked fully equal to any in the district. Lot 2d was but one ridge on the north end of lot 1st, at least equal in soil. It was both ploughed and sown on 31st March. It had, on an average (on 29th June), about one slug on each oat plant. Lot 3d consisted of a few acres contiguous to lot 1st, on its south end. It was ploughed on 13th and 14th March, and sown on 14th April. It had on an average about three slugs on every two plants. Lot 4th, also a few acres, was ploughed between 23d March and 12th April, and sowed on 13th April. It lay west from lot 1st, and separated from it only by a patch of dry meadow. It had fully two, or perhaps nearly three, slugs on each oat plant. Lot 5th lay south from lot 4th, was ploughed between the 18th and 21st March, and sown on the 20th April. I am sorry to be compelled to state that the slugs on this lot as exceeding four on each oat plant! The appearance was most melancholy and disgusting. Every blade was more or less injured by the slugs; many blades were stripped so, that only some thready fibres remained, and many were half withered! The plants were very strong in stem, yet many were half bent down with the weight of slugs on them. Need I tell the rook advocates that these were the slugs which injure the corn, and these were the slugs which rooks will not eat? For, as I stated before, the rooks passed over them every day, yet not one would light on them! The slugs were set up to tempt the rooks, but the temptation was vain! How long will some men adhere to absurd notions?—*Dumfries Herald.*

Asphodeleous Plants.—Many of these secrete in their bulbs volatile oils or acrid principles, and these being in greater or less proportion to the rest of the herbaceous portion, several species have been employed as condiments or as medicines. Though in the parts of Asia earliest inhabited the Asphodeleæ are less abundant, yet many are mentioned by the Persian writers on Materia Medica, in consequence, probably, of their being indebted for their information to the Arabic translations of Greek authors. The Onion, Garlic, and Leek, called in Arabic Busl, Som, and Korras, seem to be alluded to in the earliest parts of the Bible (Numbers, ch. xi., v. 12), as the names there used are very similar to these. All are cultivated in gardens in India, as well as Allium ascalonicum and A. tuberosum. The bulbs of Allium leptophyllum are eaten by the hill-people, and the leaves are dried and preserved as a condiment. Muscari moschatum, *βολβος εμετικος* of Dioscorides, is literally translated Busl-al-kue by the Arabs. Squill has been most anciently and extensively employed, owing to the presence in it both of a volatile acrid matter and a bitter principle called scillitin; according to the dose Squill may stimulate various functions or act as an emetic. It is curious that in India a species very closely allied to the Mediterranean plant, and called Scilla indica by Dr. Roxburgh, is substituted for the Urginea or Squilla maritima, and Iskeel given as its Greek name; the bulb is also used by weavers in preparing their thread. Asparagus officinalis contains a peculiar principle, which by Vauquelin and Robiquet was called Asparagine. The roots of Asparagus racemosus and of A. adscendens are both used medicinally in North India; those of the latter, conical in form and semi-transparent, are considered a good substitute for salep.—*Royle's Illustrations.*

Management of Bees in Kashmir.—Every farmer in the Eastern district of Kashmir has several hives in his house, in building which a provision is generally made, by leaving appropriate cavities in the walls, which cavities are cylindrical, and extend quite through the walls. These tubes are lined by a plastering of clay mortar, about an inch thick, and the mortar is worked up with the chaff or husk of Rice, or with the down of Thistles. The dimensions of a hive are, on an average, about 14 inches in diameter, and, when closed at both ends, about 20 or 22 inches in length. That end of the cylinder next the apartment is closed by a round platter of red pottery ware, a little convex in the middle, but the edges are made flush with the wall by a luting of clay-mortar, and the other extremity is shut by a similar dish, having a circular hole, about a third of an inch in diameter, in its centre. The process of preserving the whole swarm when the honey is taken is well worthy of imitation in Europe, and is effected in the following manner:—Having in readiness a wisp of dry rice straw, and a small quantity of burning charcoal in an earthen dish, the master of the house, with a few strokes of the point of a sickle, disengages the inner platter of the tube, bringing into view the combs suspended from the roof of the hive, and almost wholly covered with bees, none of which, however, offer to resent the aggression, or to enter the room. Having placed the straw upon the charcoal, and holding the dish close to the mouth of the whole, he blew the smoke strongly against the combs, but removed the straw the instant it took fire, to prevent it from burning the bees, and quenched the flame before he employed it again. Almost stifled by the smoke, the bees hurried through the outer door, when the farmer introducing his sickle, cut down the combs nearest to him, which were received into a dish previously slidden underneath them, and left undisturbed about one third of the combs, which were almost close to the outer door. He then replaced the inner platter, and brushing off hastily a few bees which clung to the combs, though apparently in a state of stupefaction, threw them out of the house. Observing many others lying motionless on the floor of the hive, I inquired whether they would recover, I was answered in the affirmative, but was not wholly satisfied that this recovery would take place.—*Moorcroft's Travels*, vol. ii., p. 155.

Horned or Spurred Rye.—It is well known that the Rye is subject to a disease which causes its grains to lengthen, harden, turn black, and form horns or spurs upon the ears. Where Rye is the food of man or of cattle most dreadful consequences have followed the use of the spurred grains. The French call this disease the Ergot, a name now familiarised among us. Some curious observations have lately been made upon it by M. Bonjean. He says that the action of Ergot on animals is extremely similar to that of morphine, although it in fact contains no trace of that substance. The first effect of it is to produce a loss of appetite, and a kind of stupefaction; when it begins to act, dogs howl frightfully until they are completely under its influence, and then lie down and groan. In fowls the comb and crop become black. It appears that the Ergot which breaks with a white fracture is quite as dangerous as that which is violet; but until it is quite ripe it has no dangerous action; six or eight days are sufficient for its maturity, and even its being very old, hard, and dry seems in no way to impair its venomous qualities. M. Bonjean adds that the Ergot contains two principles entirely different: one, of an oily nature, is venomous; the other, of a watery character, is harmless, but produces the extraordinary medical effects for which Ergot is employed—in particular in stopping the most frightful cases of hemorrhage. He asserts that the watery part, which he calls *hæmostatic extract*, may be prepared without difficulty, and that he has administered as much as 2 drachms of it, which is equal to 9 or 10 drachms of the Ergot, without any dangerous consequences.

A Great Misfortune.—In a late Number of the "Botanical Magazine" is a figure of a plant called Mr. Wailes's Catasetum. A young lady, hearing this mentioned, exclaimed, "Mr. Wailes's cat-has-eat-him! what a sad death to die!"

Hungarian Naturalists.—It is announced that the next annual meeting will be held at Neusohl and Szliacs, on the 4th of August.

THE TARIFF,

AS IT HAS PASSED BOTH HOUSES OF PARLIAMENT, SO FAR AS AGRICULTURAL OR HORTICULTURAL PRODUCE, AND TIMBER, ARE CONCERNED.

Fruits, Trees, and Plants of Kashmir.—Abundance of fruits grow wild in this country, and many thousands of acres, skirting the foot of the hills, are covered with Apple and Pear trees, and Vines in full bearing; they are also cultivated, as are Apricots, Peaches, Cherries, and Plums. The Walnut is one of the principal articles of cultivation; there are four varieties of it, but one kind is remarkable for being much thinner in the shell and larger than the rest. Its superiority is said to be attributable to its having been originally engrafted; however this may be, it is now raised from seed alone, and does not degenerate. The nuts, steeped in water for eight days, are planted in the beginning of March, and the shoot generally makes its appearance in about 40 days. If reared by grafts, the process is performed when the plants are five years old; the head being cut off horizontally, at a convenient height, is partially split, and the scion is inserted into this without any binding; but clay mortar, mixed up with rice husks, is put round it, and kept from being washed away by being enveloped in broad slips of birch bark. About 12,000 ass-loads of Walnut kernels are annually appropriated to the oil press in Kashmir, where Walnut oil is preferred to Linseed oil, and is chiefly employed in cookery and for burning in lamps. This oil possesses such qualities as fairly entitle it to introduction into Europe, and if divested of its mucilage, it might, perhaps, compete with oil of Olives, at least for medicinal purposes, and could be raised in any quantity in the British Indian provinces. There are said to be 18 or 20 varieties of Grapes in this country, of which only 4 are of foreign introduction; these are usually cultivated on high horizontal trellises of wood. The indigenous Vines are generally planted at the foot of a Poplar, and run up to the height of 50 or 60 feet, bearing abundance of fruit. The Grapes are commonly thick-skinned, rather rough and astringent, but juicy. They are gathered about October, and are kept through the winter in shallow earthen vessels till the spring, when they are applied to the fabrication of wine, vinegar, and brandy. The Sanjit (?) is plentiful at Kashmir, and has a beautiful appearance; its flowers are exquisitely sweet, and its fruit, by distillation, yields a beverage which the Chinese hold to be not inferior to that of the Grape. The Horse Chesnut is wild, and the Hazel is abundant, but so luxuriant in the production of the wood and leaf, that the nuts, scarcely of the size of peas, do not come to perfection. The Alder is of rapid growth, and the shoots are tall, straight, and free from knots. The most valuable tree, however, is the Deodar, a variety of Cedar, the timber of which is extensively employed in the construction of houses, temples, and bridges: pieces of it from the Zein-ul-Kadal bridge were found little decayed, although exposed to the action of the water for 400 years. The Crocus of Kashmir has long been celebrated for the excellence of its saffron; it produces freely the third year after being planted: the greater part is exported to Hindustan. Amongst the other useful plants occur Alisma plantago, and the Cárthamus tinctórius. The Cotton plant also grows here, in every variety of situation: it is seldom higher than two feet, and if taller, is said to yield an inferior article. It is sown in May, and the cotton is gathered in September and October. About a thousand ass-loads of the root of the Kulh, or Costus, from the mountains, are annually exported to China: for what purpose the Chinese use it, is not known; but in the north of Hindustan it is celebrated as a vermifuge, being administered to children in an infusion of the powdered root; it is also used as a topical application in chronic rheumatism.—*Moorcroft's Travels*, vol. ii., p. 145.—[What is Sanjit? The Hazel, Alder and Crocus here spoken of are not the same species as those of Europe. In what way is Alisma Plantago used?

Plums of Thibet.—The orchards of Deh Dadeh are famous for Pomegranates and Plums. There are two kinds of the latter, one a large black Plum or Gage, the other called Kara Alu, the Damson of England. This is preserved in an intermediate state between dry and fresh, so perfectly, that the skin can readily be separated from the pulp; at the time I had an opportunity of tasting it, the beginning of February, it was infinitely preferable to the best French Prune. The Plums are gathered with their footstalks, and tied with a thread to a Willow twig so as not to touch; they are then hung up to dry.—*Moorcroft's Travels*, vol. ii., p. 491.

Reviews.

Selby's British Forest Trees.

In Nos. 4, 5, and 6 of this excellent work we find popular notices of Willows, Poplars, Alders, Birch, and Oaks, the history of all which is condensed with the same skill and practical knowledge that have elicited our approbation on former occasions. The following account of the Athenian Poplar will be new to many of our readers:—

"As a species nearly allied to the Aspen, but as an ornamental tree superior to it in many respects, we deem the Populus græca of Aiton, and other writers, worthy of a few remarks. The specific term of græca, and classic appellation of Athenian Poplar, naturally lead to the supposition that this species is indigenous to Greece, and that it derives its name from the city of Minerva; such an opinion we entertained in common, we believe, with many others, and even botanical writers gave weight and currency to the supposition, as Willdenow records it in his "Species Plantarum" as a native of the islands of the Archipelago. It appears, however, from the account contained in the "Nov. du Hamel," and from other evidence, that the North American Continent is its real native country, and that growing abundantly in a particular township called Athens, it received from it the imposing and euphonious title of Athenian Poplar. This origin Loudon thinks the more probable from the circumstance of its having been first introduced by Hugh, Duke of Northumberland, who served in America during the colonial war, and imported from thence a great variety of American trees, many of which now adorn the grounds at Sion House and Alnwick Castle, at which latter place the original tree from whence our own plants and those disseminated in the north of England are derived was first planted. It is a tree of handsome appearance, with a stem rather slender in proportion to its height. The bark, until the trees become of a considerable size and age, is very smooth, and of a pale greenish-grey colour, and the leaves, which are roundish-ovate in shape, and terminate in a sharp point, are of a pleasant, deep, and rather glaucous green; they expand early in spring, immediately succeeding those of the Balsam Poplar, and have the advantage of being retained till a late period in autumn. The catkins are shorter than those of the Aspen, and come out at a much earlier period. It grows rapidly, young trees often making shoots in one season of five or six feet in length, and, though a slender-stemmed tree, has the valuable property of resisting the wind, and is never seen, even in the most exposed situations, but with an erect and perpendicular trunk. The same objection, however, attends the cultivation of this species as that of the Aspen, viz., the throwing up of numerous suckers from the surface roots, and on this account its cultivation as an ornamental tree must always be limited, and of the propriety of planting it in mass with a view to profit, in outlying situations, we cannot venture an opinion, having had but little experience of the properties and qualities of the wood."

In the account of the Alder are some observations as to its effect on soil which deserve attention.

"Favourable, however, as our opinion of the Alder may appear to be, viewing it as an ornamental tree, and much as we should regret its disappearance from scenery where it is an expected and natural attendant, we are far from advocating its cultivation upon an extended scale, or as a profitable timber-tree; on the contrary, we advise the planter to be chary in admitting it into his grounds, and when he does, always under certain precautions and in limited numbers. In many treatises on planting we find the Alder mentioned, and recommended as a proper plant to fill up moist tracts in woods and artificial plantations; but the authors who thus recommend it seem not to have been aware that in so doing they were giving directions which, if adopted, would soon convert into a complete morass or bog, ground that otherwise by draining and planting with trees of a different nature might be rendered comparatively dry and productive. Such, however, is the nature of the Alder, that wherever planted it attracts and retains the moisture around it. This effect is occasioned by the nature of its roots, which are chiefly composed of a huge mass of small fibres, whose capillary attraction is always in action, and prevents the escape of the redundant water in the vicinity of the plants. This property of creating swamps we have repeatedly observed in the Alder, and from experiments we have made, are fully convinced that a plantation of Alders would soon render the ground (even should it be previously of tolerably sound and dry quality) soft and spongy, and in time convert it into a decided bog. The Alder, therefore, in our opinion, ought never to be planted in low bottom ground of a moist or wet nature (except in particular localities, such as where it is cultivated in the coppice or holt fashion, for the valuable charcoal it produces); if introduced at all, it ought to be where it cannot well retain the water in any quantity around its roots. All moist and spongy land we would recommend to be well drained by open cuts, and then planted with trees whose roots, instead of retaining water, act rather as drains; such are some of the Poplars, the Ash, &c., whose roots are thick, and extend horizontally to a great distance on every side."

Speaking of the Oak, Mr. Selby has some valuable practical observations upon the effect of pruning it.

"The excision of large branches of the Oak close by the stem we have always found attended by injurious effects, but to a much greater extent when performed during the dormant or winter season than when the tree was in leaf, and its vitality in full action. If performed during the first-named period, in addition to a rapid taint or incipient decay of the surface of the wound, we have generally observed that the bark at its lower angle lost its vitality and began to decay, thus enlarging the wound to a considerable extent downwards, as shown in the figure, and exposing, in addition to the space occupied by the branch, a large surface of the stem to the action of the air and moisture. This, however, rarely takes place in a healthy tree when the branch is taken off during summer, or immediately after the tree has expanded its leaves, for its vital functions are then in full activity, and it has already begun to elaborate and deposit its layer of alburnum or young wood, which immediately begins to form around the edges of the wound as shown in the figure, (where the white ring represents the recently-deposited wood,) and, continuing to advance upon it, has generally by the end of summer so far covered it as to protect the lower angle from the effects of cold and moisture. But the Oak in mixed plantations, or grown in mass, does not require the artificial pruning that Pontey and others have advocated, to give it length and cleanness of stem, to qualify it when mature for plank timber; in such situations it must necessarily make every effort to keep pace with the growth of the other trees around to secure its portion of light and air; its growth is, therefore, for many years principally confined to the elongation of the trunk or main stem; this, together with the confined space to which it is restricted, prevents the vigorous growth and great enlargement of the lateral branches, which always takes place in single trees, or where they have space and air. Indeed the difficulty is to induce the Oak in plantations to retain lateral branches sufficient to maintain and support it in vigorous health, and this can only be effected by oft-repeated thinnings to admit of sufficient light and air, and prevent too close an interference of other trees with its growth and head room; for how often do mixed plantations meet the eye wherein the unfortunate Oaks, from want of air and timely thinning, are drawn up to long consumptive-looking poles, entirely divested of their lateral branches, or as it were deprived of a portion of their lungs, and barely kept in a lingering state of existence by the few topmost shoots, that in the struggle for life have forced their way to the light! At Twizell, where thinning has been freely administered and carefully attended to, the Oaks in plantations of about thirty years old have run up with fine straight stems, many of them full thirty feet in length, and still carrying an upright leader. All these, however, still retain a portion of their lateral branches, which assist so essentially in the important functions of conducting and elaborating the sap, and without which the deposition of the woody fibre cannot be effected to the extent necessary to the health and vigour of the tree; these laterals, we expect, will retain their vitality so long as the trees require and are benefited by their presence, their removal or decay only taking place gradually, or as the upper branches which are to form the future head of the tree become enlarged, and are able to take upon themselves the entire support of the lower portion of their trunks. Upon single trees, or where the Oak stands free and unencumbered, the pruning knife must be used with the greatest caution, and only at an early stage of growth, when it may be necessary to remove a second leader, or to curtail a side branch that threatens to interfere with the form and destroy the balance of the plant; for being naturally a wide-spreading tree, the lopping of the side branches in order to give length of stem, as directed and recommended by some writers, is certain not only to destroy its characteristic beauty and grandeur of form, but to prove most injurious to its growth, as the tree is thereby deprived of those very members upon which its health and vigour mainly depend, not to mention the risk of producing early decay by taint received through the medium of the wounds caused by the excision of the branches."

We have only to add that the woodcuts with which this work is illustrated continue to be beautiful specimens of art.

CALENDAR OF OPERATIONS *for the ensuing week.*

As the present is a good time for budding fruit-trees, we take this opportunity of reminding those who work their own, of the importance of selecting those sorts only which experience has proved to be best suited to the soil and situation of the garden they are intended permanently to occupy. The component parts of some soils are so happily blended by nature that, with the assistance of a favourable climate, all kinds of hardy fruit attain perfection in them: while there are other soils in which, although according to chemistry no appreciable deficiency of any essential constituent may exist, some particular variety of fruit refuses to thrive. Pears, for example, differ exceedingly in quality in different soils, so much so that a sort which is of the highest excellence in one garden, is in another scarcely worth eating; and it is well known that in many places the Moor-Park Apricot cannot be made to succeed. So far as it is practicable, therefore, it would be desirable to prove the various sorts by fruiting them before they are extensively propagated, and this might be done to a great extent by working many kinds upon one bearing tree; thus the annoyance and loss consequent upon nursing a young tree for years, and then finding its produce worthless, may in a great measure be prevented.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—When any considerable number of suckers has been collected, and there is no pit at liberty, a dung-bed should be made up for their reception. Put them into small pots, in light soil which is rather dry than moist. If they are lightly syringed every day, the soil will not need watering till roots appear, which will soon take place in the close moist atmosphere of a dung-heated frame, provided there is a brisk bottom-heat to excite them into growth. Whenever a sucker is taken off a plant, it should, after the necessary trimming, be at once stuck into the bark-bed. It is a slovenly system, and likewise injurious to the suckers, to let them lie about the houses and sheds for two or three weeks before they are potted. Suckers are preferable to crowns, inasmuch as they make fruiting-plants in considerably less time; therefore the latter need not be planted unless suckers are scarce.

VINERY.—Try to prevent Red Spider in the late houses, by maintaining a moist atmosphere and by gentle syringings. If the Vines upon which there is now ripe fruit are infested, measures must be taken to extirpate them as soon as the fruit is cut, that a stock may not be left to produce a brood next season. In Vineries this can be done by often-repeated washings, but when Vines are trained upon the rafters of Pine-stoves, it will be more difficult, and they should be turned out of the house rather than deluge the Pine-plants with water. Sulphur has been repeatedly recommended, but its efficacy seems doubtful.

PEACH-HOUSE.—As in the Vineries, every exertion should be made to free the trees from their injurious enemy—the Red Spider. If one washing in a day is found not to reduce them, let the foliage be thoroughly moistened morning and evening, observing to throw the water chiefly upon the under side of the leaves. This must be attended to in the early houses also, where, although the fruit is gathered, the leaves are still necessary to perfect the buds for next season.

FIG-HOUSE.—See the last Calendar.

CUCUMBERS AND MELONS.—As Melons ripen keep the atmosphere of the pits dry, to prevent them from cracking; air should, consequently, be given to such frames or pits earlier than to those in which the fruit is swelling. Plants may be put out now to produce very late fruit, but it must be in pits to which fire-heat can be applied when required. Cucumbers may likewise be planted with a similar object. The glasses might now be taken away from ridge Cucumbers. Fasten the shoots firmly to the ground with pegs.

Out-door Department.

BEANS.—Where very late Beans are required, it might be advisable to sow a few rows of Marshall's Prolific in a well-sheltered part of the garden, but a very scanty return, if any, can be expected from them.

BROCCOLI.—Transplant from the latest sowing. Plant these one foot apart in the rows, and every alternate one may be removed in autumn to a north border, where they will produce some very late heads.

CABBAGES.—In late situations this vegetable should now be sown to furnish the earliest spring supply; but in warm gardens the last week in the present month will be soon enough.

CAULIFLOWERS.—Plant from the bed sown in May. These may be put in closer together than the former crops.

CELERY.—Continue to plant for late crops.

PARSLEY.—Sow now, that the plants may get well established, and able to stand the winter.

PEAS.—Those who have warm gardens may put in a few rows of some early kind on a south border, but it must be done immediately; these may possibly produce a dish of Peas towards the end of October. If the ground is dry, the drills should be well watered; the seed ought also to be soaked previously to sowing.

RHUBARB.—Thin seedling plants where they are too thick, and also Sea-kale.

SPINACH.—Sow a good breadth for late autumn use.

SUCCORY.—Sow in drills on trenched ground; this is a most useful spring salad plant when Endive becomes scarce.

TOMATOES.—Let these be regularly nailed. The nails might be driven through the stems, which will save shreds, and no way injure the plants.

TURNIPS.—Sow a large breadth of the Stone, to supply the table during the winter months.

Orchard.—In many situations wall-Grapes will now be forward enough for thinning, which should therefore be done. The berries ought to be well thinned out, which will cause the fruit to ripen better. The nailing of wall-trees ought now to be finished. Continue to prepare Strawberry plants for forcing (using 48-sized pots, not 32's, as written by an oversight in the last Calendar). When Currants are perfectly ripe, some trees should be matted, to preserve them for late use. The late sorts of Gooseberries may be kept a considerable time by the same means; but they must not be covered up till the fruit is quite ripe; the trees must also be dry when matted.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Any repairs required may now be done, and if requisite, the plants may be placed in a sheltered situation in the open air for a short time, without suffering any permanent injury. Attend particularly to the cleaning of the wires and walls where creepers have been. Of course these things must be done at the most convenient time, but must not be put off until late in the season, as the weather will then become too cold for the plants.

GREENHOUSE AND CONSERVATORY.—Gather seeds of the finest Calceolarias and Pelargoniums as they ripen, and sow them immediately. Take care that the Greenhouse Plants which are set out are not loosened from their supports, so as to be blown about and strained by strong winds, and see that they are properly watered. Climbers in any of the houses must be neatly and regularly fastened up, and if any that are growing in pots or boxes require shifting, let it be done soon, that they may get well established before winter. Mark the finest Balsams for seed; from Cockscombs seed might be taken when ripe, without at all injuring the comb.

PITS AND FRAMES.—Cuttings of the choicest Pelargoniums had better be potted singly, and kept for a short time in a frame, where they will sooner make plants than if planted promiscuously in a bed with the common stock. Shift young plants of the Chinese Primrose which are intended for winter flowering. Cactaceous plants growing on dung beds should be very cautiously watered, particularly in dull weather.

Out-door Department.

All trailing plants should be constantly fastened down to the beds they are meant to cover, both as a safeguard against high winds, and for the sake of neatness. Rose-trees whose bloom is over should be cleared of the remains of the flowers. The flowering of many kinds of annuals might be prolonged by preventing the plants from bearing seed. Take up the tubers of Anemone and Ranunculus when the leaves decay; those of the latter plant soon commence a new growth when left in the ground. Many herbaceous perennials, as Chelone, Pentstemon, Phlox, &c., may be propagated by cuttings under hand-glasses.

NURSERY AND FOREST DEPARTMENT.

Bud stone-fruits whenever the bark runs freely. Rose-trees which were budded early will most likely require the ties to be loosened by this time. Those who possess young Laburnums fit for standards should bud them at the proper height with other species of Cytisus, especially C. nigricans and C. purpureus. These highly ornamental trees are much neglected.

FOREST AND COPPICE WOODS.—See the two last Calendars.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending July 14, 1842, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 17th, in 1834—thermometer 94°; and the lowest on the 19th, in 1832—thermometer 41°.

REPORT ON COVENT GARDEN MARKET,

For the week ending July 15, 1842.

OWING to the continued fine weather, the supplies of Fruit and Vegetables have been very good during the past week, and trade has been tolerably brisk, although not so much so as in the preceding week. *Fruit.*—Pines are plentiful; and amongst them we observed some fine fruit of the Providence: their price varies from 4*s.* to 8*s.* per lb. Grapes are very good, and are selling at the same price as quoted in our last account. English Melons are from 2*s.* to 6*s.* each; the Dutch, from 1*s.* to 4*s.* Peaches and Nectarines are becoming much cheaper; the inferior fruit may be obtained at 6*s.* per dozen, but the finest fetches 21*s.* per dozen. Cherries are not quite so plentiful, although there is, notwithstanding, a good supply; the wall-fruit is selling from 1*s.* to 3*s.* per lb.; the standard fruit from 1*s.* to 6*s.* per doz. lbs. Strawberries do not vary much in price. Currants are abundant; the Red are fetching from 2*s.* 6*d.* to 5*s.* per half sieve; the White and Black from 3*s.* to 4*s.* per half sieve. Excellent Gooseberries are to be obtained for 3*s.* 6*d.* to 5*s.* per half sieve. Raspberries are plentiful, from 6*d.* to 1*s.* 3*d.* per gallon. Apples have been rather plentifully supplied; the dessert fruit from 5*s.* to 6*s.* per bushel; the cooking do. from 3*s.* to 4*s.* per bushel. Pears have also made their appearance, principally the small Citron des Carmes, from 5*s.* to 6*s.* ber bushel. Cucumbers are plentiful, from 1*s.* to 8*s.* per doz. *Vegetables.*—The price of Cauliflowers continues the same as in our last report. Cabbages are selling from 6*d.* to 1*s.* 6*d.* per doz. Peas are abundant from 2*s.* 6*d.* to 4*s.* 6*d.* per bushel; and broad Beans from 1*s.* 6*d.* to 3*s.* per bushel. French Beans are considerably cheaper: the younger samples selling from 2*s.* to 2*s.* 6*d.* per-half sieve, and the older from 1*s.* 6*d.* to 2*s.* per half-sieve. Turnips and Carrots are remarkably good; the former fetch from 2*s.* to 5*s.* per dozen bunches; the latter from 3*s.* to 6*s.* per dozen bunches. Lettuces have materially fallen in price, very good ones being obtainable at 9*d.* and 1*s.* per score. Potatoes are also cheaper: the Kidneys are selling from 2*s.* to 4*s.* per half-sieve, the round ones from 1*s.* 6*d.* to 2. 6*d.* per half-sieve. Artichokes are tolerably plentiful. Vegetable Marrows are reduced in price, fetching only 6*d.* and 1*s.* per dozen. A small quantity of Endive may still be obtained from 1*s.* to 1*s.* 6*d.* per dozen. *Flowers.*—We have not seen so good a display of these in the market for some time. Amongst them were a very good collection of Roses, several varieties of Alstrœmeria, Bignonia vennsta, Ceanothus azureus, and handsome Picotees, Carnations, and Pelargoniums.

PRICES, SATURDAY, JULY 16, 1842.—FRUITS:—

Apples, dessert, per bush., 4*s* to 6*s*
Pears, dessert, per hf. sieve, 3*s* 6*d* to 5*s*
Pine Apple, per lb. 4*s* to 8*s*
Grapes, per pound, 2*s* to 5*s*
— Muscats, per pound, 7*s*
Melons, English, each, 2*s* to 6*s*
— Dutch, 1*s* to 4*s*.
Peaches, per doz. 6*s* to 21*s*
Nectarines, per doz., 6*s* to 21*s*
Cherries, wall, per lb. 1*s* to 3*s*
— standard, per doz. lbs., 1*s* to 6*s*
Currants, White, per hf. sv. 2*s* 6*d* to 4*s*
— Black, per hf. sv., 2*s* 6*d* to 3*s* 6*d*
— Red, for wine, 3*s* 6*d* to 4*s*
— for dessert, 4*s* to 6*s*

Gooseberries, per hf. sve., 2*s* 6*d* to 5*s*
Cucumbers, per doz., 1*s* to 8*s*
Strawberries, forced, per gall., 6*d* to 2*s*
Raspberries, per gall. 4*d* to 1*s* 3*d*
Oranges, per doz., 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Lemons, per doz. 1*s* to 2*s* 6*d*

Mushrooms, per pottle, 1*s* 6*d* to 2*s*

Notices to Correspondents.

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s.* for every 25 copies required.

Browning.—It is probable that the bursting of your GRAPES, which are grown in a greenhouse, is caused by the excessive dampness of the atmosphere, which should be gradually diminished as the Grapes approach maturity, otherwise their flavour will be inferior. All kinds of ROSES, whether standards or not, will strike from cuttings put in at the present season.

Philomela can hardly expect us to name his plants if he will not take the trouble to number them.

C. M.—PENTSTEMONS and other HALF-HARDY PERENNIALS may be readily propagated either by seeds or cuttings; if by the latter method, the sooner the cuttings are put in the better. The best varieties of Pentstemon are Murrayanus, gentianoides, gentianoides coccineus, Cobæa, Scouleri, pulchellus, speciosus, and campanulatus. This is the proper season for increasing the PINK LABURNUM, which may be budded upon the common yellow species. All the varieties of CISTUS may be propagated by cuttings or by layers. The plant sent is Cynanchum Vincetóxicum.

Bringlass.—SMITH'S YELLOW ROSE blooms best when budded on stems of the common Dog Rose; but it requires to be protected during winter, and should not be grown in too rich a soil. In our answer to "A. A," p. 457, you will see a list of AUTUMNAL-FLOWERING ROSES, to which you may add the Duchess of Sutherland, Sisley, William Jesse, Comte de Paris, Emile Courtier, Clementine Duval, Bouquet de Flore, and Madame Nérard.

A Jerseyman.—The reason why some of your PELARGONIUMS do not swell off their seed, is because the seed has not been perfectly impregnated. Your failure has probably been owing to the stigma of the flowers not having been in a fit state for the reception of the pollen.

M. C.—Your SALVIA is S. bicolor; it is hardy and a perennial. The height of a VINE is not so essential to its bearing fruit as the age and strength of the plants. Many Vines will show fruit the first season after being planted out, but no fruit should be allowed to remain upon them until the second year, in order that the plants may get fairly established. We would recommend you to try the effect of root-pruning upon APRICOT-TREES, which have not borne fruit for three years, although to all appearance healthy.

A Constant Reader.—Your seedling PETUNIA is a large and fine variety. We can say nothing in favour of your PELARGONIUMS; they are badly formed, not at all suited to the present state of this tribe of plants.

R. Aldridge, Hoxton.—The bloom of your DAHLIA is not so good as that we received last season—it is too early to have them in perfection—we expected to have seen it larger.

P. R. W.—No. 2 is Pinguícula lusitanica; 3, Juncus bufonius; 5, Bromus mollis; 6, Euphórbia exigua. The whole were in a withered state, having been collected and packed without any care; those omitted are indeterminable.

T.—From the quantity of seedling PELARGONIUMS raised, varieties appear so closely resembling each other, that the differences can be perceived only by close examination. We have seen more than one repetition of your seedling this season; the distinction consisting in a slight variation of colour, or in the form of the petals. Your flower is of a good colour, and is bold and attractive; its faults are in the form, which is too long, and the upper petals are rather pointed; they are also uneven at the edge, which being thin, gives them a watery appearance.

Allman's Pear is the Muscat Petit, or Little Musk.

L. W. D. has had PONTEDE'RIA CRA'SSIPES for nine years without its ever having shown the slightest disposition to flower, and it has been tried by floating in water only, and with the mud newly dry, and by various alterations in the summer from the stove to the greenhouse, and to a pond in the open air. What treatment will render it productive?—[It probably wants more *bottom* heat.

Davies.—The American spotted autumnal GENTIAN is probably G. ochroleuca.

An Original Subscriber.—The nearest station to CHATSWORTH on the North Midland Railway is Chesterfield. We believe that the Conservatory is only shown to persons specially introduced; the other part of the Duke of Devonshire's grounds is always open.

J. W.—It is a good practice to bend down the tops of ONIONS when they are nearly full grown, as it checks the flow of sap upwards, and throws a greater supply into the bulbs, which are by this means materially increased in size.

A. B.—The sepals of your FUCHSIA do not possess the dingy hue which characterises most of the seedlings lately raised; the petals also are of a good purple colour. It appears to be a promising variety.

W. M. D.—A correspondent ("Bringlass") would be obliged by your stating the manner in which your DOUBLE YELLOW ROSE has been treated; particularly as regards the nature of the soil, the aspect, pruning, and the age of the tree: and whether it was grown upon its own roots, or budded upon the Dog Rose or any other stock.

C. B——t.—Most of the AYRSHIRE Roses flower freely and look well, if allowed to trail upon the ground; the everlasting Pea, and some of the Clematises, such as flammula and viticella, would probably succeed in like manner. Œnothera cæspitosa is a perennial, with white flowers, not quite so large as those of Œn. Missouriensis, which it much resembles in habit; it is apt to rot off in winter, if planted in a damp situation.

M.—You had better plant your BULBS at once, unless they should be very fine and sound.

A Small Farmer.—Your Carlisle Alabaster is GYPSUM, and you have only to grind it to powder to render it fit for use. Don't burn it.

Wm. S.—We are not aware that there is any instrument for testing the strength of GAS-WATER. The appearance on the seeds of Turnips is not produced by the ova of the Turnip-fly. There is an excellent account of this insect, by Mr. Curtis, in a late number of the "Transactions of the Royal Agricultural Society."

F. R.—"Lindley's Synopsis of the British Flora" contains the flowering plants of this country, arranged in their natural orders. The same author's "Introduction to the Natural System," 2d ed., is a review of the whole vegetable kingdom, upon the same plan.

A Subscriber.—We really do not know how to avoid calling things by their right NAMES, even although we should be ill-understood by our readers. What if we called Nitrate of Soda Cubic Petre, and Sulphate of Soda Saltcake, should we be at all clearer? We doubt it. Saltpetre and common Salt would probably be used for these substances. Certainly our great object is to be understood by the meanest capacity, for it is in this way only that we can effect real good; and we are infinitely obliged to our correspondents for hints and advice upon the subject. We are not acquainted with a Double White Hepatica.

Z.—Your informant deceived you when he told you that Ixora coccinea was a greenhouse plant, for it requires a stove. You cannot do better than follow Mr. M'Intosh's directions, which you have quoted. By resting it he means to keep it rather dry and cool, but not to withhold water altogether, for then, as you suppose, it would surely die. The best time for repotting is in the spring, and the best soil is leaf-mould, peat, and rotten dung. These should be mixed together, and frequently turned over before being used. If you have a tan or leaf bed to place it upon, in a stove or pit, it is sure to succeed, but it will not do to keep it in a very dry stove or in a greenhouse.

Anonymous.—We doubt the advantage of using asphalte as a bottom for a SMALL FISH-POND. It would be a long time before the water would cease to be affected by the taste of that substance. Better render the sides with cement upon brick-work, and puddle the bottom, placing over the puddle a foot of clean coarse gravel. In any case take care that you have a ready means of continually turning off the water as it becomes foul.

A. S. D.—A distinction between British trees and British plants. We can only parody the old saying,—"a mare is a horse, but a horse is not a mare." A tree is a plant, but a plant is not necessarily a tree. We fear we do not understand the intention of your question.

D. Vaux.—We are not aware that the KHELAT LUCERNE requires any treatment different from common Lucerne. All that we know of it was mentioned a few weeks back.

Kathleen.—If our fair correspondent will tell us what plant she means by the ALLSPICE-TREE, we will tell her how to manage it. We should have supposed the Calycanthus was intended, but it is not a tree. Nothing will grow in a situation where there is no sun, very little air, and much damp, except FERNS, and it is the very place for them.

J. Astle.—NITRATE OF SODA acts very beneficially on Rose-plants, if applied to their roots—not leaves—when they are growing. It may be applied dry by strewing it on the ground, or melted in water. An ounce per Rose bush is probably enough.

Camphytius.—Your plant is Erodium incarnatum.

M. P.—The seeds of COLLINSIA BICOLOR which have just ripened, will flower again in the autumn, if sown now. We do not advise you to turn into the open ground a Fuchsia corymbiflora about three feet high, which has just done flowering in a room.

T. H. H.—We regret to report from the judges an unfavourable opinion of the varieties of Mimulus.

M. C., Bath.—A very good Cucumber, yet not equal to the best prize sorts, judging from the growth of the specimen that we received.

R. H. W.—Your plant is the true wall Pellitory, and its Botanical name is Parietária officinalis.

T. S. P.—Your Apple, Pear, Plum, and Cherry trees that have only been PLANTED 5 years, could not as yet be in condition to bear much fruit: but as your Gooseberries, Currants, and Raspberries, planted at the same time, bear plentifully, there is every probability that in due time your other fruits will also be productive. It is, however, absolutely necessary, in the first instance, that wood should be produced whereon the fruit may be afterwards supported. Your selection of sorts is very good. A rocky subsoil, such as you describe, is not injurious. Cherries will succeed as espaliers, and under that mode of training they can be protected from birds. All the varieties of fruits you enumerate are adapted for either standards or espaliers: and for either you may add Hacon's Incomparable, Dunmore, Knight's Monarch, and Thompson's, to your Pears, and Royale Hative and Ickworth Imperatrice to your Plums.

E. B.—Sappho is a pretty and well formed Pansy, but too small; there are varieties in cultivation, very like it, larger and finer.

H. Major.—The Pansy you intend to name the Bridegroom is a desirable flower; the eye is bold, and the general form of the flower is good; the inside is a good white, and the border round the under petal deep and rich.

W. Lodge.—1. The Lancashire Witch is a bold and attractive flower; in its general form the lip extends a little beyond its proper limits; the deep bright blue border which surrounds the lower petals is fine in colour, and decidedly marked. 2. White, with very good eye. 3. This is the most correct flower in its general form and proportions, but the eye is too weak; light flowers require the eye to be bold and rich. This is not sufficiently good to send out.

W. Taylor.—The Amaryllidaceous plant is Phycella ígnea; the other is Lotus major.

A. G. C.—We are unacquainted with the plant said to be called Tarrara in New Holland.

Facile.—If you will forward to us leaves of the Strawberries sent you as Myatt's British Queen and Swainstone Seedling, we will inform you whether they are correct. Your description of the fruit does not appear to correspond with their general character.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE afflicting calamity which has fallen on the Royal Family of France, in the violent death of the Duke of Orleans, is an event which not only touches the hearts and interests of the French people, but involves in its possible consequences the future destinies of Europe. Among the severe dispensations which have stricken the House of Bourbon, there is none which has been felt more deeply than the awful accident by which the heir-apparent to the throne has just perished in the streets of Paris. How great the loss may be to France, it is impossible to tell. Regarding it merely on personal considerations, the untimely death of a young, high-spirited, and gallant Prince, distinguished in the field, amiable in domestic life, and unexceptionable in private character, is an event calculated to inspire universal sympathy. But, looking to the political consequences which may follow, it is impossible not to feel that it suggests matters of more extended interest, and that an infant heir, in the present temper of the French people, involves the prospects of Europe in doubt and obscurity. The life of Louis Philippe, which has so often been providentially preserved, is now more than ever valuable, if, indeed, it be not essential to the peace of the world. The King has borne his dreadful affliction with his customary firmness; his health and vigour are unimpaired, and we may therefore hope that his life may long be spared to consolidate the institutions which he has hitherto so ably maintained, against difficulties which no less powerful mind could have controlled. Previous to this melancholy occurrence, the papers were entirely occupied with the elections. The results in the Capital have been very unfavourable to ministers, who have likewise been defeated in several important contests in the provinces. In the early part of the week it was believed that a resignation must ensue, and that no Cabinet of moderate principles could carry on the Government. The later returns, however, have somewhat restored the balance of parties; and it is now known that the ministerial loss and gain are nearly equal, and that the new Chamber will be constituted very nearly like the last. In the present crisis of affairs, the duties of the Chamber will be unusually onerous and important; a Regency Bill will necessarily be one of their first acts, and the issue of their deliberations may be looked for with great interest.—From Spain there is little news beyond the prospect of an approaching prorogation. The Session is drawing to a close, and the Opposition appears to reserve its strength until the commencement of a new campaign.—From Portugal we have at length the gratifying intelligence that the Commercial and Slave-trade treaties have been signed by the two Plenipotentiaries and forwarded to London. The Queen was to open the Cortes in person on the 10th, after which the Duke of Palmella was expected to enter the Cabinet as Secretary for Foreign Affairs.—In the Levant, the state of Syria continues to be the source of much anxiety. The Divan is determined to pursue the line of policy against which the Allied Powers have so long remonstrated; and it is feared that a demonstration of hostilities is not far distant.—From the United States we learn that the mission of Lord Ashburton still inspires the utmost confidence in the result, and the American papers look for an early and satisfactory adjustment of the boundary question, and all other matters in dispute.

At home, Government have introduced a bill for the better protection of her Majesty's person, which has been so well received that it has passed both Houses during the week. By this act, power is given to dispense with the forms usual in cases of high treason, and to meet such offences as those which have recently been before the public with corporal punishment,—a provision which has met with general approbation from all parties. The Poor-law Bill has made but little progress; the clause for the continuance of the commission for five years has passed after a warm opposition; and it is expected that Ministers will consent to pass a temporary Bill, and bring the whole subject forward at an early period of next session. The new Tariff received the Royal assent on Saturday, and came into operation on Monday. Lord Ashley's Bill on Mines and Collieries has been read a second time in the House of Lords, after being subjected to several material modifications, in order to conciliate its opponents.

Home News.

COURT.—On Saturday afternoon the Queen and Prince Albert accompanied by the Hereditary Prince and Princess of Saxe Gotha, left town for Claremont. The Prince of Wales and the Princess Royal followed in another carriage. Her Majesty and the Court remain at Claremont, and continue in excellent health. During the week, the Queen Dowager, the Duchess of Saxe Meiningen, and the Duchess of Kent, have visited her Majesty at Claremont. The Queen Dowager on Wednesday visited Greenwich Hospital, accompanied by the Duke, Duchess, and Hereditary Prince of Saxe Meiningen, who left Greenwich on the same day to embark at Dover for the Continent. The Duke of Cambridge attended divine service on Sunday morning in Cripplegate Church, and afterwards honoured the Rev. Dr. Blomberg with his company at luncheon. On Monday his Royal Highness went to the review at Wimbledon, and on the following day left town to attend the Agricultural Meeting at Bristol. The Court will go into mourning immediately for the late Duke of Orleans.

Parliamentary Movements.—It is announced that Mr. Parnham Phillips, of Wendover has consented to come forward on the Liberal interest, to oppose Capt. Fitzmaurice at the forthcoming election for the county of Bucks.

Foreign.

FRANCE.—*Death of the Duke of Orleans.*—It is with sincere regret that we announce the sudden and violent death of the Duc d'Orleans, the heir-apparent to the French throne. The lamentable event occurred on Wednesday afternoon, in consequence of a fall from the carriage in which his Royal Highness was proceeding from Neuilly to Paris. The following are extracts from the Paris papers, giving the particulars of this melancholy calamity, which has called forth a universal feeling of deep and unaffected sorrow. On Wednesday morning, at half-past twelve, the Duc d'Orleans, who was about to set off for Plombières, where the Duchess is at present staying, was returning from Neuilly after having taken leave of his family, when in the centre of the Chemin de la Révolte, a short distance from the Porte Maillot, the horses ran away in spite of the efforts of the postilion, and there was every reason to fear that the carriage would be overturned on the slope at the side of the road. At this moment the Duke, to avoid the danger, leaped from the carriage; but unfortunately his spurs, or, as some say, his sword, caught his travelling-cloak. This accident caused him to fall, and the Prince received some contusions on the temple and the wrist. A cerebral congestion was occasioned by the shock, and was succeeded by a suffusion on the brain. Having fainted in the road, his Royal Highness was removed to the nearest house, occupied by a grocer, and assistance speedily arrived from the Tuileries. Bleeding was resorted to almost immediately, but the Prince did not recover his consciousness. Dr. Baumy, happening to be on the spot, gave every assistance to Dr. Pasquier, his Royal Highness's physician, who had come from Paris. The King, who was to preside at a Cabinet Council in Paris, had quitted Neuilly. He arrived at the spot where the accident occurred when the Prince was being raised. His Majesty was accompanied by the Queen and Madame Adelaide. Our readers may well imagine how heart-rending a scene that melancholy spectacle occasioned. A clergyman of St. Philippe du Roule, and the *curé* of Neuilly, were called in, but could only administer extreme unction. The Prince died at three o'clock. M. Le Baron Fain left immediately to announce to the Ministers assembled at the Tuileries, the event which had delayed the arrival of the King. The Ministers immediately started for the purpose of being near his Majesty. The Duc d'Aumale, who was at Courbevoie, as soon as he heard of the accident that had happened, set off in a hired cabriolet. This carriage broke down on the road, and the Prince was obliged to continue his route on foot to see his dying brother. The body of the Duke was placed on a litter, and carried by soldiers to the chapel of the Château of Neuilly. The King, the Queen, Madame Adelaide, and M. le Duc d'Aumale, followed the funeral cortége on foot, attended by a battalion of the 17th Light Regiment. Their duty drew tears from the soldiery. Behind the litter, mingling indiscriminately with the members of the Royal family, followed the Ministers, officers of every grade, and citizens of every class, who had collected on the first tidings of the catastrophe. Several clergymen followed the *cortége*, repeating prayers for the Royal dead. It appears that the Prince was alone in the carriage. The carriage, called a *demi-Daumont*, carried a *tambour* in front, which came off and struck against the horses. The startled animals ran away, but the postilion succeeded in stopping them when they had run about forty paces from the spot where the Prince had fallen. The death of the Prince is attributed to the dislocation of the spine. The King gave orders to General Rumigny to depart for Plombières immediately, where the Duchess of Orleans was staying. The late Prince had testified the greatest pleasure at his intended journey, for which preparations had been made in the various towns through which he was to pass. He was to have taken the command of a camp of 40,000 men in the course of a few days. Nothing can exceed the sensation produced in Paris by the event. The death of the Prince, who was one of the most gallant soldiers of France, was regarded as a national calamity. The streets of Paris were crowded, and grief was painted in every face. The theatres were closed. The funds fell rapidly, and the consternation at the Bourse produced quite a panic in the commercial circles. A telegraphic despatch was issued by Ministers to the Prefects of Departments, announcing the calamity, and stating that the King has borne the affliction with his customary firmness. The Count de Paris, born Aug. 24, 1838, is now the heir to the French throne. It would be idle to speculate on the probabilities of a long Regency, or on the possible effect which this event may have on the prospects of France after the decease of Louis-Philippe. The public mind is too much absorbed with the calamity to look beyond it for the present; but it is impossible not to regard with doubt and uncertainty the consequences to which it may give rise at no very distant period.

The Elections.—With the exception of the melancholy fate of the Duke of Orleans, the Paris papers, as might have been anticipated, are occupied almost exclusively with the elections. The results in the capital, and in several of the departments whence the telegraph had brought the returns, caused great anxiety in the early part of the week, as they were by no means so favourable to Government as there was reason to expect. The total number of candidates appears, from a table published by one of the journals, to have been about 700. Of these nearly 300 were of the Opposition, and the remainder Conservatives. In Paris, Ministers have been unexpectedly defeated, Ministerial candidates having been returned only in the two first colleges, comprising the rich quarters and the Bourse. In the 12 others the Opposition have carried the day, two of them returning Republicans of the most ultra principles. The fiercest struggle was in the third arrondissement, between M. Billaut of the Opposition, M. Thiers, Under-Secretary of State, and M. Legentil, a wealthy man of business. M. Billaut carried his election by 746 votes against 617. M. Guizot has been elected at Lizieux, and M. Thiers at Aix. MM. Delessert, Piscatory, Royer Collard, De Laborde, and more than 20 other Ministerialists have been rejected. The Government, however, have gained a decided triumph at Strasburg, where a Conservative has been returned in place of M. Martin, the Radical deputy for that city. Of the other great towns, Bordeaux has returned its old members, being two Conservatives, and one attached to M. Thiers. Marseilles has returned its three old members, M. Berryer and another Oppositionist, with a Conservative. Toulouse returns its old members, three Oppositionists. Nantes returns its old members, a Conservative and a Liberal. Rouen has elected three Oppositionists and one Conservative, choosing M. Laffitte amongst the former, and rejecting M. Barbet, its old mayor, by which Ministers have lost one vote. The Opposition, on the other hand, have lost nearly thirty elections, including many of the most eminent of their party. M. Garnier Pagès has been elected at Verneuil, where, as in most districts, the Legitimists voted for the Liberals, and even for the Republicans where they themselves had no chance. The Legitimists are said to have gained in the smaller towns. At four o'clock on Monday the Opposition calculated on having already gained 17 votes; while if the remaining returns gave a result similar to those already known, it was generally stated that not merely M. Guizot, but Count Molé would find it impossible to carry on the Government; and the struggle would then be between M. Thiers and M. Dufaure. The funds underwent considerable fluctuation and depression on Monday on the Paris Bourse, but they improved a little towards evening, when the results of 336 elections were known, showing that the Ministers gained ground, although the Opposition had obtained another vote in the tenth arrondissement of Paris. The Ministerial majority then reached 47 votes, and there remained about 100 more results to be known, which were expected to increase the Ministerial strength. The general results up to that time were, nevertheless, unsatisfactory to the dispassionate friends of Ministers, who considered that a Chamber not more ardent nor constant than the last in its support of the policy of the actual Government would be rather more dangerous than a consistent Opposition. It was everywhere believed that if the last Chamber, when approaching its natural expiration, had become unmanageable, a new one composed of the same materials could not be relied on. On Thursday, the papers announced that the results of 450 nominations were known, and that the Ministerial loss and gain were about equally balanced. The amount of loss was as great on the side of the Opposition, but the candidates were by no means so eminent as those of the Ministerial party.

The Capital.—A scene of disorder occurred last week at the cemetery of Mont Parnasse on the occasion of the interment of M. Bauny, a physician, well known for his violent republican principles. The procession was composed of a great number of persons in plain clothes, and a certain number of National Guards of the 12th legion in arms, and several in uniform, with their sabres. The body was deposited in a temporary grave, and the usual salute fired over it. Four speeches were then delivered; the first and third being political, and impressed with a spirit of opposition, but without going beyond certain limits; the second, by a medical student, was perfectly consistent, being purely biographical and scientific; but the character of the last was completely seditious. When this last speaker came to excite disobedience, and even resistance to the laws, and to a declamation against the rights of property, a commissary of police interfered, and insisted that such language should not be continued. Threats, hisses, and cries of "*A bas le commissaire*," were uttered. The agitators, wishing to make a collection for the benefit of political prisoners, remained stationary. The commissary, therefore, gave orders to detachments of the Municipal Guard to disperse the assembly. Upon this the agitators threw stones at the armed force, crying "*Aux armes*," and some actually drew their swords. This, however, did not prevent the arrest of the most violent, and the restoration of tranquillity.—The lighting of Paris with gas is making great progress. Within the last few weeks no fewer than 38 streets, passages, &c. in different quarters have received the benefit of this improvement.—It is stated that a large number of suicides have lately taken place among the troops engaged on the fortifications, and that many have contracted fever while labouring at the works.

The Provinces—The Lyons papers of the 6th mention that the rain which fell in that neighbourhood on the preceding day had completely dissipated all fears for the harvest.—The Strasburg papers state that the manufacturing interests in Alsace are threatened with a new crisis. At Mulhouse a number of calico-printers are unemployed, and at Colmar no less than 50 weavers applied for employment at one establishment and were refused. Several mills have been closed in consequence of a want of water.

The Navy.—The "Moniteur" contains a report to the King from the Minister of Marine, recommending that a gold medal should be given to Dr. William Davies, an English physician, of Port Jackson in New South Wales, for his prompt and able assistance rendered, in December last, to several of the crew of the French corvette Aube, who had become dangerously ill by eating some poisonous fruit. The report states that when Dr. Davies was asked what his charge was, he replied, "I should be ashamed to receive payment for assistance rendered to an English ship of war, and I have the same feeling as regards a French ship." The King has approved of the recommendation of the Minister.—The journals announce the arrival, at Toulon, of M. Ratti-Menton, late French consul at Damascus, who obtained so much celebrity in the affair of Father Thomas, assassinated in that city.

Imports and Exports.—The "Moniteur" publishes the table of French exports and imports during 1841. The chief increase of importation is in coals and iron. There is a sensible decrease in the importation of machinery, and an increase in its export. The greatest increase of export is in the article millinery. The export of cotton and linen goods shows a decrease, that of woollens and silks an increase. Glass and porcelain also show an increase.

Algeria.—The accounts continue highly favourable. The last despatch announces that the Government of Abd-el-Kader is broken up. This chief, formerly at the head of a more powerful nation than was generally believed, is now an outcast, with a handful of cavalry. The war is in earnest finished, and there now only remains to destroy some scattered vestiges of a power skilfully established. General Changarnier gained a signal advantage on the 1st inst. on the right bank of the Upper Chelif, at 50 leagues from Algiers, over the Khalifat Sidi Limbanah. He made 3,000 prisoners, and took from 15,000 to 20,000 head of cattle, of which 1500 were camels. The Governor-General adds that they must now seriously consider the preservation of the conquest, so as to render it useful. "The army, he says, will be for a long time the only means of government, for we can neither govern nor direct these people by political opinion, nor by religious sentiment."

SPAIN.—Little seems to occupy attention in Madrid but the approaching prorogation. The Rodil Cabinet had issued a circular, prescribing to the local authorities the utmost vigilance in putting a stop to smuggling, one of the greatest evils with which Spain is afflicted. The session of the Cortes was fast approaching to a close, the coalition being inactive; the different budgets were thus voting rapidly, and the Senate was expected to be equally as expeditious, so that by the 15th the prorogation was expected to take place. Rodil is said to have disarmed the coalition Opposition by a threat of dissolution. In the Chamber of Deputies the Ministers for Foreign Affairs and Finance alluded to the necessity of a project of law to authorise the Cabinet to modify the tariff. Count Almodava observed that this authorisation was the more requisite, inasmuch as negotiations were on foot with Belgium to conclude a treaty in respect to linen cloths, and it could not be signed without a modification of the Spanish tariff. A telegraphic despatch from Bayonne of the 9th brings advices from Madrid of the 4th inst., on which day the Cortes had granted the Rodil Cabinet the necessary authorisation to collect the taxes. The prorogation will therefore speedily follow.—A despatch from Perpignan of the 8th announces that Gen. Zurbano had entered Barcelona on the 4th, charged by the Queen's Government to put down the Carlists in Catalonia, and to intimidate the republicans of that province. The republican organ of Barcelona affects to regard with satisfaction the expected arrival of the General, as the only man calculated, from his knowledge of mountain warfare, to put down the Carlist guerillas. Barcelona was quite tranquil on the 2d. The eldest son of Don Francisco de Paula was expected at Madrid from Corunna. A Cadiz journal contains an account of a less agreeable visitant on the shores of Portugal—the plague, or some similar disease characterised by the appearance of buboes. The Junta of Health at Seville were already occupied with the consideration of this subject, so serious to their city, between which and Cadiz steamers now ply constantly. The health of the Regent is said to be re-established; he has consulted Dr. Costello of London, who has given a favourable report on his case, considering that there is no chance of another return of the painful malady to which he has been subject.

Portugal.—Advices have been received from Lisbon to the 4th instant, by the Braganza steamer, acquainting us with the gratifying fact that both the commercial and slave-trade treaties had been signed by the two Plenipotentiaries on the previous day, and were forwarded by this packet. The Duke of Palmella would not immediately enter the Administration. His Grace's resolution on this subject had taken the Government by surprise; but there was the best ground for believing that it was not intended as definitive, and that after the division on the first stormy debate in the Cortes, which were to be opened by the Queen in person on Sunday the 10th inst., his Grace would enter the Administration as Secretary for Foreign Affairs. His Grace's reasons for the course now adopted, which were embodied in a long letter, had reference chiefly to the part which he took as head of the short Administration in February last, by which the restoration of the Charter was momentarily opposed, and to the false position in which his too ready acceptance of office would probably place him.

Belgium.—The representatives of the linen manufacturers have had interviews with the Ministers of Foreign Affairs, the Interior, and Finance, on the subject of the French ordonnance respecting linen fabrics. After detailing the state and prospects of the manufacturers, they said that it was necessary immediately to take a provisional measure, in order to prevent the importation into Belgium of large quantities of English thread. It is reported they said, that a vast depot of English thread is going to be formed in Belgium, and that the necessary result will be, that if the French market is closed against the English, its thread and linen will take another direction and be passed into our market. The Minister of Finance replied that he had received day by day an account of the English importations into Belgian ports, and that he had not heard of any importation; and that if any such thing should happen, he would immediately take some steps to prevent it; if the existing laws should not allow the application of a sufficient remedy, recourse will be had to the legislature. He stated that no consignment intended for France had had its destination changed, and been sent to Belgium. The explanations given by the Minister were received with confidence by the deputation, and relieved the apprehension of most of the members. The deputation has since had an audience of the King, who stated that he would do his utmost to obtain a modification of the French tariff, which was chiefly aimed against England and English manufacturers.

Germany.—Letters from Berlin state that General Van Boyen, the minister of war, will not go to the province of Prussia till the 7th of July. At the meeting of his excellency with the King, on his return from Konigsberg, the plans for the fortification of that city will, it is said, be determined on. Several able engineers are already gone to Konigsberg in order to draw up the detailed plans. It is also stated that the difference respecting the fortifying of Kostadt are arranged, and that that place is to be a fortress of the first class. It is expected that the works will soon commence, and that 6,000 workmen will be employed.—Letters from Dresden mention the drought prevailing throughout Saxony; notwithstanding which, all the fruits of the earth are remarkably fine: the vineyards especially promise to yield abundantly. In Bohemia, on the contrary, everything is burned up, and the prices of corn are rising. The Elbe becomes more and more shallow, and even the Prague steamboat, the Bohemia, which kept up the communication between Dresden and Teschon, for travellers going to the Saxon Switzerland and Toplitz, is now laid up.—The papers mention the sudden death of Lady Whittingham, attributed by her physicians to a diseased liver, and an excessive use of strong Spanish snuff. Lady Whittingham, who was the widow of the English general of the same name who held an important command in India, was a native of Spain, and was said to be descended from the illustrious family of Ximenes. She was a woman remarkable for her abilities. Lady Whittingham was on her way to Aix-la-Chapelle, accompanied by Prince Paul of Wurtemberg.

Hamburg.—The 7th inst, having been appointed by the Senate as a day of thanksgiving and humiliation—in fact, a general fast—it was so kept, in the strictest sense intended. Business was entirely suspended, and the churches, as well as those buildings which are now used as substitutes for St. Nicholas' and St. Peter's, were crowded to suffocation during their several services, and liberal contributions were made towards the re-construction of those sacred edifices, the loss of which is so universally deplored. Divine service was likewise performed in the British church. The committee appointed by the Senate has published a list of contributions for the aid of Hamburgh, including the money received by the relief committee. The amount received up to the 22d June is about 3,230,000 marks banco.

Denmark.—Letters from Altona state that the King of Denmark has acceded to the petition of a company to make an iron railway from Altona to Kiel. A letter from Copenhagen mentions that Mademoiselle Rachel is to visit the Danish capital on her way to St. Petersburg. She will pass some time in the last-mentioned city, during the festivities in honour of the 25th anniversary of the marriage of the Emperor and Empress of Russia, and is engaged to give eighteen performances, for which she will receive 36,000 silver rubles.

Russia.—The papers announce the arrival of the Russian Minister of War, Tchernitschew, at Teflis, on the 20th of May last. It appears that he will not assume the command of the army about to act in the Caucasus, but merely inspect the provinces, and put an end to the existing abuses. The same journals announce the intention of the Duke of Bordeaux to proceed to the North on a matrimonial speculation. It is asserted that a new convention relative to deserters is to be shortly concluded between Prussia and Russia, but for a brief period only.

Italy.—A letter from Turin announces that the Marquis de Spinola, Grand Chamberlain to the King of Sardinia, has discovered, in an obscure corner of the Palace at Genoa, a portrait of Pope Julius II., painted by Raphael. It had, from misusage, become very much defaced; but being cleaned and restored, indubitable proofs of its authenticity were brought out, particularly the device of Raphael on the Pope's ring.—A riot has occurred at Mantua between the Jews and the inhabitants, which the Government has been obliged to put down by force.

Turkey and Syria.—Letters from Constantinople of the 23d ult. announce the sailing from that port on the previous day of two frigates and three corvettes, having a large reinforcement of troops on board, together with a million and a half piastres for the Ottoman army in Syria, where the Divan was determined to pursue the line of policy against which the representatives of Great Britain, Austria, and France had remonstrated. These letters also refer to some misunderstandings between Russia and the Ottoman Porte, evincing the disposition of the latter to assert its full independence. Sir John M'Niel, our Envoy in Persia, left Constantinople on the 20th, on his return to this country *via* Vienna. Baron Sturmer, the Austrian Internuncio in the Turkish capital, was to leave Broussa for Italy. A great fire, destroying 120 houses, had taken place at Hasskien, a suburb of the harbour of Constantinople. Letters from Jerusalem state that the Bishop continues to exercise his duties without open interruption from his Christian colleagues, and that he receives all due protection from the Governor, Tayar Pacha. The difficulties encountered in establishing the foundations of the new church have been overcome, and the work is proceeding in a satisfactory manner.

United States.—The packet-ship England, Capt. Waite, which sailed from New York on the 20th ult., arrived at this port on Sunday morning, and the Russell Glover, in the evening. The papers by the latter are six days later than those by the Great Western, but their contents are unimportant. No authentic particulars had been allowed to transpire respecting the negotiations between Lord Ashburton and the United States' Executive. The Queen's messenger carried to Halifax by the Rhadamanthus steamer arrived at Boston on the 18th ult., in the Britannia, and proceeded express to Washington. The negotiations for a settlement of the differences between Great Britain and the United States would be quickened on the arrival of the despatches of which he was the bearer, and terminate, it was hoped and believed, in the early and satisfactory adjustment of the boundary and other disputes. The bill extending the tariff laws till the 1st of August was before the Senate on the 18th ult. It was generally believed that the President was determined to *veto* any bill providing for the collecting of the existing tariff after the 1st of July, or imposing an additional tariff, unless the same bill should provide for the repeal of the law distributing the proceeds of the public lands among the states. The Hibernia has since arrived, bringing accounts of a large meeting in favour of the nomination of Mr. Clay as the new President.

Canada.—The Montreal Papers contain no less than seven and a half columns filled with the names of persons appointed justices of the peace in four several districts in Lower Canada. The whole list embraces more than 1,200 names. The papers complain that there are too many French names, and state that Sir Charles Bagot is evidently attempting to carry out the policy of Lord Durham, so far as giving the two races a fair share in the government.

West Indies.—By the arrival at Liverpool of the last packet from New York, we have received important news from St. Domingo, stating that a revolution has taken place in Hayti; President Boyer has been deposed and his life was in imminent danger. "We learn to-day, says the *Philadelphia Journal* of the 23rd ult., from Capt. Hill, of the brig William Thatcher, which arrived here from St. Croix on Saturday, which place she left on the 7th inst., that just before his departure he was informed by one of the most respectable citizens of St. Croix that letters had just been received by an arrival from St. Domingo, giving the important information that a revolution had taken place in the island, that President Boyer had been deposed, and had been, or would be, put to death. In the hurry of departure, Capt. Hill did not make very particular inquiries. The impression, however, is strong on his mind that his informant said that President Boyer had been put to death, but of this he is not positive." A letter from Cape Hayti, dated the 29th May, contains a description of the late calamity at St. Domingo, fully confirming all the horrors of the earthquake, and the depredations of the mountaineers, with a few additional particulars. It appears that all the towns within 150 miles have suffered more or less, and that the Palace of the celebrated Christophe, and the citadel in which he is buried, which is about 14 miles from Cape Hayti, are a mass of ruins. The city itself, which is indifferently called the city of Cape Hayti, Haytien, or François, was built by the French while in possession, and so magnificent were its buildings, that it was styled the "Palace of the Antilles." In extent it is about a mile square, the streets running at right angles, and among the principal buildings were a palace built of marble brought from France, barracks, a splendid hospital, a cathedral, just finished at an enormous expense, and a large house built by Borlax, the late Governor, for a theatre, but used as a Freemason's lodge. The recent death of this Governor Borlax, who was also commander-in-chief, seems to be very much regretted, for it is said his character was such that he would have acted like the General commanding at Port de Paix, who, finding some of his men refusing to obey orders, at once ordered them to step out of the ranks, and shot them on the spot. The consequence of this act of timely severity at such a crisis was, that not a dollar was lost; while in Cape Hayti, for want of sufficient discipline, there seems to have been a needless sacrifice of life and property. The sick and maimed of Cape Hayti, when taken from the ruins, were moved on board the Active, a Hamburgh merchant-vessel, the master of which, named Price, is spoken of in the highest terms for the great kindness he displayed to the sufferers. The Governor, Boyer, was already falling into disrepute in consequence of adopting arbitrary measures. Some time ago, finding the majority of the Legislature opposed to his government, he placed a guard before the House of Assembly, giving the officer a list of the names of about 30 members who were to be forcibly excluded. These political differences had been interrupted by the earthquake, which, of course, has been all-absorbing; but it seems certain that no more Presidents will be elected for life.—The only intelligence in the Jamaica papers is the serious illness of Lady Elgin, who had been dangerously unwell, but was again in a fair way of recovery. The merchants of Kingston are complaining loudly of the bad management of the Royal Mail Company; and the "Jamaica Dispatch" quotes at length the remarks of the colonial press on that subject. The promotion of the Hon. Edward Panton to the office of Vice-Chancellor had created a vacancy in the speakership of the House of Assembly of Jamaica. The "Barbadian" states that the weather continued exceedingly dry, the cane plants were drooping under the fierce and burning heat of the sun, grain and vegetables becoming extremely scarce and dear.

Parliament.

HOUSE OF LORDS.

Saturday.—The House met to hear the royal assent given by commission to several bills.

The Speaker of the House of Commons, attended by several Members of that House, having appeared at the bar, the commission was read, and the royal assent given in the usual form to the following bills:—The Custom Acts Bill (the tariff), the Dean Forests Poor Bill, The Deptford Pier Bill, the Ross and Cromarty Court House Bill, the Marine Insurance Company Bill, the York Cathedral Bill, the Stafford Grammar School Bill, and to the Manners' Estate Bill, Hawkes's Divorce Bill, and some other private bills.

Monday.—The Duke of Buccleuch reported from the select committee that the House might proceed with the consideration of the Mines and Collieries Bill.

Lord Brougham, pursuant to notice, brought forward his motion on the subject of distress, and concluded a very long speech by moving the appointment of a committee of inquiry.—The Earl of Ripon opposed the motion, on the ground that it would be unwise and unjust to excite expectations, by the appointment of a committee, which could not be realised by that measure.—The debate was protracted to a late hour, but presented no important feature differing from the statements and arguments advanced during the recent discussion of the same subject in the other House of Parliament. On the division the numbers were:—Contents, 14; Non-contents, 61; majority against the motion, 47.

Tuesday.—Several petitions were presented against certain clauses of the Mines and Collieries Bill.

On the motion of the Marquis of Clanricarde, the Witnesses Indemnity Bill was read a second time, went through Committee, was reported, read a third time, and passed, the standing orders having been suspended in order to allow the Bill to be passed through the several stages.

The Marquis of Londonderry, in presenting petitions against the Mines and Collieries Bill, read several documents and communications upon the subject.

Lord Wharncliffe, after laying on the table the Minutes of the Council of Education, for the years 1841 and 1842, presented a petition, signed by above 1,400 persons, who had received instruction in the elements of music in the classes at Exeter Hall, which prayed that means might be given to the Committee of the Privy Council for Education to render assistance to those classes. The noble Lord detailed at considerable length the advantages which had arisen, and the farther advantages which were promised by the system; and expressed a decided opinion in favour of the object the petitioners had in view.—The Marquis of Lansdowne and Lord Brougham corroborated the statements, and concurred in the views of the Lord President; the latter expressing an especial interest in the extension of the system among the Dissenters of Scotland.—Lord Wharncliffe observed, that if the Dissenters of Scotland undertook to build a normal school, as those of England had done, they would then have the same claim to assistance.—The petition was then laid on the table.

The Drainage Bill was read a third time.

Thursday.—In committee on the Railways Bill, Lord Campbell proposed a clause forbidding "locking-up" of passengers in carriages, which was rejected by 35 to 31.

The Queen's Protection Bill was brought up from the Commons, and the Duke of Wellington gave notice of his intention to move the suspension of the standing orders, in order to carry the bill through its different stages on Friday.

The Earl of Devon moved the second reading of the Mines and Collieries Bill, stating the alterations which were made in it, in order to conciliate its opponents. He hoped their Lordships would at once adopt the bill, so far as the exclusion of females was concerned. With respect to boys, their age for entering he would have no hesitation to fix at ten years, their apprenticeships not to extend beyond 18 years of age. But he reluctantly acceded to the proposition of permitting the employment of persons at the engine under 21 years, as no sufficient reason appeared to him to have been urged, except the fact of the general employment of lads of 15 and 16 years. Lord Hatherton and the Earl of Radnor said that these alterations had removed many of their objections, though the latter objected to legislative interference with the freedom of the people in the choice of their employments.—The Earl of Galloway supported the bill.—The Duke of Wellington declared his support of the principle of the bill, and would state his views on its details when it went into committee.—The Marquis of Londonderry was afraid that a compromise had been entered into between Lord Hatherton and the promoters of the bill. After complaining of the mode in which the commissioners had got up their report, he moved that the bill be read a second time that day six months.—Lord Wharncliffe wished to avoid committing greater evils than those which were to be cured. He thought that the House of Commons had not done its duty by this bill, but had passed it on an impulse of mere humanity, and without a due consideration of the capital and interests involved. As the bill was now altered, however, he was enabled to support it.—The Duke of Buccleuch supported the bill; and after some further debate, the gallery was cleared for a division, but none took place, and the bill was read a second time.

Friday.—The Lord Chancellor moved the second and third reading of the Queen's Protection Bill, which was seconded by Lord Melbourne.—Lord Cottenham and Lord Brougham warmly supported the measure.—An addition, suggested by Lord Campbell, providing against cases where persons possess or produce firearms intended to alarm her Majesty, and another respecting intruders into the Palace, were adopted.—The Duke of Wellington concurred with Lord Brougham in expressing the deepest concern and sympathy with the Royal family of France on their recent calamity.—The Bill was then read a third time and passed.

HOUSE OF COMMONS.

Saturday.—There was a very thin attendance of Members, the only business before the House being to hear the Royal assent given by commission to the Customs Act and some other Bills.

Monday.—Mr. O'Connell brought up the report of the Belfast Inquisition committee, with the minutes of evidence, which were ordered to be printed.

In reply to Mr. Hume, the Chancellor of the Exchequer stated that the Mint was at work upon silver coin, and was supplying the Bank as fast as possible. The Bank had recently issued [illegible]

In moving the order of the day for the House to resolve itself into committee of supply, Sir R. Peel took occasion to advert to the statement made by Lord Palmerston a few evenings ago, that Lord Auckland had been requested by the present Government to retain the office of Governor-General of India, and to the inference drawn by the noble Lord from that fact, viz., that the present Government had expressed its approbation of the policy pursued with respect to Affghanistan. The right hon. Baronet said that Lord Ellenborough had a high personal opinion of Lord Auckland, and if he made the alleged request, it must have been the expression of his private feelings, for the Government had been no party to it.

Mr. Villiers, as an amendment to the motion for going into committee of supply, moved the repeal of the Corn-laws, which gave rise to a long discussion.

Sir R. Peel said, that so long as the hope of a diminution in the duty should be kept alive by these discussions in Parliament, the new law could not have fair play. If it could really be made out that the Corn-laws were the cause of the present distress, and that their repeal would relieve it, he would not hesitate to concur in that repeal, nor, he was persuaded, would the friends around him. He then gave some explanations relative to those articles of import on which there has been a recent diminution of revenue, from the suspense occasioned by the proposed reductions in the tariff, and to those articles on which, being untouched by the tariff, the revenue had actually increased. It was said that something must be done for the relief of distress. He trusted that the subscriptions, though they could not permanently cure it, would not be discontinued, for they were of the utmost importance as a temporary mitigation; but his more lasting hope was in the extension of commerce. Perhaps the repeal of the Corn-laws might afford a temporary stimulus; but he believed the day would early follow when the depression of the agricultural classes would bring a deep regret for that short-lived appliance. He had been censured for not carrying his own principles far enough, yet he had lowered the duty, not only on cattle, but on rice, fish, potatoes, and all the raw materials of manufacture. He adverted shortly to the chief measures of his Administration, and acquainted the House that the commercial treaty with Portugal had now been brought to a satisfactory conclusion. He deprecated a precipitate condemnation of his experiments, and declared his willingness to revise them should they be found, after a fair trial, to disappoint the hopes he had formed of them.

Lord John Russell considered the conclusion of Sir R. Peel's speech as intimating no great confidence in his own measures. He denied that the entry of corn was obstructed by these motions; a similar motion had been made respecting sugar, and yet in sugar there had been an increased import. He agreed that even the temporary alleviation afforded by the subscriptions was a desirable and important one; how much better still would be a permanent alleviation, not by charity, but by law! The late Government had been condemned as incapable; another had succeeded of absolute wisdom; and what had it done? It had expressed its hope of a good harvest. Why, the late Government could equally have hoped for that. Their abilities might not have been very shining, but at least they were competent to look at the barometer. He spoke with strong sympathy of the patience with which the poor were enduring their privations, and suffering life itself to ebb away, without violence or impatience. He could not concur in the proposal for a total repeal of the existing law; but he would vote for a committee to consider its provisions.

Mr. Cobden denied that in times of ordinary prosperity labour is displaced by improvements in machinery. It was feared that the land would be thrown out of cultivation; but the Scotch, the best farmers, laughed at the notion of your being defeated in the tillage of your land. When the tide which had flowed into the towns should ebb back upon the rural districts, what would become of the agriculturists then? The Legislature, when they called on the working people to pay a high fixed price for their loaf, seemed to forget that they had passed no law to fix a high price of wages. If England had no Custom-house, it might be unreasonable for the manufacturers to call upon the Government for markets; but, under a tariff remitting duties on almost everything else, they had a right to require that their corn should be imported freely.—After some remarks from Lord Howick, Mr. Grimsditch, and Sir J. Hanmer, the House divided:—For committee of supply, 231; for committee on Corn-laws, 117; majority for supply, 114.

Sir R. Peel declared his intention to go on at once with the supply, postponing any one or more votes which it might be thought desirable to discuss more fully than the lateness of the hour would then allow.—Lord John Russell approved this course; and the House went accordingly into committee of supply.—Sir G. Clerk moved the sum of 806,566*l.* for the expenses of the war in China.—After some discussion, the vote was passed.—Sir G. Clerk next proposed a sum of 108,000*l.* for militia and other expenses in Canada: which was also agreed to.—Upon the next motion, for the sum of 10,000*l.* for the improvement of harbours, &c., Mr. Williams, to prevent the further progress of public business, moved that the resolutions agreed to be reported to the House. A division took place, in which he was defeated by a large majority; but Mr. Hume and Dr. Bowring persevered in repeating the same species of motion, until it being manifestly useless to contend longer against such opposition, the committee of supply was postponed.

On the order of the day for the adjourned debate on the Flag Officers (Navy) Bill, the House divided:—For the motion, 16; against it, 60; majority, 44.

Tuesday.—Sir R. Peel presented a petition for the singing classes at Exeter Hall, similar to that presented in the Lords by the Lord President. The right hon. Baronet stated, that on the part of the Crown, he had no difficulty in acceding to the request of the petition, that a reasonable amount of money should be devoted to the encouragement of a science so conducive to the refinement and amelioration of the people.

Sir R. Peel moved for leave to bring in a bill for the better security and protection of her Majesty's person. He stated the objects contemplated by the bill, which is intended to dispense, when deemed necessary, with the formalities observed in the examination and trial of persons charged with high treason, and to inflict the punishments of transportation and personal chastisement on persons guilty of the wanton and cruel modes of alarm and annoyance practised recently. "I propose," said the right hon. Baronet, "to constitute no new offence, and I do not intend to constitute any new punishment; I merely propose a change in the form of proceedings in cases where a charge compassing the wounding of the Sovereign is made, and to assimilate the form to that observed when the life of the Sovereign is said to have been attempted. It was on this principle that we recently acted in the case of Francis. In that case, after full consideration, notwithstanding that his life was forfeited, we determined that it was not for the public interest that the sentence of capital punishment should be carried into effect. The decision to which we came was founded upon the unanimous report of the judges before whom the prisoner was tried, and the law officers of the Crown who conducted this prosecution. It was no feeling of false humanity which tempted us to remit the capital sentence, but into the reasons which influenced us I am sure the House will not expect that I should enter into detail. The bill now proposed will also provide for other offences beyond those which bear the name of treason. I propose that after the passing of this act, if any person or persons shall wilfully discharge, or attempt to discharge, or point, aim, or present at or near the person of the Queen any gun, pistol, or other description of fire-arms whatsoever, although the same shall not contain explosive or destructive substance or material, or shall discharge or attempt so to discharge any explosive or destructive substance or material; or if any person shall strike or attempt to strike the person of the Queen with any offensive weapons or in any manner whatever, or if any person shall wilfully throw or attempt to throw any substance whatever at or on the person of the Queen, or with intent, in the cases aforesaid, to break the public peace, or with intent, in any of the cases aforesaid, to excite the alarm of the Queen; in all these cases I propose that the party so offending shall be subject to the same penalties which apply to cases of larceny, that is, that he be subject to transportation not exceeding seven years; but we propose also another punishment more suitable to the offence, and more calculated to repress it—that there be a discretionary power of imprisonment for a certain period, with authority to inflict personal chastisement (the right hon. Baronet was here interrupted for some time with loud cheers from both sides of the House.) I think," he continued, "that this punishment will make known to the miscreants capable of harbouring such designs as are pointed out by this bill, that instead of exciting for their offence a most misplaced, and I may say stupid sympathy, their base and malignant motives in depriving her Majesty of that relaxation which she must naturally need after the cares and public anxieties of her station, will lead to a punishment proportioned to their detestable acts. I do confidently hope that, without calling for any powers of extreme severity, the provisions of this bill will be effectual for the purpose; for observe what we have to guard against—it is not any traitorous attempt against the peace of the nation by conspiring to take away the life of the Sovereign; but it is the folly or malignity of wretches who are guilty of acts prompted by motives which are scarcely assignable. The law, in its charity to human nature, has omitted to provide for the case of any being, formed like a man, who could find a satisfaction in firing a pistol at a young lady—that lady a mother, and that lady the Queen of these realms. It never entered into the conception of former law-makers, that anything so monstrous should arise as that the Queen of these realms should not enjoy a degree of liberty granted to the meanest of her subjects. I am sure the house will respond to the proposition to give the security of this law for the protection of her Majesty. We have every confidence in the protection vouchsafed by Divine Providence; and we trust that the strong feelings of veneration and affection of her Majesty's subjects will have the effect of drawing a rampart round the throne which will prove too powerful, not only for any attempts which may be made to disturb the peace of the realm, but what is more to be guarded against, which would bear harmless her Majesty's gracious person, whatever designs wretched miscreants may entertain against it. The knowledge that such attempts should be made have disturbed not only her Majesty's peace, but that of every loyal subject in the empire; and if we can devise an additional security against them, by an enactment such as I propose, which trenches upon no principle of English jurisdiction—which invokes no undue severity of punishment, I am sure it will meet with the unanimous approval of this House, and that every individual member will retire with an increased satisfaction in having contributed to secure that freedom, or rather, that tranquillity of mind, to which the Sovereign is at least as well entitled as any of her subjects. I beg to move for leave to bring in a bill to provide for the security and protection of her Majesty's person.

Lord J. Russell expressed his hearty concurrence, and observed that the offence was undoubtedly new in its kind, and had its origin in some base and malicious passion to injure the person of the Sovereign; he considered that as it is the offence of base and degraded beings, a base and degrading species of punishment is most fitly applied to it; for it is impossible to think, or almost to divine, what kind of motives are those by which this crime is prompted. Mr. Hume expressed himself quite satisfied that the House would pass this law unanimously; and Mr. O'Connell said he could not avoid expressing, in the name of his constituents, and in the name of that part of the empire from which he came, the universal abhorrence and disgust felt there at those base offences committed against her Majesty's person, and the thankfulness which they will entertain towards her Majesty's Government for a measure calculated to mark with the contemptuous execration of the whole nation these brutal attempts on her Majesty's life. Leave was then given to bring in the bill; and it was forthwith brought in, and went through the two stages of being read a first and second time, and ordered to be committed on Wednesday.

On the order of the day for going into committee on the Poor-Law Bill, after a question from Mr. Liddell, Mr. T. Duncombe asked if Government really meant to go on with the bill, seeing the near approach of the termination of the commission—Sir J. Graham, attaching great importance to the bill, felt bound to go on, and ascertain the sense of the House with respect to it.—Capt. Bernal declared his determination to resist its progress.—A conversation arose on the expediency of going on with the bill, and Sir R. Peel, confessing that the Government were placed in a difficult position, thought the House should first decide whether the commission should continue for five years or not.—After some further discussion, Sir J. Graham reiterated the recommendation of Sir R. Peel; but several Members, especially Mr. O'Connell, entreated the Government to pass a temporary bill, and bring the subject on at an early period of next session. At last Sir J. Graham expressed, on the part of the Government, a disposition to concede the point of pressing the entire bill, but asked for a decision as to the continuance of the commission for five years, a point which he considered essential. For this purpose the House went into committee, and Mr. S. Crawford pleaded for shortening the duration of the commission to one year, moving an amendment to that effect.—Mr. Ferrand seconded the amendment, which was supported by Mr. Aglionby, Mr. Hardy, Sir C. Napier, and Mr. Liddell. Mr. Hawes spoke in favour generally of the Poor Law Amendment Act, as a great social benefit, and expressed his regret that the Government were not going to press the entire bill before the House during the present session.—After some observations from Mr. C. Wood, in support of the permanency of the commission, and from Lord Sandon, who argued in favour of a frequent revision by Parliament of the commissioners' powers, Sir J. Graham said that there could not be a greater mistake than to assume that the commissioners were irresponsible. Their powers were subjected to a rigid supervision, more so than any other authority in the country. He argued at considerable length against many of the objections urged against the bill. A desultory debate continued for some time longer, when a division took place, and there appeared, for the amendment, 92; against it, 164. Repeated divisions, and considerable debate, arose on motions to compel the adjournment of the proceedings, which ultimately ended in the clause being voted by 146 to 26.—Some other business was then disposed of.

Wednesday.—In reply to Mr. Grimsditch, the Chancellor of the Exchequer stated that the Commissioners for inquiring into the circumstances connected with the forged Exchequer Bills fraud, had already examined 130 witnesses, and that they expected shortly to bring their inquiry to a close.

Sir R. Peel moved that the House resolve itself into committee on the bill for the protection of her Majesty's person.—Mr. Hume desired to know whether the Ministers, who were about to ask for votes of public money, were prepared with any measure of economy? He would recommend that they should advise her Majesty to reduce the expenses of her household by one-half. He believed that the splendours of the Palace were very unpalatable to the people. The same principle ought to be applied to the whole civil expenditure, upon which he said that two or three millions sterling might be saved.—Sir R. Peel presumed that the speech just made had been delivered under the mistaken apprehension that the motion then before the House was for going into committee of supply. He regretted the reference to her Majesty's personal expenditure and bounty, and hoped that the House would proceed this evening to vote the supply without needless obstruction.—Sir R. Inglis rebuked Mr. Hume for his topics, and for the occasion which he had taken for introducing them.—Mr. Hume defended himself; and was seconded by Mr. Williams.—Sir R. Peel interposed in a conciliatory tone.—Sir R. Inglis explained; and the altercation then ceasing, the Protection Bill went through committee.—Sir R. Peel took this opportunity of stating that Francis was to be transported to the most penal of the convict colonies.

Sir R. Peel, in reply to Mr. Hawes, said that the Government did not contemplate any grant for church extension.

The House then resolved itself into committee of supply.—Mr. Hume and Mr. Ewart, on the vote for the British Museum, offered various suggestions, with a view to render its contents more accessible to the working classes, children included; and Mr. Hume demanded a share for the public in the election of the trustees.—Sir R. Peel showed the practical working of the present constitution to be better than any results which Mr. Hume's reforms were likely to produce.

On the estimate for public buildings and Royal palaces, Mr. Hume suggested some alterations at Hampton Court, but Mr. Williams questioned the propriety of keeping up so many palaces at the national expense.—Mr. Protheroe suggested the annexation of a chapel to Buckingham Palace, for the sake of relieving the Queen from the danger to which she had lately been exposed in her drive to the Chapel at St. James's. Mr. Ewart and Mr. Hawes pressed for a more general opening of Richmond and Kew Parks.—Lord Lincoln said that a chapel at Buckingham Palace had been contemplated irrespectively of the recent outrages. He vindicated the admission of the public to the parks.

On the vote of a sum for the completion of a model prison, Mr. Williams contended that the silent system, which that prison was intended to try, was not likely to answer in this country. He condemned the discontinuance of transportation. In the last opinion Sir J. Graham concurred; but he was very desirous that a fair trial should be given to the model prison, which might, he thought, be made a useful auxiliary to transportation.

On the item for the expenses of the two Houses of Parliament, amounting to 62,300*l.*, Mr. Hume required an account of the expenditure of the House of Lords.—Sir R. Peel said that the House of Lords had, from time immemorial, refused to give this information; and this sum formed the only portion of the public money over which they had no control. The amount was placed at the disposal of the House of Lords by means of an address to the Crown. He therefore hoped that Mr. Hume would not insist on the information, as it was calculated to revive jealousies between the two Houses. Mr. Hume, however, persevered, and moved a reduction of the vote by 21,000*l.*, the amount appropriated to the House of Lords. He was defeated, on a division, by 90 to 23. He made another attempt by moving the reduction of the vote to 12,000*l.*, but no division took place, and the original vote was agreed to.

The rest of the evening was occupied in discussing various other grants, such as the expenses of the Poor-Law Commission, the Consular Establishment, &c.; after which, the Queen's Protection Bill was read a third time and passed; and the orders of the day were then disposed of.

Thursday.—Mr. Hume called the attention of the House to the report of the select committee on national monuments in June, 1841, and moved an address to the Queen, that directions be given to the trustees of the British Museum, National Gallery, authorities at the Tower, and persons in charge of public edifices and cathedrals, for the adoption of these facilities towards the public and improvements which are recommended in that report, one of them being that such places as the British Museum should be opened to the public on Sundays, without interfering with the hours of divine worship.—Mr. Ewart seconded the motion, pressing on the Government the importance of the subject.—The Chancellor of the Exchequer admitted the importance of it, and expressed his cordial desire to see every proper step taken which would tend to the elevation of the great body of his fellow subjects. The opening to the public of the parks, &c., in the neighbourhood of London, produced advantages, not only as it conduced to the amusement and health of the humbler classes, but in the gratifying scenes thus presented to those moving in a higher order of society. There was no sight that could confer more real pleasure on a humane and rational being, than that of seeing the humbler classes enjoying the gifts of Providence in an innocent and beneficial manner; and he (the Chancellor of the Exchequer) frequently resorted on Sunday to the Parks, for the purpose of seeing his fellow-beings enjoying healthful and salutary recreation. Between him and the Hon. Member there was one point of difference in the committee, namely, on the propriety of opening the British Museum and the National Gallery on Sundays. The Hon. Member would call this a prejudice; but the way to change the minds of those who entertained that opinion would not be to move an address to her Majesty for the interposition of her authority. He would advise the Hon. Gentleman not to persist in a course which would meet with great opposition from those who thought that opening the institutions on Sundays would be extremely prejudicial to the moral habits of the people, but to leave those prejudices, if they were prejudices, to be operated on by the reflection that might produce a change of opinion. The Hon. Member himself used some observations which made against the expediency of the course he now proposed to pursue; for he showed how public opinion was gradually doing what could not have been effected by violence, and that the disposition was daily increasing to open not only public, but even private grounds and buildings of general interest, to the public. It was admitted that the suggestions of the committee had, in Greenwich, and other places, had the effect of procuring increased accommodation to the public; and if every indulgence that might be desired could not be granted, there was every disposition to accommodate the public as much as possible. He hoped that Mr. Hume would not press his motion, but rest satisfied with having obtained a general expression of opinion from the House favourable to the objects he had in view.—Sir R. INGLIS could not concur in these objects. The recommendations of Mr. Hume's committee appeared to desire that a race should be run between London and Paris in the desecration of the Lord's Day, by throwing open to the Londoners the various places of public amusement on Sundays. He denied that there was any connection between improvement in the fine arts and the morals of a people, for in Greece and Rome high art and great corruption were contemporaneous.—Mr. G. KNIGHT expressed his surprise at the sentiments uttered by Sir R. Inglis, who appeared to him to speak more in the tone of a holy monk of the middle ages than of an enlightened legislator. He cordially supported the motion, as he believed in the humanising influence of art, and could see nothing but beneficial results from permitting hardworking men to improve themselves in the British Museum, or recreate in the Parks, during those hours of Sundays which did not interfere with the time set apart for divine worship.—Sir R. PEEL pointed out that there were objections to the motion, founded on technical and decorous considerations. "In my opinion," said the right hon. Bart., "free access should be afforded to the working classes to our national monuments, for I think that it would be of the greatest advantage to refine the public taste. I agree with my hon. Friend, the Member for Oxford, that it would be most unsatisfactory to propose them as a substitute for religion; but it is not as a substitute for religion, but a substitute for drunkenness on the Sabbath, that I support the view of the hon. Member for Montrose. The duties of religion discharged, it would be much better for the poor man to spend the remainder of the day in contemplating the wonders of nature or the resources of art, than in drinking his earnings and squandering his health in a public-house. The greatest advantage to the community would be derived from a refinement of the public taste. There is also another advantage in the proposition, namely, that, if carried into effect, it is likely to enlist the great body of the people in favour of our institutions. At present they rarely come into contact with the State, except for the purposes of punishment. But I want them to see that, in our expenditure, we have their interests as much at heart as our own. By this means you will have a guarantee for the security of the monarchy, and for our present form of government. There is, therefore, a double object in acceding to the recommendations in the report of the committee, namely—the refinement of the people and the enlistment of their sympathies in favour of our existing institutions. I do not, however, agree with some points of the motion. For instance, I do not think it for the advantage of the public that the British Museum and the National Gallery should open on Sunday. We should carry all classes along with us as much as possible in our improvements. The jealousy of admitting the public at large I hope will be gradually removed. Indeed it is in evidence that it is not the poorer class who do the damage that is complained of, but the vulgar rich, who can afford to pay the price of admission. The only object of these institutions is to promote refinement and national taste, and that is only to be done by giving free access to them.—After some further conversation, during which several Members agreed that this discussion would produce a most favourable impression on the public mind, Mr. HUME expressed himself satisfied with the debate, and withdrew his motion.

Mr. EWART then brought forward a motion, "That it is expedient that the Government School of Design be formed into a Central Normal School, for the instruction of teachers of design, in communication with other Schools of Design throughout the country; and that the general recommendations of the committee, which reported on this subject in the year 1836, be adopted." —Dr. BOWRING seconded the motion.—Mr. GLADSTONE said that the recommendations of the committee of 1838 were gradually adopting. Six provincial schools of design are to be established in Manchester, Birmingham, York, Coventry, Norwich, and another town not yet fixed on; and the objects of the institution of the central School of Design are to be extended. But in the present state of the experiment it would not be advisable to adopt the motion.—Mr. LABOUCHERE expressed his satisfaction with this statement, and gave some account of the gradual progress of the School of Design.—After some further conversation, Mr. EWART withdrew his motion.

Sir R. PEEL moved for leave to bring in a bill to continue the act for the trial of controverted elections. As he only proposed that it should extend till the end of next session, he avoided saying anything on the principle of the measure, and did not anticipate controversy.—After a brief conversation, leave was given to bring in the bill.

After certain returns connected with the clergy reserves in Canada were granted, on the motion of Mr. SHEIL.—Sir J. EASTHOPE, at the request of Sir R. Peel, founded on the absence of Sir J. Graham, from indisposition, postponed his motion for returns of the amount and application of every church-rate in every parish for the last three years.

Mr. HUME then moved for a copy of the last patent constituting the commission for executing the office of Lord High Admiral, with various particulars connected with the rank and emoluments of each Lord.—Sir G. COCKBURN stated the gradual, though rapid, steps by which he himself had risen in the profession, as a proof that Mr. Hume's charges as to the favouritism and jobbing in the navy were not well founded.—A compromised set of returns was offered to Mr. Hume, with which he was not satisfied; he then divided the House, and was defeated by 99 to 23.

The CHANCELLOR of the EXCHEQUER obtained leave to bring in bills to reduce the expenses of the offices attached to the Superior Law Courts in Ireland, and to effect alterations in the English Court of Exchequer.—The House then went into committee on the stamps and assessed taxes, when a series of resolutions were agreed to, preliminary to the introduction of a bill.

Friday.—After some conversation respecting the gold coinage, and a short Bill to correct errors in the Tariff, the House went into committee of supply. Several votes passed without opposition. Mr. WILLIAMS then divided the House on the vote of 39,200*l.* for secret service money, which was affirmed by a majority of 104. On the vote of 30,000*l.* for public education, a discussion of considerable length ensued, which ended in the vote being carried. Another division took place on the vote of 13,215*l.* for the Colonial Church establishment, when the vote passed by a majority of 106. The vote of 50,000*l.* for the National Board of Education in Ireland led to a discussion, when Mr. WARD insisted on a division, when there appeared—for the vote, 94; against it, none. The resolutions were then reported, and the House adjourned.

CITY.

Money Market, Friday.—The lamentable intelligence of the death of the Duke of Orleans, has had a very unfavourable effect upon the English funds. Consols on Thursday rapidly declined ¾ per cent. At the close yesterday they were 90½ to ⅝ for money. Three per Cents. Reduced, 90⅞ to 1; Three-and-a-Half per Cents. Reduced, 99⅞ to 100; New Three-and-a-Half per Cents., 99¼ to ⅜; Exchequer Bills, 48s. to 50s. prem.

Metropolis and its Vicinity.

Court of Aldermen.—A Court was held on Saturday to elect two active and two passive commissioners for carrying into effect the provisions of the Income Tax for the City. The Court having been officially informed that the Court of Common Council had elected four aldermen and four common councilmen to act as commissioners under the Income Act for the City, proceeded to the election, when Alderman Farebrother and Alderman Gibbs were elected the active commissioners, and Mr. J. Dixon and Mr. Cope the passive commissioners, for the purposes of the Act.

Public Meetings.—The annual general meeting of the subscribers to the London Diocesan Board of Education took place on Tuesday, the Lord Bishop of London presiding. The report stated, that during the past year the committee had appointed an inspector to visit those schools in union with the Board and the National Society. From his report it appeared that the benefits of the system were already felt, and that the number of schools was daily increasing. Schools had been established in Duke-street, Manchester-square, Islington, and Mile-end, under the superintendence of the clergy, where the children of the middle classes, in addition to the principles of Christianity being taught them, received a sound commercial education. The central school, in Rose-street, Soho, had now 100 pupils; but it was a source of regret that, owing to the inadequacy of the funds, the board had been compelled to raise the terms for pupils from 5*l.* to 6*l.* per annum. In order to assist the funds, the bishop of the diocese had caused a circular letter to be issued, and through it the sum of 470*l.* was collected, of which sum the Queen Dowager subscribed 50*l.* Notwithstanding this sum, after paying various expenses, but a very small balance would remain at the discretion of the board. The report, after alluding to the establishment of a national school for the training of masters, concluded by stating, that the amount of subscription received on account of the National Society's fund was 805*l.* 17*s.* 11*d.*, including a grant from the board of 332*l.* 10*s.* 1*d.*, and, on account of the Diocesan Board of Education, the receipts, including the balance last year of 481*l.* 2*s.* 1*d.*, amounted to 997*l.* 7*s.* 7*d.*, and the expenditure to the same amount, including grants to the amount of 322*l.* 7*s.* 6*d.* Lord Radstock moved the adoption of the report, which was seconded by the Rev. Dr. Russell, and carried unanimously. The Bishop of London then adverted at considerable length to the necessity of encouraging education, and cited the opinion of the Rev. Mr. Eden, who had been inspecting the schools in Essex, and who observed that had the Government of the country in former days directed their attention to the education of the poor, there would have been no occasion for the present police establishment. He (the Right Rev. Prelate) was of the same opinion. It would have been far cheaper for Government to have built churches and schools, than to erect poor-houses, penitentiaries, and gaols. This was a truth which was now felt by Government, who were using exertions to place the education of the poor on a firm and proper basis.—A meeting of the Colonial Society was held on Tuesday to consider the most appropriate mode of expressing to the Right Hon. Sir Charles Metcalfe, the grateful sense which the Society entertains of the important benefits arising from his government of Jamaica. The Earl of Mountcashel, who presided, said they were called upon to bear testimony to the services performed by Sir Charles Metcalfe. It was almost unnecessary to dilate upon his merits; but it behoved the Society, as a body representing the interests of all the colonies, to come forward and publicly express their approbation of the conduct and the sound policy which had been upon all occasions manifested by him. The noble chairman then gave a history of Sir C. Metcalfe's career in India, and said that it was his intention to have retired into private life, when he was solicited to accept the governorship of Jamaica. They would recollect the unsettled state of Jamaica at that time. The authorities were almost in a state of rebellion; at least, they were very much opposed to the Government and policy of England; great dissension prevailed, and it was at one time feared that civil war would take place. It was at that time that Sir C. Metcalfe accepted the appointment of Governor, and it was soon after his arrival in the colony that, by dint of sound policy and judgment, matters were brought to a smoother state, and the insurrection quelled. The disturbances between the coloured population and their employers were peaceably subdued, and having restored the tranquillity of the island, he had returned to this country. His conduct was approved of by Her Majesty, by Her Majesty's late and present Government, and by the inhabitants of Jamaica. In his lordship's opinion they would be doing as much honour to themselves as to Sir Charles by publicly expressing their admiration of his conduct. Mr. Burge, the agent for Jamaica, then brought forward the address, which was adopted, and a deputation appointed to present it.

Metropolitan Roads.—The income derived from the tolls on the Metropolis roads since the introduction of railroad travelling in 1837 has progressively decreased from 83,497*l.* to 67,475*l.*, a falling off of 16,000*l.* per annum. The Commissioners, in their report just issued, state, that under these circumstances they found it incumbent upon them to contract their expenditure; and with this view, after duly considering the nature of the various branches of service for which they had to provide, they resolved to relinquish the expense of lighting the roads, and which presented, in their opinion, the most appropriate source for reduction, being an accommodation more applicable to the parties living by the sides of the roads than to the general traveller; and, moreover, being a service to be performed at the discretion of the Commissioners, and not imperatively imposed upon them by their Act. They considered, therefore, that this expense might be properly saved, and transferred to the respective parishes through which the main lines of road pass which were lighted by this Commission. It appears that the greater part of the parishes have taken on themselves the lighting of the turnpike roads. The exceptions are the Kensington and Brentford roads.

Police Arrangements.—Several cases having lately occurred in which criminals have not been taken into custody so promptly as the public had a right to expect, the Commissioners of Police have arranged that a new company shall be immediately raised out of the present police, to be called the "Detective Force." It is to consist of two inspectors and eight serjeants, and private constables to be selected by the commissioners from the most efficient officers belonging to the various divisions of the present police force, who are to have full range of the whole Metropolitan district, with power and funds to enable them to prosecute a diligent search, in order to detect and bring to justice offenders whose crimes have laid them open to the punishment of the law. The two inspectors are to receive each 200*l.* per annum, and the pay of the other eight officers is to be raised to 30*s.* per week each.

Custom House.—The new tariff came into operation on Monday. The clerks in the Import-office were in attendance at their respective posts as early as eight in the morning, and throughout the day the greatest activity prevailed in the establishment in granting clearances for bonded goods. At the Bonded-office, in the docks, a great deal of business was done, and a considerable quantity of foreign produce, which had been waiting the passing of the bill, was cleared from the different warehouses. The Hamburg steamer, which arrived on Monday morning, had a quantity of poultry and meat on board, which was admitted by the new bill.

Metropolitan Improvements.—A parliamentary paper just published states that a favourable opportunity having presented itself to prevent the perpetuity of a nuisance which has long existed in the Kensington-road, in consequence of a public-house, called the Half-way House, standing in the road itself, and occupying a considerable portion of its width, the commissioners, in conjunction with the Commissioners of her Majesty's Woods and Forests, made arrangements with the Dean and Chapter of Westminster for the purchase of their interest in these premises. This transaction has been lately completed, and the commissioners have purchased the property for 470*l.* 15*s.* 10*d.*, but the transfer of this deed is delayed for a time by some official formalities.—A new arcade, to bear the name of the Duke of Wellington, is about to be erected. It will extend from Wellington-street north, immediately opposite the portico of the English Opera House, to Catherine-street, Strand. The boarding has been erected, and the preliminary clearings for it have already commenced.

Vauxhall Gardens.—This pleasant place of entertainment is again opened to the public with various objects of attraction, the principal of which is the representation of the late fire at Hamburgh, painted by Mr. Marshall. The scale upon which it is painted may be judged when it is known that the spire of St. Nicholas is nearly 150 feet high, and may be seen from the different bridges.

Duel.—A duel took place yesterday morning in the neighbourhood of Osterley Park, between Capt. Boldero, M.P., and the Hon. Craven Berkeley, M.P. The dispute arose in consequence of Mr. Berkeley having attributed to Capt. Boldero the use of certain expressions disrespectful to the Queen, which the latter peremptorily denied. The parties exchanged shots without effect, and a long correspondence has since been published, containing letters from several Members of Parliament, supporting Capt. Boldero's version of the affair.

Police.—On Tuesday, a tradesman in the City applied at the Mansion-house for advice whether any criminal proceedings could be taken against the persons concerned in the Westminster Discount Loan and Investment Society. He produced a receipt for the sum of 67*l.* paid as a deposit with the society, when it had an office in Buckingham-street, and before it opened the great house in Adam-street, Adelphi, as a savings'-bank. From the receipt it appeared he was the 150th depositor as early as September 1841, and that the institution was enrolled under the 5th and 6th Wm. IV., c. 23, the Act for establishing societies for making loans not exceeding 15*l.* The receipt specifies that the money is taken as a deposit for one month, at five per cent. interest, subject to withdrawal on four days' notice. The applicant stated that on applying for the return of his money at the house in the Adelphi, he was referred to a solicitor, who said he was unable to give him any information. He had also endeavoured to learn who were connected with this concern is shareholders. He had received a copy of the *Sun*, wet from the press, in February last, containing the report of the last general meeting, from which it seemed they were thriving, having loaned 180,000*l.* in three years, and divided eight per cent. among the shareholders. He had been induced to invest his money merely by reading the advertisements in the newspapers, in which there appeared to be some respectable names. Sir Peter Laurie said it was not always the law protected the inconsiderate. He reminded the applicant of the Independent and West Middlesex Company, and said that there was more swindling going on in the form of companies than by individuals, and two years ago a committee was appointed by Parliament to inquire into such concerns, which made little progress; but he hoped the subject would be again taken up. He should be happy to assist the applicant; but he was at present not sufficiently informed about the facts and the parties to be assisted. The applicant must consult and act with some of his fellow-sufferers. It has since been announced that a respectable solicitor has been employed to wind up the concern.

Provincial News.

The Weather and the Crops.—The country papers are beginning to report on the prospects of the coming harvest. In Sussex, the latest accounts state that the wheat crops look well; the straw is unusually high, the ears large, and the grain good. In Hampshire, the crops are looking remarkably well: the late showers and fine weather have brought forward the corn, and a bountiful harvest is expected. In Devon, the early wheat has come into excellent bloom during the warm weather; but the lately sown is stunted, and will prove a short crop; the early barley promises well, but the late grain is very backward. In Gloucester, the wheat has been greatly benefited by the rains; a little has been beaten down, but not to any injurious extent. In Herefordshire there is no doubt that the hay and clover harvest will suffer from the heavy rains which have visited that county; the hop-grounds have also been injured, and the crop of apples is variable. In Leicestershire the grass is light; the wheat, though very thin, is of good quality; and the corn crops generally will be of an average quantity if the weather continues fine. In Derbyshire there has scarcely been seen such an abundant wheat crop, and a luxuriant harvest is promised. In Cumberland also a good harvest is anticipated; the growing crops look well throughout the country. In Lancashire the weather has been cold and windy, accompanied by rain; the grass is not so heavy as was expected, but all kinds of grain have a healthy appearance. In Wales the rain has not yet been injurious to wheat, barley, or oats, but fine weather is yet wanted to ripen and house the corn. Several fields are in a forward state and are beginning to turn colour fast; the barley is also looking well.

Brighton.—The Nautilus, 10 gun-brig, Lieut. Paulson, is still cruising off the coast for the protection of the fisheries. While lying at anchor a few days since, off this town, a party of ladies went on board to look at her; during their stay it came on to blow a gale of wind, so that the Nautilus was obliged to slip her cable and put out to sea, carrying the ladies with her, who were thus unexpectedly compelled to go on a cruise, which lasted several days, as there was no opportunity of landing them until the weather became more moderate.

Bristol.—The great meeting of the Royal Agricultural Society of England has completely filled this city with visitors from all parts of the country. All the inns have been crowded, and throughout the week it has been difficult to procure lodgings in private houses. The Duke of Cambridge arrived on Tuesday, and took up his residence at the seat of Mr. Miles, where the Duke of Richmond was also staying. The entries for the exhibition of stock were very numerous; above a thousand tickets for specimens had been issued in the beginning of the week, and it was confidently expected that the show would exceed that at Liverpool in point of numbers. On Tuesday the Mayor gave a dinner at the Merchant's Hall to the council of the Society, at which his Royal Highness and a large number of the nobility were present. The speech of the evening was that of Mr. Everett, the American Minister; he said that there were many associations between the ancient city of Bristol and the United States, and he felt satisfaction, while at such a distance from his home, at being in a city which from the earliest times had been connected more or less with his own country. Perhaps it was not known to many who were present that the discoverer of America, the great Columbus himself, had been at one period of his life a resident in Bristol, engaged in carrying on the trade of a common pilot between Bristol and Ireland. In later times associations had sprung up between Great Britain and America which he hoped would be advantageous to both countries. Steam navigation had still closer cemented the intimacy of both countries, and he could not forget that to Bristol was the honour due of having first originated that navigation across the Atlantic: and he could assure them that the arrival of their noble Great Western at the shores of America was considered as an era in the history of their country, which he hoped would prove but the harbinger of a closer union, and that the steam navies of both countries would only be used to assist each other. He assured them that he felt at home in this the home of his fathers, and in coming down from London to-day every name and every spot on the map appeared familiar to him. This was to be accounted for from some of the earliest settlers in America coming from this part of England, and they in the United States had their Bristol, their Bath, their Wells, their Exeter, their Gloucester, every name in this neighbourhood seemed to remind him of the home of his heart, and to make him, a pilgrim in a strange land, feel at home. Mr. Everett then concluded by expressing a hope that the communication between the two countries would be still more frequent and their union more cordial than ever. The agricultural exhibitions commenced on Wednesday, and there appeared every reason to believe that the results of the meeting will be as satisfactory as those of last year's meeting at Liverpool.

Denbigh.—Great sensation has prevailed in the parish of Caerwys, and the vicinity of the Vale of Clwyd, in this county, in consequence of the death of an aged farmer, named Roberts, from the effects of poison administered to him by his wife. It appears that he was seventy-seven years of age, and held a small farm in the parish of Caerwys, at the distance of half a mile from the town. About two months ago he married a girl of 19 in inferior circumstances to himself, with whom he lived on unhappy terms. On Friday, the 10th ult., the prisoner went to Holywell, and purchased some arsenic, which she administered to her husband on the following Sunday in his food. He died on the following day after considerable suffering. The jury at the inquest returned a verdict of Wilful Murder against the wife, who has been committed to take her trial. Since her committal she admits the deed, and says that she was instigated by a young man, the son of a late mistress, who had some time promised marriage to her, previous to her knowledge of deceased.

Halifax.—The poll for the church-rate in this town terminated last week. On Monday, the vicar attended in the vestry, and announced the result as follows:—for the rate, 541; against the rate, 1,561. Majority against the rate, 1,020.—On Thursday evening the Commerce coach was overturned on its way to Leeds, in Godley-lane, near this town. There were six or seven passengers at the time, all of whom were more or less hurt; one female sustained a concussion of the brain, and another had one of her arms broken.

Lichfield.—The local papers mention with much satisfaction that the health of the bishop continues to improve although slowly. At the request of his family public thanksgiving for his lordship's convalescence were offered up in the cathedral on Sunday morning.

Manchester.—A long correspondence on the subject of printed or stamped wafers on newspapers have been published in the Manchester papers. It appears that a gentleman of that town received a newspaper sealed with a printed adhesive wafer or label, and which was charged by the post-office authorities for having "information on the wrapper." The gentleman complained to the Postmaster-general, and received for a reply that the newspaper was correctly charged, and that the amount of postage could not be refunded.

Portsmouth.—The neighbourhood of Havant, in this county, has been thrown into great alarm within these three weeks, by various acts of incendiarism and malicious injury to cattle, accompanied by a system of threatening letters, which, in one or two instances, have been but too punctually performed. The Rev. Mr. Mountain, the rector of Havant, has had his barn burned down, and a valuable carriage burned with it. The Rev. gentleman received a letter containing threats of personal violence. Another fire took place immediately after the last mentioned, and was equally destructive. Some cattle and sheep have been maimed, and left lying about the fields in that state. Various other attempts to set fire have occurred in this immediate vicinity; and letters of a threatening character have been received by Mr. Andrews, one of the guardians of the Havant union, and by Mr. Longcroft, the clerk to the board. A communication has been held with the Home-office upon the subject, and precautions have been taken to abate the uneasy feeling that at present pervades the neighbourhood.—His Belgian Majesty's steam-ship, the British Queen, sailed on Monday for New York from the Motherbank, where she arrived on Friday night from Antwerp. She did not proceed to Southampton as announced, but has been remaining at the Motherbank, where she has taken in her mails and passengers. Capt. Keane, R.N., who commanded her the last voyage, does not do so the present one, as the Belgians were desirous that she should be commanded by one of their own naval officers, and not by a British one. It appears that a great part of the cargo has been insured in several of the London offices, with the understanding that the vessel was going out under the command of Capt. Keane. As no official or public notice has been given by the Belgian Government of this change of command, and as even up to the last hour the vessel was advertised to sail under the command of Capt. Keane, should any accident befal the ship or cargo, that country will be liable to pay up to the shippers the full amount of freight, the insurance being rendered invalid.—On Monday morning the Echo steam-vessel took nearly three hundred convicts from the York hulk, and embarked them on board the Marquis of Hastings, at Spithead, which will get under weigh in the course of a few hours for New South Wales. The convict Francis is one of the number.

Stockton-on-Tees.—On Thursday morning the fine cathedral, erected by the Roman Catholics of this town, aided by contributions from wealthy members of that communion, resident elsewhere, was dedicated and opened for divine worship by the Catholic bishop of the district. The Rev. R. W. Sibthorp, who lately seceded from the Church of England, preached to overflowing congregations in the morning and evening.

Stockport.—Mr. J. Howard, a manufacturer of power-loom cloth in this town, has given notice to reduce the wages of the power-loom weavers in his employ, to the amount of 15 per cent. The weavers are taking measures in consequence of this proceeding; and on Thursday evening a public meeting was held on the subject, in the Chartist Association Room, Bomber's Brow. From the language made use of on that occasion, it appeared the operatives were driven to a state of desperation, and one of the speakers said the extent of their present earnings was 5*s.* 6*d.* per week from two looms; and he declared he would never work at the reduced prices; and should he want bread, he would take it from where it was to be had. Others made use of violent language, and it was unanimously resolved, that the weavers to whom the reduction is offered should cease as they finished their week's work. The other weavers promised to contribute to their support during the strike.

Windsor.—It has been finally arranged for the Court to visit Windsor for a somewhat lengthened period, immediately after the prorogation of Parliament. The repairs and alterations which were commenced at the Castle immediately after the departure of her Majesty on the 13th ult, will be completed for the Queen's reception at a very early period in the ensuing month. In excavating the ground nearly in the centre of the quadrangle, for the purpose of erecting a reservoir to contain several thousand gallons of water to be in readiness in case of fire, the workmen have reached the crown of the arch of an extensive well, which was first discovered by Sir Jeffry Wyatville, in the reign of George IV., at the time the quadrangle was lowered. This curious excavation was found hollowed to the depth of nearly 80 feet in the chalky rock. Its shape is circular, and the descent to it was by a flight of stone steps, at the base of which had been the entrance. Several bones of animals mixed with rubbish were its only contents, and it is conjectured that it was used as a depository for treasure. There was also discovered, at the same period, on the east side of the quadrangle, a sally-port, arched and roofed with stone, leading under the ancient moat into the park, and retaining traces of having been defended by massive doors. The entire arch of the well, to the depth of five feet, has now been removed, and iron girders thrown across the walls on each side to support the tank, bricked arches being thrown over from girder to girder. This reservoir will be completed in the course of next week, when the erection of cast-iron tanks at the top of the towers will be immediately proceeded with.

Wycombe.—On Thursday morning a rick of sanfoin hay was discovered on fire at the bottom of Carver-hill, belonging to Mr. Treacher, of Hill Farm, near this town. There appears to be no doubt that it was the act of incendiaries, as on inspecting the premises, it was discovered that the rick had been recently thatched, and a quantity of loose straw left around it, some of which had been collected together and set fire to, about four or five yards from the rick. From this was found a layer of straw communicating to the rick in different parts, but owing to an early discovery, timely aid was afforded, and the greater part was saved.—The piece of plate to be presented to the Duke of Buckingham by the farmers of this county has just been completed by Messrs. Green and Ward, of Cockspur-street. Its height is about five feet, and it weighs upwards of 2,500 ounces.

IRELAND.

Dublin.—The Lord Lieutenant has addressed a letter to Earl Donoughmore, the Lieutenant of Tipperary, expressing his warmest acknowledgments to the gentry and magistracy for their aid and support at the late trials. His Excellency adds, that their prompt attendance in such numbers has enabled the officers entrusted with the administration of the law to vindicate its authority without having recourse to any extra-official proceedings, and will, he trusts, have the most beneficial effect upon the future tranquillity of the county.—Intelligence has been received in Dublin of the death of Mr. Justice Foster, which took place suddenly on Saturday, at Cavan, where the learned Judge bud been on circuit. His Lordship had retired from the court on Saturday, and added a codicil to his will. In a few minutes after, he expired. It is not many months since he was removed from the Court of Exchequer to the Common Pleas, to make room for Baron Lefroy. He was a kind and benevolent man, and one of the best landlords in Ireland.—On Thursday, Gen. Bustamente, the ex-President of Mexico, arrived at the Imperial Hotel, and, attended by his suite, proceeded to inspect the Royal Barracks, and other public establishments. On Saturday, he was present at a review of the troops in the Phœnix Park, under the command of Sir E. Blakeney. The Lord Lieutenant was present, and received the salute as the troops marched past. They then formed for manœuvres, and a number of brilliant evolutions were performed.—The papers are filled with details respecting the death of Mr. Augustus Byrne, which has taken place at his residence, Albert-terrace, Rathmines, under very suspicious circumstances, and a coroner's inquest is occupied in inquiring into it. His death appears to have been concealed by his wife and family till his body had become putrid, and the cause of his death is at present a mystery. He was not more than 30 years of age, and moved in a highly respectable sphere of life. His wife was a widow, with two sons by a former marriage. They have been arrested, together with the servants, to await the issue of the inquest.—Intelligence reached town on Wednesday of the death of Dr. Dickenson, Bishop of Meath, which took place at Ardbraccan on the previous day, after a short illness.

Dundalk.—At the Assizes on Thursday, Judge Perrin addressed a jury in these terms:—"Gentlemen, you are discharged from your attendance at these assizes, and I am happy to inform you that I think I am entitled to a pair of gloves, as there has not been a single conviction at the assizes of the county of Louth." Lord Jocelyn, the high sheriff, who was beside his Lordship, said he was delighted to know that such was the fact.

Longford.—At the late assizes, a man named M'Canna was tried before Baron Pennefather, for Ribbonism, found guilty, and sentenced to seven years' transportation. The evidence brought the fact home to the prisoner in the clearest manner, and consisted of the mixed testimony of approvers, and of other witnesses not liable to exception. The evidence of an approver named Hagan was remarkable. He said about one-third of the lower classes in the county are Ribbonmen, and that he has known foreigners to attend their meetings: there was one from France in 1832, and one from America in December last. The objects of the society were opposed to Orangeism. If any member was dispossessed of land, and any one else took it, he would not have long to live. He had himself initiated above 200 members into the society.

Tipperary.—The proceedings of the recent commission still occupy the attention of the public. The Cork papers mention, as a proof of the lamentable state of this county, that of 13 gentlemen from the northern district of Tipperary, who met at dinner during the commission, there were but two who had not lost a father, a brother, or some immediate relative, by the hand of the assassin; and that the reader will not wonder that juries, composed, as they usually are, of persons easily accessible by a bullet, are sometimes tenacious of pronouncing a verdict that may doom themselves to death. Among the 11 sufferers was the brother of Mr. Welland, murdered in the company of Mr. Cooper; the latter gentleman, it will be remembered, was murdered also.—In regard to the culprit Byrnes, now under sentence of death for the murder of Mr. Hall, the papers refer to the circumstances connected with his trial at the last assizes for Nenagh, where he was arraigned on the same charge. The same witnesses were sworn, the same evidence was produced, and few who heard the one or who read the other could have required much time for deliberation; yet 11 of the jury were for acquittal, while only one would have pronounced him guilty. That one had immediately after to quit the county. His life was not safe in the neighbourhood in which he lived, and he had to seek an asylum elsewhere. Even to this hour, so much does he dread assassination, that he is preparing to emigrate.

Wicklow.—The case which has been so often before the public, and created so great an interest, that of Lord Powerscourt against the squatters on the commons of the Sugar-loaf Mountains, his Lordship's property, and which was to have been tried by a special jury at the present assizes, has been amicably adjusted to the full satisfaction of the noble plaintiff, and the record withdrawn.

SCOTLAND.

Edinburgh.—Much interest has been occasioned by the intelligence that Government has determined to act with decision in the case of the Strathbogie Ministers. The papers state that the Moderator has received a letter from Sir James Graham, intimating to the majority of that Presbytery that they would be protected in all their rights and privileges; and that, in any legal measures they were forced to have recourse to, they must apply to the Crown agent, who had directions to do whatever was requisite for their interests.—We learn from the charge of the Bishop of Edinburgh, that in the short interval between November last, when the scheme was first published, and the present time, 15,000*l.*, being more than one-half of the required amount, has been subscribed towards the establishment of the Episcopal College in Scotland.

Arbroath.—A meeting has taken place of the Arbroath and Forfar Railway Company. It appeared from the report that there would be a dividend of 5 per cent. to the new shareholders; but the absorption of 1,288*l.* 12*s.* 11*d.*, which this payment would cause, left only a balance of 836*l.* 7*s.* 6*d.* out of the 2,125*l.* 0*s.* 5¼*d.* net profit of the year, and therefore prevented the declaration of a dividend to the original shareholders. The total revenue of the Company appears to have amounted to 9,327*l.* 12*s.* 7½*d.*, and the gross expenditure for the year has been 7,218*l.* 16*s.* 4*d.* The report of the Directors states that although the traffic of the line has not as yet answered the expectations formed of it, it is still believed that the success of the undertaking will within a few years be complete.

Dumfries.—A formidable meal mob occurred in this town on Saturday night. A story was bruited abroad that the grain dealers had entered into a combination for the purpose of raising the price of oatmeal, although most of them, from particular circumstances, have been selling lately at or under prime cost. The mob assembled in number about 500, including many women, and several shops were visited and plundered. Special constables were sworn in, and 12 of the ringleaders were apprehended.

Dunblane.—A smart shock of an earthquake was felt last Sunday, about mid-day, by the congregation assembled in the cathedral church of Dunblane. The shock occurred just before the dismissal of the congregation in the forenoon. Volcanic agency has for some time been suspected to be at work in this locality; and noises have been heard for some time under the church. The instruments indicated the direction to have been in a line from north-west to south-east.

Glasgow.—Tuesday a serious accident happened on the Edinburgh and Glasgow Railway. The train from Glasgow, and the one from Edinburgh, had both reached Cowlairs, and were slowly passing, each on its proper line, when, owing to the negligence of the pointsman in leaving the points shut instead of open, the Edinburgh train passed over to the other line; the engine, in consequence, came in contact with the last carriage of the Glasgow train, the buffer rod of which was driven into the last carriage, which was considerably injured by the blow, and a passenger inside had one of his legs much bruised or broken. The pointsman was taken into custody immediately after the accident, and has been handed over to the legal authorities, that the necessary investigation may be made into the matter.—The meeting of the Glasgow, Paisley, and Greenock Railway Company, held on the 1st inst., showed the revenue of that undertaking for the last half-year to be 18,085*l.* 1*s.* 6*d.*, and the disbursements 12,396*l.* 15*s.* 6*d.*, leaving, after deducting the interest payable on debentures and the addition of the balance of the last half-year's accounts, the sum of 2,846*l.* 11*s.* applicable to a dividend. The directors suggested that out of this amount a dividend of 2s. 6d. per share should be declared on the old shares, and 7 1-5d. per share on the new or half shares, and that the balance, 606*l.* 11*s.*, be carried to the credit of the next half-year.

Fife.—A new railway from Halbeath, in this county, to the collieries of Lamphinoans, Lochgilly, and others, to connect them with the sea at Inverkeithing, and thus open up a coal-field of immense extent, is projected; and from the general concurrence it meets with in the neighbourhood, an act of Parliament, it is believed, will not be required.

Perth.—The reports from the moors are of the most cheering character; they concur in stating that grouse will be found this season in more plenty than has been the case for several years past. This they attribute to the favourable state of the weather during the period of incubation, which was neither too hot nor too wet, either of which extremes generally proves fatal to two-thirds of the young during that process. Partridges and pheasants are likewise very forward, and promise more than an average number.

Peterhead.—Intelligence has been received here of the arrival at Lerwick, of the Mary, the first British ship this season, from the Greenland seal fishery, which has again unfortunately failed in yielding a successful return to those engaged in it, almost all of whom have zealously persevered in the prosecution of it, and whale fishing, for many years. The following is a list which has been received from the Mary:—Eclipse, 1,000 seals; Mary, 1,700; Union, 2,000; Ranger, 1,400; Traveller, 700; Resolution, 1,700; Jane, 900; Gleaner, 6,000; all of Peterhead. Fairy, of Dundee, 1,800; True Love, of Hull, 1,700; Jane, of Hull, 1,700; and Caledonia, of Kirkaldy, 900.

Miscellaneous.

South Polar Expedition.—The "United Service Gazette" has published the following extract from an officer of this expedition, dated the Falkland Islands, May 1st, giving the details of the return of the expedition:—"The Erebus and Terror were at the Falkland Islands on the 1st of May last. They left New Zealand on the 23rd of November; entered the ice on the 18th of December; were beset in it nearly seven weeks, but succeeded in taking up a position for exploring near the place they retired from the summer before—about 78 degrees south—but were unable to add more than 80 or 90 miles to former discoveries. This was in a continuation of the great barrier of ice (connected with the volcano), which they still found stretching east and west, but they had the satisfaction of making seven miles more southing; for on the 23rd of February, when they were compelled by the season to make their way northward, the ships were in latitude 78 10, longitude 162 20 W., within three or four miles of the barrier. They saw no land, although at one time they were driven within 100 miles of Franklin Island, where a landing was effected last year. They did not leave an hour too soon; for, before they got clear of the region of icebergs, dark nights overtook them, and on a stormy night, while hauling away from a cluster of them, both ships unavoidably came in contact. The Terror got off with the loss of some spars, but the Erebus lost her bowsprit and foretopmast; they, however, had a fair passage after, and arrived at the Falkland Islands on the 6th of April. One man belonging to the Erebus was unfortunately drowned off Cape Horn. Every one else was quite well." The expedition will return to the ice next year.

Burial in Towns.—Our readers will be gratified to learn that the parliamentary committee appointed to consider the important questions connected with the health of the inhabitants of towns, have sent in their report. They state that, after examining numerous witnesses, they have unanimously come to the conclusion, that a legislative enactment, prohibiting interments in towns and their vicinity, is required for the welfare of the community, and that it is desirable such enactment should emanate from the Government.

The committee conclude their report with the following resolutions, to which they have agreed:—

Resolved, that it is the opinion of this committee—

1. That the practice of interment within the precincts of large towns is injurious to the health of the inhabitants thereof, and frequently offensive to public decency.

2. That in order to prevent or to diminish the evil of this practice, it is expedient to pass an Act of Parliament.

3. That legislation upon the subject be, in the first instance, confined to the metropolis, and to certain other towns or places, the population of which respectively at the last census exceeded 50,000.

4. That burials be absolutely prohibited, after a certain date, within the limits of such towns or places, except in the case of family vaults already existing, the same partaking of the nature of private property, and being of limited extent.

5. That certain exceptions, as applying to eminent public characters, be likewise admitted with regard to Westminster Abbey and to St. Paul's.

6. That certain exceptions be likewise admitted with regard to some cemeteries of recent construction, according to special local circumstances, to be hereafter determined.

7. That within the dates which may be specified the parochial authorities in such towns or places be empowered and required to impose a rate for the purpose of forming cemeteries at a certain distance from the same.

8. That a power be given to the parochial authorities of two or more parishes or townships of the same town to combine, if they think proper, for the same cemetery.

9. That a *minimum* of distance be fixed for such cemeteries, from the same motive that leads to their establishment—the public health; and that a *maximum* of distance be likewise fixed, so as to secure the lower classes, as far as possible, from the hardship of loss of time or weariness in proceeding to a great distance to attend the funerals of their relatives.

10. That the parochial authorities be responsible for the due and decent administration of each burial within the new cemeteries, in the same manner as they now are within the present churchyards; and that, on the other hand, they be entitled to the same amount of fees on each burial as they at present receive.

11. That due provision be made for the perpetual possession by the parishes or townships of the ground on which the cemeteries shall be made.

12. That due space be reserved, without consecration, and within the limits of the intended cemeteries, for the separate burials of such persons or classes of persons as may be desirous of such separation.

13. That no fees from any such burials in unconsecrated ground be payable to any ministers of the Church of England.

14. That, subject to the conditions expressed in the 10th and 13th resolutions, arrangements be made to equalise as far as possible the total amount of fees payable on burials within the same cemetery, whether in the consecrated or the unconsecrated ground.

15. That considering the difficulty of fixing the same date for the prohibition of burials within the limits of different towns, or the same distance for the construction of the new cemeteries, and the importance of having reference to various local circumstances, it does not appear desirable to observe in all cases a uniform rule in these respects, but that the time and manner of applying the principles set forth in the foregoing resolutions should be entrusted either to some department of the Government, or to a Board of Superintendence, to be constituted by Act of Parliament.

16. That the duty of framing and introducing a Bill on the principles set forth in the foregoing resolutions, would be most efficiently discharged by her Majesty's Government, and that it is earnestly recommended to them by the committee.

Longevity.—We quote the following from the *Presse*, relative to a venerable author formerly well known in London:—"The oldest man of France is M. Noel de Quersonnières, who was formerly a commissary of the army, now living in Paris. Though born at Valenciennes in 1728, he is not subject to any infirmity, takes four meals a day, shaves himself, reads and writes without spectacles, sings very agreeably, and sleeps soundly. He writes very good poetry, and his conversation is full of wit and sense, abounding with anecdotes. At the age of 90 he married a young English girl, aged only 16, who died in giving birth to a son. He states that his grandmother died at the age of 125, and would have lived longer but for a severe fall. When conversing gaily he will frequently invite his friends to his funeral in the next century."

Railroads.—A correspondent of a Morning Paper has communicated the following statistics on railways, which will be found interesting, as giving a comprehensive view of the progress of the system all over the world. It appears that England possesses 29 principal railroads, and 108 branches. Amongst these are only 30 railroads of 5 to 7 miles in length, the average length of the others being from 30 to 40 miles. The Great Western is 140 miles long, and the Birmingham 130 miles. There are several other undertakings from 70 to 90 miles in length. It is calculated that during the present year the money received by the various railway companies in England for passenger traffic on their lines will amount to little less than 3,000,000*l.* The total length of railways in England is estimated at 2,336 miles, which cost on an average 40,000*l.* per mile. The Manchester and Liverpool cost 46,000*l.* a mile. In France there are at present 16 railroads, the most important of which is that between Basle and Strasburg, and the Paris and Orleans line. The railway which cost the most for construction is the line from Paris to St. Germain, which, in consequence of the value of the ground, &c., required an expenditure of 17,000*l.* per mile, and the one which conveys the most passengers is that between Paris and Versailles, which has carried 40,000 persons in one day. In the United States there are 5,000 miles of railway, the State of New York alone possessing 800 miles already completed, the principal line of which is that from New York to Erie, which is 350 miles long. In Germany 20 lines of railway are completed; the most important line is that from Vienna to Bochnia, which is 140 miles in length. There are also several other great lines constructing, viz., from Berlin to Hamburgh, Frankfort on the Oder to Stettin, and from Magdeburg to Cologne. When these are completed, the Prussian and German Confederation will possess 3,900 miles of railway. Austria is forming five principal lines—from Vienna to the frontier of Poland, to Lintz, Hungary, Trieste, Milan, and Venice. Russia is constructing railroads from St. Petersburgh to Varsova, Odessa and Moscow, and from Moscow to Varsova and Odessa. Belgium has six railroads, the principal line being from Ostend to Aix-la-Chapelle. In Italy the Milan and Monza railway was opened in 1840, and the line between Naples and Nocera is now completed.

SPORTING.

LIVERPOOL JULY MEETING.

WEDNESDAY.—*The Croxteth Stakes* of 15 sovs. each, 30 added, 8 subs., won easy by Lord Westminster's Satirist (Marson), beating Shadow, Currier, and Meal.

The Produce Stakes of 50 sovs. each, h.f., 7 subs., won by Lord Derby's Fortune-Teller (Holmes), beating Sir R. Bulkeley's c. by Beagle, by a head.

The Bickerstaffe Stakes of 100 sovs. each, h.f., 6 subs., won by Lord Westminster's Candahar (Marson), beating Lord G. Bentinck's Peloponnesus by a head.

The Sefton Stakes, for fillies, of 50 sovs. each, h.f., 9 subs., won by Mr. Meiklam's Florence (Templeman), beating Col. Crawford's f. by Langar, and three others. A fine race.

The Mersey Stakes of 25 sovs. each, 50 added, 22 subs., won by Mr. G. Clarke's Philip (Holmes), beating Egidia, Maria Day, Colin Clink, and Gipsy Queen, by half a length, easy.

The Sweepstakes of 300 sovs. each, h.ft., walked over by Lord Westminster's Auckland.

The Maiden Plate of 70l., won by Mr. G. Clarke's Woldsman (Nat), beating Recompence, the [illegible] filly, Fatalist, and three others.

THURSDAY.—*The [illegible]* of 10 sovs. each, 7 subs., won easy by Clinker (Nat), beating [illegible].

The Foal Stakes of 100 sovs. each, h. f., 7 subs., won by Peloponnesus (Rogers), beating Bona Fide and Sir R. Bulkeley's c. by the Mole.

THE CUP.

Mr. Holmes's Vulcan	(J. Day, jun.)	1
Lord Chesterfield's Rhodanthe	(Chapple)	0

The following also started :—The Currier, Satirist, Bellona, Cruiskeen, the Lord Mayor, Portrait, Prince Caradoc, Collina, Retriever, Black Beck, Miss Skelton, Clinker, Champagne, Thirsk, Pagan, Forester, Una, and Phaon. A dead heat between Rhodanthe and Vulcan. It was a splendid race, and won by a neck.

The Derby Handicap of 10 sovs. each, 80 added, 25 subs., won by Ermengardis, beating William de Fortibus and several others.

The Queen's Plate of 100 gs. was won by Mr. Meiklam's Physician.

Law.

HOUSE OF LORDS.

APPEALS.—*The Rev. John Ferguson and seven other Ministers, and Andrew Morrison and two others, Elders, forming the Presbytery of Auchterarder,* v. *the Earl of Kinnoull and the Rev. R. Young.*—This was an appeal against a decree of the Court of Session, arising out of the following circumstances. In the year 1834, the Earl of Kinnoull, the patron of the church of Auchterarder, presented Mr. R. Young as his nominee to that church. The Moderator and Presbytery of Auchterarder were required, in the usual form, to take trial of the qualifications, &c., of the said Robert Young, and after having found him qualified, &c., for the functions of the ministry of the said church, to admit and receive him thereto, and give him his act of ordination in due and competent form. On the 14th of October, 1834, the deed of presentation, together with a certificate of the patron's having qualified to Government, a parochial certificate, and a certificate signed by five ministers of Dundee, that the presentee was a licentiate of the Presbytery of Dundee, &c., were given in, and at the next meeting, on the 27th of October, 1834, other documents were produced, one of which was a recommendation from the Presbytery of Dundee. The Presbytery of Auchterarder so far sustained the presentation, as to appoint a day for moderating in a call to Mr. Young. The Presbytery, at a meeting held on the 7th of January, 1835, did, on the sole ground of the male heads of families, communicants in the parish of Auchterarder, who had dissented, without any reason assigned, from his admission as minister, refused to take trial of the qualifications of Mr. Young, and did then reject him as presentee to the church, so far as regarded that presentation. Intimation of this was given to the patron and the presentee, and they thereupon instituted a suit against the Presbytery of Auchterarder, against each of the individual members composing the same, and prayed a decree that he had been lawfully presented, and that the Presbytery, as the only legal and complete court to that effect by law constituted, was bound and astricted to take trial of the qualifications of the patentee, and his rejection in the manner before described was illegal. In March, 1838, the Lords, on the first division, pronounced a judgment declaring the action competent, and finding that in rejecting the presentee, in the manner stated, the Presbytery had acted to the hurt and injury of the pursuers, illegally and in violation of their duty, and contrary to the statutes libelled upon, and decreed accordingly. On the 3rd of April, 1838, a memorial was presented to the Presbytery of Auchterarder, setting forth this decree, and requiring the members to take the said Robert Young on trial, and thereafter proceed in his settlement as minister of the church without any further delay. Nevertheless, the members of the Presbytery refused to make trial of the pursuer, Robert Young, and to proceed in his settlement as aforesaid, and therefore the pursuers, in their respective interests as patrons and presentees, protested that the Presbytery, and the individual members thereof, should be conjunctly and severally liable for all loss, &c. The Presbytery of Auchterarder, and the several members thereof, having referred this memorial to the Synod of Perth and Stirling, the Synod referred it to the General Assembly, which approved of the conduct of the Presbytery of Auchterarder, and authorised the Procurator for the Church to appeal against the judgment of the Court of Session. The appeal was heard in this House, and the judgment of the Court below affirmed. The judgment of the House of Lords was applied in the common form by the Court of Session, and the cause remitted to the Lord Ordinary (Lord Murray), who, on the 8th of June, 1839, pronounced a judgment whereby it was found and declared that the said Presbytery, and the individual members thereof, "are still bound and astricted to make trial of the qualification of the pursuer, R. Young, as presented to the church and parish of Auchterarder; and if in their judgment, after trial and examination in the common form, he is found qualified, to receive and admit him minister of the church and parish of Auchterarder according to law." This judgment was duly notified to the Presbytery, which, and the individual members thereof, or at least a majority of them, composing the meeting held on the 2d of July, 1839, refused to take trial of the qualifications of Mr. Young, or to fix any time for his examination and trial; whereupon notice was served on the Presbytery and on each individual member, for notifying that all and each would be held liable to the pursuers for all damages and costs thereby sustained. The action was afterwards commenced against the individual members composing the majority which thus refused obedience to the orders of the Court of Session, and in that manner deprived the Earl of Kinnoull of the exercise of his patronage, and the other pursuer, R. Young, of his rights as presentee. The summons demanded as damages 5,000l. to the Earl for injury to his rights as patron; 8,000l. to R. Young for being kept out of the temporal rights of the church; and a further sum of 2,000l. as a *solatium* for the injury done to his character and usefulness and his *status* in the Church of Scotland, and also to his feelings; and 1,000l., more or less, for expenses. The pleas in law for the defenders were—1st, that it was not competent to pursue individual members of a lawful court for any act done by them in their corporate capacity; 2d, that it was not competent so to pursue them without showing malice on the part of each individual member; 3d, that the Presbyteries of the Church were the only courts competent to grant holy orders, in which they were subject to no review excepting that of the superior church judicature; 4th, that no civil court was entitled to grant a decree for the admission of any man into the Church; 5th, that, till so ordained, a man could receive no damage from any refusal to receive and admit him; and, 6th, that such was the case with the pursuers here. The Court gave judgment in favour of the competency of this action, and the present appeal was then brought. The Attorney-General, Mr. Pemberton, and Mr. Bell, the Procurator for the Scotch Church, were heard on a former day for the appellants, and insisted that the judgment now brought under their Lordships' consideration, could not be maintained. The argument was founded mainly on the question whether the individual members of a corporation were liable in damages for the acts of the corporation; the learned counsel contending that if such an action could be maintained, the consequence would be that the legal unity and indivisibility of a corporation would be destroyed. The next great principle on which it was contended that this action could not be maintained was, that the duties which the Presbytery had been required to perform were those of a judicial nature, and for the performance or non-performance of which, it was, therefore, clear that no action would lie.—The Solicitor-General, Mr. Wortley, and Mr. Cooke, of the Scotch bar, were heard for the respondents. They contended, first, that the Presbytery was not a court or corporation; and, secondly, that even if it could be so considered, the individual members of it might be so responsible for its refusal to perform the ministerial acts which the law required it to perform. The act here required was purely ministerial; it was not judicial. The Presbytery was required to take Mr. Young on his trials, that was clearly a ministerial act. The decision, after his trials, might be called a [illegible] act, but to put him upon them was purely a ministerial [illegible] the argument on the other side arose in a [illegible] from confounding judicial and ministerial duties together, and arguing as if the exemption from liability which existed in one case extended to the other. The members who were willing to obey were not to be made responsible for the conduct of those who refused to obey; on the latter alone must fall the consequences of the course they had thought fit to pursue, and if by what they had done they had inflicted an injury on the rights of any individual, they must compensate him in damages for the injury so inflicted.—The Lord Chancellor said that this was a case of great importance, and the House would take time to consider it.

COURT OF COMMON PLEAS.—*Bailey* v. *Smith.*—The trial of this cause, which occupied the whole of Friday, was resumed on Saturday morning, and was not finally concluded till 7 o'clock in the evening. It excited great interest from the extraordinary facts which it developed. The action was brought to recover the sum of 2,875l. and interest, at 4 per cent., upon a promissory note purporting to have been made by Mr. Robert Smith, ironmonger, of No. 12, Great St. Andrew-street, Seven Dials, who died on the 26th of September last intestate. He was well-known in the metropolis as a man of penurious habits, and his appearance and dress were of so dirty and mean a description that he was not unfrequently mistaken for a beggar, although, at the time of his death, he had a sum of 15,000l. in the funds, and several houses which he had built by way of investing his surplus cash. The plaintiff is Miss Ann Bailey, who at the period of the money transactions referred to in the course of the trial, resided with her father, at No. 45, Upper Arthur-street, Belfast. It appeared, according to the statement made by her brother, the Rev. W. Bailey, LL.D., of Trinity College, Dublin, and minister of St. Peter's chapel, Queen-square, Westminster, that Miss Bailey had sent over to him a sum of money in November, 1838, in order that he might invest it in English Government securities, and that Smith, with whom he had been acquainted for some years, recommended him not to buy into the funds, but to lay it out in the purchase of a rent-charge; adding, that in the mean time he would himself be Miss Bailey's banker, and would allow her a larger rate of interest than could be obtained from the Government. Dr. Bailey accordingly gave him the 550l. which he had received from his sister, and other sums which she transmitted to him from time to time, for which Smith gave his I O U. The last sum of consequence advanced was 500l., on the 1st January 1841, and upon a settlement of accounts between Smith and Dr. Bailey, as his sister's agent, upon the morning of Thursday, the 12th of August, 1841, the Doctor pressed Smith to give him some security, observing that the sum which he now held for Miss Bailey was a very large amount—2,875l. Smith said he could not give him one then, but he would call upon him at his chapel, where he occasionally attended, in the evening. Accordingly, shortly before the service commenced, he went into the vestry-room, and there handed to Dr. Bailey an I O U for the amount; but the Doctor objecting that it was only an I O U, and said nothing about interest, Smith replied, "Oh, never mind, do you and Mr. Nixon put your names to it as witnesses, and it will be all right." Dr. Bailey and Mr. Nixon, who was about to read prayers for the Doctor, signed their names as witnesses, and Mr. Smith went out of the vestry into the chapel, and remained during the service. Dr. Bailey, however, was, upon consideration, not satisfied with this I O U, and he asked for a mortgage, which Smith positively refused to give, but asked Dr. Bailey to draw out a promissory note, which he said he would sign, and also a letter to Miss Bailey, promising, should she require it, to give a bond or a warrant of attorney as a further security. The note was dated on the 9th of September last, and Smith signed both the note and the letter. In corroboration of the account thus given by Dr. Bailey, a Mrs. Ellen Gray deposed that she happened to be in the vestry-room of St. Peter's on the evening of Thursday, the 12th of August last, and that she saw Smith hand a piece of paper to Dr. Bailey, who said, "I do not like this." The paper was read over in her presence, while she was reading her Prayer-book, but her mind was not so absorbed in the book before her but that she could hear the words "two thousand and odd pounds," which excited her curiosity, as she thought it strange that Mr. Smith, an emaciated, dirty-looking man, should have so much money. She was sure, she said, it was the second Thursday in August, because she had gone the preceding Thursday to hear Dr. Bailey preach, after his return from a visit to Ireland, and she had then been disappointed. She happened to be shown into the same pew with Smith, whom she had seen twice before; and after the service she walked home with him, and on her way asked what that money meant? Smith told her that it was Miss Bailey's, and that it was well that he had it, or she would have been sure to have fooled it away. Further confirmation of the truth of Dr. Bailey's account was also tendered by the evidence of Caroline Laxton, who swore that on the 1st of January, 1841, at a time when she was housemaid in Dr. Bailey's service, she was mending the carpet in the back drawing-room while Mr. Smith and Dr. Bailey were sitting together in the front room, the folding doors being partly open, and that she heard Smith say, "300l. more, and then it will make up a round sum of 3,000l." Upon her cross-examination she went still further, and swore that she saw the Doctor give seven or eight bank-notes to Mr. Smith. She stated also that she had been on two occasions to Mr. Smith's house with notes from Dr. Bailey, and had brought answers back. This was the substance of the plaintiff's case, which rested principally, as his counsel observed, upon Dr. Bailey's credit; but many facts were elicited upon cross-examination of the witnesses which threw the greatest suspicion upon the story told by him, and the evidence for the defendant directly contradicted some facts positively sworn to by Dr. Bailey and Mrs. Gray, and made other parts of their story appear in the highest degree improbable. No account was given of the manner in which Miss Bailey acquired the money alleged to have been transmitted by her to her brother, and no correspondence was produced on the subject, although Dr. Bailey had, according to his own statement, chiefly communicated with his father on the subject of the business with Smith, and as his father's executor he had obtained access to his papers. He stated also, that generally the notes sent over were Irish bank-notes, and that he always handed over to Smith the precise notes which he received; but it was shown that Irish bank notes were subject, on exchange, to a deduction of one per cent. on every 100l., increasing the percentage when the notes were small in amount, and it was urged with great force on the part of the defendant, that it was not probable that a miserly old man like Smith would quietly submit to a loss of one per cent. The stockbroker, also, whom Smith had employed for the last eight or ten years, deposed that Smith, who purchased stock about four or five times in the course of the year, in amounts of from 200l. to 600l., never paid him in Irish notes, but with English notes, and occasionally a few sovereigns. It appeared, moreover, that Smith's books, which had been examined by an accountant since his death, had been kept with great regularity, but that no trace of any account with any person of the name of Bailey could be found in them. Further, a witness named Hiron, a builder in the employ of Mr. Smith, and his foreman, swore most distinctly, that at 10 minutes to 7 in the evening of Thursday, the 12th of August last, Smith came by appointment to Stanhope-place, Hampstead-road, where the witness Hiron was then building a house for him, and that Smith remained there giving directions about the works, for he was his own surveyor, till about a quarter to 9 o'clock, when he walked homewards with Hiron. The witnesses were positive about the day, as it was Mr. Hiron's wedding-day, and his wife had told him the evening before that Mr. Smith had left a message for him to the effect that if Smith could not see Hiron the following evening at Stanhope-place, Smith must employ somebody else. Mrs. Hiron was also examined, and corroborated her husband's testimony. It was shown also, that instead of a latch-key, which Mrs. Gray had represented Smith had on one occasion taken from his waistcoat-pocket, and with which he had opened the door of his house in Great St. Andrew-street, the only key to the door was an immense house-key, which Smith always used to carry in his coat-pocket. It should be added, that Mr. Nixon, whose signature attested the I O U, died about the same time as Smith, so that he could not be called as a witness. Four or five witnesses of great respectability stated their belief that the signatures to the note, the letter addressed to Miss Bailey, and the statement of an account between them in a book kept by Dr. Bailey, as well as the I O U, were not in Mr. Smith's handwriting, and three very respectable gentlemen swore they would not believe Dr. Bailey on his oath. It is but fair, however, to add, that two of these last-named gentlemen had had some differences with Dr. Bailey, who about seven years ago went to Tunbridge-wells, where a chapel was built on speculation, and who having failed to procure a license from the Bishop of Rochester, was obliged to go through the Insolvent Court. The right rev. prelate, who sat by the Lord Chief Justice during the trial, was examined as a witness, and stated, in contradiction to Dr. Bailey's own account, that the explanation which Dr. Bailey had given to him respecting a Mr. Pearce's signature to a testimonial was anything but satisfactory to him, and that he had never intimated to Dr. Bailey that he was satisfied with it, although he had written in a friendly tone to Mrs. Walker, Dr. Bailey's mother-in-law, upon the subject of the license. The Lord Chief Justice summed up the evidence, and the jury, after deliberating for about three-quarters of an hour, returned their verdict for the defendant.

MARK LANE, FRIDAY, JULY 15.—Several runs of English Wheat left over from Monday continue unsold, and that day's currency cannot be maintained.—Free Foreign is taken in retail on the same terms, but bonded is much neglected. Barley, Peas, and Beans, are all a dull sale without alteration. Oats are rather declining in value.

GAZETTE OF THE WEEK.

INSOLVENTS.—T. H. Munday, 9, Fore street, Cripplegate, bookseller—H. C. Jeffreys, of Much Wenlock, Shropshire, miller—W. L. Jolliffe, Portsea, grocer—H. T. Gray, Grosvenor-place, Commercial-road, East, rope maker—W. Saward, St. Leonard's Boulogne, corn merchant.

BANKRUPTCIES SUPERSEDED.—J. Wade, Warwickshire, currier—D. S. Walker, Great St. Helen's, London, India rubber manufacturer.

BANKRUPTCY ANNULLED.—W. Heywood, now or late of Basinghall-street, London, and of Manchester, warehouseman.

BANKRUPTS.—G. H. Harrison, late of 22, Moorgate-street, City, merchant—L. Durlacher, 15, Old Burlington-street, picture-dealer—J. Fisher, Chorlton-upon Medlock, Lancashire, draper—D. Barbour and J. Norris, of Liverpool, soap boilers—T. Endicott, Bath, innkeeper—S. Jackson, Newcastle-upon-Tyne, picture-dealer—E. S. Messiter and F. Messiter, Malmesbury, Wiltshire, tailors—W. Parr, now or late of Smallthorn, Staffordshire, shopkeeper—P. Humphreys, Cholmondely, Cheshire, builder—J. Clegg, Manchester, silk and ribbon manufacturer—J. Evans, Darwen, Lancashire, iron founder—R. Williams, Alvington, Gloucestershire, farmer—W. Fletcher, Birmingham, oilman—W. Downing, Sheffield, draper—E Rogers, Great Witley, Worcestershire, surgeon—C. Brayshaw, Great Castle-street, Regent-street, tailor—T. Lediard, Cirencester, money scrivener—J. H. Jackson, Eastwood, Nottinghamshire, grocer—E. Moss, Liverpool, draper—A. Bower, Manchester, banker—W. Mills, Caterham, Surrey, innkeeper—J. W. Palmer, Old Buckenham, Norfolk, grocer—E. F. Green, Leadenhall-street, merchant—G. H. Watson, Stourmont-cottage, Moscow-road, Bayswater, apothecary.

SCOTCH SEQUESTRATIONS.—J. Morrison, Laurieston, Glasgow, bookseller—J. Rae, Whitburn, innkeeper—J. Fraser, Glasgow, bookseller—A. Bousie, St. Andrews, writer—Messrs. More and Lamb, Cowcaddens, Glasgow, builders—Jacob D. Edgar, Castle Douglas, merchant—A. Elmslie, Edinburgh, tavern keeper—J. Miller and Co., Edinburgh, bone-dust-manufacturers—J. Wallace and Co., Glasgow, manufacturers.

BIRTHS.—On the 25th ult., at Cadiz, the lady of F. Lonergan, Esq., of a daughter—On the 9th inst., the lady of the Rev. W. Valentine, M.A., incumbent of St. Thomas's, Stepney, of a daughter—On the 10th inst., at Shabden, Surrey, the Hon. Mrs. St. Clair, of a daughter—On the 12th inst., in Greville-street, Brunswick-square, the lady of H. Nicholls, Esq., barrister-at-law, of a son—On the 12th inst., at Leeds Castle, Maidstone, the lady of C. W. Martin, Esq., M.P., of a son—On the 13th inst., in Piccadilly, Mrs. Thomas Collet, of a daughter—On the 13th inst., in Berkeley-square, Mrs. L. Gatacre, of a daughter.

MARRIED.—On the 12th inst., at the District Church of the Holy Trinity, Brompton, and afterwards at the Church of the Russian Embassy, Count Paul de Snasin, late Captain in the Guards of the Emperor of Russia, to Maria Caroline, only daughter of J. P. Carew, Esq.—On the 12th inst., in London, Major W. H. Hartman, 9th Regiment, to Mary, widow of the late T. Berkeley, Esq., of Grenada, West Indies—On the 12th inst., at Daventry, the Rev. A. Thompson, M.A., Rector of Ashby-cum Fenby, Lincolnshire, to Marianne Jonetta, second daughter of the late C. Rattray, M.D., of Daventry—On the 12th inst., at St. Mary's, Bryanstone square, by the Hon. and Right Rev. the Lord Bishop of Derry, Sir H. H. Bruce, Bart., of Down Hill, Londonderry, to Maryanne, only daughter of Sir J. G. J. Clifton, Bart., of Clifton Hall, Nottinghamshire—On the 14th inst., at St. George's Church, Sir J. Campbell, K.C.T.S., to Harriet Maria, widow of Major General Sir A. Dickson, K.C.B.—On the 14th inst., at St. George's, Hanover-square, the Hon. F. W. C. Villiers, third son of the Earl of Jersey, to the Right Hon. Lady E. de Reede Ginkle, daughter of the late and sister of the present Earl of Athlone.

DIED.—On the 8th inst., at her seat at St. Anne's Hill, near Chertsey, Mrs. Fox, the widow of the Right Hon. C. J. Fox, aged 97—On the 11th inst., at Kemp Town, Brighton, Sir R. Wilmot, Bart., of Chaddesden, in the county of Derby, aged 78—On the 10th inst., at Southampton, aged 72, Lady Bullen, the wife of Rear-Admiral Sir C. Bullen, K.C.B., K.C.H.—On the 12th [illegible], at Brighton, Louisa Elizabeth, second daughter of the late C. Lambert, Esq., of [illegible] square—On the 12th inst., Frederic Webb, son of T. Asher, Esq., George-street, Hanover square—On the 12th inst., at Barnsbury Villas, Islington, Mrs. Bate, relict of the late P. Bate, Esq., of New Romney, Kent, aged 75—At Sydney, New South Wales, on the 3rd of March, Mr. T. Draper, formerly of Laurence Pountney lane, London.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 16, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 30—1842. SATURDAY, JULY 23. PRICE 6*d*.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Amateur's Garden . . . 469 *b*
Araucaria braziliensis . . 470 *c*
Asparagus, grown in tubes . 471 *b*

Soapsuds, their effects on Cabbages . . . . . 470 *b*
Strawberry, Princess Royal . 471 *b*
Tariff, as it affects Horticultural and Agricultural produce 479 *a*
Thibet, plums of . . . 480 *a*
Vegetable Monsters . . . 471 *a*
Wall-trees, to prune in summer 470 *c*
Wasp, to cure the sting of . 470 *b*
Watering-pot, improved . . 470 *a*

KINGSTON.

THE ROYAL HORTICULTURAL SOCIETY has fixed their ANNUAL EXHIBITION for THURSDAY, SEPT. 15th, 1842.—For particulars apply to

JAMES JACKSON, Hon. Sec.,
Thames-st., Kingston, Surrey.

EAST NORFOLK GRAND SHOW OF CARNATIONS, PICOTEES, AND FUCHSIAS.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

MESSRS. YOUELL have much pleasure in announcing that the Show of their unequalled collection of the above Flowers will commence on MONDAY NEXT, the 25th of JULY, and will continue three or four weeks. Upwards of 2000 Pots will be staged this season; and they beg to state, that having spared no expense in obtaining every new variety attainable, possessing superior merits, it will be found one of the most splendid Exhibitions of the kind in the Kingdom.

The communication between London and Yarmouth as under·

STEAM.—"Ramona," from London Bridge Wharf, every Saturday Evening at six o'clock. "Ailsa Craig," St. Katharine's Wharf, every Tuesday Evening.

COACHES.—"Star," Spread Eagle, Gracechurch-street, every Morning at Half-past Six o'clock. "Telegraph," White Horse, Fetter-lane, every Evening at Six o'clock.

Great Yarmouth Nursery, July 21, 1842.

"MANETTIA BICOLOR."

MESSRS. VEITCH and SON have now ready for delivery Plants of this beautiful New Greenhouse Climber, at 42*s*. each.

N.B.—A Medal was awarded to this Plant at the Horticultural Society's Meeting in Regent-street, in April last.

Exeter, July 6, 1842.

LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM RISE, near London, (Removed from Walworth,) by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that he has a fine stock of Lilium lancifolium, album, and punctatum, which he can supply at very moderate prices.

He begs to say his Catalogue of Geraniums is ready for delivery, and can be had on application.

STAPLETON ROAD NURSERIES, near BRISTOL. W. MAULE and CO. beg to call the attention of Horticulturists to a new and desirable FUCHSIA, which they intend sending out by the name of "Racemiflora élegans." Its habit is gracefully elegant; the lateral branches are set at every joint with numerous long deep-red flowers, 1½in. to 2in. long, drooping around the main stem of the plant, forming a complete column of beauty. It is allowed by competent judges to be one of the best varieties in cultivation.—Fine strong plants, in bloom, will be sent, if ordered, at 5*s*. or 7*s*. 6*d*. each.

MYATT'S BRITISH QUEEN STRAWBERRY, after two years' competition, still maintains its pre-eminence; and, in returning thanks to their numerous patrons and friends, J. and W. Myatt beg to say they can with confidence recommend it as the most superb fruit yet known.

Also their new Seedling Strawberry Prince Albert, which for productiveness and size cannot be equalled. Price per 100, each, 50*s*.; and their Eliza, 20*s*. Runners are now ready, and may be had on application to them at Manor Farm, Deptford.

Myatt's famed Victoria Rhubarb, 50*s*. per 100 sets, or 1*s*. 6*d*. per root, will be ready in October.

NEW SEEDLING GOOSEBERRIES.

MESSRS. JAMES DICKSON and SONS beg to intimate that they have now got into stock of the splendid new varieties of SEEDLING GOOSEBERRIES undernoted, which took the first prize at the Autumn Show of the Royal Caledonian Horticultural Society last year, and are described in the report of the Committee as of "Beautiful appearance, full-sized, and exquisite flavour."—See "Gardeners' Gazette" for August last.

The seven varieties will be sent out in October next at 1*s*. per plant, or 5*s*. for the whole.

Messrs. J. D. and Sons expect to be able to exhibit samples of the fruit at the Royal Caledonian Horticultural Show on Friday next.

No. 1, Kippendavieana, sulphur coloured.
2, Mrs. Stirling, white, resembling Whitesmith.
3, Queen Victoria, fine flavour.
4, Prince Albert, yellow, large.
5, Princess Royal, white, superior flavour.
6, Sommervilliana, yellow, great bearer.
7, Land of Content, yellow.

Seed Warehouse, 32, South Hanover-street.
Edinburgh, July 12, 1842.

W. AGATE, FLORIST, &c., Croydon, Surrey, will send out, in September next, at 3*s*. 6*d*. per pair, his new Superb Dark-laced PINK, SIR ROBERT PEEL, and two new PANSIES, ELIZA and NYMPH, at 3*s*. 6*d*. per plant.

BRITANNIA LIFE ASSURANCE COMPANY,
1, Princes-street, Bank, London.

This Institution is empowered by a special Act of Parliament, 4 Vict., cap. IX., and is so constituted as to afford the benefits of Life Assurance, in their fullest extent, to Policy-holders, and to present greater facilities and accommodation than can be obtained in other Offices. The decided superiority of its plan, and its claim to public preference and support, have been proved, incontestably, by its extraordinary and unprecedented success.

Extract from Increasing Rates of Premium, for an Assurance of 100*l*. for whole term of Life.

PETER MORRISON, Resident Director.

A liberal commission allowed to Solicitors and Agents.

WESTERN LIFE-ASSURANCE SOCIETY.—OFFICE—49, PARLIAMENT STREET, WESTMINSTER.
Capital 500,000*l*.—10,000 Shares, 50*l*. each.
Deposit 5*l*. each Share.

This Society is established for the Assurance of Lives, upon principles combining economy with perfect security.

Directors.

Henry Edgeworth Bicknell, Esq.	John Arscott Lethbridge, Esq.
William Cabell, Esq.	Edmund Lucas, Esq.
Thomas S. Cocks, jun., Esq.	George Kennet Pollock, Esq.
George Henry Drew, Esq.	James Lys Seager, Esq.
William Evans, Esq.	John Bazley White, Esq.
William Freeman, Esq.	Joseph Carter Wood, Esq.
Francis Fuller, Esq.	Henry Wrench, Esq.
James Hunt, Esq.	

Trustees.—William Whateley, Esq.; L. C. Humfrey, Esq.; George Drew, Esq.
Auditors.—Ormus Biddulph, Esq.; John Freeman, Esq.; John Bazley White, jun., Esq.
Consulting Counsel.—William Page Wood, Esq.
Conveyancing Counsel.—Samuel Jay, Esq.
Physician.—William Richard Basham, Esq., M.D., 17, Chester-street, Grosvenor-place.
Surgeons.—Alfred Leggatt, Esq.; George David Pollock, Esq.
Bankers.—Messrs. Cocks, Biddulph, and Co., Charing Cross.
Solicitors.—Messrs. J. L. Bicknell and J. C. Lethbridge, 25, Abingdon-street, Westminster.

TABLE OF PREMIUMS to assure £100 for the whole term of Life.

Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.	Age.	Ann. Pre. £ s. d.
20	1 14 2	35	2 11 0	50	4 3 3
25	1 18 11	40	2 19 6	55	5 5 4
30	2 4 8	45	3 9 1	60	6 15 3

The object of this Society is to afford to the Assured all the benefits of Life-Assurance, at a great reduction in the rates of Premium.—FOR EXAMPLE—A person aged 30, may with this Society assure his life for 500*l*. by the annual payment of 11*l*. 3*s*. 4*d*., which in a Society where the bonus is held out as a main inducement, would cost him 13*l*. 7*s*. 4*d*., or, in other words, for the same annual premium he could at this Office assure very nearly 600*l*., whereby he derives AN IMMEDIATE AND CERTAIN BONUS OF 100*l*.

All particulars as to Shares, Loans, Assurances, &c., may be obtained on application to the Secretary; and, if required, forwarded to the country.

Parties in the country eligible for undertaking Agencies are requested to apply.

A very liberal Commission allowed to Solicitors and Agents.

EDW. T. RICHARDSON,
Actuary and Secretary.

SPLENDID SALE of the WOODHALL COLLECTION OF EXOTICS.

There will be Sold by Auction, within the Gardens of Woodhall, in the parish of Bothwell, and County of Lanark, lying 10 Miles east of Glasgow, between Airdrie and Holytown, on THURSDAY, the 28th day of JULY next, and following day, commencing at 11 o'clock each day, the whole of that extensive and celebrated COLLECTION of HOTHOUSE and GREENHOUSE PLANTS, consisting of numerous rare and valuable species, among which are many magnificent specimens of Camellias, Heaths, Epiphyllums, Citrons, Oranges, Shaddocks, Zamias and other Palms; with a very extensive and superior variety of Pelargoniums (Geranium), Indian Azaleas, and other miscellaneous Greenhouse and Stove Plants; of which Catalogues may be had by applying to Mr. Murray, of the Botanic Gardens, Glasgow; Messrs. Austin and M'Aslan, Nursery and Seedsmen, Trongate, Glasgow; Woodhall Office, 33, Buchanan-street, Glasgow; or to the Gardener by Holytown.

The collection of Camellias is well known as not surpassed by any in the Empire, the specimens being of the very finest growth, many of them from 15 to 20 feet in height. The Heaths also afford numerous specimens of the finest sort, which for size and furnishing, it is believed, far surpass any collection ever shown.

The whole of the Plants are in the very best state of health; and as the operations of the mineral workings on the estate have already encroached upon the garden, they must be sold off, as it is, in consequence of the said operations, to be entirely broken up; therefore, great bargains may be expected. The Plants will be set up in Lots to suit purchasers, beginning with the Camellias, Heaths, Epiphyllums, &c.

The collection may be viewed any day prior to the Sale, by applying at Woodhall Garden. Further information learned, and particulars given, on applying to the Factor, Woodhall-house, Holytown.

BARCLAY and SKIRVING,
Auctioneers.
Woodhall-house, May 1842.

TO NURSERYMEN AND OTHERS.

TO BE DISPOSED OF by Private Contract the Lease of an old-established NURSERY, with Seed-shop, Hothouses, Pineries, Greenhouses, and every other convenience requisite for a first-rate Nursery; comprising about 12 acres, stocked with the choicest Trees, Plants, and Shrubs, fit for immediate sale. There are upwards of 60 years of the lease of 7 acres unexpired, and upon a portion of the ground are erected 10 Cottages, with ample room for the erection of 10 more. The rent is moderate, and all the premises in most excellent repair. The Nursery and other premises are now in the occupation of Messrs Adamson and Son, of Stoke Newington Common; and immediate possession will be given, if required. For cards to view and particulars apply to Mr. Neal, Solicitor, 4, Tokenhouse-yard, London.

VALUABLE ORCHIDACEOUS PLANTS.

MESSRS. THOMAS WINSTANLEY AND SONS (of Liverpool) announce to the Admirers of curious and rare Plants, that they are instructed to sell by Auction on the Premises, AIGBURTH, near Liverpool, on Monday, the 29th of August next, and following days, at 12 o'clock precisely each day,

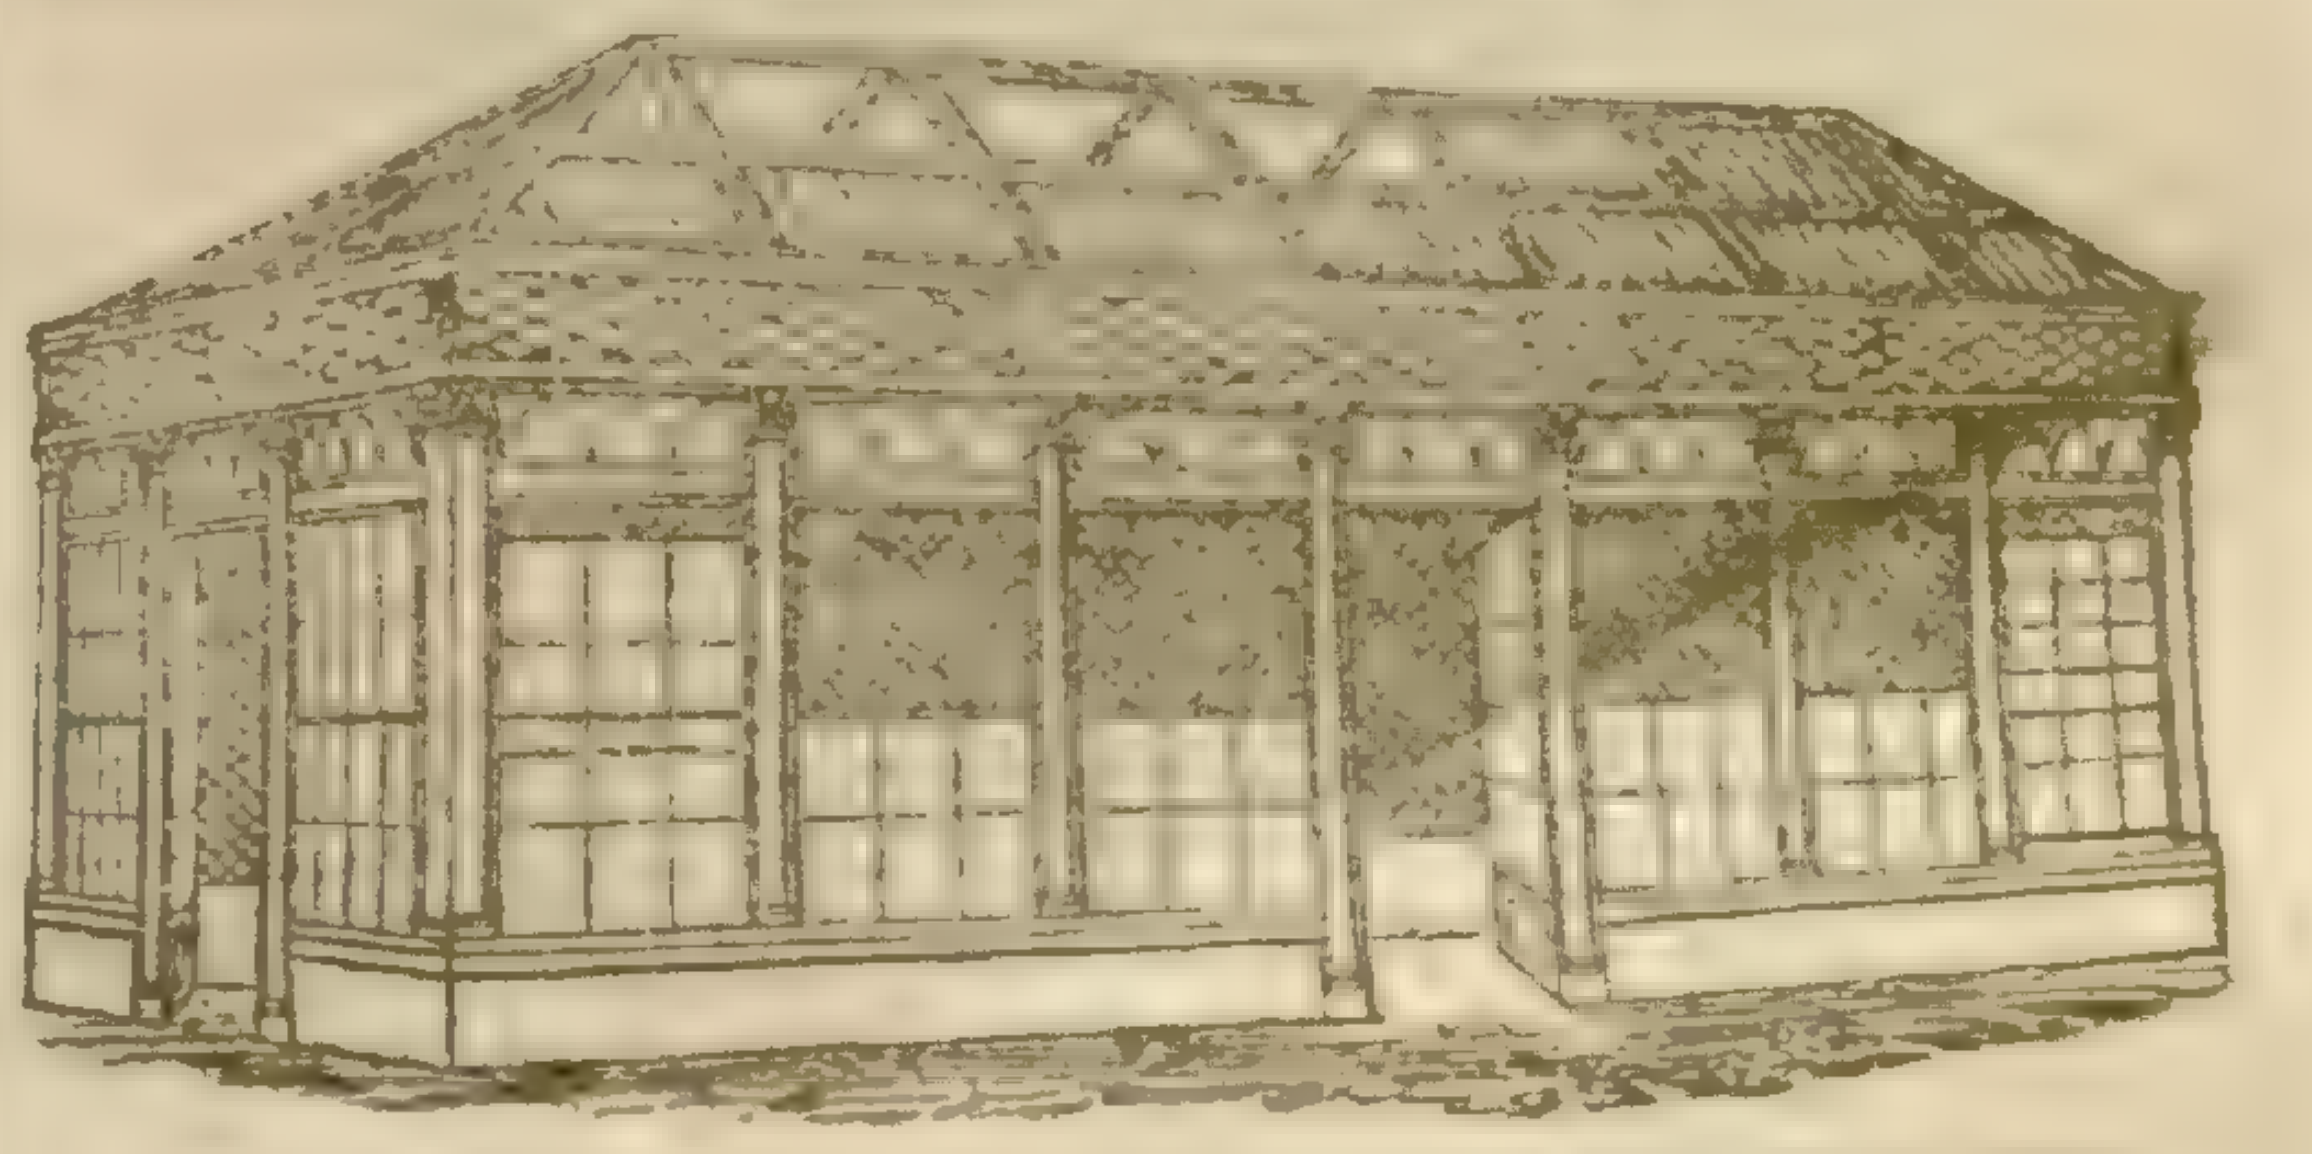
THE UNIQUE, WELL-KNOWN, AND JUSTLY-CELEBRATED COLLECTION OF ORCHIDACEOUS PLANTS,
The Property of RICHARD HARRISON, Esq.

In the Collection will be found large and rare specimens of the ANGRÆCUM EBURNIUM: CATTLEYAS, including Skinneri, Perrini (fine); Labiata (very fine); Crispa (very large); Mossii; Loddigesi; Guttata; Citrina; Superba, &c. &c.: EPIDENDRUMS, all fine; named and several unnamed MAXILLARIAS; ONCIDIUMS; DENDROBIUMS; AERIDES Brookii, cornutum, and odoratum; ODONTOGLOSSUM grande, maculatum, &c.: with about four hundred other varieties of choice PARASITICAL PLANTS—including Fernandesia, Grobya, Gongora, Heterotaxis, Hillia, Lissochilus, Liptotes, Cyrtopedium, Calanthes, Cypripedium, Coryanthes, Cirrhæa, Catasetum, Cœlogyne, Cyrtochilum, Cycnoches, Cymbidium, Neottia, Brassavola, Vanda, Rodriguezia, Myanthus, Mormodes, Miltonia, Phaius, Brassia, Burlingtonia, Bifrenaria, Batemannia, Stanhopea, &c. &c.: LÆLIA anceps, autumnale, and others. Together with a general Assortment of Hothouse plants of an important character, and highly interesting to the lover of Botany.

The above Collection, for its extent, is allowed to be one of the finest in Europe, and is the result of twenty years' formation, by Mr. Harrison, regarding only variety and perfection.

The Plants having been attended to by a skilful gardener, are in excellent condition, and will be sold without reservation.

The whole may be viewed on Friday 26th, Saturday 27th August, and on the mornings of Sale, and Catalogues, which will be ready in a few days, had at the following places:—The Offices of the *Gardeners' Chronicle* and the "Gardeners' Magazine;" Messrs. Winstanleys, Paternoster Row, London; at the place of Sale, and of Thos. Winstanley and Sons, Liverpool.



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HEATING BY HOT WATER.

JOHN WALKER, 46, St. John's Square, Clerkenwell, London, having been for many years extensively engaged in Warming Churches, Manufactories, Hospitals, Hothouses, Conservatories, and Private Houses, by means of Hot Water, either in Pipes or Pedestals, can confidently recommend this mode of heating in preference to any other. Numerous references can be given both in town and country, where he has successfully and satisfactorily applied it. Baths fitted up and heated in a superior manner. Orders executed in all parts of the Country with punctuality and despatch.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, moveable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l*. 5*s*. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above: where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—Wayte's New Patent Land-pressers and Drills.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester) beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and despatch.—33, Brown-street, Manchester.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths, may be seen in use at his house upon application to the gardener.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from £1 8s. Garden-lights made and glazed, 1s. per foot, at JAS. WATT'S, SASH MANUFACTORY, CLAREMONT-PLACE, Old Kent-road. REFERENCE GIVEN.

TO FLORISTS, HORTICULTURISTS, AMATEUR GARDENERS, &c.—CLARKE'S AIMATIC COMPOST, for the Flower and Kitchen Garden, Greenhouse Plants, Pineries, &c.: the application of this COMPOST will add greatly to the beauty of the Flower and produce of the Kitchen Garden. In making new Gardens it will be found invaluable; it has long been in use in the Royal Gardens at Kew. Price One Guinea per bag, containing two cwt., sufficient for a good-sized garden for one year.

Also, Prepared HAIR DUST. This Preparation will effectually preserve Flowers, Plants, Bulb-roots especially, from the ravages of worms, grubs, and all kinds of crawling insects. From its imperishable nature, its effect will be lasting. Price One Guinea per bag. Address, Stanbridge Clarke, St. Pancras Wharf, King's Cross; or Henry Clarke, seedsman, 86, High-street, Borough.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

IMPORTANT TO AGRICULTURISTS, &c. &c.
Just published, and sold by Ridgway, Piccadilly, and Longmans, Paternoster-row, price 1s.,

A WORD OR TWO ON GUANO, and a NEW MANURE—ARTIFICIAL GUANO.

By W. H. POTTER, M.R.A.S., Agricultural Chemist.

The New Manure is prepared from a careful analysis of Guano, is more effective, and free from moisture, sand, &c. Price 15s. per cwt. cash.—Chemical Works, Upper Fore-street, London.

TWELFTH THOUSAND. Price One Shilling.

THE INCOME-TAX EPITOMISED AND SIMPLIFIED. By WILLIAM NICHOLSON, Esq., Clerk to the Commissioners of Taxes.

"Its accuracy is attested by the Board of Stamps and Taxes having ordered Two Hundred Copies."—*Leeds Mercury.* "This brochure has a value in emanating from a Clerk to the Commissioners."—*Spectator.* "We recommend it to the notice of our readers."—*York Herald.* "Mr. N. has executed his task with great ability."—*Brit. Queen.* "It gives the Income Tax in a nutshell."—*Leeds Times.* "It is exactly the sort of Manual that every body should possess."—*Emigration Gazette.* "In this pamphlet we have a safe guide."—*Ch. Examiner.* "Drawn up with great care."—*Yorkshireman.* "An excellent epitome and simplification of the Act."—*Patriot.* "The spirit and import of every clause of the Act."—*Leeds Intelligencer.* "Executed with the Author's usual ability."—*Yorkshire Gazette.* "A useful little pamphlet."—*Morning Advertiser.*

London: Smith, Elder, and Co.; Bell and Bradfute, Edinburgh.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS of EUCLID, With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenæum.*

"Cannot be easily surpassed."—*Dublin University Magazine.*

COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES of EUCLID, with Enunciations. Price 1s. 6d.

London: Whittaker and Co.; sold by all Booksellers.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for July, 1842, contains highly-finished drawings of *Habrànthus Praténsis, Boronia Anemonæfòlia, Cinerària Webberiàna, Tropæ'olum Edùle;* likewise Papers on Gardening as a science; on Suspending Plants in Greenhouses and Stoves. Reviews—Sir Uvedale Price on the Picturesque; Loudon's Encyclopædia of Trees and Shrubs. Floricultural Notices of new and beautiful Plants figured in the leading Botanical Periodicals for June, and of those in flower at the principal Suburban Nurseries and Gardens; together with a complete Calendar of Monthly Operations for the Garden.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species, which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr and Co., Paternoster-row.

Handsomely bound in cloth, with Ninety-three Wood-Engravings, Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D,

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Tilt and Bogue, Fleet-street.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley.—*Sun.*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

One Volume, price 7s. 6d.,

THE LIFE AND TIMES OF RIENZI. "Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: Whittaker and Co.

FUN FOR THE FIRESIDE!!
Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK. A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else is perfectly familiar with its contents ...... and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published.

London: Whittaker and Co.

Price 7s., illustrated with Wood-cuts of Birds, Cages, &c.,
A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. Bechstein, M D.

"A very delightful book of its kind. . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. Orr and Co.; and W. R. Chambers, Edinburgh.

A FOREMAN WANTED.

MESSRS. VEITCH and SON are in want of a respectable and industrious person of good address, to act as FOREMAN in the Plant Department of their Nursery. He will have to take charge of and grow a fine collection of Exotics, Florists' Flowers, &c. &c.

N. B. An experienced Propagator is also kept in the same department.—Exeter, July 20, 1842.

WANTED by HUGH LOW & Co., a person of good character, qualified to take charge of a small retail Seed-shop and to act as clerk. He will also, in all probability, be required to travel for two or three months annually. He must have a practical knowledge of Nursery business in general, but more particularly of Exotic and other Plants. A person who has been accustomed to travel in the same line, and who has a knowledge of the French and German languages, would be preferred. Applications to be made by letter only.

Clapton Nursery, London, July 22, 1842.

SITUATION WANTED.

WANTS a SITUATION as HEAD GARDENER, a Single Man, who perfectly understands his business, and who lived 16 years with a family of distinction, from whom he can have an unexceptionable character.—Address to A. Z., Mr. James Curtis's, 238, High Holborn, London.

WANTS a SITUATION as GARDENER, a person 28 years of age, who has some knowledge of early Forcing of Fruits, the management of Orchidaceæ, Stove, and Greenhouse Plants; wages 70l. a-year, with cottage. For reference and particulars, address, J. S. Dow, 12, Polygon Buildings, Clapham, Surrey.

WANTS a SITUATION as GARDENER, a Single Man, aged 30. Can give eight years' reference to the Gentleman he has just left. Can wait well, and has no objection to assist the Footman occasionally. Address, W. K., 3, Sutton-street, York-road, Lambeth.

WANTS a SITUATION as GARDENER.—John Halliday having left his employer, Lord Sondes, is desirous of obtaining another situation. He has a good practical knowledge of his business in all its different branches, and can obtain most satisfactory testimonials from his late employer. Address, J. Halliday, *Gardeners' Chronicle* Office.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.
2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4s. 6d. cloth.
3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.
4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

Just published, in 2 vols. 8vo. cloth, price 24s.

HISTORICAL MEMOIRS of the QUEENS of ENGLAND. By HANNAH LAWRANCE.

"These laborious and interesting memoirs."—*Athenæum.*

"This very industrious and interesting work."—*Examiner.*

"One of the most pleasing and valuable contributions which English history has received for many years."—*British Mag.*

"Narratives of as much interest as if they were pure dramas."—*Atlas.*

Edward Moxon, Dover-street.

Just published, price 6s. cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of Reference. By G. H. CAUNTER, Esq.

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

THE "ROYAL ESSENCE OF EGLANTINE" for the Handkerchief, is prepared only by Mr. WHITE, Chemist, 24, Cornhill, London, in bottles at 2s. 6d., 4s. 6d., and 8s. each. Where also may be obtained the "AROMATIC PUNGENT ESSENCE" so useful in Headaches, Fainting, &c., at 3s. each.

N.B. Public Offices and Merchants can be supplied with Postage Stamps and Envelopes in any quantity at Government Prices.

HODGSON and ABBOTT's PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

FOR SALE, Four Years' "GARDENERS' GAZETTE," separately and neatly bound, for the years 1837, 1838, 1839, and 1840; edited by Mr. GLENNY. Also, the Works on "LANDSCAPE GARDENING," by the late Mr. REPTON; with Plans, &c. &c.; neatly bound.—For particulars address, post-paid, to "J. B., Mr. Law's Nursery, Clapton, Middlesex."

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. ⁂ NOTICE—The Name and Address of the Proprietors, A. ROWLAND AND SON, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

⁂ Be sure to ask for "ROWLAND'S."

HORTICULTURAL SOCIETY OF LONDON.

A SMALL QUANTITY OF VALUABLE SEEDS having been just received by the Society from Guayaquil, notice is hereby given, that they are ready for distribution to such Fellows of the Society as may apply for them; and that they will be sent out in the order in which the applications are made until the supply is exhausted.

The Gardeners' Chronicle.

SATURDAY, JULY 23, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday . . . . . South London . . . . 1 P. M.

COUNTRY SHOWS.—July 27, Berkshire Royal, Cork, and Guernsey. 28, Wingham. 30, Wexford.

THE BEST STRAWBERRY yet known, is, beyond all comparison, Myatt's Pine; but so few persons can grow it, that it is scarcely to be met with in cultivation. Even Mr. Myatt himself no longer succeeds with it. What is not a little singular, those who do contrive to manage it, do so under opposite circumstances. For example, the late lamented Baron Foster found it thrive in very old cowdung, unmixed with soil. In Mrs. Marryatt's garden, at Wimbledon, where there is a profusion of it, it is planted in pure Wimbledon loam; and in the grounds of Mr. Shepherd, a market-gardener at Deptford, who is one of the *fortunati nimiùm*, it bears ample crops in a black boggy soil, the very reverse of the other two.

It would seem, then, that soil is not what this Pine is so solicitous for, and that something else is at the bottom of the mystery. We do not know whether the following sensible letter, from Mr. Robert Reid, of Noble Thorpe, near Barnsley, will enable gardeners to secure this Queen of Strawberries; but we certainly recommend them to make the attempt once again:—

"Is it not remarkable," says Mr, Reid, "long as we have had this splendid Strawberry in our gardens, that so few should understand its management? In truth, there is not one amongst all our varieties of easier cultivation than Myatt's Pine; and there is not one that will produce as much fruit on the same space of ground. In cold wet summers, or in dry hot ones, it is all the same—always a heavy crop. It demands less time and trouble than others. All that is required is to make a new bed every season; to plant in the same way as with other sorts; and when the plants begin to grow, to spread betwixt the rows two or three inches of rotten manure, covering it with soil, to keep the sun and wind from drying it up. The runners will root into this, and produce such a crop the following season as will astonish you. My bed is just now (July 20) in its prime, with a splendid crop; we have gathered ripe fruit from it every day for three weeks past, and it will continue for three weeks or a month to come. The fruit is always clean in all weathers, the ground being entirely covered with foliage. The cause of its bearing so much longer than other sorts is, I suppose, owing to the runners striking root at different times, some early, some late. Now is the time to make beds, and you cannot too strongly recommend your readers to look out for plants if they have not got any. I have placed about 200 pots round my bed, some to try how they will force, and by way of experiment to plant some of them in beds with their balls entire, to see whether they will bear a crop next summer. I apprehend Myatt's Pine is a cross from the Hautbois; its habit and flavour make this probable; and all the Hautbois require the same sort of treatment to have them in perfection."

We are not aware that any evidence exists as to the origin of this fine Strawberry, but that it has in some way been bred from the Hautbois we entertain no doubt; in all probability, it has originated between that variety and the old Pine, itself a most valuable sort, far superior in flavour to Keen's seedling, which has driven it out of many gardens. [Since the above was in type, we have received from Mr. Mearns a communication upon the same subject, which will be found in another column.]

WE are perpetually urged by our correspondents to expose the system, now so prevalent, of selling old plants at high prices under the pretence of being new, or bad seedlings as valuable new varieties. One man complains that he has bought an old Strawberry, or a well-known Grape, under a new name; a second laments over the loss of his money, wasted in acquiring new Roses with high-sounding titles, which turn out less than half as good as those he had before; a third is angry at bad Cucumbers having been the produce of half-crown seed packets, puffed off as something extraordinary; a fourth says he bought a Peach-tree, and received a Nectarine; and finally, we have now before us a letter full of indignation at the writer's having purchased a score or two of new shrubs, not one of which turns out different from old and well-known sorts, except in name. "Is it not scandalous," says he, "that people, calling themselves respectable, should sell the common Abies microcarpa under the name of Larix Americana, Populus dilatata as P. fastigiata, and even the old Menziesia cærulea under the fine title of Phyllodoce taxifolia?"

We have put together all these subjects of complaint, although they refer to entirely different offences. We must distinguish the selling seeds of bad quality from that of old things under new names, both from the sale of one thing for another, and all these from vending pretended novelties called seedlings, which are either not materially different from others previously raised, or inferior to them. The second subject we shall take first.

We are far from intending to defend those who attach arbitrary names of their own to their plants without taking the trouble to ascertain whether others have been previously published. On the contrary, we regard this practice, which is notorious among a small class of nurserymen, both in this country and on the Continent, as one for which there is no excuse; it is in every sense a fraud, for which the apology of ignorance, the only one that can be offered, is inadmissible; although we are ready to concede that those who shelter themselves under this plea are ignorant enough. For malpractices of this kind there are two remedies: one is, not to deal with such people; and the other is, not to pay their bills. It would be difficult, we apprehend, to find a jury disposed to give a verdict in favour of a plaintiff claiming payment for a horse, provided the defendant could show that he, in fact, purchased only a donkey. It is, however, to be observed that these observations do not apply to the particular cases specified by one of our correspondents. It is his own ignorance—we beg pardon for the expression, but we have no other at hand—and not the nurseryman, which has misled him. All the names he has mentioned are synonymes of the plants he has purchased; he might have easily ascertained this by reference to the nurseryman himself, who would have told him so; and not having taken that trouble, he has himself alone to blame. It unfortunately happens that almost all our common plants are known by several different names: in fact, the aliases of Botany would puzzle the most expert Old Bailey lawyer. For example, the common Blue-Bottle is Centaurea Cyanus, *alias* Cyanus arvensis, *alias* Cyanus segetum, *alias* Cyanus vulgaris; and even the Hawthorn rejoiceth in Cratægus oxyacantha, *alias* Mespilus oxyacantha, *alias* Cratægus monogyna, *alias* Mespilus apiifolia, *alias* Cratægus elegans, *alias* Mespilus intermedia, *alias* Cratægus laciniata, *alias* &c. &c. Linnæus began this confusion by his extensive changes in the names of his predecessors, and his successors have amply retaliated upon him and one another. But while we thus deny that blame is much imputable to nurserymen for selling old plants under unfamiliar names, we must at the same time express our opinion that it would be far better for them to leave all the Babel of Botany to the botanists, and to stick to the name by which a plant is most commonly known, whether botanically right or wrong, provided it has been actually described in some book of authority under that name. It would save themselves from the appearance of pedantry, their customers from a necessity for complaint, and it would answer every end with which they have to do. What earthly purpose, for instance, is gained in their trade by abandoning the old name of Glycine sinensis, and substituting, in the first place, Wistaria sinensis, and then, to please a fancy of Mr. Loudon, shifting it to Wistaria Consequana? It is true that the plant is not a Glycine, as that genus is now limited by systematical botanists, but it is equally true that it has been so described, that it once belonged to it, and that it has only been excluded in consequence of modern refinement, and that *everybody knows it by that name*. Nurserymen are not able, in the generality of cases, to appreciate the soundness of the views of botanists: they cannot tell whether, when a botanist changes a name, he is justified in doing so; and consequently they have no means of judging *if an alteration is likely to be permanent*—a most important consideration, because if not permanent, they will be forced back upon the name they have abandoned. A notable instance of this is afforded by the genus Berberis. Mr. Nuttall, an American botanist of some reputation, changed the name of Berberis Aquifolium to Mahonia Aquifolium, upon an *erroneous* supposition; the nurserymen have to a certain extent adopted the change; the erroneous supposition has been corrected, and now Mahonia Aquifolium has become Berberis again. Surely it would have been better to have let it alone.

With regard to the offence of selling one thing for another—as, for example, a Peach-tree for a Nectarine, a Sweetwater Grape for a Muscat of Alexandria, or a baking Pear for a dessert variety—that we believe to be now of rare occurrence; although it was once disgracefully common. When it now takes place, it arises from accident, which is sometimes inevitable, and is certainly unknown in all respectable nurseries. There is, indeed, a tradition of a nurseryman, of some celebrity in his day, having undertaken to plant a Vinery with twelve of the best kind of Grapes, which all proved when fruited to be the Syrian (!). In that instance, the nurseryman was threatened with an action, and was glad to hush the matter up by making such compensation as was demanded. The evil by degrees wrought its own cure; the places where such practices existed became notorious, and their trade was of course destroyed.

We cannot occupy ourselves with observations upon the sale of seeds of bad quality; that is a mere shopkeeping question, for which every one has his own remedy.

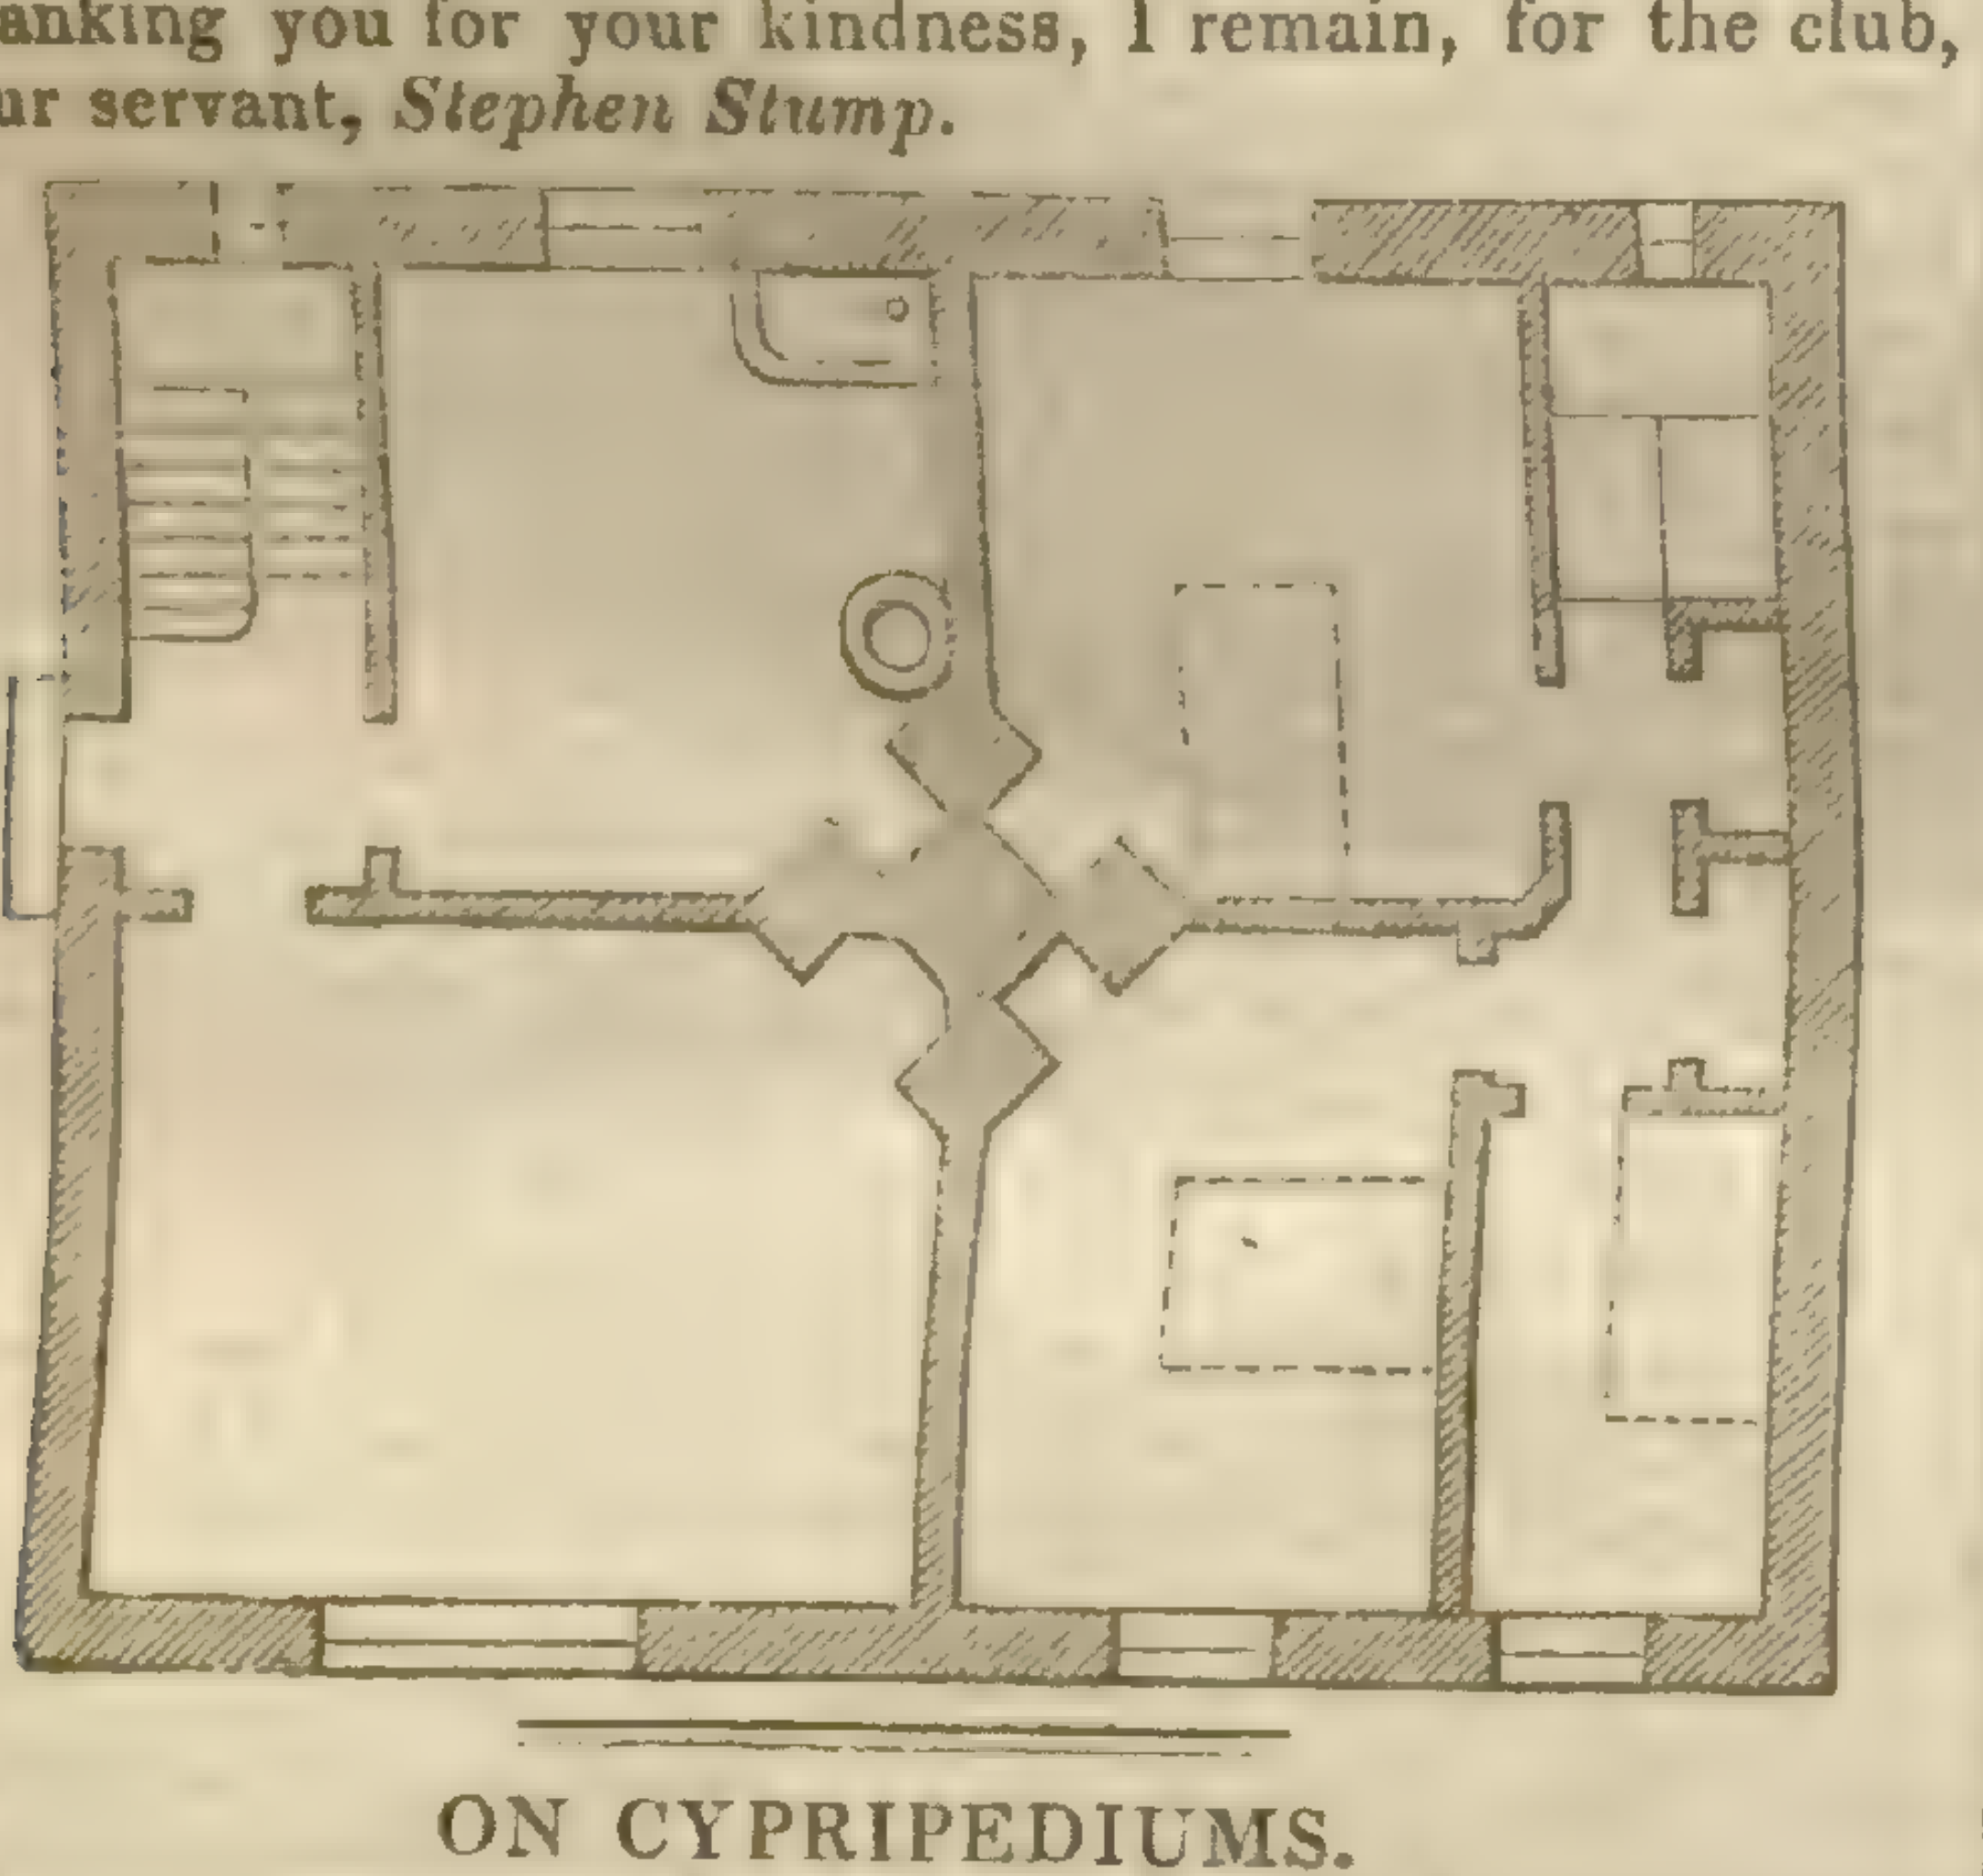
In the matter of seedlings said to be novelties, and which turn out worthless, or not novel, we would refer to some remarks in our Journal of last year (p. 579). We there pointed out the extreme folly of attaching any importance to a plant merely because it had been raised from seed; and we mentioned some of the instances in which the world had been foolish enough to pay a high price for what might have been seedlings, but which were not to be distinguished from old and well-known plants. It is morally, if not legally, fraudulent to sell a plant as a new variety raised from seed, unless it is essentially different from all previously in existence; but our calling it fraudulent will not prevent the practice, so long as the public is eager to possess everything that is puffed off as new by interested parties. The fault to a great extent, and the remedy wholly, lies with the purchasers. If buyers would refuse to lay their money out upon anything the quality of which is not attested by well-known and competent judges, the sale of all spurious varieties would soon be stopped; buyers have a right to expect such a guarantee, and in the present state of gardening and farming, there is no difficulty in giving it. There are the great exhibitions in London, the ordinary meetings of the Horticultural and Agricultural Societies, those of the Floricultural Society, and, let us add, the pages of the *Gardeners' Chronicle*, all offering ready means of obtaining a distinct declaration of the value of new seedlings; if such a declaration is not produced, buyers should keep their money until the information is afforded. If they will *not* do this, they must be contented to be imposed upon.

CULTIVATION OF MYATT'S PINE STRAWBERRY.

I ALWAYS regret when I see any remark made upon the want of success in the cultivation of the best of all Strawberries, Myatt's Pine; and in your *Chronicle* of the 9th instant, you have noticed this fact. Allow me, therefore, to state the method by which I most successfully cultivate this and all other kinds. Take off the first runner plants as soon as they have rooted—now is the best time, and the weather being showery, it is the more suitable for transplanting. Get a piece of well-exposed rich ground ready for their reception, according to the quantity desired, and let it be divided into four feet beds. Plant them about four inches every way: water them and shade them for a few days if the sun should be powerful, and keep them clear from weeds. Get a piece of ground prepared for their final transplanting either in autumn or the following spring, by trenching and manuring it. Plant them eighteen inches row from row, and nine inches in the row, and if any blossoms appear the first season, pinch them off, and keep them free from weeds; but it is not necessary to divest them of their runners until the following spring, when the beds are to be cleaned, and all runners cut off; but the soil should by no means be stirred between them, any further than, with a Dutch-hoe to loosen the surface lightly, and without destroying more of the surface-roots than can possibly be avoided, as they are of great importance towards the success of the crop. Before the leaves cover too much of the surface, hoe gently amongst them to destroy all weeds, and afterwards cover the surface in the original old fashioned way, with clean-drawn straw; whence the designation of Strawberries and of Strawberry-beds, so that such might be the more readily distinguished from Gooseberries and Raspberries; the one being then in use as seasoning for a goose, as the Apple is at the present day; and the other, probably, from its raspy canes. I have had Myatt's Pine, by the above treatment, in the greatest reasonably desired abundance. Take the first produced runners from them, and plant them in a nursery bed as in the previous season; and when the fruit is all gathered, destroy the old plants, and the ground will be then ready for Cauliflowers, or any other crop required to be put out at that time. Myatt's Pine will do little good by remaining a third season upon the same ground, however well manured; and this is generally applicable to Hautboys, the Elton Pine, Downton, and, in fact, to all Strawberries. It might be thought, until proved, that much time and trouble are necessary for the foregoing operations; but the reverse is the case, and much less ground will be required, than is usually occupied for the Strawberry; and considerably less time thrown away in the gathering, as in most cases you may, as a common saying is, 'lade them up by the handful;' and the fruit are very superior. I may observe here, that I learned the above practice, many years ago, from that most amiable gentleman, and enthusiastic horticulturist, the late T. A. Knight, Esq., and I have long been satisfied with its importance. —*John Mearns, F.H.S., Leeds Botanic Garden.*

MODEL COTTAGES.

We make bold to send you our notion of a good double cottage, which we think generally better than single cottages, though in other things we agree pretty much with your friend Mr. Screwtater. In our plan one-half shows the ground-floor and the other half the upper-floor. We make our building the same width front and back, because it will look better, and because all ins and outs cause expense and weakness, and damp, especially in the roof, which cannot be made too simple. We cover the same quantity of ground as in the model plan, making the building rather less from front to back, to make up for the extra width behind. By this means, the fireplaces, though placed angleways, are nearer the light and quite away from the door, but they may be at the side of the room if it is preferred. The stairs are got at without passing through any room, and there is a large light cupboard or pantry under them. The light of the pantry may be at the back or side so as to avoid the sun. The back kitchen window should be a sash door, so as to go in and out of the back garden that way, which is handy for washing. There should be a little fireplace in the back-kitchen, as well as a copper, in order to save lighting a fire in the living room, to boil the kettle, during summer. On the upper-floor we have three bed-rooms, and the doors not quite so close together as in the model plan. We have likewise two roomy closets on the landing, which are as useful for poor folks as for their betters. The staircase gets a little light, and the whole is, we think, more snug and convenient and cheaper than the model plan. At the same time, we beg to observe that there is very little new in it. We believe that there are many cottages in the country and near London, not very unlike it, and some perhaps that are better. It may, of course, be made smart with enriched chimneys, or ornamented gables, or bay windows, or a little porch; but all these things are quite out of the question, while comfort is sacrificed to cheapness. On this part of the subject, the cheapness, we must admit that we have a great deal to learn; Mr. Loudon's estimate says that at 6*d.* per foot the cottages will cost so much, and at 4*d.* so much, and so on; the lowest estimate being 63*l.* per cottage. We do not know what part of the world this must be in, and we should be glad to have the particulars; for I don't think we could do them for the money if we stole the materials; nothing less would do than stealing them, according to the old story, "ready made." Thanking you for your kindness, I remain, for the club, your servant, *Stephen Stump.*



ON CYPRIPEDIUMS.

A correspondent has expressed a wish to obtain some information respecting the various kinds of Cypripedium. Others of your readers may be likewise interested in the cultivation of this beautiful genus; the extreme difficulty with which they are propagated, or preserved in a flowering state, having deterred many persons from attempting to grow them. I will therefore endeavour to answer your correspondent's questions in the order in which they appear.

The sorts in general cultivation, are Cypripédium venustum (purple and green), purpuratum (purple), insigne (green and purple), húmile (purple and white), guttatum (yellow), ventricosum (dark purple), pubescens (yellow), arietinum (light red), spectábile (purple and white), parviflorum (yellow), macranthos (dark purple), and our own pretty native species, Calcéolus (yellow). Of these, the three first are from warm latitudes, and consequently require the temperature of a stove; the remaining sorts come principally from North America, and are either hardy, or require but a moderate protection during the winter and spring.

The stove kinds are found to succeed tolerably well by being potted in soil composed of rotten wood, moss, and a little silver sand; while the hardier kinds thrive best when planted in a shady situation, in sandy peat. The American varieties require a protection of straw, or some other material, to preserve them from the effects of severe frosts, and to throw off the rain in wet seasons. At Messrs. Rollisons', of Tooting, they succeed remarkably well in a peat border adjoining the back wall of a heath house; being covered, during the winter and spring months, with sphagnum, to the depth of two or three inches. Another successful method of treating them, is to pot them in good sized pots, in a mixture of sandy peat and rotten sawdust, keeping them in a cool greenhouse or frame.

The reason why they are so seldom met with is, as has been before stated, because they are so difficult of increase They may sometimes be propagated by division of the roots; this, however, occurs but rarely. Occasionally, in favourable situations, they will perfect seeds; especially if care be taken, when the flowers are in a proper state, to apply the pollen to the stigma with a camel hair pencil.

With respect to the quantity of water which they require, I can say but little. As they are plants which thrive only in shady situations, where the rays of the sun do not penetrate with sufficient power to cause a speedy evaporation, but little moisture will be necessary, even during the summer, particularly if protected with a covering of moss; and during their period of rest, in the autumnal and winter months, water may be entirely dispensed with.—*T. R.*

THE ROSE GARDEN.—No. II.

Among the fashionable Roses of the day are those Hybrid Chinese Roses which continue to bloom till Autumn, whence called "Hybrid Perpetual Roses." They seem to bid fair to supersede those perpetual Roses derived from the old Four-seasons; as they grow and bloom more freely, and also strike readily ftom cuttings. The Hybrid Perpetuals grow well in the driest and most unfavourable Rose-soils, when cultivated on their own roots; and it is to be regretted that at present but few of them possess that powerful and agreeable fragrance, so remarkable in the old perpetual Roses, which have for their type the Damask Rose. The Crimson Perpetual, Bernard, Josephine Antoinette, Royal, Grand et Belle, &c. &c., are not yet rivalled in this respect, as their perfume, like that of the old Cabbage Rose, seems to please every one, however indifferent to the odours of the flower-garden. This new race of Roses has one fault, common to most flowers originated with facility from seed—they are too much alike. Thus, Princesse Heléne, Fulgorie, Comte de Paris, Marshal Soult, Queen Victoria, Augustine Mouchelet, Melanie Cornu, Louis Buonaparte, Edward Jesse, Lady Fordwich, and Newton, are of the same reddish-crimson, tinged with purple, and when gathered can scarcely be distinguished from each other, even by Rose growers, who would all be "put to confusion" if asked to name them when placed indiscriminately in a case in clusters. Most of the above have been raised by M. Laffay, near Paris; and they are, to use a florist's phrase, in "one strain." Still they group well, and are well adapted for a bed of one leading colour. The most fragrant of those, particularly in autumn, are Fulgorie and Princesse Heléne. In this family, as yet, there are few rose-coloured and blush flowers; however, Duchess of Sutherland, Clementine Duval (this season blooming more beautifully than ever), General Merlin, Julie Dupont, Duchesse de Nemours, Pauline Plantier, Prudence Ræser, De Neuilly, and Clementine Seringe, are all beautiful Roses of these shades of colour; the three latter remarkably fragrant, more particularly Clementine Seringe, which is as sweet as the Cabbage Rose. Prudence Ræser blooms in large and beautiful clusters, and is also remarkably fragrant, and distinct in character. Clementine Duval is a dwarf-growing Rose, and, with General Merlin, is well adapted for a small bed in the rosary. One of the most distinct and beautiful among these Roses, is Madame Laffay; it would surpass the Crimson Perpetual, which it much resembles, were not the delicious perfume of the latter wanting, which shows how difficult it is to arrive at perfection, even in a Rose. The flowers of Prince Albert in many situations do not appear to open well, and it is a most variable kind, sometimes lilac, sometimes red, and anon a deep velvety crimson, on the same plant. When its flowers do expand properly, their perfume is quite delicious; it also forces admirably; coming into flower in February, and if possible it is more fragrant then than when grown in the open air. Aubernon is also a sweet Rose in every sense of the word. Duc d'Aumale, one of the newest, is of a deep crimson, with erect trusses of flowers, but is scarcely at all fragrant; this is one of M. Laffay's new Roses, as is "Perpetuelle Rivers," "dedicated," as they say in France, "to the Rose-grower of that name;" it is a large and brilliant Rose, approaching sometimes to Brennus in colour; its habit is robust in the extreme; its perfume not very perceptible. Reine de la Guillotiére is a Rose which was raised at Lyons, and, like Clementine Seringe and Pauline Plantier (also raised there), has a marked and distinct character; its leaves being dark and glossy, habit dwarf, flowers very double, and of a brilliant yet dark crimson, and is a charming and distinct variety. Guillotiére is a suburb of Lyons, whence its long name, not the most agreeable to the taste of many Rose-growers. Aricie and Mrs. Elliot are lilac-coloured flowers, rather destitute of brilliancy: the former seems dwarf and distinct in its habit, but its petals are too flaccid. Calliope is dwarf and pretty; its flowers are of a brilliant red, without perfume, and generally defective in shape.

William Jesse and General Allard are classed with these Roses, but they do not always bloom in autumn; they also group badly with them, as they make long unmanageable shoots. In a bed of Hybrid Perpetuals every shoot should have terminal flower-buds. All these kinds strike readily from cuttings planted in September under a hand glass; and some of them form fine standards. As a rule, no Rose of dwarf delicate growth should be chosen for this purpose. They have a beautiful effect in beds on their own roots, as they make compact bushes, and are covered with flowers all the summer and autumn.—*A. Z.*

AMATEUR'S GARDEN.—No. XXX.

Besides the several kinds of fruit trees and Roses, which were recommended to be propagated by budding at this season, there are two other kinds of trees which can easily be increased in the same way, and which are particularly worthy of notice. I allude to the different varieties of Cratægus or Hawthorn, and Horse Chesnut. There is, perhaps, nothing more beautiful on the lawn of a small garden than a group of Hawthorn trees. The common one of the hedges is, in itself, a beautiful object, when allowed to grow in its natural form, and some of its varieties, such as the double and scarlet flowering, are particularly striking. One group might be formed of these, and another of such kinds as Aronia and Odoratissima, which bear large and handsome fruit. The fruit of many of them is even more interesting than the flowers, and gives them an additional claim to our notice, particularly as it continues in perfection very late in the season. The Tansy-leaved, the oval-leaved, the Aronia and Odoratissima, already noticed, as well as many others, look well on a small grass-plot as single specimens; but where the lawn is extensive, a group with single specimens here and there near it, has the finest effect. The different kinds of Horse Chesnuts are also very ornamental, particularly such sorts as Æsculus carnea, Ohiotensis, and the different varieties of Pavia. The Hawthorns and Horse Chesnuts are as easily budded as the Rose or Peach, with which the amateur is perhaps better acquainted. If he has not stocks of the common varieties in his possession, he can procure trees of the above kinds in any nursery in the autumn.

There is another shrub, which has been in flower for several weeks past in nurseries and public gardens, which has a most graceful appearance upon the lawn; and I advert to it now in order that the amateur may find it out and judge for himself. It is called Spiræa Ariæfolia, and grows from 8 to 12 feet high, forming a handsome bush and producing large graceful panicles of drooping flowers. It is a beautiful object when growing near a lake or stream; but cannot fail to be ornamental in whatever situation it may be placed. Of course the autumn or spring is the proper time to procure it from the nurseries.

In saving the seeds of annuals, which are now ripe, a little discretion is required. Every year new varieties are produced, some having their flowers smaller, some larger than the original, with different shades of colour. As the amateur wants only a small quantity of the seeds which are ripened in his garden, he can afford to choose those which the finest plants produce, and to reject the worst. He will thus stand a better chance of having finer varieties raised from these seeds, than if he had saved them indiscriminately, as many persons are in the habit of doing.

Where there are Vines on the rafters of the greenhouse, they will now require frequent attention; the berries, of course, having been thinned long ago, in accordance with the directions which have been already given. The laterals must be kept "stopped," and not allowed to ramble about, shading the fruit and wood from the influence of the sun. The same observation applies to those grown on walls in the open air.—*R. F.*

HOME CORRESPONDENCE.

On the collecting of Wood and other Vegetable Substances in distant Countries.—Xylography, although it will prove to be one of the important branches of vegetable physiology, has not been so generally attended to as it deserves. The apparent uniformity of European wood, and the few collections which were judiciously made in distant parts of the world, are some of the reasons of the slow progress hitherto made by Xylography. Most of the specimens of wood, until lately, brought to Europe, were square blocks for ornamenting chess-boards, &c.; besides, such specimens were not of the least value to the botanist, as the species of plant to which they belonged was mostly unknown. These considerations struck me on the outset of my late travels; and I collected xylographic specimens, which are now in the collections of the British Museum, and those of St. Petersburg, Berlin, &c. The following instructions and observations may therefore be useful to travellers, or persons sojourning in distant countries. The pleasure of perambulating tropical forests is very great; not to mention the enjoyments of vision, the fragrance which we there meet with is beyond description. Far different is it from our climate, where most flowers have either no smell at all, or a very indifferent one. There, on the contrary, everything exhales perfumes the most refined. Not only have flowers a particular smell, but the fruit also,—even the leaves and the bark; and if (as I did often) you cut a tree with either axe or saw, perfumes will, in many cases, meet you, and the blackened instrument indicate that some particular sort of sap is contained in the vegetable limbs which you have injured. These qualities, as a matter of course, point out the properties and virtues of these plants, in many cases quite unknown; and it is Materia Medica as well, which will partially advance by the collecting of specimens, as recommended. I shall therefore first speak of collecting specimens of wood in general, and then advert to some especial rules relating to drugs, &c. The season, nay, the phase of the moon, in which a tree is cut in the tropics is, it seems, of some importance, concerning which Martius has made some remarkable observations in the Brazils. In this respect, the collector will have some scope for observation as to the rising of the sap in different climates; and his task will be, to note properly in which season (or even in which phase of the moon) a specimen has been procured. When a tree yields a particular sort of sap, like the Euphorbia phosphorea, the boring of such trees, for the sake of obtaining these substances, will be of consequence. For obtaining good specimens of wood, a healthy, fine, straight tree should be chosen; for such as are either hollow or decayed will not yield instructive specimens. The bigger a trunk, the more interesting its structure; but this certainly has its limits where trees of 7—10 feet diameter may be at hand. The thickness, however, of such specimens is never a matter of consequence, except for the collector who wishes to provide several collections, because from 2 to 4 or 6 inches are sufficient to serve all the purposes of the observer. To give, however, to his specimens an equal thickness or length will certainly increase the value of the collection. The centre of a tree is a most important part of the specimens; and for obtaining this in trees where the whole segments are too large to carry, triangular parts of such segments may be chopped off with an axe or hatchet, by which means the centre, the whole length of the radii of the fibres, the bark, and adjacent parts will be obtained. Having just spoken of huge trees, it may be as well to observe that, on the other hand, there is no shrub so small of which the wood (stem) is not of importance; each specimen can be procured with a knife. There are many trees and shrubs abroad, under the bark of which, or on the surface of which, gums, resins, or other vegetable secretions, are to be met with. To collect such is of the greatest importance. In fact, there is no part of a plant, either different in its structural or periodical development, which is not interesting to the physiologist, and, if the plant has some internal qualities, to the chemist or pharmaceutist. Such are the roots, buds, leaves, flowers, fruits, &c. Of the collecting of specimens for the herbarium, we do not speak on the present occasion, but the following additional remarks may be of use to the collector of woods and other vegetable products. Specimens of woods should always be dried before they are packed up, for which an airy open place, not exposed to the rays of the sun, is the most appropriate. As the bark of some trees or shrubs separates from the wood, it is necessary to tie it to the specimens, or to fix it with some tacks, in order to avoid the mixing up different sorts. But all the foregoing instructions would not accomplish the perfect usefulness of specimens, if the species of plants to which they belong should not be known. There are few persons, however, who would be able, whilst travelling in distant countries, to determine at once the plants whose wood they collect. Corresponding numbers between the physiological specimens and the herbarium are very useful; still these also are liable to be rubbed off. I have therefore resorted during my travels to a most simple means of avoiding this inconvenience, by tying to every specimen of wood a few twigs of the plant, either in blossom or with fruit, or, in fact, as complete as I could find them. If I had gums or resin before me, I tied my little branches to the paper in which the former were contained. This, as everything else in collecting, must be done carefully, and never left until the collector has come home; but every branch should be tied to its specimen at the time of collecting. By the way in which this is done, the botanist in England will at once see whom he has to deal with, and value the collection of a man who has not neglected even such things as may appear trifles, but are in reality most essential.—*A Traveller.*

Chemistry as applicable to Agriculture.—The public are certainly much indebted to you for the early prominence you have given to Dr. Schleiden's views on the subject of Manures. The publication of Dr. Liebig's Agricultural Chemistry has indeed been a great era in the advance of the science; but there is still much to be done before arriving at perfect principles to guide the cultivators of the soil in their operations, of which nobody seems better aware than Dr. Liebig himself. The experiments in the laboratory are necessarily on so small a scale, that some very trifling unperceived circumstance may lead to conclusions which will be disproved when nature itself comes to be consulted by practical men in the fields. That Dr. Liebig was amongst the least likely to be mistaken has been conceded on all hands. Still some of the views he has taken on the subject are startling; and before being largely adopted in practice, will require further confirmation. The most prominent of these are his views of the manner in which plants get their carbon, the most essential element in their composition. If, as has been advanced, plants derive the whole, or almost the whole, of their carbon by their leaves from the air—if only water, nitrogen, and inorganic earthy salts, are required to be absorbed by the roots, then the carbon, the most bulky portion of the manure, might as well be spread on the highways; as the air is said also to contain always the same uniform portion of carbonic acid. We, practical men, have found so much benefit from burying quantities of manure in the soil, that it will be difficult to divest us of the opinion, that the carbon is necessary also; nevertheless, if it can be found that chemical extracts will answer the purpose as well, the saving in expense, especially to such as are at a great distance from towns, the present sources of manure, will be very great. One of the principal data on which these opinions are founded, are the experiments of chemists with plants growing in air from which the atmosphere has been excluded, in which it has been said the carbonic acid is found to diminish by the action of the leaves on the confined air. On this subject, however, Dr. Schleiden differs, and says, in the experiments of Saussure, Link, and others, that confined air has not been found, in the aggregate of the experiments, to be altered, either in its qualitive or quantitive relations. The emission of oxygen has been brought forward as another proof that the carbon is derived from the air; but it is impossible here to say what part of the oxygen is from the carbonic acid of the air decomposed in the leaf, or what from the decomposition of the carbonic acid, water, and other substances, in the plant itself. Dr Schleiden has also pointed out the probability of more than sufficient quantity of carbon being furnished to plants from the water absorbed by the roots and evaporated; and the much more than sufficient from humic acid, and such compounds as humate of ammonia, potass, &c. It may be said the Sunflower, the plant mentioned by Dr. Schleiden, possesses a very great power of evaporation, and that humic acid is apt to be decomposed; but there appears abundance to make up for these deficiencies. It is known in practice, that when the top of a tree is headed down, it renews its surface of leaves much sooner than it would have done its roots, had these been cut away. This may partly arise from the want of a sufficient absorbent surface for moisture, as here the roots are cut out; but the great vigour displayed by the young shoots that spring from the roots, shows the great dependence the tree has on the roots. That some plants do absorb carbon, and at times everything necessary by the leaves, may be seen in the lower classes of plants, as Lichens, &c., the whole surface of which has an absorbent power. The vegetation, however, is feeble; and though the foliage of the higher classes of plants undoubtedly possesses the same power, yet a separate and more perfect absorbent system seems necessary for their wants. How far it may be possible to render plants vigorous in soils nearly destitute of organic remains, by the application of other substances, to the exclusion of carbon, has never yet been put to the test. It must at least be admitted to be very doubtful if on a poor hungry sand, or barren clay, destitute of organic remains, the same crop of any description could be raised of equally vigorous growth, from water, nitrogen, and the inorganic and other substances of manures, separated from the manure itself, the bulky carbon alone having been retained. If such experiments were instituted, it would put the theory to a fair test, and we should then have practice, the safest of all guides on a large scale, to confirm or destroy theoretical opinions. It will be difficult to get practical men to believe that bulky farm-yard manure is not the most suitable for their crops, yet the preponderance of opinion among scientific men seems to lean to the opposite side. In the present state of agriculture the opinions of scientific men are sought after with avidity; and if Dr. Gregory had leisure to add his quota, it would undoubtedly be very acceptable. Dr. Schleiden has also recorded his opinion that the chemical power in the leaf is more assisted than generally allowed by the activity of organic secretion, stimulated by electricity from the sunbeams. That plants are not wholly dependent on leaves, we may instance the fact, often observed, of Tulips, &c., producing their new bulb without ever having sent a leaf above ground. It is also found in practice that some crops, as Beans, &c., which contain more nitrogen than Wheat, do not exhaust the soil so much. On these subjects information would be valuable and acceptable. It matters little the form in which the opinions are issued; it is the substance, not the manner, that will be attended to. No mistakes into which Dr. Liebig or Dr. Schleiden may be led, in the application of science to practice, which is as yet only in its infancy, can at all injure their character, which is too well established to be in any danger; nor, in the present avidity for information, is there any risk of a want of sale for the works of such men. That Dr. Liebig has been a little hasty in arriving at some of his conclusions, and that Dr. Schleiden has perhaps felt it too keenly, is possible; but the valuable information to be derived from their vast and extensive knowledge on chemistry and physiology will leave everything else in the shade.—*R. Lymburn.*

Pontederia crassipes.—As L. W. D. is desirous of flowering this plant, I beg to refer him to the method of cultivating it, as mentioned in Vol. 11 of Loudon's Gard. Magazine, which I have adopted with success. By plunging the plants in a Melon-pit during the present month, and by carefully pinching off the side shoots as they successively appear, the plant will flower freely during the months of September and October.—*J. F. M. Eroy, Clapham Common.*

Bees.—In reference to the questions respecting the treatment of bees, proposed in your number of June 25, by a lady and by Rusticus, I offer the results of my experience in the management of these interesting creatures. To take the honey from a side box, made according to Nutt's plan, the most simple way is, to take the box off its board, and set it, bottom upwards, on the ground, near the front of the middle box, and to tap it gently with a stick or the hands; when the bees, being much alarmed, will hasten to rejoin the queen and the rest of their companions in the middle box. It may be safer for the person performing this operation, to wear a wire mask, such as is used by fencers, having a bit of cloth sewed all round the edges, which may be tucked inside the coat, and also a pair of gloves on the hands. The alarm, however, caused by the tapping and by the sudden exposure of the bees to daylight, will prevent them from attacking the operator, if he possesses coolness and uses no hasty or violent actions. The tapping must be done very lightly, otherwise there is a danger of loosening the tender combs, and suffocating the bees, as well as of letting out the honey. To avoid this, it is, perhaps, better to cut out the combs from the box one by one, sweeping the bees gently off them with a a feather, and laying the combs in a dish; if it is not desirable to keep them attached to the box. It is said that cutting off the communication between the middle and side boxes, and shutting the entrance of the latter, so as to keep the bees prisoners in it for a day or more previously, will induce them to leave it as soon as opened again; but for this I cannot vouch. Should the bee-manager be afraid to adopt either of the above methods, he may smoke the bees in the side box, till they fall stupified from the combs. To effect this, it is necessary to place some dried puff-balls, or rags soaked in nitre, in a perforated tin vessel; in which they will burn and the smoke escape without danger of the bees falling on the fire and being burned. The rose of a watering pot, or a small flower pot inverted over a saucer containing the smoking substance, would answer the purpose. Having made this ready, set an empty side box, bottom upwards, put inside of it the smoking puff-balls, and upon the empty box place the one full of bees, so that the edges of both boxes fit accurately. In about five minutes the bees will be all stupified by the smoke, and on tapping the upper box, most of them will fall from the combs into the empty one; but a few will probably have inserted their heads into the cells to avoid the smoke, and will there remain. Remove the vessel with the fire from amongst the apparently dead bees, and set the box in which they are on a chair, with its bottom towards the middle box, having first sprinkled the stupified bees pretty freely with sugar and water. They will soon revive when exposed to the open air, and rejoin their companions in the middle box, who will welcome them by licking off the sugar and water, and the reunion will be effected quite amicably; as I believe it would be, even without the sugar and water. The few bees still adhering to the combs in the box of honey, will soon leave it on reviving, if the box be placed bottom upwards in a shady place, or screened with a cloth near the hive. I may here mention, that I have this season taken a straw hive full of honey, worked like one of Nutt's side boxes; and that the bees were induced to leave it, and to return to the parent stock, by the first mentioned method, *i. e.*, by being drummed out. It was done towards the middle of a fine day. The same bees are now fast filling another straw hive, placed by the side of their own, as well as a bell glass on the top. They are set up on a doubling board, as described in Mr. H. Taylor's "Bee-keeper's Manual, 2nd edit., p. 21." This plan answers the purpose of Nutt's boxes, enabling common straw hives to be used; and they are the only ones which will ever be generally employed. In answer to Rusticus, who wishes to know how to join another swarm to one already hived in a square box, I would remark that this is a more delicate operation than that of merely inducing a part of a hive of bees to leave a side box. In the first case, we have two distinct communities, with two queens, to be united, and one of them to be forced to leave not only combs full of honey, but perhaps some containing brood cells also. This last consideration makes it unadvisable to unite swarms at the present season of the year, unless it be done within a day or two after one of them has been hived, and consequently before it has begun to make comb. Should Rusticus have another swarm this season, he may safely unite them to any other hive he pleases, within a day or two after the new swarm is hived; but those already established I would leave undisturbed till the autumn, when all weak hives should be united to strong ones. The simplest way to unite distinct swarms is as follows:—In the evening, when all the bees are in their hives, having prepared a small basin full of thin sugar and water, in a watering can with a rose, let an assistant gently raise the box containing the new swarm, and place it, bottom upwards, on the ground, near the one to which it is to be joined; whilst you water the cluster of bees in it with the sugar and water. Then let the assistant place the box, to which the first is to be united, gently over it, and if necessary, a wet roller-towel may be tied round the line of junction, to prevent any bees escaping between the two. Now, whilst one person holds the two boxes together steadily, the other must drum gently, with the knuckles or a stick, against the sides of the lower box; when its inhabitants will gradually, with a loud buzzing, crawl up and mingle peaceably with those in the box above, who will be so alarmed as not to think of resisting the sudden invasion. After about ten minutes, when the sound seems to have left the lower box, leave them tied together till the next morning, when the upper box containg the united colony may be replaced on its stand. There is no necessity for the trouble of looking for the queen, and taking her from either hive; for I suppose the bees put a supernumerary one out of the way quietly. I performed this operation exactly as described, only a few days ago, with perfect success, and also in previous autumns, when depriving a hive of its honey, without the loss of a bee. It is well if the hives to be united have been standing next to each other previously. If the bees to be united are in straw hives, and not in boxes, the bottom hive, from which they are to be driven, must be supported by three stout sticks, about 18 in. long, driven into the ground near together at the bottom, and sloping outwards at the top, so as to hold the hive securely, bottom upwards, between them. The sticks should be driven or thrust into the ground very quietly, for fear of disturbing the bees. There might be more difficulty in preventing the escape of bees when they are to be driven out of a round hive into a square box; but in that case I should place between the two a board as large as the box, having a large hole cut in the centre for the passage of the bees, and then proceed as before. To the other questions of "Rusticus" I answer:—I should be afraid of using tobacco for stupifying bees. It is an excellent plan to take hives in the autumn by drumming the bees out, in the manner above described, into the stock hives which are to be kept through the winter, and which are thus rendered much stronger the following spring. I have done this for cottagers, to prove to them how much better they might manage than by stifling their poor bees with sulphur. Care must of course be taken that the stock hive be heavy enough to support the inmates through the winter; and if not, they must be plentifully fed in autumn. I have tried the plan of hiving a swarm into a side box, and making them use the same common entrance with the stock from which they swarmed; but they would not agree.—*T. T.*

Efficacy of Sulphur in the Destruction of Red Spider.—I perceive in your last Calendar that the efficacy of sulphur in destroying Red Spider is doubted by Mr. Whiting. This, emanating from such authority, much surprised me, as the remedy is doubtless, when properly applied; and it is indeed the only known one, where fruit is ripe or ripening, at which time the attacks of this insect are usually most vigorous. In well-managed vineries it is rarely seen until that time; and if it be allowed to remain unmolested until the fruit is cut, the leaves will be prematurely destroyed, or their functions so much impeded, that the bearing-wood for the following season would be materially injured. In fact, the effects will be precisely the same, as if the leaves had been injured by any other means at this important season; and every gardener knows what this would be. In the latest vineries,—for instance, where the Grapes are expected to hang for a lengthened period, if sulphur be not used to extirpate the Spider until the fruit is cut, most of the leaves will have fallen; and previous to this, the pest will have increased so much, that the fruit stems will be covered with them. I am prepared to speak positively of the efficacy of sulphur in the destruction of red spider, having used it with success scores of times, both in Vineries and Peach-houses.—*John Stewart, Middleton Hall, Derbyshire.*

Rigidella immaculata.—It is worth mentioning that while Rigidella flammea expands its flowers at three in the afternoon, the new scarlet one expands earlier and closes about three. They are both flowering in the open ground, having stood the winter, and as they grow near together this difference in the time of their expansion is conspicuous.—*W. Herbert.*

Amphicome arguta.—This, which I frequently see treated as a greenhouse plant, is perfectly hardy.—*N. S. Hodson, Bury St. Edmunds.*

Management of the Peach-house.—It is a custom with many gardeners, when they have gathered the crop from their Peach-house, to remove the sashes immediately, and expose the trees to the open air. Though this is a common practice, I cannot imagine for what purpose it is done, or how Peach trees can be benefitted by being exposed to the air. Is it because the wood ripens sooner, or better, that the sashes are taken off? I should think not; for I am persuaded that neither of these effects can be produced by such treatment. I cannot, then, see any reason for removing the sashes of a Peach-house immediately after the fruit is gathered. We have, up to the time that the fruit is gathered, treated the trees more like tender exotics than any thing else; for months they have been used to a warm, humid atmosphere, many degress above the temperature of the external air; their shoots and foliage are consequently tender, the sap is flowing rapidly and thinly, and the trees are luxuriating in a tropical climate. Suddenly, the sashes are removed, and they are subjected to all the vicissitudes of a British climate, exposed to the "pitiless storm," the cold nights, and all the variations to which our climate is subject. What, then, are the consequences of this exposure?—nothing favourable to the health or strength of the trees, I apprehend. A diminution in the temperature, of course causes a diminution in the flow of the sap; the growth of the tree is partially arrested, and it does not regain its vigour for that season. These checks must have a most mischievous effect on the health of the trees; it is certain that the wood is never perfectly ripened under this treatment. Thus trees, that are forced in hothouses, never last so long as those that are planted out of doors; and the gardener frequently finds it necessary to give his plants, at least such as are forced early, "a rest" for one year; that is, he does not force them, but leaves them to nature for a year, excepting the disbudding, pruning, and other necessary operations which they may require. But Peaches, and very fine ones too, are grown in countries where frost or very cold weather are unknown; for instance, in Persia, their native country. They cannot "rest" their trees there; nor is it necessary, for the winter's cold is proportionate to the summer's heat. The trees are not subjected to a highly exciting temperature one half of the year, nor to one as depressing for the remaining six months. I must admit that I have seen very fine fruit grown in houses from which the sashes have been removed immediately after the fruit has been gathered; but it requires no little skill to keep the trees in a healthy and bearing state. I must admit, too, that there are other circumstances prejudicial, besides taking off the sashes, which tend to decrease the vigour of the trees; but I think their removal to be the principal one. Unless, then, the sashes should be particularly wanted for some other purpose, I should recommend their being kept on the house. Air may be admitted pretty freely during the day-time; the trees may have a good watering over head two or three times a week, which will keep the leaves clean and enable them the better to perform the important functions allotted to them. When, however, the trees begin to exhibit symptoms of having completed their growth for the season the syringing had better be discontinued. By these means the trees will go on regularly adding new matter to the heart-wood, which at the time of pruning will be found hard and well ripened, and with much less alburnum than those trees that have been exposed to wind and weather throughout the autumn and winter. Though the latter may produce fine fruit, I think the former will produce fruit much finer.—*Observator.* [That the practice here recommended is right, there is no doubt; but the illustration of it by reference to a Persian climate is unfortunate. Persia is very hot in summer, and very cold in winter. Look at Cabul!]

Summer Pruning of Wall-trees.—We have received from Mr. Bowers, of Laleham, specimens of Pear-tree shoots in different stages of advancement towards fructification, to show the beneficial results produced by his system of management, from which it is apparent that the practice of breaking down the shoots instead of wholly removing them is a good one. It is particularly applicable to strong growing trees, and in conjunction with root-pruning in autumn, will, no doubt, as Mr. Bowers observes, restore trees to fruitfulness where the prevalent system of summer-pruning has entirely failed. The shoots of these may be broken down, within two or three inches of their base, so as to preserve about 1-4th of their substance in connexion with the tree. He likewise removes half the strong downward growing roots the first season, and the other half the next one, which he finds to be sufficient root-pruning for several years; but the summer treatment he repeats until the trees are reduced to a fruitful state.

Araucaria imbricata.—There is something, with reference to soil or clime, in local influences relative to plants not sufficiently understood. Thus the Laurustinus, usually hardy, almost entirely perished, in some places, even of Hampshire, during the severe season of 1837—1838; whereas with me, in Scotland, the only loss I then sustained was the Gum-cistus, though the Arbutus Unedo and Erica mediterranea suffered considerably. The Araucaria imbricata succeeds very well *sub dio* at Alton Towers, Sudbury Hall, and in the Botanic Gardens at Birmingham, while it does not survive in some parts of Herefordshire. Near Ludlow, the Arbutus Unedo scarcely survives an ordinary winter, while with me it both flowers and fruits.—*J. Murray.*

Squirrels.—I saw a letter in the *Gardeners' Chronicle* some weeks since, which I think said that squirrels did not destroy the eggs of birds, nor were they in any way carnivorous. I think it may be interesting to some of your readers to hear what I saw to-day, and which makes me doubt whether squirrels deserve the good character given them in the above-mentioned letter. I was walking in a wood belonging to me some few days ago, when my attention was attracted by a great noise and cries of distress from some birds. On looking through some bushes, I saw a squirrel descending a low Spruce Fir, with a young bird in its mouth, which was crying out very much, and several thrushes, chaffinches, and other birds were fluttering about, and apparently endeavouring to frighten away the squirrel. On reaching the ground, the squirrel began biting the young bird, as if to kill it. I drove it away, with my hoe, and found the bird was a young thrush, much mangled, about a week old. In the nest from which the squirrel had taken it was another young one alive.—*A Subscriber, Esher.*

Effects of Guano and Nitrate of Soda.—With a view of trying the effects of guano and nitrate of soda, I selected three plants of Impatiens glanduligera, of equal growth, and planted them in similar sized pots as follows:—one in sandy loam and leaf mould, with dung, the remains of an old Cucumber bed; a second in the same soil, adding about a dessert-spoonful of nitrate of soda on the surface; and a third in equal parts of the former soil and pure sandy loam, adding about a table-spoonful or more of guano. They were placed in similar situations. The plant in the Cucumber soil is much the largest, being upwards of six feet high, but its wood is very long-jointed. That in guano is about 4 feet high, much more compact, of a deeper green, and its foliage much smaller than the others. That with nitrate of soda grew more slowly than either of its companions, and is not materially different in appearance from that in the Cucumber soil, except that its leaf is smaller and the plant more compact. The flowers of that planted with guano, as far as they have yet expanded, are much smaller and deeper coloured than those of No. 1. I may mention that if there be any difference in their situations in regard of light, No. 1 is most favoured, so that its tendency to draw does not arise from that cause.—*J. R.*

Gooseberry Caterpillar.—I wrote to you last year on the management of Gooseberries, and now have the pleasure to state, that this spring I mixed a little quick-lime with the earth under each Gooseberry bush (viz. 200 bushes), and that there is not one caterpillar on any of the bushes, or other insect visible to the naked eye.—*James Jackson, Trungle.*

FOREIGN CORRESPONDENCE.

Sierra Leone.—At this colony I had the good fortune to meet with that enterprising naturalist Mr. Whitfield, who at this time had a fine collection of living plants, as well as birds and animals, which he intended to bring to England. The plants I have since seen thriving, under the judicious management of a nobleman's gardener, in the vicinity of London. Being on a botanical excursion together at the time he was collecting the edible fruits of this country, I had an opportunity of seeing a great number of those mentioned in a paper in the Transactions of the Horticultural Society of London. The African Teak, which certainly is a most noble tree, was pointed out to me; it grows to a great size, but is rarely to be met with about the settlement, owing probably to its having been cut for commercial purposes. The principal place from whence this timber is obtained is thirty or forty miles up the Sierra Leone river. The Pineapple is found in great plenty, both in a wild and a cultivated state; but not so thick as to obstruct the path of the traveller, as has been reported by some who have visited this part of western Africa. The practice generally adopted in its cultivation is to form beds of about four feet in width, and raised a little above the ground-level, in which they are planted out in three rows, and about two feet apart in the row. The Pishamins are now plentiful upon those grounds which were cleared a few years back, and upon which a young vegetation has since sprung up. The Pentadesma butyrácea, spoken of as being plentiful by Mr. Don, at the time he was at Sierra Leone, is now very rare. Although Fig Trees are found in great abundance, I did not see any in fruit; the leaves of one species are so rough that they are used by the African women in the operation of washing. I met with a beautiful specimen of Passiflora and Ceropégia, which I trust are among the collection introduced by Mr. Whitfield; also a specimen of Indigo, the leaves of which, if rubbed between the hands, will dye them of a deep blue. The Pomegranate, mentioned in the list of edible fruits, is still rare about the colony; but I found it in great abundance at Cape Masurada and Grand Bassa—at both which settlements it is totally neglected by the natives. I did not meet with either the velvet or the brown Tamarinds, nor could I gain any information respecting them. I was informed by an American residing at Cape Palmas, that he had found the Guava in the interior of the country, at a great distance from that place. Phœnix leonensis is rarely to be found about the colony. Of cultivated plants and fruits they have a great quantity. Plantains and Bananas are both extensively cultivated. The Cocoa Nut Palm is plentiful now, although rare at the time of Mr. Don's visit to this place. Cashew Nuts, Mangosteen, Mango, Rose Apples, Avocado Pears, Cabbage Palms, Limes, Lemons, Oranges, Melons, a great variety of Gourds, Papaws, Sweet and Sour Sop, and Palm Nuts are frequently met with. It is said that the best Palm Wine is made from the Elais; I have however generally found this operation performed upon a species of Areca, and very seldom on the Elais guineénsis. The shrubby species of Capsicum and Egg plant are also grown. Among the vegetables are the Artichoke, Spinach, French Beans, Calocasia mucronata, Yams, Sweet Potato, Cassavas, Sugar Cane (which is eaten by the natives in a raw state), Ground-nuts, Rice, and Indian Corn. The market is well supplied with these fruits and vegetables, which may be bought at a low price, owing to the free Africans bringing the produce of their ground to the market, and trying to outdo each other in their productions. The Cola Nut is brought from the interior, being rare about Sierra Leone. The natives make a kind of tinder from some part of the Elais guineénsis, which is sold at the market. The seeds of Gourds are sold, and used in the preparation of some of the African dishes. Pineapples may be purchased for about twopence each, and are brought on board of vessels, visiting this port, in great abundance.—*J. A.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

July 19.—Lieut.-Col. J. P. Holford, J. E. Body, W. Cathrow, E. L. Gatacre, G. H. W. Heneage, C. Kiddey, W. W. Simpson, and B. Stocks, Esqrs., were elected Fellows. From Mr. Goode, gr. to Mrs. Lawrence, was a large collection of Ericas and other plants, containing a well-grown specimen of Epidendrum floribundum; a pretty variety of Oncídium Barkeri, with a small perianth of yellow mottled with brown, and a singularly large bright yellow labellum; a handsome plant of Roella ciliata, completely covered with its delicate blue bell-shaped flowers; Burtónia conferta, a good Papilionaceous plant; a well-flowered specimen of Erica exímia; E. Boweiana, loaded with a profusion of its snow-white tubes; E. daphnoides, with dense clusters of lovely pink flowers; E. cerinthoides, having heads of wax-like blossoms of the brightest vermilion, and many others: for Epidendrum floribundum, the Oncídium and the Heaths, a Knightian medal was awarded. Mr. Redding, gr. to Mrs. Marryatt, also sent a collection of plants, amongst which Triptilion spinosum, with its pretty heads of blue-and-white flowers, was conspicuous; there were also a well-grown specimen of Státice arbórea; a Cactus opúntia, in bloom, but not remarkable for beauty; Stanhópea oculata, flowering freely; and a cut specimen of Stanhópea Martiana: a certificate was awarded for Triptilion spinosum. An uncommonly luxuriant specimen of Stephanotis floribundus was sent by Mr. Edmunds, gr. to his Grace the Duke of Devonshire, at Chiswick; this, as well as a large plant of Erica viridiflora, which accompanied it, was loaded with a multitude of blossom: a Banksian medal was awarded for the former. From Mr. Mylam, gr. to S. Rucker, Esq., a singularly fine plant of Aérides odoratum, every branch being crowded with trusses of beautiful pink-and-white flowers, which, with the Stephanotis before mentioned, filled that quarter of the room in which they stood with the most agreeable perfume: a Knightian medal was awarded for it. G. Barker, Esq., sent a fine species of Mormodes, named luxatum, which has not previously flowered in this country; the blossoms are creamy white, but when first expanded have a tinge of yellow; this species is of recent introduction from the West of Mexico, where it is held in great request by the natives, who use it in decorating their temples, being less remarkable for the beauty of its flowers than the delicious fragrance which they exhale: a Knightian medal was awarded for this. Messrs. Veitch, of Exeter, exhibited a pretty Cinchonaceous plant, with elegant tubular blue flowers, recently brought over from the Organ Mountains, for which a Banksian medal was awarded. From R. Barchard, Esq., were several well-grown plants of Lisianthus Russellianus, a showy annual which has long been treated as half-hardy, but which experience has proved to succeed best when treated as a greenhouse plant, and by being allowed plenty of heat and a damp atmosphere in the earlier stages of its growth; for these plants a certificate was awarded. Mr. Cuthill also exhibited a fine specimen of the same plant, accompanied by a cutting, which when it had formed roots was placed in a phial of water, where it has since remained, and where it continues to put forth fresh roots; proving that this plant requires an abundance of water when in a growing sate. From the Hon. W. F. Strangways was a large collection of cut flowers sent to show what might be done in the open air in Dorsetshire; most of them were such as in this part of the country are treated as greenhouse plants, consisting of New Holland Myrtáceæ, Nerium Oleander, the Italian Anthyllis, and various others, which in that mild part of the country stand out unhurt during the winter. Mr. Willmer, of Sunbury, sent a handsome collection of Carnations and Picotees. Good stands of these were likewise furnished by Mr. Hogg, of Paddington, and by Mr. Atkins, gr. to T. Leach, Esq., of St. John's Wood. From Messrs. Beck and Co., of the Strand, were a large collection of German Stocks, of every colour in cultivation, and some Marigolds. J. Saunders, Esq., exhibited a pretty seedling Pelargonium, in which the colours were remarkably clear. From Mr. R. Thompson, of Stansty Hall, was a collection of fruit, amongst which were some very fine Black Hambugh and Lombardy Grapes, but their beauty had been considerably impaired by the effects of carriage; they, nevertheless, obtained a Banksian medal. Mr. Atlee, gr. to H. Beaufoy, Esq., also exhibited a basket of Black Hamburgh Grapes, in the highest state of perfection, for which a Banksian medal was awarded. Mr. Errington, gr. to Sir Philip Egerton, sent a dish of fine Murray Nectarines. From the Garden of the Society were, as usual, a large collection of Orchidaceous and other plants, amongst which the first place must be assigned to Oncídium incurvum, a rare and peculiarly graceful species; its beauteous rose-and-white flowers contrasting finely with the dark foliage of other Orchidaceous plants; there was also a good specimen of Grammatophyllum multiflorum, a plant the colour of whose flowers varies considerably in different individuals; those in the present case were not so deeply spotted as usual; the singular Cycnoches ventricosum, with a spike of large green blossoms; a small plant of Grobya Amhérstiæ, with transparent spotted petals, the rest of the flowers being mottled with brown and yellow; Silene laciniata, an exceedingly showy frame perennial, with blossoms of bright vermilion: this, although introduced nearly 20 years since, is little cultivated, on account of the difficulty with which it is preserved during the winter. There were also cut flowers of several of the best varieties of Verbena at present cultivated, with various plants in glazed pots, brought forward for the purpose of showing that the common notion which prevails, that plants grown in a hard or glazed material will not succeed as well as others potted in the soft porous earthenware generally used, is unfounded. Amongst the plants was an Abies, one of the most difficult of pot culture. The principal requisite to insure success appears to be a larger amount of drainage in the bottoms of the glazed pots than is used in the common ones. There was also an excellent seedling Pelargonium, from Jos. Dobinson, Esq., with first-rate properties; its fault was its too great resemblance to some others in cultivation.

Erratum.—In our last week's report of the Exhibition at the Gardens, we mentioned a Campanula trained upon two hemispherical trellises, as having been sent by Mr. Barnes; whereas they were exhibited by Mr. Bourne, gr. to Sir E. Paget.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

We last week gave a short notice of the proceedings at the great Bristol meeting, for a longer account of which we must refer our readers to some of the agricultural papers, from which we have, however, gleaned a few additional matters of interest.

On Wednesday a lecture on Drainage was delivered by J. Smith, Esq., of Deanstow, who commenced by showing that the soil of Great Britain, of whatever nature, must be greatly improved by "thorough" drainage, but that "less than thorough" would not do. By the assistance of a map he explained the principles proposed by him. He recommended drains about 2ft. 6in. deep, and about 18 to 20ft. apart, composed of small stones, covered over by turf to prevent the drains being choked. As, however, it was not convenient to use stones in all counties, he showed specimen of peat tiles, and a drain tile, invented by Lord Jas. Hay, composed of one measure of dry lime, one-half ditto cinders, three ditto fine sand, and three of gravel, the process of making which was explained in the lecture. After showing many specimens of soils and clays, before and after draining, and answering a number of questions, Mr. Smith proceeded to explain the principle of the "sub-soil plough," an instrument of his invention, which has been eminently successful in the cultivation of land. The object of this instrument is to break up the sub-soil, without in any way mixing it with the active soil, by which means, and by ploughing it at right angles with the drains, the water is enabled to pass through it to be drained off, and the place of the water being supplied by atmospheric air, it becomes of a rich nature; and, in consequence of the roots of grass, &c., penetrating it, which before they could not do, large crops are produced on land which otherwise could produce nothing.

Dr. Buckland stated that he had visited Mr. Smith's farm, and spoke in unqualified praise as to the success that had there attended the systems of drainage and sub-soil ploughing. He further stated that he had recommended these plans to Sir Robert Peel; and from a letter he had lately received from him, he found that a piece of land, worth not 2*s.* 6*d.* an acre before drainage, &c., had produced Turnips to the value of 1*l.* 5*s.* an acre.

On Thursday the exhibition of Implements and Stock, with the award of prizes, took place. Amongst the various objects of rarity displayed, there were none of greater interest than the unique colossal cheese, presented to the Queen in 1841, and exhibited at Bristol by permission of her Majesty. The following are its dimensions:—9ft. 4in. in circumference, and 22in. deep. It was made on the 28th June, 1839 (the first anniversary of the Queen's coronation), from the curd of 20 hhds. of milk, drawn at one meal from 737 cows, being the whole number of milch kine kept in the parish of West Kennard, near Glastonbury, Somerset. The prizes for Agricultural Implements, &c., which were not included in our report of last week, were as follows:—*For Agricultural Implements:* Hon. Mr. Nugent, for his subsoil plough, 15*l.* Mr. Howard, of Bedford, wheel-plough, 5*l.* Earl of Ducie, swing-plough, 5*l.* Mr. Hornsby, of Grantham, drill for corn and general purposes, 30*l.* Messrs. Garrett, of Leiston Works, turnip and manure-drill, 20*l.*; horse-hoe, 10*l.*; cake-crusher, 5*l.* Messrs. Saunders and Williams, of Bedford, turnip-cutter, 5*l.* Mr. Gingell, of Bristol, cheese-presser, 5*l.* Mr. Lovell, of Glastonbury, hay-making-machine, 10*l.* Mr. Grant, of Cambridge, horse-rake, 5*l.* Mr. David, of Cardiff, harrow, 5*l.* Mr. Law, of Glasgow, trenching and subsoil-plough, 5*l.* Mr. Mason, of Grafton, a 2-wheeled plough, with knives attached, for pulverising the furrow-slice, 10*l.* Mr. Grounsel, of Louth, an improved mode of distributing manure and soot, by drilling-machines, 5*l.* Mr. Plenty, horse-work for thrashing-machines, 5*l.* Messrs. Cottam and Hallen, a light grubber, 5*l.*; a dynamometer, 3*l.* Mr. Law, of Glasgow, a cart, with an improved catch, 3*l.*; an expanding horse-hoe, 3*l.* Messrs. C. and T. Thatcher, a cart with self-acting brakes, 5*l.* Mr. Huckvale, a liquid-manure depositor. Messrs. Ransome, of Ipswich, an application of locomotive steam-power to agricultural purposes, 30*l.* Mr. Cambridge, of Market Lavington, Wilts, do., 15*l.* Messrs. Wildey and Co., London, cocoa-nut-fibre sheep-netting, 3*l.*—*Miscellaneous Implements:* Messrs. Proctor, of Bristol, for their turnip and chaff-cutter combined, 3*l.* Mr. Croskill, of Beverley, potato-steamer, 2*l.*; grass-cultivator, 5*l.*; soot and lime-deposit, 3*l.* Mr. Barling, of Maidstone, an improved mode of working a hand-thrashing machine, 5*l.* Mr. Marrett, of Appledore, Dutch horse-hoe, with harrow attached, 2*l.* Mr. Richmond, of Salford, Worth's chaff-cutter, 8*l.* Mr. Dean, of Birmingham, corn-grinding and dressing-mill, 5*l.* Mr. Stratton, of Bristol, cross-lock wagon, and general exhibition of carts and wagons, 10*l.*—*Cheese:* Mr. John Talbot, of Bolton Borough, for white Somersetshire cheese, 10*l.* Mr. E. Church, of Biddisham, for Somersetshire cheese, 5*l.*—*Seed Wheat:* The best three samples of seed selected for trial under the direction of the Society, were, "The Old Lammas" white Wheat, of Mr. W. H. Prickman, of Crediton, Devon; "The Creeping Red" Wheat, of Mr. Wm. Woodward, of Breedon's Norton; and the "Glory of the West" red Wheat, of Mr. J. Davis, of Yatton, near Bristol.

FLORICULTURAL SOCIETY.

The fourth show of the Floricultural Society, for the exhibition of Carnations and Picotees, was held at the Crown and Anchor on Tuesday. There was a strong gathering of the fancy, and an admirable display of these beautiful flowers, both from amateurs and professional florists. It proved to be one of the best exhibitions of the kind we have ever seen; the stands were numerous and well-filled with the choicest blooms, and proved highly attractive and gratifying to the numerous visitors who attended in the course of the day.

Seedlings.—The Silver Cup, value five guineas, presented by Dr. Lindley, for the best Picotee of 1842, was awarded to Mr. Neville, for a light red-edged Picotee, to be named Dr. Lindley; the form of the flower is good, being round, well filled with petals, forming a good crown; the white is very pure, with the edging neat, unbroken, and confined to the edge of the petal, which is smooth, or but very slightly uneven; the bloom exhibited was young; it promises well, and will, no doubt, be improved in size under good cultivation; it resembles Headley's Sarah, with a purer white in the petals. *1st Class Prize* was given to a delicate rose-vermilion-edged flower, named Mrs. Lindley, from T. Barnard, Esq.; the bloom was young, and the crown not sufficiently expanded; it is of a promising character, the outer petals being broad and well-formed. *2d Class,* Emily, T. Edmonds, Esq., heavy-edged, delicate rose; *do.,* Willmer, a heavy-edged purple, of a beautiful bright colour; *do.,* Willmer, light-edged purple. *1st Class,* Scarlet Bizard, Willmer, white, rather pouncy, good petal, full flower. *2d Class,* Scarlet Bizard, Vivid, Brown, a good-sized flower, with the marking distinct, excepting in the dark stripe, which is not sufficiently intense; *do.,* Rose-flake, Willmer, a delicate and pleasing variety.—Picotees: *1st Class,* 1841, Nannette, Headley, heaved-edged purple, of a rich colour, the petals stout, the flower well-formed, with a good crown. *2d Class,* Sarah, Headley, light red-edged, good form, high in the centre; *do.,* Halliday, light red-edged, with stout petal; *do.,* Robinson, Nottingham Hero, purple edges. *1st Class,* Red-flakes Briseis, Bates, flower large, colour and striping fine and bold; a very good variety.

COUNTRY SHOWS.

Royal Horticultural Society of Cornwall, July 12.—This exhibition was held in the School-room at Redruth, where the following prizes were awarded:—Best Collection of Fruit: White Heart Cherry, Knight's Early Black, May Duke, Red Antwerp Raspberry, Yellow ditto, Yellow Globe Gooseberry, Crown Bob ditto, White Crystal Currant, Naples Black do., Knight's New Red do., White Dutch Currant, Oslin Apple, Early Red Margaret, Old prime Strawberry, Grove End ditto, American ditto, Lemons, Gaultheria Shallon, White Ischia Fig, White Frontignan, and Black Hambro Grapes, the *Silver Medal,* Sir C. Lemon, Bart., M.P. Pine Apple: 1, J. C. Campbell, Esq.; 2, J. Vivian, Esq. Grapes: G. C. Fox, Esq. *Best Bunch,* G. C. Fox, Esq.; 2, J. C. Campbell, Esq. Melon: G. C. Fox, Esq.; 2, J. C. Campbell, Esq. Cherries: Mrs. Sampson. Gooseberries: G. C. Fox, Esq.; 2, Mrs. Sampson. *Yellow,* Mr. J. Bishop, jun. *Green or White,* Mrs. Sampson. *Red,* J. Vivian, Esq. Currants: *White,* G. C. Fox, Esq. *Red,* Sir C. Lemon, Bart., M.P. *Black,* J. Vivian, Esq. Raspberries: *White,* G. C. Fox, Esq. *Red,* Mrs. Sampson. Strawberries: Mr. J. Bishop, jun.; 2, Sir C. Lemon, Bart., M.P. Exotic Fruit: G. C. Fox, Esq. Extra.—Pine, G. C. Fox, Esq. Apples, Mr. S. Hodge. Raspberries, Sir C. Lemon, Bart., M.P. Stove Plants: Aérides cornutum, Oncidium papilio, Trichopilia tortilis, Coryanthes speciosa, Hartwegia purpurea, Bifrenaria aurantiaca, Sir C. Lemon, Bart., M.P.; 2, Oncidium Lanceanum, O. bifolium, Rondeletia speciosa, Oncidium Loddigesii, O. flexuosum, O. papilio, J. P. Magor, Esq. *Best specimen,* Stephanotis floribundus, S. Davey, Esq. Greenhouse Plants: J. P. Magor, Esp. *Six ditto,* S. Davey, Esq.; 2, G. C. Fox, Esq. *Best specimen,* J. P. Magor, Esq. The most Ornamental Plant in Flower, *introduced in* 1841, Oncidium sphacelatum, Sir C. Lemon, Bart., M.P. Best Miscellaneous Collection of Ornamental Plants, J. P. Magor, Esq. Pelargoniums: Comte de Paris, Maid of Sarragossa, Bridesmaid, King John, Enchantress, Rose of Oxton, S. Davey, Esq.; 2, Queen of Devon, Nymph, Forster's Beauty, Enchantress, Conservative, Acme of Perfection, G. C. Fox, Esq. Collection of Cut Flowers, J. P. Magor, Esq. Fuchsias: Youelli, Chandleri, Moneypenii, insignis, arborea nova, Batesii, W. M. Tweedy, Esq. Salpiglossis: J. P. Magor, Esq. Pentstemons: gentianoides coccineus, latifólius, gentianoides, speciosus, barbatus, J. P. Magor, Esq. Heartsease (Dido, Lady Fuller, Grand Duke of Russia, Alice, Imogene, Miss Templar, Callum Beg, Miss Belfield, Brown's Zoe, Gypsey King, Amelius, Brown's Beauty, Mrs. Vyse, Jewess, alba perfecta, Lady Middleton, Flora superba, Miss Hoare, Lady Campbell, Mulberry superb, Vitruvius, Wonder, Euphrosyne, Natolia, Black Knight, Souter Johnny, Chameleon, Charles XII., Harriet, Captivation, Louisa, Sir C. Lemon, Bart., M.P.; 2, Duke of Wellington, Eclipse, Grand Duke of Russia, Widnall's Victoria, Sir H. Davy, Miss Molesworth, Windsor Castle, Hope, Tippoo Saib, Joan of Arc, Homer, Westminster Abbey, Seedling, Mulberry, Perfection, &c., &c., W. J. Rawlings, Esq. Best Collection of Tender Annuals, G. C. Fox, Esq.; 2, J. P. Magor, Esq. Hardy Annuals, J. P. Magor, Esq. Perennials, Sir C. Lemon, Bart. Roses, Sir C. Lemon, Bart.; 2, G. C. Fox, Esq. Collection of Roses, G. C. Fox, Esq. Carnations, Jolly Dragoon, Strong's King, Lady Rowley, Lady Noel, Lancashire Lass, Ely's Lovely Ann, W. J. Rawlings, Esq. Carnations or Picotees, Strong's King, Invincible, Lancashire Lass, Achilles, Lady Noel, Durham, Georgiana, Willmer's Maria, Madame Maria, Duke of Bedford, William the Fourth, Lady Rowley, W. J. Rawlings, Esq. Stocks, Mrs. Warren. Best Collection of Mimulus, Mrs. Warren. Balsams, J. P. Magor, Esq. Extra.—Miscellaneous Collection of Ornamental Plants, S. Davey, Esq. Stove Plant, Oncidium sphacelatum, do. Hedychium flavum, Sir C. Lemon, Bart. Peas: J. Vivian, Esq.; 2, Sir C. Lemon, Bart. Kidney Beans, Mr. S. Treseder. Cauliflowers, J. P. Magor, Esq.; 2, S. Davey, Esq. Lettuces, Mr. J. Treseder. Artichokes, Sir C. Lemon, Bart. Cucumbers, Mr. J. Treseder; 2, J. Vivian, Esq. Carrots, Mr. S. Treseder. Extra—*Potatoes,* Mr. S. Hodge; *Cucumbers,* W. Daubuz, Esq.; *Carrots,* Mr. J. Treseder; *Turnips,* Mr. S. Hodge; *Potato Onions,* J. C. Campbell, Esq. Market Gardeners' Prizes: *Best Basket of Vegetables,* Mr. S. Treseder; 2, Mr. J. Treseder; 3, Mr. J. Bishop, jun. Numerous Cottagers' Prizes were likewise distributed.—*Cornwall Advertiser.*

Kenilworth Horticultural Society, July 7.—At the second exhibition the productions in general were good: and, although the weather was unfavourable, the attendance was numerous, and highly respectable. The following is a list of the prizes:—Greenhouse Plants: 1, Mr. Baddeley; 2, Miss Ryley. Pelargoniums: 1, Mr. Sutton; 2, Mr. W. Robins. Verbenas; 1, Mr. Baddeley; 2, Mr. Sutton. Pinks: 1 and 2, Mr. Baddeley. Roses: 1, Mr. J. Bursell; 2, Mr. L. Heynes. Annuals: 1, Mr. W. Randle. Cut Flowers: 1, Mr. Sutton: 2, Rev. Mr. Twisleton. Device in Flowers: 1, Mr. Sutton: 2, Mr. C. Robins. Pansies: 1 and 2, Mr. W. Robins. Cabbages: 1. Mr. H. Draper: 2, Mr. W. Sutton. Cucumbers: Mrs. Parr. Cauliflowers: 1, Mr. Banbury; 2, Mr. H. Draper. Peas: 1, Mr. Dickson; 2, Mr. Sutton; 3, Mr. Freeman. Beans: 1, Mr. R. Draper. Salad: Mrs. Parr. Lettuces: 1, Mr. Freeman; 2, Mr. Sutton. Potatoes, 1 and 2, Mrs. Amherst. Onions: 1, Mr. Evans: 2, Mr. Penn. Carrots, Mr. Penn. Turnips, 1, Mr. Sutton. Strawberries: 1, Mr. Penn; 2, Mr. W. Randle; 3, Mr. Sutton. Cherries: 1, Mr. Baddeley; 2, T. Cotton, Esq. Gooseberries: 1, Mr. Evans: 2, Mr. Sutton. Currants, 1 and 2, Mr. Sutton. Raspberries: 1, Rev. Mr. Twisleton; 2, Mr. Penn. Wild Flowers: 1, Mr. C. Robins; 2, Mr. Benbow. Extra Prizes: Basket of Flowers: 1, Miss Ryley; 2, Mr. Sutton. Fuchsia Fulgens: Mr. Baddeley. Annuals: Mr. Sutton. Various Cottagers' Prizes were also awarded. —*Royal Leamington Spa Chronicle.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Hydrotæ'nia Meleagris. Spotted Waterband. (*Greenhouse Bulb.*) Iridáceæ. Monadélphia Triándria.—The appearance of this plant is by no means attractive; but the interior of the flower when carefully examined will be found to exhibit beauties of no common order. The curious watery band, which glitters as if covered with dew, or as if constructed out of broken rock crystal, is one of the most curious objects known. The stigmata too are extremely remarkable: each divides into two arms, which are rolled up as if forming a gutter, with a dense mass of bright papillæ at the end, and a single tooth on the inner edge: between the arms stands a short mucro, which is free from glands, and forms a minute horn. It is by the union of three such stigmata that the nine lobes of the style are produced. Hydrotæ'nia is a greenhouse bulb, of which the cultivation is extremely simple. The pots in which it is kept ought to receive no water after the leaves have withered in autumn, until they begin to grow again in spring. A dry shelf in the greenhouse is an excellent place to keep it during the winter. When it commences its growth, it ought then to be placed in a light situation, and to be watered gently at first, and then freely afterwards, when it will soon form its leaves and flowers. It succeeds perfectly in equal parts of loam, leaf-mould, and sand, and is multiplied by offsets, or seeds.—*Bot. Reg.*

Tropæ'olum edule. Edible-rooted Indian Cress. (*Greenhouse Climber.*) Balsamináceæ. Octándria Monogynia.—This is a strong-growing species, varying, like T. tricolorum in this respect, according as its treatment is more or less favourable. The flowers (that is, the exterior of the calyx) have a deep greenish hue while in bud, and when opened, the petals are of a showy and bright orange colour. If the tubers are not duly covered with soil, or the pot in which they are grown be too small, or an insufficiency of water be supplied, the plant is very apt to die off in dry weather, before having opened its flowers. In training it, besides using a flat trellis, the shoots should be arranged closely, or the poverty of the leaves will be too obvious, and the flowers will be too much scattered. To ensure denseness, it is better to avoid high trellises, and only to employ those which the strength of the specimen renders it probable that it will thoroughly cover.

MISCELLANEOUS.

The Sinhara, and Nymphæa Lotus.—The Sinhara or water nut forms one of the principal articles of the food of the common people. It grows abundantly in the different lakes in the vicinity of the capital, and especially in the Uular lake, which yields an average return of 96 to 120 ass loads a-year. It is fished up from the bottom of the river in small nets, and affords employment to the fishermen for several months. It constitutes almost the only food of at least 30,000 persons for five months in the year. After being extracted from the shell, the nuts are eaten raw, boiled, roasted, fried or dressed in various ways, after being reduced to flour. The most common preparation is boiling one ser of the flour with two quarts of water, so as to form a sort of gruel, which, though insipid, is nutritive. Another article of food derived from the lakes is the stem of the Nymphæa Lotus. In the autumn, after the plate of the leaf has begun to decay, this has acquired maturity, and being boiled till tender, furnishes a wholesome and nutritious article, which supports, perhaps, 5000 persons in the city for nearly eight months.—*Moorcroft's Travels,* vol. ii., p. 136.—[The Sinhara is the Trapa biopinosa, very nearly the same as the Water Chesnut, Trapa natans of the French.]

Grafting.—Dr. Edmonson's place is under the charge of Mr. Feast, jun., a young man of much taste and considerable practical knowledge, united with a great love for plants. We here saw grafting in all its varieties; Echinocáctus Eyrièsii grafted upon the ends of the pendulous stems of Cèreus flagellifòrmis! having a singular appearance. Cèreus triangulàris and several of the Opuntias are used for stocks; and, in some instances, several kinds are grafted on one plant. All the weaker growing sorts are cultivated altogether by grafting, and they bloom more abundantly, and with finer flowers. Cèreus serpentìnus, upwards of 10 ft. high, was full of buds. A novel experiment had been tried in grafting the wax plant (Hoya carnosa) upon the stapelia, and the scions had commenced growing. How it will continue to flourish remains to be seen.—*Hovey's Magazine.*

On the Cultivation of Antholyza æthiópica.—(By A. Saul; extracted from "Hovey's Magazine.")—On looking over your review of the American edition of Lindley's "Theory of Horticulture," in the chapter on Temperature, in referring to its influence on the successful growth of what are technically called Cape bulbs, you arrive at the conclusion that Antholyza æthiópica, which you have never seen bloom, and consequently rejected as worthless, might be made to bloom by the application of an extraordinary high temperature to its culture. Antholyza æthiópica is an old acquaintance of mine, and I have never seen or found any difficulty in blooming it, treated precisely the same as I'xia Babiàna, and that class of Cape bulbs, which is directly opposite to the above suggestions. Among other bulbs, same two or three years ago, were some of Antholyza æthiópica in pots. In the month of September of that year, I shook them out of their pots, &c., where they had apparently stood several years, and I repotted them in some fresh compost, of equal proportions of peat and loam, with an eighth of white sand (more or less peat and sand, in proportion to the texture of the loam); they were then placed in a cold frame, with other things of their class, with the lights off day and night at first; and as they began to grow, and the nights got colder, shut up at night, and always, from a superabundance of wet, watered only as they required it. In this situation they were kept as late in the fall as possible, protected by mats from frosts at night, until the season began to have a wintry aspect, when they were removed into a cool part of the greenhouse, where they had plenty of light and air. In this way we have had, in the month of March, for the last two years, Antholyza æthiópica flower very freely. Although not the most splendid genus of the order, it is really very curious and handsome: we have also had several species of I'xias, Sparáxis, Gladíolus, Watsónia, &c., bloom splendidly, treated in the above manner. When done flowering, and as soon as the grass or leaves begin to decay, they are placed on shelves, or any other convenient place, to be kept in their arid state until September, when they should again be annually repotted. Treated in the above manner, I have never known any of the Cape bulbs to fail blooming, and I believe the Irídeæ include all which are technically called Cape bulbs. I do not wish to be understood as claiming any originality in my system of treatment, being nothing more than I have seen practised successfully for many years, and, consequently, well known to most practical and all scientific gardeners. But being anxious my old acquaintance, Antholyza æthiópica, should not be rejected as worthless, and fearful lest some inexperienced amateur, who may perchance get a few Cape bulbs, may be induced to experimentalize on high temperature, &c., in their treatment, I was induced to forward for your consideration the above remarks.

Remedy for the Turnip Fly and Grub.—Mr. Holcombe, of Ilford, in a letter to the *Mark Lane Express,* states, that having found gas lime to be a dangerous article to use upon young Turnips, on account of its great causticity, he made use of some of the black top-dressing, formed by the patent process of heating retorts with chalk, gas-tar, and oil mixed with the soot, the produce thereof; and he had found it a much more safe and effective preventive against the fly, and an excellent manure also. It was tried upon the worst part of a field of Wheat, which is now one-fifth better than any other in every respect, being put on at the rate of about twenty-four bushels to the acre, sowed broadcast.

Sale of Orchidaceæ.—There has this week been a sale by auction, in the rooms of Messrs. Stevens, of a large quantity of fine Orchidaceous plants, in excellent order, just received from Guatemala. There was a good deal of competition among the buyers, and a considerable sum was realised by the importers. The following were the prices given for some of the lots:—For an unknown species of Chysis from the Oratorio, 3*l*. 5*s*.; for a large mass of Lælia superbiens, 10*l*. 10*s*. Four fine specimens of Odontoglossum grande were sold for 3*l*. 10*s*., and six plants of the same for 4*l*. Oncidium Cavendishianum, with several smaller ones, supposed to be O. bicallosum, for 3*l*.; and a Cycnoches, probably Egertonianum, for 4*l*. 15*s*. Three large masses of Cattleya Skinneri realised respectively 13*l*. 10*s*., 13*l*., and 8*l*. 5*s*.; an immense mass of Maxillaria cruenta, 10*l*.; while the principal object of attraction, namely Barkeria spectabilis, produced 26*l*. 5*s*. Some very small specimens of the latter were bought for 3*l*. 3*s*., and two large clusters of Epidendrum Stamfordianum severally for 4*l*. 15*s*. and 5*l*. 15*s*. A good plant of Epidendrum macrochilum roseum produced 6*l*. 10*s*., and a mass of Lælia acuminata or rubescens, 3*l*. 15*s*. There were besides several remarkably fine specimens of Lælia superbiens, which sold for 9*l*., 7*l*. 5*s*., 7*l*., and 5*l*. The total proceeds of the sale amounted to upwards of 550*l*.

Cheap Fruit.—It is a fact not generally known, that at the commencement of the fruit season, 2,000 baskets of Cherries were imported from France into this country, each basket weighing six pounds. The consequence was that the English growers were under the necessity of submitting, at the outset of the Cherry season, to a very low price for this article. The effect, however, of this early importation was principally felt in the south of England, where the supply of home-grown Cherries had proved unexpectedly abundant; and of this abundance the people of Yorkshire are now largely partaking. A fortnight ago 420 baskets of Cherries, each 48lbs. weight, arrived at the Leeds market, per railway, from Kent. This arrival reduced the price at Leeds one penny per pound; but its effect upon the wholesale dealers was somewhat serious, it being their custom to purchase from the growers in this neighbourhood, whose practice it is to arrive at the market very early, and dispose of their fruit to the dealers before the regular market business begins. This large importation of Cherries from Kent being unknown to them until after their usual purchases had been made, they of necessity had to submit to a considerable reduction on what would otherwise have been the market price. We understand that the low price of Cherries in this neighbourhood is not so much owing to importations from abroad as to the abundance of this article in the south—an abundance which has for many years existed, but which, prior to the opening of the railways, could not be participated in by the Yorkshire people, in consequence of the serious injury which fruit sustained in the unsteady mode of transport by stage-coach, or the protracted journey of the carrier's waggon, or the fly-boat and steam-vessel. In Kent Cherries are said to be so plentiful now, that had there not been a ready outlet to this and the neighbouring districts by railway, the greater part of them must have been thrown away. Large imports of red Currants from France have already arrived in the metropolis and many of the provincial towns, and they are generally preferred to the home-grown fruit. Apples and Pears also are now being brought in from Hamburg and Rotterdam, and abundant supplies are expected during the season. Indeed so extensive has the foreign fruit trade become, that we have heard several persons in this neighbourhood are about to take up their residence in France and Hamburg during the summer, for the express purpose of purchasing fruit to forward to England.—*Leeds Mercury.*

GARDEN MEMORANDA.

S. Rucker, Esq.'s, West Hill, Wandsworth.—At few places are exotic Orchidaceous plants grown in such perfection as at this; the bright green of their foliage, and the immense size of many of the specimens, bearing testimony to the judicious treatment they receive. Among the most conspicuous were three plants of the fragrant Aérides odoratum; the largest of these has no fewer than 62 spikes of beautiful pink and white flowers fully expanded, which being all brought forward so as to form one principal front, present a charming and gorgeous display. Miltonia spectabilis is also producing its showy blossoms of white and purple in uncommon profusion, one specimen having thrown up 17 flower-stems, upon many of which a second blossom is already making its appearance. A specimen of Vanda Roxburghii, with yellowish sepals and petals mottled with brown, and a light purple labellum is eminently handsome; nor is Oncidium Lanceanum far behind it in the striking contrast of colours which it presents. A fine plant of Phaius albus is flowering in dense heads of pure white, delicately streaked with purple; and Epidendrum floribundum is expanding countless numbers of its small green-and-white flowers. Maxillária tetragona had entirely concealed the surface of the pot in which it grew with clusters of its green-and-purple cups. A strong growing plant of Aérides quinquevplnera, which, we believe, has seldom bloomed in this country, is throwing out fine flower-spikes. We likewise noticed amongst several species of Stanhopea a peculiarly pale variety of St. Wardii, with scarcely any spots upon it; Aérides affine, with racemes of light purple flowers spotted with a darker colour; Sarcanthus rostratus, orange and brown, with a lilac spur, bearing considerable resemblance to a winged insect; Cycnoches chlorochilum, with immense green flowers; Maxillária macrophylla, with petals of dark brown and a white labellum; and Brássia verrucosa, with its singular strap-like perianth and warted labellum. Many varieties of Cirrhæa are blooming profusely; their long slender racemes of spotted flowers hanging around the pots, and appearing like so many insects. A large plant of Stephanotis follicularis is trained over the roof of the Orchidaceous-house, and is covered with multitudes of its white sweet-scented blossoms. The curious Nepenthes distillatoria has likewise produced a fine spike of flowers. In the greenhouse we observed a large plant of Lilium lancifólium coming into bloom, and good specimens of Erica Aitoniana, Mássoni, Fuchsia Monypennii, and various others.—*R. A., July 17.*

Mrs. Bunbury's, West Hill, Wandsworth.—At the residence of this lady is a noble specimen of the Agave Americána, upwards of 100 years old, which will shortly be in blossom. The flower-stem is already 16ft. in height, and upwards of 10in. in diameter at the base.—*R. A., July 17.*

Reviews.

The Acacia Tree; its Growth, Qualities, and Uses, with Observations on Planting, Manuring, and Pruning. By Wm. Withers. 8vo. Longman.

It is now about two centuries and a half since the false Acacia was introduced into Europe from the United States. During that time it has been generally dispersed through Europe; many books have been written about it, the qualities of its timber and its applicability to useful purposes have been highly extolled over and over again, and millions of plants have been raised from seeds, of which thousands scarcely remain. Why is this? It is asserted upon unquestionable authority, that its wood is more durable than any of our timber, and experiments appear to show that it is stronger than oak. We all know that it grows with extraordinary rapidity; there is even a case upon record of a shoot having grown 20 ft. long in a single season; and yet it is little planted. Why, again, is this? We have looked in vain through Mr. Withers's book for *his* answer to these questions. His great experience as a planter, and his thorough acquaintance with the subject, must have furnished him with ample information; and we confess our disappointment that he should not have given it. Instead of this, he has preferred treating the subject like a cause in a court of law, placing himself on the barristers' bench, and submitting to the public, as to a jury, the evidence he has collected from others. In this way a great mass of valuable information has been brought together, and we trust the world will appreciate it.

The matter relating to the Acacia, contained in Mr. Withers's book, consists of translations from foreign works, extracts from English books, and communications from his correspondents, stating their experience in its cultivation, or qualities, or rate of growth. The conclusions to be drawn from these materials is no doubt in favour of the good qualities of the Acacia; but as we have already observed, there is nothing to explain the singular fact, that with all its excellence, and notwithstanding the millions that have been raised, it is still a comparatively uncommon tree even in such a planting country as England. We believe the true state of the case to be this; the quality of the timber is first-rate, but its sap-wood perishes as fast as other wood, and therefore it is only the mature timber that can be employed. The rate of growth is great when young, and considerable always under favourable circumstances, but its branches are brittle and so apt to be broken by wind, especially when young, that large trees can hardly be raised except in sheltered situations. It does not live long in heavy land, or ill-drained soil of any kind; on the contrary, in such situations it is apt to rot at the heart and to become mossy, scrubby, and unsightly. Finally, when young, it is liable to be destroyed by game, which are very fond of it.

These, especially its brittleness, seem causes quite sufficient to explain the scarcity of the Acacia tree even here, and we fear will always operate against it. We say we fear, because it is really a matter of regret that planters should not more avail themselves of such a tree in those situations, of which there are many, in which no obstacle exists to its success. Let us hope that the materials so industriously collected by Mr. Withers will restore it to favour.

In works of this kind, whose whole aim is usefulness, it is perhaps unnecessary to dwell upon trifling inaccuracies, where they do not affect the main object of the author. We would, however, recommend, that in a future edition, the errors of Neuchateau, and a writer in the Penny Cyclopædia, who confound different plants with the Locust-tree, because of a similarity of name, should be corrected. M. Neuchateau, for instance, states, that he never drank anything to be compared with a liqueur distilled from the flowers in St. Domingo; but the Locust-tree of the West Indies is Hymenæa Courbaril, and the Robinia Pseudacacia, our Locust-tree, is unknown there. Our plant is also spoken of by the same author as being Chinese—another mistake, for which we are unable to account.

The second part of Mr. Withers' book contains an essay on planting and the management of trees, by an author unknown; and a most useful treatise on forest pruning, by the late Mr. Sandys, who for so many years had the management of the late Lord Leicester's woods, and who was certainly one of the most sensible as well as experienced men of the present century. To the latter is added a short commentary by the Duke of Portland. Mr. Withers' former works on the subject of planting are so full of sound information, and so very valuable to those who have the management of plantations, that everything upon that subject, published under his sanction, is most welcome. Our space, however, forbids our commenting at present upon this portion of his work, to which we must return at an early opportunity.

CALENDAR OF OPERATIONS *for the ensuing week.*

If some amateur of gardening, who possessed sufficient knowledge of entomology, were to devote his leisure hours to the investigation of the habits of some of the many insects injurious to cultivated plants, with a view to the discovery of a certain method of destroying them, he would confer a most important benefit on gardening and gardeners; for, unfortunately, many of the nostrums recommended as infallible, have, upon trial, proved utterly useless. Among all the plans proposed for the extirpation of the Red Spider, with the exception of water in some form, which cannot be applied in every case, not one seems to answer the desired end when the insect has established itself. Bruised Laurel-leaves were said, first by a writer in the "Gardeners' Magazine," and more recently in this publication, to be certain death to the Red-spider in Melon-frames; but a trial, conducted precisely as directed in the "Gardeners' Magazine," completely failed in destroying the insects. Some gardeners likewise deny, and apparently with reason, the efficacy of heated sulphur for the same purpose. There is no doubt that the effect of a remedy depends very much upon the manner of its application, and also upon other conditions, such as weather favourable or adverse to the propagation of the insects. We have known Plum and Cherry Trees freed from aphides by two or three successive washings with soapsuds, but this season that liquid is no greater check to them than pure water. Manufactured tobacco, either in the form of powder, or of a strong liquid, readily destroys every species of aphis; but upon a large scale this remedy would be an expensive one. Home-grown tobacco, being much less powerful, does not seem to be of great use for this purpose, when applied as a liquid. Gas-water has also been extolled. By way of preventing club in a garden extremely liable to that disease, the roots of some young Cauliflower-plants were puddled in a mixture of that liquid with mud from a cesspool; the effect of which was to kill all the young fibres in a very short time, reducing the plants to mere rootless cuttings; and yet maggots (apparently not the species which causes the club,) were found greedily feeding upon the stump. Some shoots of a Cherry-tree were also dipped into unadulterated gas-water, without in any degree discommoding the aphides with which they were covered. Perhaps the narration of these failures might induce some persons, who have leisure, to try the effect of other nauseous or deleterious substances upon insects, and report the result.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Next month is the time generally preferred for the re-potting of Pine plants, but any that have filled the pots with roots ought to be shifted immediately, rather than run the risk of throwing them into fruit by restricting their growth at a season of the year when it is generally most free. As such plants will not be shifted again till next spring, they should be deeply potted in pots larger than ordinary, which, if not quite filled with soil at present, will give room for a top dressing when the bark-bed is made up for winter. Keep the plants near the glass, and guard especially against too much bottom-heat. While warm and bright weather prevails there need be no fear of maintaining too great a degree of humidity in the house.

Vinery.—Keep the late Vines free from lateral shoots, and thin any bunches which, as the berries swell, are found too thick. Look over ripe fruit occasionally, for the purpose of removing decayed berries, but do not handle or rub the bunches; be particular also to keep them free from dust or dirt.

Peach-house.—The fruit in the late houses will now be swelling rapidly, and must therefore be liberally supplied with water. In case there is little or no rain, give the outside border an efficient watering, and then loosen the surface, to prevent the ground from drying quickly. All the air possible ought now to be given, leaving the sashes partly open on fine nights.

Fig-house.—Although advisable to withhold water as far as possible when Figs are ripe, the loss of a second crop should by no means be risked for the sake of a few ripe fruit; such ought, therefore, to be made a secondary consideration, and water be freely given at the roots of the trees, when required, on account of the advancing crop. Leave air at the house all night.

Cucumbers and Melons.—Give air to the frames betimes in the morning, if the leaves of the plants are damp from the previous evening's sprinkling. In hot weather these plants require more water than is generally given to them. Regulate the young shoots of advancing plants, and impregnate the earliest fertile flowers of Melons, which by their demand upon the plants for sap will check any tendency to over luxuriance. If canker appears on the stems of the plants, cover the affected part with powdered quick-lime, which must be changed daily.

Out-door Department.

Artichokes.—Do not let any heads remain uncut till they get old, to uselessly draw upon the plants and diminish their future produce.

Broccoli.—Should dry weather continue, let the youngest plants be regularly watered. Earth-up those of larger growth as they advance.

Cabbages.—If not already done, sow for spring use. This sowing is intended to furnish the principal early supply, but a secondary sowing is to be made in the first week of August.

Cauliflowers.—Thin those which may have been sown in rows with the intention of obtaining some very late heads, leaving one plant only in a place.

Celery.—Earth-up the early, and water the late crops, as required.

Endive.—Plant from the successional sowings as they become large enough for removal, selecting the driest ground for the plants which are intended to stand all the winter.

Hamburgh Parsley.—This being cultivated only for the fleshy roots, the plants should be thinned to about 9in. apart.

Lettuce.—Keep up a plentiful supply by planting various sorts between the rows of late Celery.

Radishes.—Sow for succession, with all other small salading that may be required. The Spanish kinds may now be sown for winter use.

Salsafy.—If the first sowing of this, or of Scorzonera, is inclined to throw up flower-stems, they should be continually broken off.

Vegetable Marrows.—Make the long shoots fast to the ground with pegs, that the wind may not blow them about.

Orchard.—Use the engine as often as practicable upon wall-trees; where this has been omitted, it will be found that Red-spider has made disagreeable progress. If late Cherries are desired, they might be preserved a considerable time upon a north wall, by protecting them as far as possible from wet; for which purpose a temporary coping might be constructed, and the trees triply covered with netting, or with single coarse canvass. Make young plantations of Scarlet Strawberries, and increase all new and valuable varieties. Gooseberries and Currants against walls must be protected by nets or mats; some trees of the Warrington (which is, perhaps, the best for late keeping) in the quarters, should also be covered with mats.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Keep the house as cool as possible during the day, while the weather continues so warm. The Red-spider is very apt to increase at this season, and must be watched and kept under by every available means. If any single plant in a pot is infested, it had better be removed from the rest, and dusted over with the flour of sulphur. Continue to propagate all desirable plants, from which good cuttings can be obtained.

Greenhouse and Conservatory.—When the leaves of Amaryllidaceous plants begin to assume a yellow colour, water should be withheld; and when quite withered, the pots may be set aside out of the way, till the time comes for arranging them in winter quarters. Plants in the open air should receive the same attention as though they were in the house in regard to cleaning, tying, stopping, potting, and watering. If it is found that worms have made their way into the pots, use lime-water once or twice, and observe particularly that the drainage is in an efficient state.

Pits and Frames.—Continue the propagation of all desirable plants, and pot off rooted cuttings as soon as they are fit. The young shoots of many Heaths, and other hard-wooded plants, will now strike freely. Balsams, Globe Amaranths, &c., for blooming late, must not be cramped for pot-room. Liquid manure given occasionally will increase the vigour of such plants.

Out-door Department.

As the foliage decays, take up all bulbs and tubers which require a period of absolute rest. Crocuses, Narcissi, Fritillarias, Snowdrops, and other perfectly hardy kinds, may be taken up, separated, and replanted immediately, retaining some of the strongest roots for blooming in pots. Any extra plants of Pelargoniums might be turned out into the borders, where they will probably make a new growth and bloom again late in autumn.

Cut off all plants whose beauty is past, and let nothing remain that is unsightly.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Frequently stir the surface between the rows of young trees, which will not only keep down weeds, but also prevent the ground from baking and cracking. Cuttings of Evergreens, and late-planted young stuff, must be regularly attended to in watering. Continue to bud Rhododendrons, Pavias, Rose Acacias, and other shrubs.

Forest and Coppice Woods.—We again strongly recommend the summer pruning of young plantations, which ought to be done immediately, if intended.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending July 21, 1842, as observed at the Horticultural Garden, Chiswick.

July		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	15	30.388	30.252	74	45	60.0	N.E.	
Saturday	16	30.175	30.008	75	55	65.0	E.

The highest temperature during the above period occurred on the 28th, in 1835—thermometer 91°; and the lowest on the 27th, in 1829—thermometer 42°.

REPORT ON COVENT GARDEN MARKET,

For the week ending July 22, 1842.

The market has been well supplied with fruit and vegetables during the past week, but trade has not been quite so brisk as during the few previous weeks. *Fruit.*—Pines have been plentiful, and of good quality; their price remains unchanged. Black Hambro' Grapes have settled to 1*s*. 6*d*. and 4*s*. per lb., and the Muscats to 4*s*. and 6*s*. Peaches and Nectarines continue good at last week's prices. A few Apricots are offered from 1*s*. 6*d*. to 4*s*. per dozen. Plums have also made their appearance; the dessert fruit fetching from 1*s*. to 1*s*. 6*d*. per punnet. Good Strawberries are rather scarce, and the best fruit is selling at 3*s*. per gallon. There is still a good supply of the inferior sorts of Cherries, but the best dessert fruit has now become less plentiful. The quantity of Currants offered is great, but the prices remain the same as quoted last week. Ripe Gooseberries are considerably cheaper, and may be obtained from 1*s*. 6*d*. to 3*s*. per half sieve. Raspberries do not vary in price, but still continue small. There is an abundance of Apples, principally Red June eatings, Keswick Codlings, and Hawthorndens, varying from 2*s*. to 4*s*. per bushel. Of the small and more common kinds of Pears there is also rather a large supply from 3*s*. to 5*s*. per bushel. Cucumbers are plentiful at the prices named in our last report. Walnuts are in an excellent state for pickling, from 2*s*. 6*d*. to 5*s*. per bushel. *Vegetables.*—Cauliflowers continue to be well supplied, and their quality is good. Cabbages have considerably advanced in price, and are fetching from 1*s*. 3*d*. to 2*s*. per dozen. Peas and Broad Beans are plentiful, and have varied little in price during the week. Turnips and Carrots have much improved in quality within the last few weeks. Spinach is becoming very inferior, and but a small quantity can be procured. The Potatoes offered are generally of good size and clear-skinned: the Kidneys from 3*s*. to 4*s*. 6*d*. per half-sieve, the Round ones from 2*s*. to 2*s*. 6*d*. per half-sieve. Mushrooms are remarkably scarce, and consequently fetch a high price. *Flowers.*—The display of Roses is uncommonly fine; and amongst the other cut flowers we observed Combretum purpureum, Roella ciliata, Plumbago capensis, Bignonia venusta, and a variety of Alstrœmerias, Gladioluses, and Yellow Picotees.

PRICES, Saturday, July 23, 1842.—FRUITS:—

Apples, dessert, per bush., 3*s* to 6*s*
Pears, dessert, per hf. sieve, 2*s* 6*d* to 6*s*
Pine Apple, per lb. 4*s* to 8*s*
Grapes, per pound, 1*s* 6*d* to 4*s*
— Muscats, per pound, 4*s* to 6*s*
Melons, English, each, 2*s* to 5*s*
— Dutch, 1*s* to 3*s*
Peaches, per doz. 6*s* to 20*s*
Nectarines, per doz, 6*s* to 20*s*
Apricots, per doz., 1*s* 6*d* to 4*s*
Plums, dessert, per punnet, 1*s* to 1*s* 6*d*
Strawberries, forced, per gall., 6*d* to 3*s*
Raspberries, per gall. 8*d* to 1*s*
Cherries, wall, per lb. 1*s* to 2*s*
— standard, per doz. lbs., 2*s* to 6*s*

Currants, White, per hf. sv. 3*s* to 4*s*
— Black, per hf. sv., 2*s* 6*d* to 4*s*
— Red, for wine, 3*s* to 3*s* 6*d*
— for dessert, 4*s* to 6*s*
Gooseberries, per hf. sve., 2*s* to 5*s*
Cucumbers, per doz., 1*s* to 3*s*
Oranges, per doz., 1*s* to 2*s* 6*d*
— per 100, 5*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 16*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Walnuts, green, per bush., 4*s* to 6*s*
Nuts, per bushel—
— Brazil, 20*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Cabbage, per doz. 1*s* 3*d* to 2*s*
Cauliflowers, per doz., 2*s* to 4*s*
Peas, per sieve, 2*s* 6*d* to 5*s*
— per half sieve, 1*s* 6*d* to 2*s* 6*d*
— per sack, 5*s* to 10*s*
Beans, Kidney, per hf. sv., 1*s* 6*d* to 2*s* 6*d*
— Broad, per sieve, 2*s*
Potatoes, per ton, 70*s* to 90*s*
— per cwt. 3*s* 6*d* to 6*s*
— per bushel, 2*s* to 3*s* 6*d*
— Kidney, per bushel, 3*s* to 6*s*
Artichokes, per doz., 3*s* to 4*s*
Turnips, per doz bun., 4*s* to 5*s*
Carrots, per doz. bunch, 4*s* to 6*s*
Red Beet, per dozen, 1*s* to 1*s* 6*d*
Horse Radish, per bundle, 2*s* to 5*s*

Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 9*d* to 1*s*
Onions, Green, per doz. bun. 2*s* to 4*s*
— Cooking, per doz. bch., 2*s* 6*d* to 5*s*
Chives, per bun., 3*d*
Leeks, young, per doz. bun., 4*s*
Garlic, per bunch, 4*d* to 6*d*
Shallots, per bch., 3*d* to 4*d*
Lettuce, Cabbage, p. score, 1*s* to 1*s* 6*d*
— Cos, 9*d* to 1*s* 6*d*
Celery, per bundle, (12 to 15), 1*s* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Parsley, per half sieve, 1*s* to 1*s* 6*d*
Vegetable Marrow, per doz., 9*d* to 1*s*
Mushrooms, per pottle, 2*s* 6*d* to 3*s*

Notices to Correspondents.

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d*. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5*s*. for every 25 copies required.

S. is quite right; the articles he alludes to in the "New Farmers' Journal" are copied from the *Gardeners' Chronicle*, but without acknowledgment.

A. M., Lanark.—Your plants are,—1, Juncus acutiflorus; 2, Carex recurva; 3, Sanguisorba officinalis; 4, Triglochin palustre; 5, an exceedingly minute specimen of Phleum alpinum; 6, Spiræa filipéndula.

A Young Botanist should be aware that it is impossible for us to name his plants unless he sends LEAVES UPON EACH SPECIMEN. Of a dozen sent only one has a leaf upon it. Those which we are able to determine are,—3, a Sparganium; 6, Juncus acutiflorus 8, Erythræa Centáurium; 10, Gálium verum.

V.—We can see nothing different in the colour of your Fuchsia from many more which have lately been raised. The petals are of the same colour as the sepals, and where such is the case the plants are of little value.

P. R. W.'s plants are, Jasione montana, Verónica officinalis, Avena strigosa, Mélica uniflora, Aira cœspitosa, Ervum hirsutum, and Vícia angustifólia.

A Limerick Subscriber.—The bulbs of the White Lily may be separated in the autumn after the leaves have died down; the soil best suited for them is turfy peat, with a slight admixture of loam. The following Fuchsias may be recommended:—F. formosa élegans, roseo-alba, Monypénnii, Lanei, stylosa conspícua, Riccartónia.

G. T.—Your plants are,—1, Valeriana officinalis; 2, Lythrum salicária; 3, Cuscuta epithymum; 4, Lotus major; 5, Erica tetralix; 6, Vícia cracca; 7, Centaurea scabiosa.

P. W. J.—Your Apple is the Red June-eating.

J. M.—We never take in unpaid letters or parcels.

Georgius.—The name of the American healing plant, which is stated to have the reputation of drawing with one side of its leaf, and of healing with the other side, is Valeriana sylvática.

Gulielmus.—We cannot say in what proportion Nitrate of Soda should be applied to Greenhouse-plants. The first Number of the *Gardeners' Chronicle* was published January 2d, 1841.

J. O.—We see nothing particularly handsome in your seedling Fuchsia; the flowers are of the same colour, but smaller than those of F. fulgens, with a slender tube about 3in. long.

H. A.—It is impossible to give any opinion respecting your Verbena, as the specimen sent was completely shrivelled up.

R. R.—It is customary for News-agents to charge 7*s*. per Quarter for the *Gardeners' Chronicle*, unless the subscription is paid in advance.

J. J. and a Lover of Fragaria.—For a sketch of Mills's Improved Melon-Pits, and an account of his method of treatment, we must refer you to Mr. Mills's pamphlet upon the subject; the contents of which we have no right to purloin. Pelargonium seed should be sown as soon as gathered. We do not know whether the Eliza Strawberry will force as well as the Keen's Seedling.

W. S.—Your plants are,—1, Krigia virginica; 2, Myoporum parvifólium; 3, Eleócharis cæspitosa.

Lomax.—The roots of your Wista'ria sinensis, which was turned out against a south wall three years ago, and which has not grown since, were no doubt matted together, and not having been straightened at the time of planting, they can barely sustain the plant alive. At all events it is worth while to raise the plant and see whether such is the case, as the evil must necessarily lay in the bad condition of the roots. You had better desist from stopping the shoots of your Chrysanthemums, and allow them to grow up for bloom, otherwise it will be extremely late in the season before they flower. Cuttings of Standard Roses put in now will grow this year, and will be benefitted by being removed after they have formed roots. Achimenes longiflora is a perennial, and may be propagated readily by cuttings.

A Subscriber.—The best-flavoured early Strawberry, which will ripen before Keen's Seedling, is the Roseberry. If the soil of your garden is light, and cracks in dry weather, we would recommend you to mix some stiffish loam with the natural soil before planting the Strawberries, and to keep the beds well mulched with litter or short grass during the bearing season. Amaryllis longifólia will flower in the open air, treated as an aquatic. It is the Oil of Vitriol, or Sulphuric acid, which is used to fix ammonia. It is impossible to state the proportion which is required to take away the unpleasant smell, as the quantity of ammonia varies greatly in different manures, and the strength of the vitriol is not always the same. It should be diluted with water and applied to the manure until an offensive smell is no longer perceptible. The Magnolia grandiflora, which has been planted 8 or 10 years against a south wall, and which grows luxuriantly, but does not blossom, is probably planted too deep. By severing some of the roots which penetrate perpendicularly into the ground, you will most likely bring it to flower.

ἐντομόλογος.—You cannot have a very clear idea of the value of time in London to suppose that we can sit down to name a box full of Beetles and Moths. With every wish to oblige you, this is a task we cannot undertake.

G. F. H.—The plant sent is a Mesembryanthemum; but without a flower we cannot determine the species.

J. C. L.—The Maxillária is M. rufescens.

A Young Gardener's plants are,—1, Manéttia cordifólia; 2, Lantana aculeata; 4, Bignónia capreolata; 3 is a very curious new plant, with which we are unacquainted. If you will send a better specimen, or a small plant of the latter, with an account of where it was received from, we will endeavour to learn its name.

Hibernia.—We would advise you to examine the roots of your Clianthus puniceus, and see whether the withering of the leaves is not caused by the drainage of the pot having become choked. We know of no method of clearing a pond from Duckweed, except by raking it off as fast as it appears. You will find your question concerning the treatment of Pelargoniums fully answered at p. 469 of last week's *Chronicle*. It is a bad plan to place old plants in a hotbed after potting; it is sure to draw them up weak and unsightly.

A. B.—Your plant is Coreopsis lanceolata, and may be propagated by dividing the roots in spring.

Discipulus.—The Cuttings of Roses must have been formed of wood not sufficiently ripened, or you would have succeeded better. In packing tender fruit, such as Strawberries, &c., tissue paper should always be placed between them and the cotton-wool; otherwise the cotton adheres to the fruit, and renders it unfit to be eaten.

G. W.—When the blossom-buds of Camellias have arrived at the size of peas, the plants should be removed to a somewhat cooler situation, which will prevent them from blooming before the spring. They may be kept in pits during winter, by preserving the interior of the pits dry, and by covering them with double mats during severe frost; allowing the plants plenty of air in favourable weather.

E. T.'s insect is the Cicada (Tettigonia) spumaria, *Linn.*, whose history we hope to give next week.—*R.*

W. T.'s No. 1, which was found on the *Digitalis parvifolia*, is Apis (Anthidium) manicatum, *Linn.*; vide Curt. Brit. Ent., pl. 61. No. 2 is Tenthredo (Trichiosoma) Lucorum, *Linn.*, probably, but it is too mutilated to determine the exact species. No 3 is a Leptura (Donacia), allied to Hydrochæridis, *Fab.*—*R.*

S. Y.—The red Cherry is the Red Heart; and the black is the Black Tartarian.

Facile.—Your Strawberries, judging from the leaves sent, appear to be perfectly correct.

A. A.—Your plant seems to be Abroma fastuosa. As it now is we have got only half a flower, and it is really impossible to do anything with such fragments.

M. P.—We will inquire about Prof. Henslow's report. We recommend to you the Quarterly Journal of Agriculture.

W. M.—Willing as we are to give information, it is quite impossible to sacrifice the time required to answer correspondents who send us plants for names without any evidence upon which to form an opinion. Naming rare plants is very troublesome, and takes a long time, even with the most complete information; without it, the task is more than we can undertake to execute. In your case, as well as in that of many others, this is strikingly exemplified. You send us a Clematis for a name, in the form of one flower and half a leaf, the latter crumpled as if it had been worn in the pocket; and in addition to this, you neither say whether it is a hardy or a greenhouse plant, nor where you obtained it from. Surely, in applying to us for information, it is only reasonable that an applicant should furnish us with such information as he himself possesses.

F. J. L. has a brick pit covered with glass, 8ft. long, 4 wide, 4 high at the front, and 5 at the back. It is heated by 3-inch hot-water pipes, from the boiler of a greenhouse, running round the pit, at an average height of 18 inches from the floor. He would use the pit for forcing a few greenhouse plants during winter, and for propagating in summer. His plan is to make a movable boarded floor, 2 feet from the bottom, so as to leave the pipes in a hollow chamber, and then to put some substance (other than bark) on the boards, a foot deep, to plunge the pots in. He inquires whether he can use his pit to more advantage; and if not, whether the plunging substance should be ashes or sawdust, or what else?—[We are of opinion that his plan is a good one; but he must use tubes, or openings of some kind, to connect the hollow heated chamber and the air above the plants. It matters little what the plunging substance is; sawdust will do very well, so will drift sand, and so will coal ashes if they do not contain too much sulphur.]

A Constant Reader.—We have only received one of the parcels promised. The plants sent are,—1, Clématis viticella, double flowering var.; 2, Erica tetralix; 3, Azalea viscosa; 4, Spiræa salicifolia; 5, Rhododendron hirsutum; 6, Hypéricum calycinum.

1842.—Your seedling Pansy is very inferior to the flowers of the present day; the form is not good, and the lower petals are out of proportion, being too small for the size of the flower.—You may pull the weakest shoots of your Lily of the Valley out of your bed now, in order to expose the others to the influence of the sun and air. When the plants die off in autumn, you can then thin the bed properly.—Verbenas are now very numerous; but the best and most distinct varieties are the following: Chandlérii, Melindres superba, Tweediana grandiflora, Hislopiana, ignea, Hendersonii, purpúrea, teucrioides, teucrioides purpúrea, t. cárnea, t. rósea, and incisa.—You will not be able to procure a complete set of the *Chronicle* for last year.

Southwester.—We have received no parcel or communication under this signature.

W. J. Epps.—The blossom of your seedling Pelargonium was of an unusually large size. It is usual, before cutting down these plants, to expose them to the sun and air, to harden the wood, and the plants so cut down are not disturbed till they have made fresh shoots about an inch in length, when it is proper to repot them. Excellent directions were given in the former volume of the *Chronicle* for the management of Pelargoniums, at pp. 83. 100. 181. No advantage could be obtained by planting the old root in the open border: the young rootlets must be injured when it is taken up to pot it for the winter season. Your Fuchsia is the variety known as F. Youellii.

A Friend's plants are—3, Poa fluitans; 5, Hórdeum murinum; 6, Catabrosa aquática; 7, Erióphorum vaginatum; 8, Trifólium striatum; 9, Trifólium scabrum; 10, A'rabis hirsuta; 11, A'cinos vulgaris; 12, Juncus acutiflorus.

As usual, many letters have arrived too late for answers this week.

Erratum.—In No. 29, p. 470, col. *b*, line from the bottom 5, for "We have scarcely any, nor have I seen any common Butterflies; since the end of May, &c.," read "We have scarcely any, nor have I seen any common Butterflies since the end of May and beginning of June; I have met with, &c."

NEWS OF THE WEEK.

The recent death of the Duke of Orleans continues to be the chief topic of interest in our foreign news. The French Chambers are convoked for the 26th inst., the anniversary of the first day of that revolution which placed the House of Orleans on the throne. The King will open the session in person, and Ministers will immediately introduce a Regency Bill to provide for the security of the crown in the event of his Majesty's death during the minority of his grandchild. In the beginning of the week, it was expected that the question would give rise to an active opposition; and public opinion was divided on the selection of a Regent. It was understood that the Government measure, in accordance with the feelings of the Court, would propose the appointment of the Duke of Nemours. The Opposition, on the other hand, supported the claims of the Duchess of Orleans as the mother of the heir apparent, and there was every prospect that the question would be discussed with much party warmth. M. Thiers, however, who was considered favourable to the Regency of the Duchess, has announced his intention to support the Ministry, and there seems to be little doubt that the personal wishes of the Royal family will be consulted in the choice of the Duke of Nemours. The calamity which has rendered these precautions necessary, is said to have created a sense of common danger, which has united men of different parties in support of the Constitution; and the Ministerial papers express their belief that it will tend to strengthen the Government, and consolidate the interests of the reigning dynasty. The commercial treaty between France and Belgium, which has so much excited the fears of our manufacturers, has been concluded. By this treaty, Belgium is bound to impose a duty upon English linens equal to that levied in France, and to reduce the duty on French wines to one-third of the existing tariff.—From Spain we learn, by a telegraphic despatch, that the Session of the Cortes was closed on the 16th. Gen. Zurbano arrived at Barcelona on the 4th, and has signified his intention to adopt the most rigorous measures to reduce Catalonia to obedience.—The Queen of Portugal opened the Cortes in person on the 10th; the speech alluded to the late changes in the constitution as a concession to the spontaneous expression of the national will, and adverted to the conclusion of the slave trade and commercial treaties with England. The mutual reduction of the tariff is still under consideration; the Portuguese commissioners have sent in their report, proposing a reduction of 40 per cent. on one class of British manufactures, and 20 per cent. on another; but nothing has yet been settled in regard to the reduction of the British duties on Portuguese wines.—In the Levant the affairs of Syria continue to give rise to much uneasiness, and the Turkish provinces on the Danube are in an unsettled state.—From the United States we learn that the President has put his veto on the Tariff Bill, and that a change in the cabinet is considered inevitable. Lord Ashburton's negotiations are represented as advancing favourably, and it is understood that a conventional line of boundary and the details of the proposed equivalents have been agreed on.

At home, the proceedings of Parliament have been unusually long and interesting. Sir R. Inglis has postponed his motion relative to Church Extension, on the understanding that Government will take the subject into their serious consideration during the recess, and state their intentions in the next session. The Bill for allowing Bonded Corn to be manufactured and exported in the form of Biscuit, has passed by a majority of 87. Ministers have abandoned their intention to press the Poor-law Bill at this advanced period of the session; and have announced their intention to introduce a fresh Bill during the ensuing year. In the mean time, the early clauses relating to the continuance of the commission, the appointment of assistants for special inquiries, and the management of the casual poor, have been carried; and a bill, embodying these provisions, was read a third time last night. On Thursday, Mr. T. Duncombe brought forward his motion on the distress of the country, and moved an address to her Majesty, praying that Parliament might be convened at an early period, in case the present crisis should continue; but after a long discussion, the motion was negatived by a majority of 56. Another motion on the distress of the country was brought forward last night by Mr. Gibson, and negatived by a majority of 92.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, have returned from Claremont to Buckingham Palace, and are in excellent health. The Prince and Princess of Saxe Coburg Gotha, still continue on a visit to her Majesty; during the week they have visited the British Institution, the Chinese Collection, and the Coliseum. It is rumoured that the Court will leave town for Windsor in a few days. The Gazette of Tuesday contained an order from the Lord Chamberlain for the Court to go into mourning for his late Royal Highness the Duke of Orleans. The mourning commenced on Thursday, and will last for the usual period of a fortnight, but the Queen and Prince Albert will continue in mourning for a month. The French papers announce that her Majesty and the Prince have written letters of condolence to the Royal family of France on their late affliction. The Viscountess Jocelyn has succeeded the Viscountess Canning as the Lady in Waiting on the Queen, and Viscount Sydney and Captain Hood have succeeded the Earl of Warwick and Admiral Sir Robert Otway, as the Lord and Groom in Waiting on her Majesty.

Parliamentary Movements.—It is stated that Parliament will be prorogued on the 10th or 11th of August. The Election for Buckinghamshire has terminated in the return of the Hon. W. E. Fitzmaurice, of Taplow, in the room of the late Sir W. Young, Bart.

Foreign.

FRANCE.—*The late Duke of Orleans.*—The papers are still occupied with the melancholy death of this lamented Prince. In addition to the details which we gave last week, we have gathered the following from the recent journals. The Prince Royal left the Tuileries in the carriage we have described, but it is not true, as had been reported, that the horses were frightened by the falling down upon them of a front boot, as the carriage had no boot or seat on the fore wheels. Every part of the carriage was in perfect order, having been carefully examined in the morning. The horses were not frightened, nor did they suddenly run away; but the accident is said to have arisen in the following manner. The Duke of Orleans, in returning from Paris, was accustomed to take the avenue leading from the Porte Maillot to his residence of Villiers, and from thence obtained entrance to the Park of Neuilly by the gate which is opposite to this avenue. But on Wednesday his Royal Highness wished to go by the road which crosses Sablonville obliquely to the old Neuilly road, and then enter the Park by the grand gate. Having been driven very fast, the horses, on reaching the Porte Maillot, became excited, and, in spite of all the exertions of the postilion, took the road to which they were habituated instead of the diagonal road the Prince intended to go. Finding themselves approaching their stables, the animals became still more eager, and the horse the boy rode kicked out several times, and struck the cross-bar, which, from the nature of the carriage, came rather close to his haunches. Then it was that the Duke stood up, and fancying that the postilion had lost all command of his horses, called to him. The boy replied that he still held them, and, in fact, the hand-horse was perfectly temperate, the lad firm in his seat, and pulling at the bridle. The springs of the carriage are said to have been very slight, and it is supposed that the Prince was thrown out by a sudden jerk. This opinion is confirmed by the testimony of an eye-witness, who states that he did not see the Prince throw himself out, and is still further substantiated by the report of the surgeons at the *post-mortem* examination. They state that the skull was fractured from ear to ear, and express their conviction that, as the head sustained the whole force of the fall, the Prince did not jump out, but was thrown out of the carriage by some violent shock while standing up. Although still overwhelmed in the deepest grief, the Royal Family are as well as can be expected. A Council of Ministers was held on Wednesday, at which Marshal Soult presided. It lasted from half-past twelve to two o'clock. When it broke up, the Ministers set out for Neuilly. There a fresh council was held, at which the King presided. The papers state that his Majesty, in announcing the holding of this council, lost nothing of the admirable firmness which he exhibited at the moment of the late dreadful catastrophe. "The blow is terrible," was the remark of the King, "but it ought not to shake our confidence in the future. We shall surmount every difficulty." The Queen is not less heroic in her resignation. Every incident related of the members of the Royal Family proves how cordially united they are in domestic life. The Duke de Nemours arrived on Thursday from Nancy; and on Saturday morning the Duchess of Orleans reached Neuilly from Plombières. The Prefect of the Vosges was informed by the telegraph on Wednesday, five minutes after the fatal accident, that the Prince had been thrown out of his carriage, and was in a dangerous state. At eight at night this despatch reached the Prefect, who immediately went to Plombières, and informed Gen. Bandrand, the Prince's aide-de-camp, who was with her Royal Highness. The General, with great delicacy and precaution, communicated the tidings to the Princess. She replied that she must instantly leave for Paris; and at five in the morning her Royal Highness left with her suite. She was much agitated, though she had no idea the Prince was dead. On the road between Epinal and Neufchateau, M. Barten de Veaux, the Prince's aide-de-camp, met the Duchess's carriage. When her Royal Highness saw him, her emotion could not be controlled. She said, "I understand he is dead!" From that moment she gave herself up to despair, and would receive no consolation. After passing Merécourt, they met the Duchess of Weimar and the Princess Clementine, with letters to the Duchess from the King and Queen. A most distressing interview ensued. The Duchess of Orleans had a succession of fainting fits. The unfortunate sisters went direct to Neuilly, where the Duchess again became insensible when she was embraced by the Royal parents. It was only at three in the afternoon that she came to her senses; at half-past three her children were brought to her, and she then was relieved by abundant tears. After this painful scene, her Royal Highness was introduced to the chapel in which reposed the remains of the Duke of Orleans. After having knelt and prayed, the Duchess asked that the coffin should be opened, that she might once more contemplate the remains of her husband. Her Royal Highness was then conducted to her apartments. The coffin will remain in state in the chapel at Neuilly until the 30th inst., and on the 1st and 2d of August the body will lie in state in the cathedral of Notre Dame, where the public will be admitted. On the 3d the funeral ceremony will take place, in presence of the church, civil, and military authorities; on the night of the 3d the body will be removed to Dreux; and on the 4th the final interment will take place in the family vault, in presence of the King and all the Royal Family, as it is expected that the Prince de Joinville will have returned before that time from the French squadron, now cruising off Sicily. The King and Queen of the Belgians arrived at Neuilly on Sunday. The will of the late Prince Royal has been opened. It was dated prior to the Duke's departure for the siege of Antwerp, but several codicils had been added on the eve of his Royal Highness's departures for the African campaigns, particularly his last one at the expedition of the Portes de Fer. The Duke in this will exhorts his brothers and his own family to concord, and to implicit obedience to and confidence in the will and wisdom of the King. The "Presse" says—"We can add that, in one of the clauses, the Prince, whilst giving fitting praise to the elevation of character and superiority of mind which distinguish the Princess Helena, speaks in express terms of the necessity, in case of a minority, of not entrusting the Regency except to virile hands, able to support the weight of state affairs in grave conjunctures, and to defend the independence of the institutions and liberties of the country. We believe we can state that, before it was known that such was the wish of the lamented Prince, the same opinion had been voluntarily expressed by his august widow." The King has purchased the house where the Duke died, No. 4, Chemin de la Revolte, which has been closed since the fatal day, and intends, it is said, to build a chapel on the site. Crowds hourly visit the spot. A statue of the Duke will be erected at Versailles, and a monument at Dreux, for which purpose M. Pradier took casts of the face, hands, and feet of the corpse, on Tuesday. M. de Cailleux, director of the Royal Museums, superintended this operation. The features of his Royal Highness were not at all altered by death; they still expressed his natural benign serenity. The work was entirely successful, and there is no doubt that M. Pradier will produce a perfect resemblance of the Prince, of whom there is only one truly faithful portrait, that recently finished by M. Ingres, which is deemed one of the masterpieces of that artist. Queen Christina, in the evening of Thursday, came from Malmaison to condole with the Royal Family. Her Majesty, with delicate consideration, would not enter the court-yard in her carriage, but alighted at the gates, and walked from them to the Palace in evident emotion. She was immediately received by the King and Queen. The Archbishop of Paris has issued a pastoral letter to all his clergy, directing masses to be performed in every church of his province, for the repose of the soul of the departed Duke. The same solemnity has been, or will be, ordered throughout all the dioceses of the kingdom. The Grand Rabbi of the Jews has also instituted a solemn service on the occasion in all the synagogues. All the Peers in Paris have hastened to Neuilly to inscribe their names, as coming to make inquiries of condolence after the King and Royal Family. Even some who were at great distances have travelled up expressly to perform this sad duty. The "Moniteur" of Sunday publishes long accounts from the provincial papers of the state of public feeling, as well as long lists of addresses of condolence from the army, municipal councils, &c. Marshal Soult has issued an order of the day, directing that mourning be immediately worn by the army until further orders; that crape be placed on the colours and standards; the drums be covered with black serge, crape and mufflers affixed to the trumpets; and that officers wear crape on their swords. Count Gerard has issued the same instructions to the National Guard; and the Minister of Marine has given similar orders to the navy. The Minister of the Interior has addressed a circular to the Prefects throughout France, stating that as France is in mourning for the heir to the throne, no festival can take place on the anniversary of the days of July; and that the funeral service in honour of the victims will alone be performed. In connexion with this calamitous event, it is mentioned as a remarkable historical fact that for the last two centuries, that is since the accession of Louis XIV., in 1643, no French King has transmitted his crown to his son. Louis XIV. and Louis XV. were succeeded by their grandsons, and since the death of Louis XVI. it is well known no son has succeeded his father on the throne of France. Another circumstance recorded is the fact mentioned by the daily papers that the news of the Prince's death was published nearly as early in London as in Paris, the sad occurrence appearing simultaneously in the Thursday's papers of both capitals—a proof of the rapidity with which intelligence is conveyed from one part of the world to the other.

The Regency.—The King has issued an ordinance convoking the Chambers for the 26th inst. His Majesty will open the session in person. It was said that he would be accompanied by his youthful grandchild the Count of Paris, but the report is contradicted. The Regency question will be the first object of attention, and the papers have already begun to discuss it with much party animosity. Ministers are said to have prepared a bill giving the Regency to the Duc de Nemours, and, in default, to his brothers in succession; the guardianship and tutelage of the Princes being given to the Duchess of Orleans. The general impression appears to be that the Duc de Nemours will be appointed, and that the melancholy event which has rendered the measure necessary will be the means of uniting Count Molé and M. Guizot, and thereby strengthen the Conservative party. The Opposition papers at first did not acquiesce in these views; they brought forward the claims of the Duchess of Orleans, although the Constitutional Assembly in 1791 set aside women from the Regency. The organs of M. Thiers avowedly declared their intention to support the Duchess; but the subsequent arrival of the Ex-Minister in Paris is said to have induced them to forego the threatened opposition. M. Thiers had an audience of his Majesty on Sunday, which lasted several hours; and it was announced on Tuesday that he had decided in favour of the Regency of the Duke of Nemours, and had persuaded the Opposition to follow his example. If this be confirmed, it is believed that the Duke of Nemours will be appointed without opposition. On the other hand, the Legitimists openly exult at the blow received by the Orleans dynasty. One of them, the "Gazette de France," denies the right of the Chambers to name a Regent. Another, "La France," says "that Providence having effaced the name of the Duke of Orleans from the page, has thereby shown its intention of writing the Duke of Bordeaux in lieu of it." In short, the proceedings of the Legitimists seem to have had great influence on the Liberals, who declare that after these avowals they must separate from their alliance with them. From all these facts, there is still a strong impression that a warm conflict may be expected in the Chambers, even though the Regency question may be amicably settled.

Commercial Treaties.—The treaty of commerce between Belgium and France has been concluded. Belgian linen and thread are to be still admitted into France on the existing duties, but British articles of that kind are not to be imported into Belgium except on payment of the duties set forth in the French tariff. Belgium is to reduce the duties on French wines one-third. The Navigation Act is moreover to be altered so as to give to French salt the advantage on that produced or manufactured in England.

SPAIN.—Several of the Madrid Journals have ceased to appear for some days past, in consequence of a strike among the operative printers. There is, therefore, little news from the ordinary channels; but a telegraphic despatch has reached Bayonne, announcing that the Cortes closed their session on the 16th.—The mails from Catalonia of the 11th inst. represent Felipe as having been executed, and several of the smaller chiefs taken. Gen. Zurbano arrived on the 4th, and established his head-quarters at Gerona. He writes to his military friends in Madrid in excellent spirits, talks of having issued an order amongst his officers that nothing is to be said of him in the newspapers, and of his intentions of treating the enemies of the constitution in the most constitutional manner.—Private letters advert to the extraordinary spectacle lately presented in the Congress, of the late and the present Ministers of Foreign Affairs denying the existence of any proposition on the part of England for the establishment of a treaty of commerce between the two countries, notwithstanding that facts to the contrary are well known in Madrid, and that Sir Robert Peel in Parliament had stated the fact of the harmonious progress already made in the matter. This proceeding on the part of Ministers is attributed to their desire to propitiate the contrabandistas of Catalonia and Andalusia for party purposes.

PORTUGAL.—We have Lisbon news to the 11th inst., brought by the Royal Tar steamer. The Cortes were opened by the Queen on Sunday the 10th. The Royal speech is a short one: the late changes are referred to as being a concession to the spontaneous expression of the national will. The conclusion of the slave trade and commercial treaties with England, and the arrival of the Pope's Nuncio and of the Prussian and Sardinian Ministers, were the chief topics of the speech. It was expected that after verifying the returns, and ordering writs for the elections required by the double returns, the Chambers would be further adjourned over the hottest of the summer months. The Ministry continued without change, though modifications were expected. The Queen and Court returned to Cintra after the opening of the Cortes. The Peers, when the packet left, were occupied with an interesting question relative to the right of the 30 new Peers to sit, under the terms of the Queen's convocation of the Cortes, which under one interpretation requires a deliberate ratification of the new system. The new Peers threaten, if defeated, to go down to the Chamber of Deputies, and proclaim the Upper Chamber in a state of revolt. The Portuguese Commissioners have given in their final report as to the reductions in the tariff which they propose for embodiment in the supplemental article to the commercial treaty. These are a reduction of 40 per cent. upon one class of British manufactured goods, and 20 per cent. upon another. The larger reduction is upon those goods which pass through Portugal to Spain. They did not touch the question as to the reduction of our tariff upon the importation of Portuguese wines. The British Commissioners have made little progress. Everything remains *in statu quo*, until the Duke of Palmella shall have had a conference with the Government, consequent upon which will be his proposition of mutual tariff reductions to Lord Howard de Walden.

Germany.—The King of Prussia has addressed to the Minister of Public Worship an order relating to the connexion between the English Bishop of Jerusalem and such Protestant German communities as may be formed in Palestine. He encloses a letter from the Archbishop of Canterbury, dated June 18, offering the protection of the Bishop of Jerusalem to all Prussian subjects of the Protestant religion residing under his jurisdiction. The King, after expressing his satisfaction at the proposal, declares, "I shall always be ready to lend my support to such properly qualified persons as may be anxious to go to Palestine to convert the Jews, and who can give proofs that they will faithfully adhere to the evangelic belief founded on the dogmas of the Confession of Augsburg."—A letter from Berlin, of the 11th inst., states that the King, when passing through Dantzic, on his way to St. Petersburgh, ordered a measure to be observed towards the Polish provinces of his kingdom, which forms a strong contrast to those adopted by the Emperor Nicholas with regard to the Polish nation. His Majesty ordered that in all the schools in these provinces education should be given in the Polish language, except religious instruction, which may be in Polish or German, according to the choice of the parents. He has further ordered, that no German, or other foreigner, shall be appointed a professor to any of the schools, unless he is able to speak fluently, and write correctly, the Polish language.—The Berlin papers state, that an experiment has been made on the Berlin and Potsdam railroad, as to the possibility of using the line in case of war, as the means of transporting artillery. For this purpose, a park of guns, with all their articles, and the usual number of men and horses, was placed on the common carriages of the railroad, and was transported with the greatest safety, by a single locomotive, from one town to the other in 20 minutes.—Letters from Toplitz state that the visitors to the waters are this season extremely numerous. A German paper makes the arrivals to the 1st instant, 1738. The Germans are chiefly Saxons and Prussians. There are many Russians, and some English, among whom Lord Mount Edgcumbe is mentioned.

Belgium.—The King and Queen, with their suite, arrived from Laeken on Saturday morning, at the railway station. After remaining a brief space in the reception room, where a number of persons of distinction had assembled to offer their condolence for the calamity which has visited the Royal Family of France, their Majesties proceeded by a special train to Mons, on their route for Paris. The King, dressed in a plain suit of black, and wearing no decorations, looked extremely pale. The Queen, with all the Royal suite, were also in deep mourning. The papers state that it was most affecting to mark the almost insupportable sorrow of the Queen. Her Majesty when first informed of the death of her brother, was so grievously affected that her cries were heard in many rooms of the Palace, and was scarcely able to articulate, or walk to the carriage that was to convey her to Paris. Few persons were able to restrain their feelings.

Italy.—The "Papal Calendar," published at Rome, has just appeared for the year. According to it, the Pope will complete his 77th year on the next anniversary of his birthday (Sept. 18th), in the 11th year of his papacy. There are at present 60 cardinals, at least this is the number put down for the college. There are six cardinal bishops, 43 cardinal priests, and 11 cardinal deacons. Card. Russi, the oldest cardinal, is 87, and Prince Schwartzenberg, the youngest, is 33. The ages of all the cardinals make 3,580 years, the average of which is 59 1-3.—Letters from Naples state that the import duty on books has been reduced one-half by a royal decree.—Considerable sensation has been produced at Florence by a fracas between Mr. Delamore, an English gentleman of large property, residing there with his family, and Mr. Baldwin, an American of fortune, also living lately in the same capital. Mr. Delamore and Mr. Baldwin were at one time very intimate, and were in the habit of playing together for small stakes. The former having been a winner, Mr. Baldwin urged him to play for large stakes, as high as a hundred louis a throw. After repeated trials, Mr. Delamore left off a winner of 6,000*l.* and upwards, for which Mr. Baldwin gave his bill at sight, with the understanding that he was to be allowed time to pay his losses. This occurred in April, but in May, Mr. Baldwin, in company with a Mr. Taylor, accused Mr. Delamore of playing with false cards and dice. Angry communications passed, and Mr. Delamore submitted a statement of the affair to Lord Holland, the British Minister, expressing his desire to have it investigated. The cards and dice are under seal at one of the principal banking-houses.

Greece.—Letters of the 30th ult. state that the Monarch line-of-battle ship was then at Athens, and that her officers and crew have suffered very much from sickness, caused by the marsh fever, caught at Xanthus, where the ship had been embarking the antiquities found by Mr. Fellowes. Major Meech and Lieut. Burton, both of the Royal Marines, had died from this cause, and were buried at Athens. The crew was now, however, convalescent, and only one more death was expected. The letters mention as a curious fact, that the French squadron went from Athens to Rhodes, but on meeting the English men-of-war, and finding that they had embarked the antiquities, they proceeded to Smyrna. It is asserted that the French Admiral declared that should he have found the English had abandoned the affair for the summer, he would carry the antiquities off to France.—The financial affairs of Greece are in a very unsettled state. The King had sent the Budget to the Council of State, and the Greek newspapers do not scruple to assert that it will be utterly impossible for the Government to pay the troops much longer, unless the Allied Powers come to the assistance of Greece with more money. The Budget sent to the Council of State clearly shows a deficit of a million, which will in reality, it is said, amount to three times that sum.

Russia.—The St. Petersburgh journals confirm the rumoured recall of M. Perrier, the French chargé d'affaires at the Imperial Court. It is stated that he was personally disliked by the Emperor, and that the Secretary, M. André, will carry on the business of the legation. The "Augsburg Gazette" announces that the Circassians have gained an important advantage over the Russian corps of Gen. Grabbe, who were attacked in a forest by the Lesghians, and cut to pieces. The Russians are said to have lost 1,500 men and 25 officers. The artillery, being in the rear, was saved.

Turkey and Syria.—Letters have been received from Constantinople of the 29th of June. The affairs of Bosnia and Wallachia are in a very unsettled state, and give rise to much anxiety. Fresh instructions have been sent to the Sultan's agents in Syria, to institute renewed investigation into the causes of the Maronite grievances, and, by personal interviews, to endeavour to elicit the truth. In the mean time the state of the Lebanon is said to be deplorable; and the accounts express fears that coercive measures, if adopted, may lead to revolution and civil war. The people, excited by foreign intrigue, are ripe for revolt, and are taught to expect assistance from foreign powers. In consequence of the disposition to squabble with the Turkish authorities, and the want of conciliatory language and manner on the part of our consular agents in the Ottoman empire, Sir Stratford Canning has addressed a circular to these gentlemen, reminding them of their duties, and calling upon them to use their endeavours to unite more closely, by cautious and temperate proceedings, the bond of unity that connects the Queen's and Sultan's Governments. This document has given great satisfaction to the Turkish Ministers. The Greek Patriarch died on the 24th, and Yermanos, archbishop of Therapia, long in favour with the Russian embassy, has been chosen by the Synod in his stead. He was inaugurated as Patriarch on the 28th ult., and was reminded by the Grand Vizier that he was responsible for the loyalty of ten millions of the Sultan's subjects. The abuse of the system of granting protections to the Sultan's subjects by foreign legations, especially by those of Russia and Greece, has called forth a strong remonstrance from the Porte, addressed to all the legations. Formerly this system was restricted; but latterly any Turkish subject obtaining a passport for Odessa is enabled to obtain Russian protection, and to return a Russian subject, emancipated from all allegiance to the Porte.—Lady Canning and family reached Constantinople safely, on board her Majesty's steamer Polyphemus, on the 25th ult.

Egypt.—Advices to the 26th ult. inform us, that couriers have been despatched to all the provinces, ordering the new wheat to be brought down without delay; but there is so little water in the canal, that for another month no arrivals of importance can be expected. The Pacha is about to despatch a frigate he has in the Red Sea, built some time since in Bombay, with a cargo of wheat to the Mauritius, under the superintendence of an English merchant who sails with the vessel, entrusted with the charge of opening markets in the Eastern seas for Egyptian produce. An idea seems very prevalent that the inundation this year will be very scanty; but it is too early yet to base this calculation on any correct data. Some English subjects had died of plague at Alexandria.—The contract for supplying the carriages to convey passengers across the desert has been obtained from the Peninsular Company by Mr. Andrews, of Southampton. Each carriage is to be in the form of a small omnibus, to carry four inside and two out. They will be of a very light construction, for the purpose of passing easily over the sand. Each carriage will be drawn by two Arab horses, to run seven-mile stages. Forty carriages are to be ready by the 1st September next.

United States.—The Royal mail steamer Britannia arrived on Saturday last at Liverpool. She sailed from Boston on the afternoon of the 2d, and Halifax (off which port she was delayed by fog 36 hours) on the morning of the 6th inst. The passage from the latter port occupied ten days. She has brought upwards of sixty passengers from Boston and Halifax. Among them is Mr. Cook, a special messenger from Lord Ashburton, bearing despatches for Government. We have received by this conveyance files of New York papers to the afternoon of the 1st instant inclusive, Boston to the 2d, and Halifax to the 5th. Canada papers of late dates have also been received. The President and the Congress had disagreed on the question of the revenue. As the Compromise Act would expire on the 30th of June, and as the legislation on the subject contemplated by that act had not been matured, and was not likely to be so in time to meet this contingency, a temporary bill had passed both Chambers, extending to the 1st of August the duties in force on the 1st of June, and the laws for collecting those duties. This temporary bill was called "the Little Tariff Bill," and upon it the President put his veto. As there were not two-thirds in either House to carry the bill, notwithstanding the veto, the measure is defeated. The effect of the veto would be, that the distribution of the proceeds of the public lands would take place immediately. Private letters state that it is impossible at this moment to foresee the consequences of the veto; but it is expected that the first effect will be a change in the Cabinet, and the retirement of Messrs. Webster, Spencer, and Forward, all of whom are from high-tariff states. Rumours of a projected change in the Cabinet are already current, and it is reported that Mr. Marcy, late Governor of New York, will preside over the War Department; that Mr. Webster will go to the Court of St. James's, and Mr. Everett to Paris.—The negotiations with Lord Ashburton are said to be advancing favourably to an honourable adjustment. Indeed, it was well understood among the Members of Congress that a conventional boundary line, equivalents, &c., had been agreed upon.—The State of Rhode Island had been the scene of a rebellion. The universal suffrage party had, under the command of Dorr, their irregularly elected Governor, actually taken the field. A force amounting to between 700 and 800 men, fully armed, had taken up a position near a place called Chepachet, and thrown up field-works. The Government troops and the militia, to the number of nearly 3,000, under the command of Major M'Neill, moved against the rebels. But before the attack commenced, the universal suffrage men, deserted by their leader, Dorr, broke and dispersed. Only one or two lives were lost on the side of the rebels, about 200 of whom were made prisoners. A large reward had been offered by the Governor of the state for the apprehension of Dorr, who had eluded pursuit, and, it was supposed, made his escape into Canada.—Mr. Horsley Palmer left Washington on the 28th inst. for Philadelphia, New York, and so on to Montreal. Lord Cranbourn has also left Washington, after a sojourn of a few days, for Canada, and intends being in England by the middle of September.

Canada.—The papers received by the Britannia state that the new tariff, in relation to American flour, will cause numerous mills to be erected in Canada to grind United States wheat into flour for export to England; or rather, perhaps, Canadian flour will be sent to England, and American grain ground in Canada for the consump- of the province. It is estimated that 600,000*l.* will be expended this year in Canada, in public works and improvements. Large amounts of British goods are smuggled across the Canadian lines into the United States, and sold at from 20 to 30 per cent. less than the regular importations. Many new-comers are settling on the Canada Company's Huron tract, where lands are very cheap, no money to be paid down, but 5*d.* per acre the first year, up to 21*d.* per acre, &c., in six years, until the whole shall be paid off.—The Montreal papers notice the receipt of a number of a New York work, called "The New World," containing the whole of Mr. James's last novel, entitled "Morley Ernstein," at the price of 1*s.* 10½*d.*, the publishing price in London being 1*l.* 11*s.* 6*d.* There can be no doubt of the necessity of an international copyright, when the colonies are thus supplied by the piratical booksellers of America.

Parliament.

HOUSE OF LORDS.

Saturday.—The Commons assembled to hear the Royal consent given by commission to the Protection of Her Majesty's Person Bill and several private bills.

Monday.—Lord Wharncliffe, in reply to Earl Radnor, said that the Government did not intend to bring forward any specific measure for the relief of the existing distress, which they believed to be ameliorating by that revival of trade and commerce which was following the passing of the recent measures.

The Lord Chancellor moved the second reading of three bills, which he thought might all be discussed together—the Bankruptcy Bill, the Lunacy Bill, and the County Courts Bill. By the Bankruptcy Bill it was proposed to extend the jurisdiction of the London Commissioners from 40 to 100 miles round the metropolis; by the Lunacy Bill, to establish Commissioners for the trial of cases, and to diminish the extravagant expenses at present attendant on these proceedings: and by the County Courts Bill to provide, instead of resident judges, who might be warped by their local feelings or prejudices, judges who would go their circuits like the judges of the land. The noble and learned Lord made a long statement, and entered at length on the subjects of the three bills.—Lord Cottenham expressed regret that the bills did not go far enough. He reviewed their provisions, pointing out where he thought they would prove insufficient, professing himself favourable to the entire abolition of imprisonment for debt, and contended that if in the Bankruptcy Bill the principles for which he argued were not embodied, it would be difficult to do so at a future period.—Lord Brougham concurred generally with Lord Cottenham, though he admitted that the bills were improvements so far as they went.—Lord Wynford considered that the country was deeply indebted to the Lord Chancellor for these bills.—Lord Campbell contrasted the positions of the insolvent and the bankrupt—the one with liabilities hanging over him long afterwards, and undergoing imprisonment, the other coming forth a free man after going through the court, and not necessarily liable to imprisonment. He was afraid that these bills would stand in the way of further improvement.—After a reply from the Lord Chancellor, the bills were read a second time.

Tuesday.—Lord Cottenham gave notice for next session of his intention to move for leave to bring in a bill to abolish imprisonment for debt.

A debate arose on the Irish Drainage Bill, the Earl of Glengall moving that it be referred to a select committee. This was negatived on a division; after which the House went into committee, and a somewhat long discussion followed. The bill ultimately went through committee, and after some other business the House adjourned.

Thursday.—The Earl of Shaftesbury occupied the Woolsack in the absence of the Lord Chancellor from indisposition. The Lunacy Bill was read a third time and passed. Several bills were advanced a stage, and their Lordships adjourned.

Friday.—Lord Radnor moved for returns connected with the Corn Trade, which were granted, Lord Wharncliffe observing that the new Corn Law could not produce all the benefit expected, so long as it is supposed that government will not have the firmness to act on their own measures. Some bills were brought in and read a first time, and the Bankruptcy Bill passed through committee. A conversation ensued on the Mines and Collieries' Bill, and on the appointment of the sub-commissioners. Lord Londonderry complained of the report, which was defended by Lord Campbell and Lord Normanby.

HOUSE OF COMMONS.

Saturday.—After some unimportant business the House went into committee on the Licensed Lunatic Asylum Bill.—Lord Ashley expressed a hope that the measure would tend to ameliorate the condition of the pauper lunatics throughout the kingdom. He had formerly entertained some doubts as to the practicability of carrying out the system of non-restraint, but those doubts had been removed by a visit which he had lately made to the Hanwell Asylum. Having witnessed the system pursued there, he felt that he could not speak too highly either of the system itself or the manner in which it was carried out by Dr. Conolly. The bill then passed through committee, and was ordered to be reported on Monday.

The Irish Fisheries Bill, with amendments, then passed through committee.

Monday.—Sir R. Peel, in reply to Mr. Hawes, said that he would take the subject of church extension into his serious consideration during the recess, and would state his intentions in the next session.—Sir R. Inglis then said he would postpone his church extension motion till next session.

The order of the day having been read for going into committee of supply, Mr. Sheil made some animadversions on the policy of the Government in Ireland. That policy, he said, was still tainted with the old spirit of Toryism. Ireland, which Sir R. Peel had some time since acknowledged to be his chief difficulty, would always remain so to every Ministry who should be obliged to govern against the opinion of the majority of the Irish members. He referred to the declarations with which the present Irish Government had been ushered into office, and from which he had inferred that it was about to act independently of the Tory party in Ireland. But he lamented to say that the days of exclusion were still continued. No single Roman Catholic had been placed in any high situation. Although Serjeant Green had been continued in the Counselship to the Castle by the Government of Sir R. Peel in 1835, yet the like forbearance had not been preserved in the case of Mr. Monaghan, a Roman Catholic, who held the same offices on the late change. The new Solicitor-General and Mr. Serjeant Warren, at the election of the former for Dublin University, had selected, as one of their topics for attack, the education system, for which Ireland was so much indebted to Lord Stanley. At the election for Dublin city, the popular party applied to have the duties of the shrievalty executed by the sheriff elect, rather than by the old sheriffs, who were keen partisans; but this reasonable application had been refused. Liberal professions were made, on Lord De Grey's accession, of the Government's resolve to administer justice impartially; yet the judge appointed to succeed Mr. Justice Johnson was Mr. Lefroy, an able lawyer indeed, and a high-minded gentleman, well fitted to have decided Irish appeals in the House of Lords, but too warm a partisan in Irish politics to be fitly sent upon Irish circuits. Mr. Sheil then entered into some details respecting particular trials, in order to show that juries still continue to be unfairly composed, and that the Attorney-General opposes undue impediments to challenges. He concluded with a complaint respecting the indulgence shown to Mr. St. George, who had been formerly removed from the magistracy for an indecorous letter to Lord Normanby, while holding the office of representative of the Sovereign in Ireland. Application had been made to the present Government to restore him. The Irish Chancellor had refused to do so, unless upon condition of an apology or explanation. Mr. St. George had peremptorily refused; and at last, without any apology or explanation at all, had been restored. Mr. Sheil's motion was for the correspondence connected with Mr. St. George's case.

Lord Eliot rejoiced in the opportunity thus afforded him of vindicating the Irish Government. He contended that the declarations which he had made had been acted up to in spirit as in letter. He reviewed the various appointments of the Irish Government, and justified its interference in the Dublin election; defended the conduct of the Irish crown solicitor, with reference to the trials adverted to by Mr. Sheil: and, after explaining the circumstances attending the restoration of Mr. St. George to the magistracy, declared that it would be inexpedient to produce the required correspondence.—After some remarks from Sir W. Somerville, the Solicitor-General for Ireland contrasted the fair and manly course of Mr. Sheil with the conduct of Mr. O'Connell, who, after promulgating charges against the law officers of the Crown, and giving repeated notices of motion respecting them, none of which he ever brought forward, now thought fit, when the opportunity arrived for making known the truth, to absent himself on the pretext of municipal business in Dublin. The Solicitor-General retorted the charge of wanton challenging, and showed Mr. Sheil to have been himself an indiscriminate challenger on his Irish circuit. He vindicated the appointments of Lord Chief Justice Pennefather and Mr. Lefroy, insisting particularly on the importance of Mr. Lefroy's great knowledge of equity, with reference to the present circumstances of the Irish Court of Exchequer, and showing that, under former Governments, he had no less than thrice been requested to accept a seat upon the bench. The Solicitor-General, in conclusion, strongly reprobated the attempts of agitators at public meetings and in the press to abuse the public mind in Ireland.—Mr. M. J. O'Connell entered generally into the subject of the discussion, contending that the present Irish Government, by their libel prosecutions, were attempting to stifle the liberty of the press.—Lord Jocelyn justified his interference in the Dublin election, denying that in his canvass any threats had been held out to such of the electors as were under Castle control. The late Government had, however, used their influence to compel the Dublin electors to vote against their feelings and conscience.—Mr. C. Buller condemned the late prosecutions for libel in Ireland, the course adopted with respect to the striking off juries, and the charge of Lord Chief Justice Pennefather on the before-mentioned trial. If these abuses were to be tolerated in Ireland, they would ere long be introduced into England; and then the press must be conducted in a manner very different from that to which we had now been long accustomed in this country.—Sir J. Graham reminded the House that the present Irish Attorney-General had been the law officer of, and much trusted by, the Administrations both of Earl Grey and of Lord Melbourne. Gentlemen had found fault with the appointment of Mr. Lefroy, on the ground that he had been a political partisan. Why, all the Judges appointed by the late Government had reached the bench through the road of politics—Perrin, O'Lochlin, Woulfe, Ball, Richards, Brady, Crampton. If Lord Jocelyn, when attached to the Lord-Lieutenant's household, had canvassed in Dublin, Mr. Byng, when Controller to the Household of the Queen herself, had been chairman of a Westminster committee. With respect to trial by jury, he feared there was no analogy between the state of England and of Ireland. So long as the arbitrary right of challenge should be exercised by the prisoners in Ireland, a corresponding power must be exercised by the Crown; but, in fact, it had not been exercised otherwise than according to established rules, upon sound and fixed principles, and with the fullest examination and approbation of the Lord Chancellor of Ireland, Sir E. Sugden. It was not the wish of Government to multiply prosecutions for libel; but malignant and mischievous attacks must be punished by a Government.—Lord Palmerston, giving credit to the Lord Lieutenant for good intentions, was not surprised at the failure of the Irish executive in obtaining the confidence of the people. Their appointments were unfortunate; and the right of challenging jurors ought undoubtedly to be exercised so as to inspire confidence in the administration of justice. Still he was pleased with the tone of the debate, which was honourable to both sides of the House, and indicated that change of feeling which Lords Normanby and Fortescue had been so instrumental in bringing about.—Mr. Gregory made some remarks in reference to his election for Dublin.

Sir R. Peel, addressing himself to the specific subject of Mr. Sheil's motion, vindicated the reinstatement of Mr. St. George, and appealed to the House whether there was any connexion between the motion and the general subjects of the speech by which it had been introduced. He felt how important it was that justice should not only be done, but believed by the people to be done. The mitigation which Lord Palmerston had noticed in the tone of this debate was a proof that the Irish Government was successful in its attempt to govern Ireland. He enumerated the chief appointments of that Government—those of the Lord-Lieutenant, the Chief Secretary, and the Lord Chancellor—as guarantees of the spirit in which he intended that Ireland should be governed. He certainly had never supposed the gentlemen opposite so simple as to believe that he meant to take the chief officers of his Government from the ranks of his opponents. He had merely said that religious opinions should be no disqualification, expressly reserving the right to place his own supporters in those political offices which he should be called on to fill up. He then vindicated his judicial and other legal appointments, adding, that a lecture on this subject from those who were parties to the offer of the Chief Barony to Mr. O'Connell, really savoured of something which he believed it would not be unparliamentary to call "assurance." He adhered in office to the principles which, out of office, he had professed; and by them he desired to be tried.—Col. Verner gave some explanations of a local and personal character; after which the House divided, rejecting the motion by a majority of 71, the numbers being—For the motion, 75; against it, 146.

Tuesday.—Captain Fitzmaurice took the oaths and his seat for Buckinghamshire.

Lord Stanley declined to answer a question put by Sir R. Inglis, as to the determination of Government to insist, in the pending negotiations with America, upon the principle that the moment a slave touched the soil of Britain he became free. To another question put by the hon. Member, his Lordship replied that the surrender of criminals who had escaped from the United States into Canada was regulated by treaty.

Sir J. Graham, previous to moving the order of the day for the committee on the Poor Law Bill, announced that at the late period which the session had now reached, it was the intention of Government to press only the early clauses (which are those relating to the continuance and powers of the Commission), together with some miscellaneous provisions, relating principally to casual poor and lunatics, and to the qualifications and powers of guardians. In the next session, the Government, he said, would introduce a fresh bill, embodying the clauses now to be dropped. Considering this altered state of things, he hoped that gentlemen opposite would forbear from insisting on the amendments of which they had given notice. Mr. Fielden and Mr. Crawford, who had motions preliminary to the commitment of the bill, declined to acquiesce in the proposal. Mr. Crawford moved an instruction, to the effect that the Commissioners should be empowered to order relief for the Irish poor "on the terms of the out-door labour test." No answer being called forth by the speech in which this instruction was proposed, the House divided forthwith, rejecting the motion by a majority of 101.—Mr. Fielden, on the motion for the Speaker's leaving the chair, moved, by way of amendment, a resolution that the House would proceed no further with the bill, until the good effects originally anticipated from the central authority should be ascertained by inquiry to have actually followed the constitution of it. This motion was seconded by General Johnson, and opposed by Mr. Grimsditch, Mr. Aglionby, and Sir J. Graham, who expressed his belief that the existing system had produced a beneficial effect on the poor. After some further discussion, the House divided, negativing Mr. Fielden's motion by a majority of 117, and proceeded to resolve itself into committee.

On the second clause, enabling the Commissioners to appoint assistants for the conduct of special inquiries, Mr. T. Duncombe proposed that on any such inquiry it should be competent to any party to attend by counsel or agent.—Sir. J. Graham observed, that he wished to take time for considering this proposal, and said that it was not intended to intrust any special commissioner with the revision of the conduct of the central authorities. His duty would be limited to questions merely local.—A desultory discussion then ensued respecting the appointment of the special commissioners by the Crown, during which Sir J. Graham objected to any change which would break in upon the principle that the power of the Central Commissioners ought to be supreme over the whole administration and machinery of the Poor Law. The Executive Government was not intended to be responsible for anything but the conduct of the central authority itself. The question being put that the clause stand part of the bill, Capt. Pechell opposed it by calling for a division; when the Committee decided in favour of the clause by a majority of 50.—The first four clauses having been passed, which are those relating to the Commission, the Committee proceeded to strike out a great number of others, being those which Sir J. Graham had declared his intention of embodying in a future act. It being proposed, however, to retain in the present bill some miscellaneous clauses, among which was one enabling guardians to require work from persons relieved as casual poor, Mr. Sharman Crawford objected to this enactment as tyrannical, and divided the Committee against it, but was defeated by a large majority.—The 38th clause, which provides for the costs of apprehending vagrants, was, after a great deal of discussion, withdrawn.—The Committee, having gone through all the clauses in the printed bill, Mr. Darby proposed an additional one for exempting places under local acts from the control of the Commissioners, unless with consent of two-thirds of the guardians. This, he said, would enable those Unions where the machinery worked well to let well alone; while, if the machinery worked ill, the guardians would thus be in a condition to supersede it by substituting the control of the central authority.—After some discussion, the Committee divided—For Mr. Darby's clause, 42; against it, 91; majority, 49.—The House then resumed, the chairman reported progress, and the report was ordered to be read on Wednesday.

On the motion of Lord Stanley, the House went into committee on the South Australia Bill.—After a few words from Mr. Hume, the Chancellor of the Exchequer, and Mr. B. Wood, Mr. Hume expressed his strong disapprobation of the manner in which the colony had been governed, from the time of Lord Glenelg downwards, and moved that the clause relieving it from its liability be omitted.—Lord Stanley opposed the motion.—The committee divided, and the numbers were—for the amendment; 10; against it, 73; majority in favour of the clause, 63.—On the motion of Lord Stanley a clause was added, providing against the colony being made a penal colony.

Wednesday.—In reply to questions from Lord Palmerston, on the state of our relations with the United States, Sir R. Peel said, that with respect to the boundary question nothing had yet been definitively settled, nor are the papers relating to it prepared to be laid before the House. The delay, he believed, had chiefly arisen from the necessity of some barometrical observations being completed. The negotiations on the subject of a convention for the surrender of convicts are still going on, and on this part of the question he could not therefore say more at present. With regard to the Slave Trade Convention, the papers not already laid on the table would be ready in a few days.

Sir J. Graham, in reply to Mr. Barclay, stated that he had resolved to postpone till next session his announced measure relative to the charters of the Colleges of Physicians and Surgeons.

Mr. Gladstone moved the second reading of the Bonded Corn Bill. He regretted that he had formerly opposed a similar bill, but a full investigation of the subject convinced him that, without injuring the agricultural interest, the measure would be beneficial to the trade of the country. He intended to introduce some amendments in committee.—Col. Rushbrooke opposed the bill, as injurious to the agricultural interest; and moved, as an amendment, that it be read a second time that day three months. A desultory discussion ensued, during which Mr. Roebuck attacked the landlords for opposing this measure on interested motives.—Sir T. Acland indignantly denied that the country gentlemen wished to uphold their rents at the expense of the people.—The House then divided, when there appeared, for the amendment, 29; against it, 116; majority for the second reading, 87.

On the bringing up of the report on the Poor Law Amendment Bill, Mr. Escott moved a clause, that it shall be lawful for all boards of guardians of the poor in England and Wales to grant such relief as in their judgment shall be necessary to poor persons at their own homes, any order, rule, or regulation of the Poor Law Commissioners notwithstanding. He had taken great pains to get at what was the principle of the Poor Law, but was still ignorant of it. If its principle were the denial of relief except in the workhouse, then he strenuously opposed it, and believed that it could not long stand. As a resident in an agricultural district, he knew from personal experience that the in-door labour test was productive of the very worst effects. The honest hard-working labourer refused to go into the workhouse, and lingered on till poverty and disease broke him down, while the idle and profligate went into it, and got fat. He freely admitted that there were evils contingent on the adoption of his proposition; but on the whole, he thought that these evils were lesser in amount than those attending the workhouse test. He knew instances in which boards of guardians violated the law by giving out-door relief, under the guise of loans which they never expected to be repaid; and it was a shocking state of things to drive humane men to violate an Act of Parliament. He called on the House to adopt his proposition before a coming winter laid its iron grasp on the poor.

Sir J. Graham complimented Mr. Escott for the ability, as well as sincerity with which he had argued the question. But it was quite a mistake to suppose that out-door relief was prohibited; the guardians had discretionary power to administer it in cases of sickness or distress. Returns (produced by Sir James) for the last three years, strikingly exhibited this; the number of those relieved within the workhouse during those years (1839 to 1841) bore no proportion to the numbers relieved out of it—a fact which was still further illustrated by the figures exhibiting the proportions of the rates expended in relief within and without the workhouse. The right hon. Baronet argued strongly against the adoption of Mr. Escott's clause, as calculated to revive all the old evils, without producing any counteracting benefit.—A long discussion on the general question ensued, in which several Members on both sides joined; and at length the House divided, negativing the clause by 90 to 55. The bill was then ordered to be read a third time on Friday.

The House then resolved itself into a committee of supply.—Several grants having been voted without opposition, that of 8,928*l.* for the Roman Catholic College of Maynooth was proposed.—Mr. Plumptre objected to the vote as being one most offensive to several of her Majesty's subjects, and expressed his determination to divide the House against it. A discussion ensued, which partook of a theological as well as party character, and was marked by much personal animosity; the house then divided, affirming the vote by 95 to 48.

On the motion that the report of the South Australian Bill be brought up, Mr. B. Wood addressed the House in opposition to the measure.—Lord Stanley followed in its support. Dr. Bowring moved that the debate be adjourned. The House divided, when there appeared, for receiving the report, 59; for the adjournment, 1; majority, 58. The report was then received.

The Prisons Bill and the Election Petitions Trial Bill were read a third time and passed.

Thursday.—Sir R. Peel suggested the expediency of postponing the motion for papers relating to the negotiation on the Stade duties, of which Mr. Hutt had given notice, as in the present state of the negotiation he could not, consistently with his duty, take any part in the discussion. The motion was then withdrawn. Papers relating to the deposition of the late Rajah of Sattara were ordered, on the motion of Mr. Hume.—Sir R. Peel said that in his observations on the state of Indian finance, on bringing forward the budget, he had not by any means admitted that the Indian Government had any claim upon the English Treasury on account of the Affghan war.—The Solicitor-General stated that the Local Courts Bill and the Bankruptcy Bill would certainly be proceeded with this session.—On the motion of Capt. Pechell, returns were ordered of naval officers who had been admitted to Haslar Hospital.—Mr. T. Duncombe brought on his motion with respect to the state of the country. After contrasting the conduct of the ministerial party when in opposition with that of the present opposition, he expressed regret at the apathy evinced by the majority of the House respecting the distress of the country—a distress which threatened social dissolution, and which rendered the peace and tranquillity of the country not worth forty-eight hours' purchase. The people had hitherto suffered in patience and with hope; but hope was vanishing, and winter was approaching. Confident expectations were uttered with respect to an early and abundant harvest; but the "Mark-lane Express" authoritatively discouraged any anticipations of that nature. He called on the House to entertain his motion, which was for an address to her Majesty, praying that, if no amelioration take place in the condition of the country at an early period after the prorogation of Parliament, it may be speedily called together again, in order to devise means to give an impulse to trade and industry, and avert those calamities which the inclemency of winter must produce.—Mr. Ward seconded the motion.—Mr. D'Israeli admitted the extent of the distress, but attributed it to the foreign policy of the late Government, and said that it could only be remedied by commercial diplomacy; upon which Mr. Ewart observed that if this theory were correct, the distress would be cured by placing Mr. D'Israeli in the Foreign-office.—Mr. Brotherton read the requisition addressed to him, and signed by the Boroughreve and other authorities of Salford, requesting him to join in stopping the supplies, and said that it was a striking proof of the condition of that part of the country.—Mr. Ricardo adduced documentary evidence as to the alarming state of affairs in Staffordshire.—Sir J. Graham had never denied the existence of great and wide-spread distress, but objected to taking the state of things in Staffordshire as a measure of its severity. Mr. Duncombe had brought his motion forward in a fair enough way, but it was only a peg for a renewed discussion on an exhausted subject—the repeal of the Corn-laws. The time of calling Parliament together was a matter which should be left to the discretion of the responsible advisers of the Crown.

—Mr. HAWES contended that the present Corn-law was a mere makeshift, which must give way to public opinion; and, for himself, he would seize every opportunity of bringing the subject before the public.—Mr. M. PHILIPS also declared that he would not shrink from his share in any discussion on this important subject, for the tariff would do little towards relieving the distresses of the working classes.—After some remarks from Mr. PARKER and Mr. THORNELEY, Sir R. PEEL said there never was, in any session of Parliament, so great a relaxation as that given by the tariff, and he was surprised to find it disparaged by those who praised it in its progress. He deeply deplored the distress, but thought the condition of the country was not such as to warrant the discouraging tone taken in the debate, which he illustrated by showing that there was an increase in the aggregate number of inhabited houses during the last ten years. The essence of the motion before them was neither more nor less than that a pledge should be given by the House that, at an early period, the Corn-laws should be repealed. The responsibility of bringing Parliament together should be left with the executive Government: any minister who believed that Parliament could relieve the distress, and neglected to advise the Crown to summon it, would be guilty of a gross abandonment of duty.

Lord PALMERSTON thought that the ministerial side of the House had evinced a sound discretion by their comparative silence, because they had nothing to say. The tariff was a valuable instalment, but still only an instalment, of the great principles of free trade, and but for the aid of the Liberal party it would never have passed into law. As to the allegation about the deficiency left in the revenue, and the necessity for the Income-tax, let it be remembered that the measures proposed by the late Government would have saved that alleged necessity, and have materially mitigated the existing distress. He did not, any more than Sir R. Peel, despair of the fortunes of the country, but the energy and hope of the people must be inspired by sound legislative measures.—At the conclusion of Lord Palmerston's speech, Mr. HUME moved the adjournment of the debate, but subsequently withdrew the motion.—The House then divided—For the motion, 91; against it, 147; majority, 56.

On the motion that the South Australian Bill be read a third time the House divided; an amendment to defeat the Bill having been proposed by Mr. HUME. The numbers were—for the amendment, 15: against it, 68: majority, 53.

Friday.—Lord ASHLEY brought up the report of the Newcastle-under-Lyme Election Committee, stating that Mr. J. Q. Harris was not duly elected, and that Mr. Colquhoun ought to have been returned. On the order of the day for the third reading of the Poor Law Amendment Bill, Mr. CRAWFORD divided the House, on a motion for postponing it for three months, which was negatived by a majority of 73. On the motion of Sir Thos. ACLAND, a clause was adopted to enable guardians to appoint local committees for receiving applications from the poor of parishes situated at a distance of four miles from the place of meeting of the board of guardians. The Bill then passed, on a division, by a majority of 78. Mr. GIBSON moved, as an amendment to the Committee of Supply, that the House resolve into committee to consider the distress of the country. A long discussion ensued, when Mr. COBDEN moved an adjournment, which was negatived, and after a long debate on the main question, the House, on a division, negatived Mr. Gibson's amendment by 92, and went into Committee of Supply.

CITY.

***Money Market, Friday.*—Consols for the Account closed at $90\frac{3}{4}$, and $90\frac{5}{8}$ for money; Bank Stock, $165\frac{1}{2}$ to $6\frac{1}{2}$; Three per Cents. Reduced, 91 to $\frac{1}{8}$; Three-and-a-Half per Cents. Reduced, $100\frac{5}{8}$ to $\frac{3}{4}$; New Three-and-a-Half per Cents., 100; India Stock, 248 to 9; Exchequer Bills, 46s. to 48s. prem.**

Metropolis and its Vicinity.

Metropolitan Improvements.—The parish of St. George, Hanover Square, have resolved to pave Piccadilly with wood from the Black Bear to Lord Ashburton's, at the corner of Bolton-street, the work to commence at the close of the season.—A petition, respectably signed, was presented some months ago for widening that part of Piccadilly between Bolton-street and Park-lane, and her Majesty was pleased to grant the land of the Green Park necessary for that purpose. The daily papers now announce, that in consequence of some dispute between St. George's and St. Martin's Vestries as to which parish shall keep in repair the additional carriage way, this improvement is not likely to be effected for the present.—In compliance with the will of the late Mr. Barber Beaumont, an Artesian well, 264 feet deep, has been sunk in Piccadilly, opposite St. James's Church, and a cast-iron pump, resembling a gothic shrine, has been erected over it. The supply of water is abundant, and the quality excellent. The pump, which was opened on Wednesday to the public, bears the following inscription:—"This pump was erected, and the well sunk to the depth of 264 feet, by the representatives of the late T. Barber Beaumont, Esq., and by the commissioners for paving the parish of St. James, in order to carry permanently into effect the desire of Mr. Beaumont to afford the public an uninterrupted supply of pure spring water, A.D. 1842."

The Thames Navigation.—The Lord Mayor has held his annual Courts as Conservator of the Thames and waters of the Medway, in the counties of Surrey and Middlesex, for the purpose of receiving reports from the juries on the state of the river. The following is the substance of the report of the Middlesex jury, which is considered to be the most important, as it relates to topics of great interest along the banks of the river in its most dangerous parts. The jury reported, that in the execution of their duties they presented the bridges of Battersea and Putney as nuisances and obstructions. They believed these bridges to be dangerous impediments to the common passage, inasmuch as the most skilful pilots were frequently of no avail in their attempts to steer clear of the piles which support those constructions, which cause the loss of boats, paddle-boxes, and not unfrequently the loss of life. In soliciting the attention of the chief magistrate to these dangerous nuisances, they submitted an opinion they unanimously held, that immediate steps should be taken to uproot a portion of the piles or supporters of the bridge, so as to throw two openings into one, wherever that can be effected with safety. They also reported that, in consequence of the constant and daily demand made for extraordinary accommodation, arising from the annually increased number of steam-boats and passengers, steps should be taken by the Conservator of the river fully to protect the public, particularly in regard to the numerous landing places for passengers. Their attention had been especially directed to those at Hungerford Market and the Adelphi, which, in their opinion, call for the immediate interference of the Court. The report of the Surrey jury briefly stated that the wreck of a brig belonging to Rotherhithe, caused an obstruction and impeded the free navigation of the river; that some blocks of wood were improperly laid opposite the wharf of the Steam-boat Company at Lambeth, which were covered at high-water, and thus rendered dangerous; that a nuisance was occasioned by the chemical works on the banks near Battersea-fields; and that Battersea and Putney Bridges ought either to be wholly removed or widened as to some of the arches. The Recorder informed each jury that the City Solicitor should receive instructions to act as the various occasions seemed to require, and the Court was adjourned for 12 months.

Public Meetings.—On Friday evening a public dinner, at which the Duke of Richmond presided, was given at the Thatched House Tavern to Sir Allan M'Nab, by the British American Association. The dinner was intended as an acknowledgment of the loyal services rendered by Sir Allan to the mother country and to Canada during the outbreak which occurred in British America in 1837-38, and was attended by a large number of distinguished guests. Capt. Drew, who headed the volunteers and was instrumental in the capture of one of the steamers on that occasion, was also present. Sir Allan M'Nab, in alluding to this circumstance, said that he had the gratification of publicly declaring in England that no service could be more difficult, more dangerous, or more gallantly performed than the destruction of a vessel employed to succour and sustain those who were in arms against her Majesty, and he well knew that he expressed the sentiments of the people of Canada, when he stated that they look forward with intense anxiety to see the loyalty and gallantry of Capt. Drew generously rewarded. They feel that he rendered them a great and important service, which, as loyal and honest men, they never can forget or too highly appreciate. We have long felt, he said, in Canada the want of population, and there is no portion of the world from whence we so naturally and so earnestly desire to receive that population as from our fatherland. I was therefore delighted on my arrival in this country to find that an association had been formed, and was fast ripening into maturity, which, if carried into successful operation, will confer incalculable benefit both on Canada and the parent state; and I can only add in the strong and beautiful language of the Aborigines of that country, my sincere hope that the glorious connexion between Great Britain and the North American Colonies may continue "as long as the waters run and the grass grows."

City Companies.—At an inquest recently held before Mr. Payne, the City coroner, the summoning officer said that a party had objected to attend as a juror, claiming exemption on the ground of his being a freeman of the Worshipful Company of Cooks, who are exempt from serving on juries, &c.; to prove which an Act of Parliament, dated 1664, called the 16th of Charles II., was produced. The party having proved that he was entitled to this privilege, was excused from serving.

River Steamers.—An act received the royal assent on Friday, by which some fresh regulations are made for public-houses and the management of steam-vessels on the River. It enacts that no excisable liquors shall be sold by retail on board any steam-boat or other vessel, moored or lying at anchor within the Metropolitan Police district, during the hours of Sundays, Good Friday, or Christmas Day, on which licensed victuallers are by law obliged to keep their houses closed; and any master, steward, or other person, who shall during those hours sell any exciseable liquors on board, is liable to a penalty not exceeding 5*l.*

Marylebone.—On Saturday a meeting of the vestry took place for the purpose of receiving the report of the committee appointed to consider the number of police-stations and policemen employed in the parish, and to ascertain whether the amount levied on the parish for the maintenance of the police force is a fair proportion as compared with that levied on other Metropolitan districts. It appeared that from the year 1818 to 1827 the average cost of the police force in Marylebone was 9,566*l.* The number of officers employed were, for day duty 59, and for night 197—total 256. From the year 1830 to the 29th Sept. 1841, the amount spent in the maintenance of the police had been 301,464*l.* 6*s.* 8*d.* This demand was made for one superintendent, four inspectors, 25 sergeants, and 181 police-constables, or 211 men. During the eight years ending 1827, the amount paid for the Marylebone watch during that period was 79,044*l.*, giving an average annual amount of 9,880*l.* 10*s.* Taking the eight years under the present system, after the passing of the Act, which provided for the payment of a proportion of the rate from the Consolidated Fund, the amount demanded by the police commissioners was 204,797*l.*; and the amount actually paid by the parish appears to have been 153,535*l.* Since the introduction of the new police the annual increase was 9,311*l.*, being nearly 100 per cent., although the difference in the numbers is 45—the number employed on the parochial watch being 256, and the Metropolitan police 211. The Report recommended immediate measures to rouse the attention of the parishioners to the increasing expenses of the present system, which involves no less than one-sixth of the whole local taxation of the parish.

Kensington.—On Saturday, at the Divisional Petty Sessions, the magistrates were occupied for a considerable time in hearing and determining a number of informations at the instance of the county inspectors of weights and measures, against publicans and shopkeepers, residing in the parishes of Chelsea and Fulham, for having in their possession, and using, unstamped and deficient weights and measures, as well as fraudulent balances. In most of the cases convictions took place, and the defendants were each fined in sums varying from 3*l.* to 5*l.*, with 6*s.* 6*d.* costs in each case. The fines, &c., amounted to a total of 29*l.* 11*s.*

Islington.—On Monday night, between 40 and 50 able-bodied paupers, in a ragged condition, from various parts of the country, besieged Islington workhouse and demanded relief and admission, saying that they were exhausted through starvation; they had sought work without success, and could proceed no further. Crowds of persons assembled, and were loud in their exclamations against the parish officers for not admitting them immediately, and it was much feared that the result would be violence. A communication having been made to the relieving overseer, he came and furnished them with an order for food and beds for the night, and they were admitted as casual poor. On Tuesday morning, it was found that they had been very unruly during the night, and had destroyed their clothes for the purpose of being kept in the workhouse or supplied with new clothes. They were therefore, taken to Clerkenwell police court, when the prisoners in their defence said, that they had come from various parts of the country in search of work; they met accidentally and formed themselves into a body for the purpose of demanding and insisting upon being relieved by the parishes through which they passed. The magistrate said that such conduct could not be tolerated, and committed them to the House of Correction for 21 days. It was stated in court that 19 paupers were committed from Guildhall a few days ago for similar misconduct.

Peckham.—An inquest has been held at St. Thomas's Hospital, on the body of James White, a labourer, late in the employment of Messrs. Noble and Mee, extensive farmers and milkmen, of Frier's Farm, Peckham-rye, who died from the effect of wounds inflicted on his head while sleeping in the barn on the night of Tuesday, the 12th inst. A fellow labourer, named Webb, is in custody on suspicion of being concerned in the murder, but as the evidence is not at present complete, the inquiry has been adjourned for a week.

Mortality of the Metropolis.—The number of deaths in the Metropolis from all causes registered in the week ending Saturday, July 9, was as follows:—Males, 371; females, 374; total, 745. Weekly average 1838-9-40-1, males, 467; females, 445.

Greenwich.—A public meeting took place on Monday last in the Pensioners' Library of the Hospital, Sir Robert Stopford in the chair, when five blind pensioners, instructed on the Phonetic principle, or by Mr. Frere's system of teaching reading to the blind by the combination of elementary sounds, read the Scriptures before a numerous assembly. One of these pensioners, aged 78, who learnt at the age of 75, read before her Majesty the Queen Dowager, on the occasion of her late visit to Greenwich. Another, who had never been able to read when possessed of his eyesight, had learnt to read the Testament embossed upon this principle, when blind, in five lessons. Several other blind persons, not belonging to the hospital, also read. One blind young woman, who instructs eight blind girls, not only in reading, but in working, attended with two of her pupils, and gave several examples of their proficiency.

Chatham.—Orders were received at Woolwich during the past week to build a war steam-vessel, of very large dimensions, to be named the Dragon. The order has since been countermanded so far as regards her being built at Woolwich, but it is understood that she will be immediately commenced at this port. Some idea may be formed of the magnitude of this vessel, when it is stated that her engines are to be of the power of 800 horses. The Devastation and other first-class steamers at present in the service have only engines of 400 horse power.—The Goliath, 80, and Virago, a large class steamer, will be launched from this dockyard on Monday next, the 25th inst. The Goliath is to mount 68 32-pounders, long guns, and 12 six-inch guns. The length of her gun-deck, 190 feet; her burden in tons, 2,599. The Virago is to mount two long guns, 84-pounders, and four 32-pounders. Her length on deck is 180 feet; and burden in tons, 1,000.

Provincial News.

Bolton.—The local papers have published the following statement relative to the distressed condition of the hand-loom weavers. On a careful survey, made a few days ago, it was found that in one street there were 46 looms out of a total of 92 standing idle from want of work. In another district, comprising about 70 houses, there are 200 looms idle, and it is calculated that out of the whole number of 2,800 hand-loom weavers in this borough, 1,500 are out of employment. The average earnings of 700 weavers employed at Christmas last, by one of the best houses in the town, amounted only to 5*s.* $0\frac{1}{4}$*d.* per week, and from that sum a deduction of 3*d.* for each shilling must be made for materials used, leaving only 3*s.* $9\frac{1}{4}$*d.* net. Since that time a reduction has been made of 20 per cent. in the wages paid to hand-loom weavers.

Bristol.—The first meeting on the Messrs. Acramans' bankruptcy took place on Saturday, at which the choice of assignees, &c., took place. The liabilities of the firm are stated to be nearly 300,000*l.*, in addition to the liabilities of each of their private estates. The amount of debts proved up to the close of the meeting amounted to 84,000*l.* There is another branch of the firm against which a fiat has been issued as steam ship-builders, and the whole is said to have been the most extensive private commercial establishment in the kingdom.—The Agricultural Society closed its anniversary last week after a very favourable meeting; at one of the dinners which took place subsequently to our last report, the American Minister, Mr. Everett, in a very eloquent speech, alluded to the connexion of the United States with England, and especially to British agriculture, in terms which cannot fail to be gratifying to our readers. "It is a singular circumstance," he said, "that the history of North America runs back to this very point. Its very first chapter was written in the chamber of the merchant adventurers of Bristol. I am not now alluding to the coincidence I mentioned the other day, that Columbus himself was resident here; but to the more striking circumstance that Sebastian Cabot, who was the great discoverer of America, and sailed from this port when he discovered Newfoundland and ran down the coast of North America to Florida, was a native of Bristol. And we all know that it was under the auspices of the Plymouth Company that the settlement of New England began, and the rock upon which the fathers of New England first set foot was called, and is called to this day, Plymouth Rock. The father of Wm. Penn, the great founder of Pennsylvania, lies buried in the vaults of St. Mary Redcliffe; and although William Penn was not himself a native of Bristol, yet doubtless, from his having heard in his youth the stories of the navigators of this port, on coming back from their Western adventures, he first derived the thought of settling in that region. I assure you, gentlemen, that the community between us, arising from common descent and connected by the ties of common language and kindred blood, is not confined to speculations of business or commercial adventure: this is the least important part of it. This common origin—this kindred blood—this tie of common ancestry, actually makes us one people in all but political jurisdiction; for every purpose—social, literary, moral, and intellectual—it does make us one people. We have kept our eye particularly on what has been doing for the improvement of agriculture. The climate of New England, though more severe than that of England, running into either extreme to a greater extent, is yet, on the whole, not much dissimilar; and we are enabled to derive instruction from all the works that issue from the British press in relation to agriculture. These works are read with avidity, and I wish the intelligent agriculturists of England to know that the seeds of improvement which they have scattered here are literally sown broadcast in America. You cannot, by your improvements, shorten the bones of a pig, straighten the back of a cow, or make the wool of the sheep finer, but in due time the effect of all your improvements is felt across the Atlantic. I am glad that the interest awakened in these most peaceful pursuits, has an effect far beyond the material interest. I believe that people must be good friends with each other, and nations must be kindly to each other, who are engaged together in the prosecution of such pursuits; and while Mr. Smith is lending us his system of thorough draining, that lesson will at the same time tend to draw off the bitter waters of international jealousy, creating a warm and genial soil on the surface for the peaceful fruits of harmony and good-will." In a subsequent speech he said, "It has been stated that that man will be the greatest benefactor of his race who can make two blades of grass grow where only one grew before. I have been told, and statistics have been shown me, giving in figures the proof as plain as day, that by the improvement of agriculture during the last generation—it might probably be said within the last few years—not two blades only, but four, and even six, have been made to grow where one grew before. I think, sir, this is not only a benefit, but absolute creation. If you double the food required for the sustenance of man and beast, have you not doubled your territory? Is it not as if, by stretching out a magic wand over the unruly sea, you could make another England rise up—as if you could raise another island like this out of the bosom of the deep, with all

'Her waving fields and pastures green,
And gentle slopes and groves between'?

And all this, sir, to be subjected to the peaceful sway of your youthful and beloved sovereign—and all this, too, to be accomplished without the cost of a single pound, except that which would come back with benefit to the people, and without shedding one drop of human blood. What are the conquests of all the Alexanders and Cæsars that ever wasted mankind compared with this? This peaceful triumph of your Society, sir, is one which cannot be confined to your own country, but of which all nations will share the benefit, and to which all nations must wish God speed."

Cambridge.—An ivory model of the celebrated Indian temple, the Tage Mahal, at Agra, has been presented to the University by Mr. R. Burney, M.A., of Christ's College, and has been placed in the Pitt Press. The value of the model is stated to be about 7,000*l*. On the 10th of October a grace will be offered to the Senate to affix the seal to a letter of thanks to Mr. Burney for his present. A similar grace will be offered on the same day to affix the seal to a letter of thanks to Messrs. Rundell, Bridge, and Co., of London, for a bronze cast of the shield of Achilles, by Flaxman, lately presented by them to the University.

Epping.—A gang of highwaymen has recently been discovered in Epping Forest, where they had constructed a cave in the thickest and least-frequented part of the forest. The police, in consequence of numerous robberies in different parts of Essex, scoured the forest last week, and succeeded in finding the cave. By watching the movements of the party, four men, well known to the police as bad characters, were apprehended, and committed to Ilford gaol for three months' hard labour. The police are now using every exertion to apprehend their companions.

Exeter.—A correspondent informs us that a series of fatal accidents have occurred at Bicton, the seat of Lady Rolle, within the last few days. On the 8th inst., the foreman in the kitchen-garden, a young man named Robert Vinicombe, fell from a ladder in the tool-shed, and was so seriously injured, that he died on the 12th inst. The jury returned a verdict of Accidental death. A short time previous to this, a young man named Pile, while making some alterations to the fireplace in the hot-house department, fell into the boiler, and was so severely scalded, that he died a few days afterwards. Subsequently to these occurrences, one of the coachmen was found dead in the Park, having ruptured a blood-vessel while returning from this city with his horses.

Lancaster.—On Friday last, about four in the afternoon, during a heavy shower of rain, a singular occurrence happened at Constable, about two miles from Haslingden in this county. The day had been altogether rainy, but unaccompanied by any wind or thunder, when suddenly a whirlwind commenced, exceeding in violence anything of the kind ever remembered. Trees were uprooted; others had large branches torn off the trunks, and scattered about in the fields like straw. Cocks of hay were entirely removed. A cart, standing in the road-side, was lifted up, and turned upside down; chimneys were thrown down, and a considerable quantity of the slates blown off a factory in the neighbourhood. A woman was raised entirely from the ground, and carried over a wall into the adjoining field. Her cloak was stripped off, and was afterwards found at a distance of half a mile from the place. No other accident occurred. The whirlwind lasted for about two minutes, and was not felt more than a quarter of a mile from the place where it began.

Leeds.—On Monday a meeting of the bankers, merchants, and manufacturers of this borough was held at the Court-house, "to take into consideration the present appalling state of trade and of the country, with the view of making another appeal to her Majesty's Ministers and Parliament on the subject before the close of the session, irrespective of all party feeling and party measures." The requisition calling the meeting was signed with the names of several of the leading gentlemen of the town. The meeting was numerously attended, the Council-room being completely filled. The Mayor was in the chair. Several gentlemen addressed the meeting, detailing the alarming distress in the manufacturing districts; and resolutions in accordance with the requisition were unanimously carried.

Liverpool.—A public meeting of the inhabitants of this town was held on Monday, in Clayton-square, for the purpose of taking into consideration the great and daily increasing distress of the country, and to petition her Majesty not to prorogue Parliament until remedial measures have been adopted. There were between five and six thousand persons present. Mr. Hugh Hornby presided. Several of the most influential inhabitants addressed the meeting, showing that the distress of the country, even at this most favourable period of the year, was unparalleled in extent and severity. The principal resolutions affirmed that no measures could save the nation from impending ruin in all its interests, agricultural, commercial, and manufacturing, except such as could remove the hindrances to trade. All the resolutions were unanimously carried.

Manchester.—In addition to the cotton-mills before stated as having been wholly or partially closed, there are now to be added two others, belonging to Mr. Guest, in which were employed 500 or 600 hands. The extensive mills known as the Salford Mills are also standing, which when fully occupied did not give employment to fewer than 1,000 men, women, and children.—The memorial to the members of this borough to stop the supplies until the restrictions on the food of the people be abolished, received 30,000 signatures in one day.

Nottingham.—The local journals mention that last week upwards of 200 operatives of this town, who are in a state of starvation owing to their inability to obtain work, paraded the streets four deep, soliciting charity. They were headed by a cart drawn by men, and several of their body went to the different houses and solicited alms of money or bread. They had a considerable quantity of the latter in the cart, which would be distributed by an equal division. At Bulwell also the greatest distress prevails; a great many are totally unemployed, and others have but half work. Last week 36 operatives drew a waggon-load of lime through the streets of this town and Newark, and expressed their willingness to undertake any kind of labour for subsistence.

Portsmouth.—The perpetrators of the incendiary fires in the neighbourhood of Havant, and the authors of the numerous threatening letters, have just been discovered and committed for trial. They turn out to be a young man named Parrot, and another named Sparkes, son of the gardener of Mr. Longcroft, of Havant. Both prisoners had been employed by their masters to watch the premises during the last few weeks, and have confessed their guilt since their apprehension.—It is stated that the St. Vincent, 120, with the flag of the Commander-in-Chief, Sir Edward Codrington, is to be fully equipped and to proceed to Spithead, where she is to take up her moorings instead of lying in the harbour. It is also stated that the flag-ship at Sheerness, the Camperdown, is to take her station at the Nore, and that the flag-ship at Plymouth, the Caledonia, is to be moored in the Sound instead of Hamoaze.—One of the largest seizures of tobacco made at this port occurred last week, when upwards of four tons were discovered by the officers, concealed in cases of confectionery from Guernsey.

Rugby.—The election for the Head Mastership of Rugby School excites increased attention as the day of election approaches. The following candidates have been announced;—Rev. S. Donne, D.D., Master of Oswestry School; Rev. J. A. Giles, D.D.; Rev. H. Highton, Assistant-Master of Rugby (educated at the School); Mr. B. Price, Assistant-Master of Rugby; Rev. C. J. Vaughan, Vicar of St. Martin's, Leicester (educated at Rugby); Rev. C. A. Waldron, of Westbromwich; Professor Brown, of King's College, London; Rev. H. Kynaston, Master of St. Paul's School; Rev. R. Michell, Rev. R. J. Spranger, Rev. A. C. Tait; Rev. B. H. Kennedy, D.D., Head Master of Shrewsbury School; Rev. J. W. Blakesley, Rev. J. Hildyard, Rev. C. Merivale; Rev. W. A. Osborne, Head Master of Macclesfield School; Rev. T. H. Steele, one of the Masters of Harrow School; Rev. R. Shilleto; Rev. R. Bingham, Master of Gosport School, Hants; Rev. W. Fletcher, Master of Derby School. Although the emoluments of the Head Master depend in some degree on the number of the pupils, the annual income may be estimated at about 4,000*l*.

Shrewsbury.—The local papers announce that the colliers at Ketley, on the estate of the Duke of Sutherland, have turned out, and are going about the country in large bodies. As this place is only 25 miles from the Potteries, it is feared that the movement may add to the difficulty of a settlement in the disturbed districts of Staffordshire. The ringleaders have been apprehended.

Stafford.—Serious disturbances have taken place in the Potteries of this county, which have excited considerable apprehensions for the public peace. It appears that within the last two or three weeks the masters have made an attempt to reduce the wages of the men employed in the collieries of North Staffordshire, the consequence of which has been a turn-out of the miners. The proximate cause of the disturbance appears to have been the reduction of 7*d*. per day from the wages hitherto paid to the colliers by Mr. Sparrow, whose works are situate near Burslem. Such is the magnitude of Mr. Sparrow's establishment, that the reduction of 7*d*. in each man's wages made a difference of not less than 300*l*. per week. At the first outbreak, Burslem, Hanley, Stoke, Tunstal, and Lane-end, the chief towns within the Potteries, were greatly excited; so much so, indeed, that the authorities deemed it necessary to call in the immediate aid of the county police and military. The turn-outs, to the amount of some thousands, visited the collieries, iron-works, and potteries, where men were to be found who had accepted the reduced scale of wages, and in some instances inflicted personal violence upon men whom they found peaceably engaged at work. Many of the country people were lightened of their stocks on their way to market; and in the neighbourhood of Lane-end, market-carts proceeding to Burslem and Hanley, were regularly stopped and cleared of their contents. The turn-outs threatened to pursue the same system with the butcher's shops on Saturday night, and, in fear of such threats being put into execution, many of the provision tradesmen of the district closed their establishments. Some few acts of violence were committed; but the presence of the troops, the strength of which had been augmented by the arrival of two companies of Foot from Weedon Barracks, prevented the execution of a premeditated attack. The Cheshire troop of cavalry, and the Newcastle troop, subsequently arrived at Newcastle, and encamped, in conjunction with the regular troops, in the Pottery race-course. There was a great number of magistrates and principal gentlemen of the place present, and the whole had an alarming appearance. So great was the terror amongst the shopkeepers, that many of them closed their shops, and all trade was suspended. Many of the inhabitants, in order to save themselves from being plundered, gave many of the rioters food and money liberally. The county magistrates assembled on Monday, in order to effect an amicable arrangement between the masters and the workmen, who declared that they were not disposed to break the peace, but were determined not to return to work until they obtained their old prices. From all accounts it would appear that the turn-outs are almost exclusively colliers, upon whom, as a matter of course, the pottery manufacturers depend for their ordinary and necessary supply of coal. The event most dreaded is the non-employment of the potters—a certain contingency, if the colliers continue their turn-out for many days longer. In the beginning of the week coal became scarce at the pit's mouth; and in another week the pottery establishments will be for the most part without a supply. It is also feared that the potters will avenge themselves upon the colliers as the authors of their privations, or combine with the turn-outs against the masters; the most lamentable consequences must then ensue. By such an event at least 40,000 persons will be thrown out of employ. These apprehensions are not without foundation, for on Tuesday the works of Messrs. Copeland and Garratt were closed for want of coal, and other houses have since been obliged to shut up their establishments.

Stockport.—The distress in this town continues to increase: 15 cotton-mills, 149 shops, 10 public-houses, and nearly 3,000 cottages are now to let. The number of dwelling-houses, shops, and taverns in the borough, according to the census of June 1841, was 10,890; so that one-fourth, or upwards, are now to let, while the number of cotton-mills amounts to about one-half, from the stoppage of which, and the reduction of wages within the last two years and a half, about 3,800*l*. per week are paid less in wages than previously to that time. Within two minutes' walk, in the principal street in the borough, there are 37 tenantless shops, and the tenants of five others in the same street are about leaving their premises. In 1840 there were about 240 beer-houses in the borough; the total number now is 104. There cannot be less than between 4,000 and 5,000 factory operatives out of employment at the present time, who have to be supported chiefly from the poor-rates, which are now higher, and the chance of paying them less, than was ever before known. The local papers state that nothing will probably prove the existence and increase of distress in Stockport more than the poor-rates; and, referring to these, it will be found that in the year 1836 the poor-rate was 2*s.* 6*d.* in the pound upon the annual rental; in 1837 the amount was 3*s.* 6*d.*; the two following years, 4*s.*; in 1840, 6*s.*; and in 1841, 10*s.*; and with this increased amount the late guardians retired from office nearly 3,000*l.* in debt.

Warrington.—A fatal accident occurred on the Howley Locks on Saturday. It appears that the Old Quay Company have for some time past been engaged in repairing their locks at the terminus of the canal joining the river Mersey, and for that purpose had erected a temporary railway upon bulks of timber, to convey the blocks of stone. On Saturday, during the operation, the foundation gave way, and the whole machinery, carriages, engines, &c., fell into the excavation upon the workmen below. Two were instantly killed, and nine others had their limbs broken. A coroner's inquest was held on Monday. The circumstances of the accident were detailed, and a verdict returned that deceased met their death accidentally, owing to the defective state of the frame-work on which they were employed. A deodand of 5*l.* was laid on the machinery.

Railways.—The following are the returns of the principal railways for the past week:—London and Birmingham, 17,342*l.* 17*s.* 2*d.*; Great Western, 14,563*l.* 9*s.* 6*d.*; South Western, 7,064*l.* 13*s.* 2*d.*; Brighton, 3,477*l.* 4*s.* 10*d.*; Blackwall, 1,333*l.* 6*s.* 2*d.*; Greenwich, 910*l.* 17*s.* 10*d.*; Croydon, 463*l.* 2*s.* 4*d.*; North Midland, 4,501*l.* 2*s.* 4*d.*; York and North Midland, 1,596*l.* 18*s.*; Edinburgh and Glasgow, 1,890*l.* 5*s.* 2*d.*; Eastern Counties, 1,133*l.* 15*s.* 2*d.*; Glasgow and Ayr, 1,059*l.* 13*s.* 2*d*; Glasgow, Paisley, and Greenock, 1,100*l.* 0*s.* 5*d.*; South Eastern, 846*l.* 5*s.* 11*d.*—The "Railway Magazine" states that experiments are about to be made on the Eastern Counties' Railway, under the superintendence of Mr. Hood, for the purpose of inquiring into the cause and phenomena of the crystallisation of railway axles.—Several of the railway companies have intimated an intention of publishing and distributing among their shareholders their reports which they present at their yearly and half-yearly meetings, a fortnight before such meetings actually take place, in order to put the proprietary in full possession of the subjects likely to be discussed. Such an arrangement has long been adopted with great success in France.—It is mentioned as a curious fact connected with railroad travelling, that on Wednesday the 13th, the Great Western train took down at one time 1,800 passengers, of whom 1,400 went all the way to Bristol. Most of them, it is presumed, went with a view of attending the great agricultural meeting. They were drawn by two engines only, and went with their usual speed.—An accident, but fortunately involving no other inconvenience than delay to the passengers, occurred on the Birmingham Railway on Friday afternoon. Shortly after the 4 o'clock train from Birmingham left Coventry, the axletree of the truck suddenly broke, and was dragged for a considerable distance on the line, displacing several of the carriages from the rails, and causing a delay on the line of nearly two hours.—An accident occurred last week at Lanehead, the terminus of the Stanhope and Tyne Railway, by which the eldest son of Mr. T. Kemp, gardener to the Rev. W. N. Darnell, rector of Stanhope, unfortunately lost his life. It appears that he was accompanied by two young lads, and was in the act of crossing the footpath which passes over the line of railway, when three lime waggons, which were retarded in their progress up the incline by a deficiency of steam, became detached from the rope. The waggons ran down the incline with great velocity, and the last of the three passed over the children, killing the deceased on the spot and seriously injuring one of the other lads. The jury at the inquest returned a verdict of "Accidental death," with a deodand of 3*l.* 5*s.* on the waggon and lime.—An accident occurred last week on the Great North of England Railway, by the train being turned into a siding, in consequence of which the engine and the first carriage went over an embankment. Several of the passengers were much hurt, but they were able to pursue their journey to Darlington on the arrival of another engine.

IRELAND.
